## SCHOOLS FOR X-RAY TECHNICIANS

The American Registry of X-Ray Technicians, which is sponsored by the American College of Radiology, requested the American Medical Association to assume the responsibilities of approving schools for x-ray technicians. A resolution embodying this request was presented to the House of Delegates of the American Medical Association during the 1943 session. Action on the resolution delegated the Council on Medical Education and Hospitals to establish standards of training, inspect schools and publish lists of approved schools. With the advice of the Registry and the College suitable standards were prepared and, during the 1944 session, were accepted by the House of Delegates.

Prior to this time approval was granted by the Registry. All the schools on the 1944 list published by the Registry were surveyed before the standards, or "Essentials" as they are referred to by the Council, were finally adopted. This information as well as that obtained from other schools which were anxious to be approved has been tabulated and made available to the Registry. The first list of schools approved by the Council was printed in THE JOURNAL on Jan. 13, 1945. Approximately 400 reprints of the approved schools and essentials have been distributed. At present there are 115 approved schools. Tabulated information has been compiled for 135 schools.

## APPROVED SCHOOLS FOR X-RAY TECHNICIANS

Council on Medical Education and Hospitals of the American Medical Association

NOTE: Complete details regarding admission to an approved school for x-ray technicians can be obtained by communicating directly with the radiologist.

\* Male students are admitted.  
a. Registered nurses also accepted.  
b. Two years' training in an accredited school of nursing also accepted.  
c. Degree from Mercy College, Detroit.  
d. Students working for B.S. degree are required to spend three years at Hamline University, St. Paul, and one year at hospital.  
e. High school graduates enrolled in degree course spend three years at University of Minnesota and one year at hospital.  
f. One year's training in an accredited school of nursing also accepted.  
g. Students are paid a monthly stipend of \$25 for second six months and \$50 a month during second year.  
h. High school graduates enrolled in degree course spend three years at the University of Buffalo and one year at hospital.  
i. During second six months students receive a stipend of \$25 a month and in last six months, \$50 a month.  
j. High school graduates accepted for twenty-four months' training; tuition, \$150.

## SCHOOLS FOR MEDICAL RECORD LIBRARIANS

The American Association of Medical Record Librarians presented a formal resolution to the 1942 session of the House of Delegates of the American Medical Association requesting the latter to assume the responsibilities of approving schools for medical record librarians. Action on the resolution granted the Council on Medical Education and Hospitals authority to establish standards, inspect training programs and publish lists of approved schools. Minimum essentials were formulated with the assistance of the American Association of Medical Record Librarians after all existing schools were inspected. These essentials were officially accepted by the House of Delegates in 1943. The first list of approved schools was published in June 1943. Currently there are 10 schools on the approved list.

Exceptional progress has been made during the last year in coordinating the curriculums of all schools. The product of these schools, it is felt, will therefore be more uniform as the subject matter of each school becomes more fully standardized. The stimulus for this reorganization was a critical review of all schools by a conference of instructors during the last annual meeting of the American Association of Medical Record Librarians. Requests have been made to the Council that the essentials should be changed in accordance with the new policy. The Council in turn plans to present the new curriculum to the House of Delegates of the American Medical Association at its next meeting for official action. It is understood that the new curriculum is now in effect in all the schools.

Emphasis has also been placed on the problem of training large numbers of persons who have been employed by hospitals to act as medical record librarians. In 1943 over 700 untrained persons were employed for this purpose, while at least 65 were placed in similar positions of responsibility in 1944. The second table on page 781 is the source of these data. If hospitals are forced to rely on untrained employees for this technical work, some type of in-service instruction must be made available. The Educational Board of the American Association of Medical Record Librarians has met this problem by outlining an intensive five day period of instruction which can be presented in certain key centers. Plans also are being developed to take this program to various centers throughout the nation. Later a correspondence study course can be instituted for con-

tinued instruction. Thus the hospitals will benefit immeasurably if these plans can be realized.

The continued need for qualified record librarians is evidenced by the fact that hospitals are forced to employ larger numbers of workers in this field than are graduated from the approved schools. Additional record librarians employed by hospitals in excess of the graduating class were 349 in 1942, 702 in 1943 and 65 in 1944. Every effort should be made, therefore, to produce more trained and qualified personnel. This can be done only by filling present schools to capacity and instituting new schools. Improving the qualifications of persons who have already been employed is an additional problem.

Current reports from the approved schools indicate that last year the capacity remained at 90, although only 28 students were graduated. There were no new schools added to the list. It is noteworthy, however, that although 32 graduates are expected next year, three of the schools do not have any students. A decided decrease in enrolment has been reported by all but one school since our nation has been at war. Only one school graduated more than 5 students this year, although one third of the schools were doing this four years ago.

Entrance requirements of the approved schools are designed for high school graduates in three instances but the training program for these students is integrated with a four year college curriculum. Other courses are open to persons having completed two years of college or an acceptable nurse's training. One course is arranged solely for college graduates. Applicants who do not enter the four year course are required to be proficient in typing and shorthand.

Tuition varies from \$100 to \$250 for the twelve months of training with \$125 fee being most common. There has been very little change in tuition during the last few years.

College credits are obtained in four schools while the student is pursuing the prescribed curriculum. A degree is presented by three schools while all others grant a certificate or diploma when the course is completed.

Correspondence regarding registration should be addressed to the Board of Registration of the American Association of Medical Record Librarians, State Institute for the Study of Malignant Disease, Buffalo, N. Y.

## SCHOOLS FOR OCCUPATIONAL THERAPY TECHNICIANS

At the 1933 session of the House of Delegates of the American Medical Association a resolution was introduced that some plans be effected for the establishment of standards, ratings and inspections for training schools for occupational therapy technicians. This program was referred to the Council on Medical Education and Hospitals, and all of the 13 existing schools were surveyed. The Essentials of an Acceptable School of Occupational Therapy were ratified by the House of Delegates of the American Medical Association at the Atlantic City session in 1935, such standards to become effective on Jan. 1, 1939. A report of the Council on Medical Education and Hospitals to the House of Delegates in 1936 contained the names of 4 schools which had already met these standards. There are currently 17 schools on the approved list.

The stimulus to produce more occupational therapy technicians for the armed services resulted in a graduating class of 277 in 1944. Only 50 of these therapists were enrolled in short courses. Consequently the effort to fill regular classes during the last few years is beginning to produce larger numbers of graduates. In addition to 22 courses following the prescribed curriculum and 9 advanced standing courses, both of which are accredited by the American Medical Association, 8 schools have also trained several selected students for a four months period. Following the didactic instruction presented to the latter group, students are transferred to army hospitals through civil service appointment for an additional eight months supervised practice. Thus there has been, in reality, a total of 611 students who have graduated or have completed the didactic portion of the war course.

Estimates for 1945 place the number of graduates from approved courses at 317, or an increase of 47

over this year's report and 2.7 times the graduating class of four years ago. For a clearer picture of the functions of the schools, war course graduates should be added to these figures. In conjunction with this expansion the approved schools have enlarged their capacity. Entering classes for all courses can now total 1,650 or more each year. Such a number is equal to the total registered therapists a few years ago.

The need for additional qualified occupational therapists is demonstrated by the fact that for the last two years more "therapists" have been employed in hospitals throughout the United States than have been graduated by the approved schools. Large numbers of qualified personnel will also be needed by rehabilitation centers operated by federal institutions and industry.

In an effort to supply the armed forces with a sufficient number of therapists emphasis has been placed on the advanced standing courses. Eight schools have indicated that a maximum of 266 students can be trained in these courses in addition to the regular programs of study. Tuition for the advanced standing students is, on the average, somewhat less than that required in the regular course.

The average capacity of the approved schools has been steadily increasing during the last few years. Now an average of 49 regular and 28 advanced standing students can be trained in each school. The recently approved schools have been graduating small classes since they are just beginning in their organization of the curriculum. Therefore the average number of graduates per school has been decreasing since several new schools have been approved recently. Next year, it appears, there will be an additional increase in the total number of graduates.

## APPROVED SCHOOLS FOR OCCUPATIONAL THERAPY TECHNICIANS

## SCHOOLS FOR PHYSICAL THERAPY TECHNICIANS

The House of Delegates of the American Medical Association in 1934 requested that some plan be effected for the establishment of standards, ratings and inspections of schools for the training of physical therapy technicians. The Council on Medical Education and Hospitals assumed responsibility for this program and by 1936 had completed a survey of these schools. Certain minimum standards were formulated. These were presented to the House of Delegates of the American Medical Association and were ratified in May 1936. The first published list of 13 approved schools for physical therapy technicians appeared in THE JOURNAL in August 1936.

It has been four years since the emergency course was outlined in an effort to supply larger numbers of physical therapy technicians to the Army. In that period there has been a progressive increase in the number of schools, the number of students, the size of graduating classes and, especially among the emergency programs, in the courses offered without tuition. Today there are 32 schools presenting approved training in physical therapy and offering a total of 41 courses. The latter are designed to attract not only those prospective students who desire the minimum amount of training but those who request additional training in physical therapy or the collegiate subjects which are integrated with the professional course. Soon it will be advisable to encourage an additional type of training designed to give selected students graduate instruction in the basic sciences.

Graduates last year reached a peak of 288 from the regular and 344 from the emergency courses. This total of 632 graduates will be exceeded by the estimated 904

graduates for 1945. Last year's estimate of the size of the present class was only 87 in excess of the actual number. Consequently it would appear that at least 800 graduates could be expected. Considerably more students could be trained by the present schools, since the maximum capacity of all schools has been placed at 1,229. Under present conditions it does not seem likely that this maximum capacity will be filled. Last year the total applications for enrolment in the regular courses was practically equal to the capacity, but many of the applicants are not qualified for the intensive curriculum which has been outlined. It is impracticable to correlate applications and capacity in the emergency courses, since half of these programs are located in army hospitals and all of the emergency students are expected to finish their practical supervised experience in army installations.

Entrance requirements are almost identical with those reported last year. All but 4 of the civilian schools admit students who have had two years of college training, including satisfactory courses in biology and other sciences. Two of the other schools require three years of college and a third is designed only for high school graduates who plan to devote four academic years to the curriculum, while the fourth limits enrolment to graduate nurses or physical education majors.

College credit is obtained in 1 emergency and 13 regular courses. Seven of the regular programs are designed for one full year of college credit during the nine to twelve months curriculum, while four additional programs provide enough college credit for a degree in the course outlined for high school graduates.

\* Courses are so arranged that any of the entrance requirements will qualify students for training. a = Graduation from accredited school of nursing; b = Graduation from accredited school of physical education; c = Two years of college with science courses; d = Three years of college with science courses; H. S. = High school graduation.

† For complete information regarding entrance to Army training schools write to Major Emma E. Vogel, Director of Physical Therapists,

Office of the Surgeon General, War Department, Washington 25, D. C.

1. Male students admitted.

2. High school graduates accepted for four-year course leading to A.B. degree; students admitted quarterly and tuition is \$113 per quarter.

3. High school graduates admitted to four-year college course.

4. Non-residents charged additional fee.

## SCHOOLS FOR CLINICAL LABORATORY TECHNICIANS

The original survey of 196 schools for clinical laboratory technicians was published in THE JOURNAL, Aug. 29, 1936 together with the first list of 96 approved schools. Essentials had been formulated by the Council on Medical Education and Hospitals of the American Medical Association with the cooperation of the American Society of Clinical Pathologists and ratified by the House of Delegates of the American Medical Association in May 1936.

The 256 schools for clinical laboratory technicians approved by the Council on Medical Education and Hospitals graduated 942 students last year. These figures, compared with those published by the Council for 1941, represent an increase of 82 schools but only 25 more graduates. In 1942 there was a pronounced increase in the number of approved schools. This was reflected in the peak of graduates during 1943, since the majority of schools require a twelve months training period. The report accompanying statistics for the peak of annual graduates called attention to the extremely small average number of graduates per school. Using 1941 as a basis for comparison, when the average graduates per school was 5.2, succeeding years are represented by 4.4 for 1942, 4.2 for 1943 and 3.7 for 1944. It is clear, then, that the average number of graduates per school is decreasing while the total number of approved schools is increasing steadily. Statistics for 1944 represent a decrease of 103 graduates from the peak of the preceding year.

During this same period since 1941 the maximum capacity of schools has increased progressively from 1,254 to 1,818. The total number of students enrolled, however, has resulted in an increase of only 398, which definitely indicates that an additional one or two students could be trained in each school. Each year the number of applications for training is twice or more than the graduating class and already there have been enough applications reported to fill all schools for 1945.

It should be remembered, however, that an extremely large number of these applications come from individuals who are not sufficiently prepared to take the intensive twelve months of hospital training. In fact, over half of the schools have been referring their excess qualified applicants to other schools in an effort to enroll the maximum number of students in all schools.

It would appear, then, that the number of qualified students that can be obtained for training in these schools is definitely decreasing and has been decreasing as an average for each school since 1941. Such a development is occurring in the face of increased demands for additional technicians. Last year it was reported that an additional 2,383 full time and 238 part time technicians were employed by hospitals, while only approximately 1,000 were graduated. The second table on page 781 indicates increasing reliance on technicians in spite of the decreasing number of graduates.

Entrance requirements of two years of college training are reported in 69 per cent, while the length of training is limited to twelve months in 84 per cent. Tuition is free in 56 per cent of the schools, while the average is \$42. There has also been a decrease in the number of schools charging tuition over \$150. Now only 12 per cent fall in this category, although last year there were 16 per cent.

Increased college affiliations are encouraging. When accredited colleges give credit for training received in the hospital, as most of the affiliated colleges do, they have every right to determine that the caliber of instruction is acceptable.

Correspondence regarding schools for the training of clinical laboratory technicians should be addressed to the office of the Council on Medical Education and Hospitals. Graduates of approved schools desiring registration should communicate with the Board of Registry of Medical Technologists, Ball Memorial Hospital, Muncie, Ind.

## APPROVED SCHOOLS FOR CLINICAL LABORATORY TECHNICIANS

Council on Medical Education and Hospitals of the American Medical Association

NOTE: Under "Tuition" the letter B indicates that a breakage fee is charged; the letter U indicates university fees. Students lacking the scholastic requirements should contact the registrar of the college or university and not the hospital. Those who wish to enroll in a course given by the college or university or who desire to transfer their credits should correspond with the registrar and not the hospital.

## STORM OVER VETERANS ADMINISTRATION MEDICAL CARE

The Subcommittee on Wartime Health and Education of the Committee on Education and Labor of the United States Senate has issued a report on the health needs of veterans;<sup>1</sup> this is condensed elsewhere in this issue of THE JOURNAL. Medical care for veterans would involve some 13,000,000 people, and, if their families are included, as many as 40,000,000. The senate committee has felt that the whole program of educational, employment and monetary benefits for veterans should be reexamined in the light of the accumulated experience. The subcommittee, of which Senator Claude Pepper is chairman, proposes to examine both the quality of medical service given in Veterans Administration facilities and the ability of the administration to discharge the heavy duties which will be placed on it. The committee points out that criticisms of the quality of service given by the Veterans Administration have been made by organizations and individuals who speak authoritatively. It is emphasized that the personnel classifications and salaries for physicians, nurses and social workers are not sufficiently high to attract the best practitioners and workers. The hospitals of the Veterans Administration are likely to be isolated geographically and medically. Although the administrator has full authority and adequate funds to avail himself of the very highest quality of consultation and part time services of leading physicians, the utilization has been minimal.

During the last few months storm clouds have gathered over the Veterans Administration; the rumblings of thunder point toward a possible stroke of lightning aimed toward medical care specifically in the Veterans Administration. A continuous flow of charges comes from a variety of investigators, commentators, periodicals and publications whose observations have led them to believe that medical care in the Veterans Administra-

tion is on a standard far lower than that prevailing in ordinary practice in the United States. The deteriorated service seems especially poor when contrasted with the high quality of medical care rendered to those in the armed forces.

Many theories have been offered as to just why medical care of the veterans should reach a low state. The majority opinion seems to tend toward the concept that the nature of the system whereby the medical staff is chosen and whereby its administration is developed, and the conditions under which the medical staff serves, are the factors chiefly responsible. The charge has been made that the chief administrator of the Veterans Administration has little sympathy with a high quality of medical service. A series of articles by Albert Deutsch in *PM*, following a personal investigation made by him, apparently served to arouse many legislators to demand an investigation. A recent contribution by Albert Maisel in the *Cosmopolitan* magazine for March focused attention particularly on a comparison between methods and results in the care of the tuberculous in the Veterans Administration as compared with Army and volunteer institutions, and very much indeed to the discredit of care of the veteran. Another article called attention to the low quality of rehabilitation available for men with surgical disabilities.

Recently a special committee appointed by the Division of Medical Sciences of the National Research Council submitted a Report of a Survey of Medical Records Created by the Federal Government,<sup>2</sup> in which one section is devoted to the Veterans Administration. Here it is revealed that the Veterans Administration has developed a depository for x-ray films in which there are now twenty-two million x-rays on hand, most of which are on 4 by 10 inch or 14 by 17 inch acetate film. There are 44 men working an eight hour day shift and 17 men working a four hour night shift engaged in filing these x-ray films, and there is a backlog of an estimated six million films awaiting filing, with five hundred thousand additional x-ray films received each month. It is impossible even to forecast the eventual total volume of such x-rays likely to result from the current war. Physicians everywhere are convinced that the records of the Veterans Administration offer great opportunity for research which would lead to the advancement of our knowledge of disease and thus redound to the credit of the Veterans Administration. Unfortunately, the valuable research emanating from the Veterans Administration is scanty. There does not seem, moreover, to be any real uniformity pointing toward a high standard of clinical records in most veterans' hospitals.

As will be observed in this issue of THE JOURNAL, veterans' hospitals are not accredited as institutions

1. Health Needs of Veterans; Interim Report from the Subcommittee on Wartime Health and Education to the Committee on Education and Labor, United States Senate, Seventy-Ninth Congress, Washington, D. C., Government Printing Office, 1945.

2. Report of a Survey of Medical Records Created by the Federal Government, Prepared by the National Archives in Collaboration with the Committee on Medical Records of the National Research Council, Washington, D. C., January 1945.

suitable to the training of interns by the standards of the Council on Medical Education and Hospitals. The proper development of the hospitals for veterans would lead, no doubt, in the future toward the utilization of veterans' hospitals for this purpose; this in itself would tend to raise greatly the standard of medical care.

Perhaps the time is ripe for a really authoritative, independent investigation of the administration of medical service to veterans, made by a committee responsible directly to the executive office of the President.

---

#### HOSPITAL CENSUS OF 1944

The Twenty-Fourth Annual Hospital Census conducted by the Council on Medical Education and Hospitals is described in this issue of *THE JOURNAL*. The survey includes 6,611 registered hospitals compared with 6,655 in 1943. This reduction in the number of hospitals was not accompanied by a corresponding loss in bed capacity; on the contrary, the construction of new units and the expansion of existing services resulted in a net gain of 80,691 beds, the equivalent of a new 220 bed hospital for each day of the year. Again the greatest increase was in the federal group, which now has 551,135 beds, or 74,462 more than the number reported in 1943. The present capacity of all registered hospitals is 1,729,945 beds.

The most striking feature of the Council's report is the continued expansion of inpatient hospital care as evidenced by the unprecedented total of 16,036,848 admissions in 1944 exclusive of newborn infants. Equally indicative of the tremendous task which hospitals have assumed under wartime conditions is the daily patient load or average census. Measured over a yearly period the present average of 1,299,474 represents a record total of 475,607,484 patient days. Hospital births reached their highest number in 1943, when 1,924,591 were reported in the hospitals registered by the American Medical Association. While the present survey shows a reduction of only 4,615 births, this figure becomes particularly significant when compared with increases of over 250,000 in each of the two preceding years. Sixty-two per cent of the gain in hospital admissions last year occurred in the nonfederal group. This is in sharp contrast to the report of 1943, when approximately 83 per cent of the increase was in federal hospitals.

The average bed occupancy has increased in all divisions of the nongovernmental hospitals, whereas decreased rates were noted in the governmental groups except the state institutions. The latter, it should be noted, are devoted mainly to psychiatric service in which long continued treatment and custodial care are involved. The reduction in percentage occupancy in the county, municipal and city-county hospitals, with corresponding increases in the proprietary and non-

profit groups, is in keeping with present economic conditions. In the federal groups, however, the decrease may be attributed mainly to the continued expansion of general hospital beds and the necessity of maintaining a reserve supply in anticipation of future needs. The general hospitals as a group show an increase of one half day in the average length of stay per patient. The principal gain was in the federal division, in which the average period of hospitalization increased from 20.3 to 22 days. In other governmental groups there was a slight decrease except in the state institutions. No change occurred in the church related hospitals and other nonprofit organizations, which continue to report an average length of stay of 9.8 days.

In a special study of hospital facilities for children, it was found that 61,262 beds are regularly available for the hospitalization and care of children, exclusive of newborn infants. Of this number 36,462 are located in general hospitals. Reports also are included regarding schools of nursing education, graduate and student nurses, auxiliary workers and technicians. These show the number of persons in each group but do not indicate the changes in employment or other difficulties that many institutions experience in obtaining competent personnel in the various departments. Although operating under difficult conditions, the hospitals continue to render efficient service to the sick and injured and should be commended on their resourcefulness and skill in meeting the increased demands of the wartime period.

The Council's report is presented as a service to the medical profession and to all institutions, organizations and agencies concerned with hospital activities and allied functions. As an inventory of existing facilities and services the report should prove a valuable source of reference in the study and evaluation of future hospital needs.

---

#### TECHNICAL PERSONNEL IN HOSPITALS

The annual report on technical personnel in hospitals is presented elsewhere in this issue. An enormous increase in numbers of technicians in hospitals has occurred during the war years. This closely parallels the increase in bed capacity (30.6 per cent) and total admissions (38.3 per cent) since 1941. With the rapid pyramiding of technical helpers it has been necessary, in many instances, to employ some whose efficiency is limited by inadequate training and experience.

Two problems are paramount: Those now employed who have not had the benefit of satisfactory instruction must receive additional training; approved schools must produce sufficient graduates to supply hospitals and other employers with a normal increase in personnel and replacement of those no longer serving as technicians.

The medical record librarians in particular have been studying the problem of improving the large number

of new employees in their field. Plans have been outlined to start an "in-service" type of training for those workers so that hospitals can improve the service that is rendered. In addition to the number of record librarians employed in 1941 almost ten times the total number of graduates in the last three years have been added to hospital staffs. Some of the other groups are apparently handicapped in outlining a similar program, since their standards would necessitate the inclusion of certain college subjects.

The second problem, that of increasing the number of graduates, is even more difficult to solve. A comparison of the increased employment of technical personnel with the annual graduates of the approved schools demonstrates the magnitude of this problem. With the diversion of increasing proportions of all workers into war industries it is unlikely that sufficient students can be enrolled in the approved schools to supply the annual increase in employed technical personnel. Reports on data collected from technical schools approved by the Council on Medical Education and Hospitals are also included in this issue.

In two important divisions increased employment has noticeably lagged behind the increase in annual admissions. Occupational therapists have been increased only 20 per cent over the 1941 report and physical therapists only 28 per cent in the same period. Hospitals are particularly in need of comparatively larger numbers of occupational and physical therapists. Both are needed by the armed forces. An additional four to six hundred qualified graduates in each group might easily be absorbed by hospitals and still not exceed the ratio to total admissions maintained in 1941.

The other groups whose work increased in proportion to the total admissions have been augmented by 40 per cent or more. These groups include clinical laboratory and x-ray technicians, medical record librarians, medical stenographers and pharmacists. Although the increase in personnel in record departments has been proportional to admissions since 1941, approximately 90 per cent of the added group have had insufficient training. Larger numbers of qualified graduates must be produced by the approved schools for medical record librarians and other technical personnel.

#### HOSPITAL TRAINING FOR PHYSICIAN VETERANS

By using the material obtained from the questionnaires returned by medical officers to the Committee on Postwar Medical Service, an estimate has been made of the probable number of house officerships in hospitals required after the war. Hospitals and medical schools will need to expand their educational facilities sufficiently to provide a high quality of training not only for the veterans but also for the new generations of

physicians who will graduate from medical schools. On the basis of the estimated demand, the Council on Medical Education and Hospitals has communicated with all hospitals now approved for either residency or internship training. Replies have already been received from approximately one fourth of the approved institutions. The returns are encouraging, indicating that hospitals throughout the country are seriously planning for expanded educational opportunities and guarding at the same time against a lowering of the quality of the training offered.

Certain larger hospitals, particularly those connected with medical schools, have developed broad educational plans. One of the most striking examples of such planning comes from Northwestern University Medical School in Chicago. Dr. Arthur R. Colwell, who is chairman of the school's Committee on Graduate Education, has described the Northwestern plan in detail elsewhere in this issue. The plans and principles in this statement should be useful to the many other groups throughout the country with somewhat similar plans. Among the principles adopted by the committee are the following:

A portion of the residency training is to be in a graduate department of the medical school for which a full time faculty consisting of teachers with clinical experience and insight will be employed. In a three year residency such work combining basic sciences or research and study in clinical subjects related to the residency may occupy as much as a year.

Internships are to be restricted to one year of rotation, which will release facilities for resident instruction previously used in internships lasting more than a year.

A system of cooperation with other hospitals has been developed in which there will be exchanges of residents for short periods of time, thereby increasing the educational value of residencies in both private and public hospitals. In such an arrangement the central hospital assumes responsibility for the quality of instruction in the affiliated hospitals.

There is to be a generous use of private patients for teaching purposes. In any residency the teaching attitude of the attending staff is of at least as much value as the number of free beds available.

It is planned that material in the departments of pathology, radiology and anesthesiology will be used to a greater extent than has been the case in the past.

There will be increased experience in outpatient departments, intern and extern instruction, organized conferences or seminars in clinical subjects and library assignments. Finally, research projects and thesis production are contemplated in selected cases.

This program is a noteworthy attempt to meet the serious responsibility of hospitals with educational programs in the postwar years.

## Current Comment

### NECROPSY PERFORMANCE IN INTERNSHIP HOSPITALS

Elsewhere in this issue is a report on necropsy performance in internship hospitals from 1926 to 1944. In this comparative study one may observe not only the immediate effect of the necropsy requirement established by the Council on Medical Education and Hospitals in 1928 but also the continued expansion of postmortem studies until wartime reductions in medical personnel and house staff made it difficult for some hospitals to supply the requisite amount of teaching material in pathology. The decline in necropsy performance was most pronounced in 1943, when 100 approved internship hospitals failed to meet the minimum requirement of 15 per cent. Some improvement occurred in 1944, however, when 323 hospitals had rates of 30 per cent or over and 26 attained the level of 70 per cent. These figures are encouraging, for they indicate that even under wartime conditions it is possible to maintain the essential functions of an educational program. Since one of the most important objectives in the training of interns is the correlation of clinical and pathologic studies, it is strongly urged that hospitals with low necropsy rates exert every effort to obtain sufficient material for house staff instruction. If in any of these institutions the deficiency in necropsy performance is allowed to continue, the quality of the educational service will be seriously impaired.

### INTERNSHIPS

The intern or house officer in a hospital today is not, in many instances, securing the kind of medical training that was given before the war. The demands of the armed forces have greatly depleted the number of men available for internships and residencies. Partly as a result of the shortage of house officers, hospitals have endeavored to recruit interns among medical students long before graduation. In some instances hospitals have made appointments to medical students in the sophomore year. A medical student is in no position to evaluate the internship he wishes to apply for until he has had some experience in the clinical years. Therefore the appointment of interns should not be made until the close of the junior year. The Committee on Internships of the Association of American Medical Colleges has recommended to medical schools that recommendations for internships and information regarding students should be withheld from hospitals until after the students have completed the junior year. This action was approved by the Association of American Medical Colleges at its executive session in Detroit in October 1944. The aid of hospital associations has been enlisted, and these have indicated an approval of this plan. The Council on Medical Education and Hospitals has likewise participated in the discussions and is in full accord with this arrangement. The plan will be successful only if there is complete cooperation

on the part of the medical schools and the hospitals. The Council on Medical Education and Hospitals strongly recommends that this procedure be followed. Not only formal letters of recommendation and summaries of scholastic records from deans' offices but also informal letters from members of the college faculties should be withheld. Similarly, the staffs of medical school teaching services should refrain from conversations with their clinical clerks which might be interpreted as promises of appointments to internship.

### THE POWER OF THE PURSE

The *British Medical Journal* of February 10 speaks somewhat bitterly regarding a statement given by Mr. Willink, minister of health, in a report to the House of Commons on the so-called Goodenough Report on Medical Education. If we may be pardoned the exceedingly obvious pun, that report is not good enough for the British Medical Association. Mr. Willink apparently said that the British government shared the view of the report "on the importance of affording to women equal opportunities to those enjoyed by men for medical training and for obtaining postgraduate experience." With this point of view there need not necessarily be any differences. However, the British Ministry of Health then decided that the payment of grants to medical schools will depend on whether or not they adopt the principle of admitting a reasonable proportion of students of both sexes. The *British Medical Journal* asks "whether it is wise generally to enforce coeducation by the threat of the purse." Even more serious, however, was the discussion by the minister of health regarding revision of the medical curriculum. Mr. Willink said "The government attach equal importance to the revision of the medical curriculum, and acceptance of the principle of increased grants for medical education and research is dependent on the early completion of this process." Thus the Ministry of Health is threatening to withhold money from medical schools "unless the curriculum is revised by licensing bodies," and it insists on early completion. In Great Britain the responsibility for maintaining standards of medical education lies with the General Council of Medical Education and Registration, a statutory body set up by the Medical Act of 1858. The Ministry of Health is apparently trying to enforce revision of the curriculum according to the conclusions reached by a committee of its own choosing—the Goodenough report. It is, in fact, trying to use the power of the purse to coerce those responsible for teaching medical students. Apparently the British Ministry of Health is—according to the *British Medical Journal*—"abrogating the functions of the General Council of Medical Education and Registration and, by implication, is questioning its efficiency in maintaining standards of medical education." Is it any wonder that we here in the United States are inclined to view with alarm attempts by various governmental agencies to take over control of medical education, medical research and the practice of medicine?

# MEDICINE AND THE WAR

## ARMY

### ARMY INCREASES CALORIES FOR OVERSEAS COMBAT RATIONS

The War Department recently announced that more nutritive elements are being included in the C and 10 in 1 combat rations for our troops overseas. The standard ration for overseas troops, wherever they have regular access to the army kitchens, is the B ration. This ration, which already provides approximately 3,900 calories per man daily, has been found to be ample for the average soldier and remains unchanged. When troops go into combat, however, they are cut off from their mess facilities and for this reason must depend on packaged rations. The 10 in 1 ration, a packaged ration that is the next thing to the food provided by the soldier's regular mess, now provides 4,150 calories per man daily, as compared to a former caloric content of 3,927. The C ration now provides 3,700 calories, compared to the 2,775 calories. The pocket or K ration, issued for emergency use by troops, is rated at 2,860 calories and remains unchanged.

### VENEREAL DISEASE AMONG TROOPS OF THE PANAMA CANAL DEPARTMENT

Success in the fight against venereal disease among the troops of the Panama Canal Department is reflected in the annual report for 1944 recently issued by Col. Wesley C. Cox, department surgeon and venereal disease control officer, which shows a new low rate of 2.09 per cent. This rate is less than one half of the previous annual low of 4.27 established in 1943 and considerably under one third of the 6.6 per cent recorded in 1940, the first year in which large scale control campaigns became necessary. Contributing to the 1944 record low was a rate of 1.4 per cent attained in the final month of the year. Reports for the first two months of the present year show a still further decline to a rate of 1.8 per cent, which gives army venereal disease control officers a basis for setting the goal for 1945 at 2 per cent or less.

Brig. Gen. Henry C. Dooling, chief health officer, the Panama Canal, and surgeon, Caribbean Defense Command, acts as liaison officer between the Army and the civil authorities. Cooperation by the Republic of Panama is under the direction of Dr. Guillermo Paredes, director of public health, who works in liaison with General Dooling.

### NINETEEN NURSES OF SEAGRAVE UNIT DECORATED

The Bronze Star was recently awarded to nineteen nurses of the Seagrave Unit in Burma during their heroic service the early part of 1942. One award was posthumous and was made to Miss Luzon Htulum, who gave her life in service. The citation accompanying the award read "for heroic and meritorious service in connection with military operations against an enemy of the United States from January 9 to March 24, 1942. By her untiring efforts Miss Htulum supervised in a most efficient manner the nursing services of seven widely separated hospitals of the Harper Memorial Hospital Mobile Surgical Unit, serving the Chinese Sixth Army in the Southern Shan states. In the absence of medical officers she organized and operated the 100 bed hospital at Mong Pan until her death, while on duty driving a light truck which served as an ambulance, March 24, 1942. This outstanding service reflects great credit on the entire nursing profession."

Awards were made also to M. T. Baw, Maru Baw, Emily Benjamin, Lulu Dwe, Ma Graung, Ohn Hkin, Malang Kaw, Ma Koi, Labang Lu, Maran Lu, Kaw Naw, Than Shwe Noe, Ester Po, Hla Sein, Na Shaw, Ruth Shu, Ruby Thaw and Roi Tsai for "heroic and meritorious service" in connection

with military operations against an enemy of the United States from Jan. 9 to May 20, 1942. The citation read "As nurses in a medical unit organized to provide aid for Allied forces fighting in Burma they underwent indescribable hardships and fatigue, worked with limited supplies and facilities yet saved many lives and did much to maintain morale of the troops during the fighting in and retreat from Burma. Their unflinching attention to duty, tireless performance of all tasks, resourcefulness, courage and unceasing good humor won the respect and admiration of every one with whom they served."

### LIEUTENANT COLONEL RAYBURN RELIEVED OF ACTIVE DUTY

Lieut. Col. Charles R. Rayburn, formerly assistant medical superintendent of the Central Oklahoma State Hospital, Norman, has been relieved of his duties as Wing Surgeon of Hunter Field, Georgia, and placed on inactive status to resume his former position. Dr. Rayburn, a veteran of the first world war, reentered the service June 15, 1942 and was assigned to Hunter Field, where he was appointed hospital executive officer and chief of the neuropsychiatric service. Under his guidance the AAF regional hospital expanded and is now one of the best equipped and best staffed hospitals in the Third Air Force. Dr. Rayburn graduated from the University of Oklahoma School of Medicine, Oklahoma City, in 1925.

### MISSING IN ACTION

Capt. Edwin C. Yeary, formerly of Oklahoma City, has been reported as missing in action in Belgium since December 19. Dr. Yeary graduated from the University of Oklahoma School of Medicine, Oklahoma City, in 1939 and entered the service in June 1941.

Capt. T. J. Huff, formerly of Walters, Okla., has been reported missing in action in Luxembourg since Dec. 19, 1944. Dr. Huff graduated from the University of Oklahoma School of Medicine, Oklahoma City, in 1942 and entered the service in August 1943.

### ARMY TRAINING RECONDITIONING INSTRUCTORS

According to the Office of the Surgeon General, the Army now has 680 officers and 1,486 enlisted men who are graduates of training courses in physical and educational reconditioning. More are constantly being trained not only to take care of the increasing number of convalescents in army hospitals but to replace instructors called to general duty. Because able bodied instructors in educational reconditioning are subject to reassignment at any time, every effort is being made to fill these posts from the army rolls of physically disabled. These handicapped instructors, many of whom suffered amputations, are particularly inspiring to the convalescent soldiers they instruct.

### CAPTAIN FREDERICK MARKS RELEASED FROM GERMAN PRISON CAMP

Word has recently been received from the United States military mission in Moscow through the adjutant general's office that Capt. Frederick Marks, formerly of Chicago, has been released from a German prison camp by the Russian army. He was captured at the Anzio beachhead May 26, 1944. Dr. Marks graduated from Northwestern University Medical School, Chicago, in 1941 and entered the service in April 1943.

## ARMY AWARDS AND COMMENDATIONS

## Major William D. James

Major William D. James, formerly of Oconomowoc, Wis., was recently awarded the Bronze Star for meritorious service in combat during September 1944. Dr. James is a group surgeon for a combat engineer group on the western front. He graduated from the University of Wisconsin Medical School, Madison, in 1935 and entered the service in March 1941.

## Captain John E. Tuhy

Capt. John E. Tuhy, formerly of Portland, Ore., was recently awarded the Bronze Star "for meritorious service in connection with military operations against the enemy from June 10 to Nov. 1, 1944." His evacuation hospital has seen much strenuous and dangerous duty. It went through the African campaign and was also in Sicily. After a rest in England it was one of the first two evacuation units to land in France; at Pont l'Abbe they narrowly escaped capture. Later they moved north in the wake of retreating Germans, to become one of the two evacuation hospitals nearest the front in the big break through. Dr. Tuhy graduated from the University of Oregon Medical School, Portland, in 1938 and entered the service July 15, 1941.

## Major William T. Vaughan

Major William T. Vaughan, formerly of Akron, Ohio, was recently presented with the Bronze Star for "meritorious service in connection with military operations against the enemy on Leyte, P. I., from Dec. 7 to Dec. 18, 1944. During this period Major Vaughan, both as commanding officer and surgeon of the — hospital, worked tirelessly and unceasingly. He participated in over 100 surgical operations, often operating under aerial attack and artillery bombardment. He worked day and night without consideration of his personal comfort or safety and was a constant source of inspiration to his men." Dr. Vaughan graduated from Georgetown University School of Medicine, Washington, in 1935 and entered the service Aug. 17, 1942.

## Colonel Herbert B. Wright

The Bronze Star has been awarded "for meritorious service in connection with military operations" to Col. Herbert B. Wright, formerly of Cleveland, and now chief of professional services in the Medical Department of the U. S. Strategic Air Forces in Europe. He supervises the activities of all the doctors in the air forces in Europe. Dr. Wright graduated from Harvard Medical School, Boston, in 1923 and entered the service in June 1942.

## MISCELLANEOUS

## RUSSIAN WAR RELIEF, INC.

A Medical Textbook Committee was recently established by the Russian War Relief of Essex County, N. J., of which Dr. Max Danzis is chairman. Any medical textbook published since 1926 and written in English, French, German or Russian, or any classics of any date are sought by the committee. The books are urgently needed because so few are now available in the training of doctors and nurses in Russia. Donations may be made personal by pasting a greeting label inside the books. Labels may be secured from the Russian War Relief, Inc., 744 Broad Street, Newark 2, N. J., where the books should be sent.

HOSPITALS NEEDING INTERNS  
AND RESIDENTS

The following hospitals have indicated to the Council on Medical Education and Hospitals that they have not completed their house staff quota allotted by the Procurement and Assignment Service:

(Continuation of list in THE JOURNAL, March 24, page 718)

## ILLINOIS

Walther Memorial Hospital, Chicago. Capacity, 209; admissions, 5,665. Mr. William C. Martens Jr., Superintendent (4 interns).

## MASSACHUSETTS

Cambridge Hospital, Cambridge. Capacity, 272; admissions, 6,214. Dr. F. A. Washburn, Medical Director (1 intern, July 1).

## NEBRASKA

St. Elizabeth Hospital, Lincoln. Capacity, 230; admissions, 6,433. Dr. Arthur L. Smith, Medical Director (interns).

## NEW YORK

New York Post-Graduate Medical School and Hospital, New York City. Capacity, 410; admissions, 8,423. Dr. Clarence G. Bandler, Medical Director (resident—urology, July 1).

## OHIO

Fairview Park Hospital, Cleveland. Capacity, 201; admissions, 6,170. Reverend Philip Vollmer Jr., Superintendent (2 interns, July 1).

## RHODE ISLAND

Homeopathic Hospital, Providence. Capacity, 196; admissions, 5,439. Mr. Carl A. Lindblad, Director (interns, July 1).

## SOUTH CAROLINA

Greenville General Hospital, Greenville. Capacity, 355; admissions, 8,515. Mr. J. B. Norman, Superintendent (interns, July 1).

## WISCONSIN

Methodist Hospital, Madison. Capacity, 127; admissions, 3,738. Miss Grace A. Knight, R.N., Superintendent (interns, July 1945, March 1946).

## WARTIME GRADUATE MEDICAL MEETINGS

The following subjects and speakers for Wartime Graduate Medical Meetings have just been announced:

## California

Camp Haan, Riverside, Calif.: Neoplasms, Benign and Malignant, Observed in China, Capt. J. A. Biello, April 3.

Station Hospital, Camp Cooke, Calif.: Salicylates, Lieut. Comdr. H. R. Butt, April 4.

Hoff General Hospital, Santa Barbara: Salicylates, Lieut. Comdr. H. R. Butt, April 4.

Torney General Hospital, Palm Springs, Calif.: Effects of High Altitude and Gravity, Dr. Douglas R. Drury, April 3.

A. A. F. Regional and Convalescent Hospital, Santa Ana Air Base, Santa Ana, Calif.: Classification and Diagnosis of the Anemias, Dr. Alvin Foord, April 3.

U. S. Naval Air Training Station, San Diego: Some Fundamental Considerations for the Understanding of Psychiatry, Dr. Glen E. Meyers and Comdr. Walter Rapaport, April 6.

Letterman General Hospital, San Francisco: Treatment of Abnormal Mechanisms of the Heart, Dr. William J. Kerr, April 7; The Hemorrhagic States, Dr. Paul M. Aggeler, April 14.

Station Hospital, Camp Roberts, Calif.: Psychosomatic Medicine, Dr. Douglas G. Campbell, April 21.

Station Hospital, Chico Army Air Base, Calif.: Diagnosis of Deficiency Diseases, Dr. James F. Rinehart, April 19; Newer Methods of Treatment of Heart Disease, Dr. Francis Chamberlain, April 26.

## Ohio

Station Hospital, Lockbourne Army Air Base, Columbus: Lung Pathology Other Than Blast Injuries, Dr. Karl P. Klassen, April 5; Traumatic Heart Injury, Dr. R. W. Kissane, April 12; Pulmonary Tuberculosis and Its Complications, Dr. Myron Miller, April 19; Use of Heparin, Dr. J. McLean, April 26.

## Virginia

Regional Hospital, Camp Lee, Petersburg, Va.: Shock, with Special Reference to Blood and Plasma Transfusions, Major John J. McGraw, April 13.

Regional Hospital, Camp Lee, Va.: Orthopedic Problems, Fractures, Wounds and Reconstruction, Capt. Robert W. Augustine, April 6; Shock Burns and Plasma, Major John J. McGraw, April 13; Evaluation of the Surgical Risk and Anesthesia, Capt. William A. Weiss, April 20; Prevention and Treatment of Wound Infections with Sulfonamides, Capt. James E. T. Hopkins, April 27.

# ORGANIZATION SECTION

## HEALTH NEEDS OF VETERANS

### Interim Report

(Pursuant to S. Res. 62)

#### Digest of Report from the Subcommittee on War-time Health and Education to the Committee on Education and Labor, U. S. Senate

The health of veterans is a matter of concern to the nation. Every possible step must be taken to make certain that good medical care is within the reach of every veteran.

#### Veterans Disabled in Service

The number of veterans who will incur disabilities in the present war can be only roughly estimated, but probably it will be not less than 1,500,000 and it may be as great as 2,500,000, depending largely on the length of the war. In addition there are now about 350,000 veterans of World War I who are receiving compensation for disabilities incurred while in service and many others with minor service connected disabilities who are not receiving compensation.

While first thought must be given to the veteran disabled in service, the health needs of the great body of veterans who will not have incurred injuries in the service are also a real responsibility of the American people. In the postwar period, veterans of this and previous wars will constitute a large and important segment of the population. The number may well be 20,000,000, or one in every seven of the total population; veterans with their families may comprise from one third to one half of our whole population.

#### Provisions of the G. I. Bill of Rights

The G. I. bill of rights (with previous legislation) does not assure medical care for all veterans. It does not assure full care for all who receive medical discharges from the armed services. Nor does it provide that all who are disabled in the line of duty shall receive all of the medical care which they may need immediately or in the future, despite a prevailing impression that this is assured. The bill authorizes appropriations for great expansion of present hospital facilities of the Veterans Administration. It recognizes the administration as an important war, as well as postwar, agency and gives it necessary priorities for carrying out its functions. The right of the veteran to claim hospitalization or compensation is given further protection. Complete care, including hospitalization and outpatient treatment by the Veterans Administration, is assured for the treatment of conditions incurred or aggravated as the result of military service, but the fact that an individual has a service connected disability does not entitle him to treatment of another disability which is not service connected.

#### How the Medical Care Program Operates

In 1942, before veterans of the present war were numerous enough to be a significant factor, the Veterans Administration operated hospital facilities at ninety-two locations in forty-five states. The bed capacity was about 62,500, not including 18,400 beds in domiciliary facilities. The investment in buildings was \$213,000,000. The annual operating cost was \$65,000,000.

More than 93 per cent of patients admitted to the Veterans Administration facilities in 1942 were treated for ailments not connected with service. Since June 7, 1924, when hospitalization was first authorized for veterans of all wars without regard to the origin of their disabilities, subject to certain limitations in the treatment of non-service connected disabilities, more than 79 per cent of all admissions have been for the treatment of such disabilities. The percentage admitted for treatment of non-service connected disabilities has increased steadily.

#### Full Medical Care for the Disabled

If the Veterans Administration were limited by law to the treatment of service connected disabilities, it could have operated in 1942 with one fourth or less of the hospital beds under its

control. The subcommittee believes it was fortunate that there was no such limitation. While the subcommittee does not recommend change in the law pertaining to eligibility for medical care of veterans who do not have service connected disabilities, it feels strongly that any veteran who has a service connected disability should be entitled to treatment of any condition from which he suffers, whatever its origin. This should include hospital and outpatient treatment for all of his ailments.

#### Future Development of the Program

In describing contemplated development of the medical care program, the Administrator of Veterans' Affairs has stated that ultimately 275,000 to 302,000 beds will be provided. There are now 101,275 beds available or authorized, including 15,685 for domiciliary care. Appropriations of \$500,000,000 authorized in the G. I. bill of rights will make possible the construction of an additional 100,000 beds, and an equal number may be obtained from the armed services.

The peak demand for hospitalization is expected by the Veterans Administration to occur in 1975. Addition of about 16,000 beds during the next three years is recommended by the administration, bringing the total number of hospital beds, excluding domiciliary, to 101,540 by 1947. The Veterans Administration contemplates the development during the next twenty years of a physical plant representing an investment of \$1,000,000,000 in addition to the present investment of \$213,000,000. The annual operating cost of hospitals will presumably approach \$300,000,000 annually, judging from present expenditures.

There can be little doubt that 101,000 beds will be sufficient for full care of veterans with service connected disabilities. There is no assurance, however, that these facilities will be sufficient also to meet the needs of veterans who have not been disabled in the service, even after 200,000 beds have been added in the period from 1947 to 1975.

#### Problems of Mental Illness

The committee believes that a fundamental approach to the problem of neuropsychiatric treatment for veterans is an urgent necessity. It proposes an immediate study of means by which effective stimulus can be given now to the development of mental hygiene clinics to serve the public in as many communities as possible and of training facilities for medical and auxiliary personnel in the psychiatric field.

This study should concern itself not so much with the question of need, which we believe to be well established, as with the feasibility of federal-state cooperation in assisting communities to establish mental hygiene clinics. It has been estimated on good authority that there should be at least 1,300 such clinics, a ratio of 1 for each 100,000 of population. New and existing public and voluntary clinics should be given financial assistance when they conform to standards set by the state and approved by the federal administering agency. Consideration should be given also to the development of mental hygiene services in general hospitals where practicable.

#### Summary and Conclusions

1. Full medical care by the Veterans Administration should be made the right of every veteran who has sustained a service connected disability, whatever the origin of the condition for which he needs treatment. Care should include hospitalization and outpatient treatment for all of his ailments.

2. In order to assure availability of adequate medical care for the great body of veterans, 13,000,000 more or less, who will not have service connected disabilities, measures should be initiated as promptly as feasible to meet the medical needs of the

whole population in accordance with recommendations set forth in the subcommittee's Interim Report No. 3 on the nation's health.

3. Expansion of Veterans Administration hospital facilities should be carried as far as may be required to assure full care of veterans with service connected disabilities. It would be medically and economically unsound to set up medical facilities for all other veterans separately from the provisions which must be made for the whole population. It is desirable, however, that the Veterans Administration should continue to provide hospitalization, when beds are available, for care of any veteran unable to pay for such service or to obtain it in his own community.

4. Federal, state and local governments and public and voluntary agencies should cooperate to develop a network of mental hygiene clinics for the maintenance of mental health among veterans and the whole population.

5. The whole program of educational, employment and monetary benefits for veterans should be reexamined in the light of accumulated experience in order promptly to bridge gaps and remove inequalities which interfere with the health and welfare of veterans. Among obvious needs are extension of social security credits under the Federal Old Age and Survivors' Insurance Act, dependency allowances for families of the disabled and inclusion of merchant seamen among those eligible for educational and unemployment benefits.

6. In order that every possible step may be taken to safeguard the health of disabled veterans, the subcommittee proposes to examine and appraise both the quality of the medical services given in Veterans Administration facilities and the ability of the administration to discharge the heavy duties which will be placed on it. Special attention will be given to neuropsychiatric services. The investigation will be conducted with the help of recognized authorities in various medical specialties, of veterans' organizations and of professional groups.

FEBRUARY 19, 1945.

H. ALEXANDER SMITH.

## Medical Legislation

### MEDICAL BILLS IN CONGRESS

*Changes in Status.*—H. R. 2348 has passed the House, to provide for the coverage of certain drugs under the federal narcotic laws. The purpose of this bill, as stated by the House Committee on Ways and Means, is to provide a prompt and convenient method for bringing under the control of the federal narcotic laws any newly discovered synthetic drug which is determined, after appropriate inquiry, to possess the same or similar dangerous, habit-forming or habit-sustaining qualities as morphine or cocaine. H. R. 610, the Tolan bill to permit chiropractors to treat the beneficiaries of the United States Employees' Compensation Act, has been referred to a subcommittee of the House Committee on the Judiciary, of which Congressman Weaver, North Carolina, is chairman. H. R. 2277 has passed the House, providing for the selection under the Selective Training and Service Act of male and female nurses between the ages of 20 and 45. Female nurses married before March 15, 1945 and those with dependents or children under 18 years of age may be deferred.

*Bills Introduced.*—S. 715, introduced by Senator Walsh, Massachusetts, proposes to provide more efficient dental care for the personnel of the Navy by reorganizing the Bureau of Medicine and Surgery to assure greater integrity of the dental service. If the bill is enacted, the dental division of the bureau will establish professional standards and policies for dental practice, conduct inspections and surveys for maintenance of such standards, initiate and recommend action pertaining to complements, appointments, advancement, training, assignment and transfer of dental personnel, and serve as the advisory agency

for the Bureau of Medicine and Surgery on all matters relating directly to dentistry. S. 731, introduced by Senator Pepper, Florida, provides for the appointment of female dentists in the Dental Corps of the Army and Navy. S. 753, introduced by Senator Wherry, Nebraska, proposes to amend the Social Security Act so as to provide for the voluntary coverage of state and local public employees under the old age and survivors' insurance provisions of that act. S. 717, introduced by Senator Mead, New York, for himself and Senator Aiken, Vermont, proposes to authorize a federal appropriation to assist the states in more adequately financing education and in removing substandard conditions in education. S. 781, introduced by Senator McCarran, Nevada, proposes to amend the G. I. Bill of Rights to provide that if any publicly supported institution or private institution exempt from income taxes under section 101 (6) of the Internal Revenue Code has no established tuition fee, or if the established tuition fee is less than the actual cost of furnishing the education or training, the Administrator of Veterans' Affairs will be authorized to provide for the payment to such institution of the actual cost of furnishing the education or training to the beneficiary of the new law, but not to exceed \$500 for an ordinary school year. H. Res. 172, submitted by Representative Philbin, Massachusetts, proposes to create a committee composed of five members of the House Committee on World War Veterans' Legislation and six other members of the House, all to be designated by the Speaker, to institute an investigation into alleged "intolerable" conditions, irregularities and hindrances affecting war veterans and members of the armed forces, in connection with hospitalization, medical and nursing services, compensation, pensions, vocational guidance and training and other matters relating to the welfare of veterans and their dependents. H. Res. 201, submitted by Representative O'Toole, New York, proposes to create a special committee of five to be appointed by the Speaker of the House to investigate the history of the achievements of Sister Elizabeth Kenny in the treatment of infantile paralysis. This committee will investigate particularly, it is proposed, (1) whether or not there has been any organized opposition to Sister Kenny in the United States; (2) whether or not she has been deliberately impeded by any individual or groups of individuals; (3) whether or not any one else has achieved a degree of success in the treatment of infantile paralysis equal to that of Sister Kenny; (4) whether or not she and her methods have received a fair and impartial trial; (5) whether or not the difficulties which she has had since her arrival in this country have been due to her own nature or other causes, and why at the present time she plans to leave the United States. H. R. 2376, introduced by Representative Boran, Oklahoma, proposes an appropriation of \$2,000,000 to construct a hospital for Negro veterans at Boley, Okla. H. R. 2417, introduced by Representative Gathings, Arkansas, proposes to authorize an appropriation of not to exceed \$200,000 for use in the completion of hospital projects initiated under the Lanham Act by the Works Progress Administration and the Work Projects Administration. H. R. 2466 and H. R. 2467, introduced by Representative Dingell, Michigan, propose, respectively, to direct the Surgeon Generals of the Navy and Army to appoint as ensigns or second lieutenants, as the case may be, enlisted men who have served three or more years in the Hospital Corps of the Navy or in the Medical Department of the Army. H. R. 2477, introduced by Representative Fenton, Pennsylvania, would direct the Secretary of War to provide for the award to officers and enlisted men of the Medical Corps of the Army, for conduct or performance of duty in connection with action against the enemy corresponding in its noncombatant nature with the conduct or performance of duty of a combatant nature which establishes eligibility to wear the combat infantryman badge, of a badge which shall be known as the expert medical corpsman badge. H. R. 2498, introduced by Representative Neely, West Virginia, and H. R. 2755, introduced by Representative Patrick, Alabama, propose to authorize grants to the states for surveying their hospital and public health centers and for planning construction of additional facilities. These bills are identical with the Hill-Burton hospital construction bill, S. 191. H. R. 2521, introduced by Representative Edwin Arthur Hall, New York, proposes the construction of a veterans' hospital in Broome County N. Y. H. R. 2550, introduced by Representative Priest, Tennessee, pro-

poses to establish a National Neuropsychiatric Institute in the United States Public Health Service to (1) conduct researches, investigations, experiments and demonstrations relating to the cause, diagnosis and treatment of neuropsychiatric disorders; (2) assist and foster similar research activities by other agencies, public and private, and promote the coordination of all such researches and activities and the useful application of their results; (3) train personnel in matters relating to neuropsychiatric disorders; and (4) develop and assist states in the use of the most effective methods of prevention, diagnosis and treatment of neuropsychiatric disorders. H. R. 2594, introduced by Representative Angell, Oregon, proposes to provide for compensation to blind persons for loss of earning power due to blindness. H. R. 2601, introduced by Representative Ervin, North Carolina, proposes to amend the G. I. Bill of Rights to provide that any person eligible for education or training, or a refresher or retraining course, may elect a short intensive post-graduate or vocational training course, provided the institution and the course are approved by the appropriate state educational agency, if the institution is a public one, or by the Administrator, if the institution is a private one. H. R. 2605, introduced by Representative Heffernan, New York, would authorize the Superintendent of the United States Military Academy and the Superintendent of the United States Naval Academy, respectively, to confer the degree of bachelor of nursing on commissioned officers of the Army and Navy Nurse Corps. H. R. 2606, introduced by Representative Byrne, New York, would authorize the Administrator of Veterans' Affairs to acquire by lease from the state of New York such buildings in the vicinity of the Veterans Administration facility at Saratoga Springs, N. Y., as may be necessary to enable such facility to accommodate 500 additional bed patients pending the construction of new accommodations. H. R. 2610, introduced by Representative Gibson, Georgia, would authorize correspondence schools to participate in the program for the education of veterans under the G. I. Bill of Rights. H. R. 2611, introduced by Representative Latham, New York, proposes to establish at the seat of government an executive department to be known as the Department of Veterans' Affairs, to be administered by a Secretary of Veterans' Affairs. H. R. 2657, introduced by Representative Holifield, California, proposes to facilitate the receipt of hospital treatment and domiciliary care by former members of the armed forces at institutions nearest to their places of residence. H. R. 2739, introduced by Representative Heffernan, New York, proposes to create in the Veterans Administration a Federal Board of Psychiatrists to be composed of fifty psychiatrists chosen by the Administrator of Veterans' Affairs from among the duly licensed physicians of the several states and the District of Columbia. The duty of this board will be (1) to advise state hospitals and physicians generally as to the treatment of mental disorders and on the subject of mental hygiene generally and (2) to make every effort to bring about a lessening of nervous disorders among the people of the United States and more particularly among veterans.

## STATE LEGISLATION

### Georgia

*Bill Introduced.*—H. 306 proposes to direct the governing board of the State Medical College at Augusta in accepting students to give preference to citizens of the state and to admit noncitizens only if applicants from the state fail to fill the enrolment capacity.

### Illinois

*Bills Introduced.*—S. 191 proposes to appropriate \$1,500,000 for the establishment of the Illinois State Cancer Hospital for the care and treatment of persons afflicted with cancer. H. 249 proposes to authorize the department of public health to purchase or manufacture and distribute free of charge, in addition to drugs now authorized by law, biologic products, blood plasma, penicillin, sulfa and such other products and medicines as are of recognized efficiency in the use of first aid treatment in case of accidental injury. H. 250 proposes to make it a misdemeanor for any hospital, public or private, or for any licensed physician to refuse to give emergency medical treatment or first aid in case of accident or injury liable to cause death or severe injury. A hospital or physician whose services are sought under such

circumstances must, regardless of the solvency or insolvency of the patient, and without delaying treatment to ascertain the patient's ability to pay, provide such blood plasma, penicillin, sulfa and other products or medicines as may be the indicated emergency treatment. The bill further proposes that in the event the hospital or the physician is not paid by the patient it or he shall be reimbursed by the governmental agency charged with administering relief under the Pauper Act. H. 252 proposes to prohibit the operation of a nursing home without a license from the state department of public health. The bill defines a "nursing home" as a private home, institution, building or other place which undertakes to provide maintenance, personal care or nursing for three or more persons who, by reason of illness or physical infirmity, are unable properly to care for themselves.

### Maryland

*Bill Introduced.*—H. 765, to amend the medical practice act, proposes that any physician who is licensed to practice medicine in the District of Columbia shall be entitled to a special license without fee and without examination to practice within that portion of the Maryland-Washington metropolitan district lying within Montgomery County.

### Massachusetts

*Bill Introduced.*—H. 1695, Appendix J, proposes that fraternal benefit societies, with the approval of the commissioner of insurance, may operate plans for a payment of hospital and medical expenses and for the services of physicians and nurses.

### Minnesota

*Bill Introduced.*—H. 1090 proposes to enact what appears to be the uniform vital statistics act respecting the registration, compilation and preservation of data pertaining to births, adoptions, legitimations, deaths, stillbirths and data incidental thereto.

### Missouri

*Bill Introduced.*—H. 138 proposes to authorize the curators of the University of Missouri to establish and conduct a complete course of medical instruction in the University of Missouri, the last two years of which shall be conducted in Kansas City.

### New Jersey

*Bill Introduced.*—S. 180 proposes to enact a separate chiropractic practice act and to create an independent board of chiropractic examiners to examine and license applicants for licenses to practice chiropractic, defined in the bill as "the philosophy, art, science and practice of things natural; a system of adjusting the articulations of the spinal column and adjacent tissues by hand only for the correction of the cause of disease." Such a license, the bill proposes, would authorize the holder thereof to "examine patients and to diagnose and adjust for any interference with the transmission of nerve energy and to prescribe or regulate the patients' dietary, sanitary and hygienic requirements; also to use the Neurocalometer, x-ray and any other instrument for the purpose of diagnosis or analysis only, and such licensee shall have the right to employ nurses and assistants."

### Oklahoma

*Bill Introduced.*—H. 446, to amend the law limiting the retail sale of barbiturates to sale on the written prescription of a licensed physician, osteopath, dentist or veterinarian, proposes similarly to limit the retail sale of isonipecaïne and benzedrine. The bill proposes to define both of these drugs as barbiturates.

### Pennsylvania

*Bills Introduced.*—H. 979 proposes to enact a separate chiropractic practice act and to create an independent board of chiropractic examiners to examine and license applicants for licenses to practice chiropractic, defined as "the science of palpating and adjusting the articulations of the human spinal column." H. 1022 proposes to enact a so-called animal research act and to establish a board to license and regulate the sale, use, distribution and disposition of live animals for teaching, scientific study, research and experiment. The board is to consist, among others, of the professors, associate professors and assistant professors of anatomy, medicine, physiology and pharmacology.

and the heads of the departments of pathology and surgery of legally established medical, dental, veterinary, pharmaceutical and agricultural schools and colleges in the state. No person, association or corporation shall use or sell live animals for the purposes germane to the bill without first obtaining a license annually from the board. The board is to be authorized to establish and promulgate rules, regulations, ethical standards and methods for the detention, housing or use of live animals for teaching, scientific study, research and experiment.

#### Rhode Island

*Bill Introduced.*—H. 836 proposes to authorize the organization of nonprofit medical service corporations to operate nonprofit medical service plans.

#### Vermont

*Bill Introduced.*—H. 238 proposes to direct the governor to appoint a commission of five members to survey and evaluate the location, size and character of all existing hospitals and health centers in the state. The bill proposes to authorize the commission to accept and expend any grant or advance made by the United States for these purposes.

#### Virginia

*Bills Introduced.*—S. J. Res. 2 XX proposes to create a commission to study the operations of the state department of health, the best manner to provide public health services and medical and hospital care for the medically indigent and the major health problems of the state. S. 5 XX, to amend the law restricting the retail sale of hormones to sale on the written prescription of a licensed physician, proposes that the restriction shall not apply to "preparations intended for external use containing hormones in combination with other ingredients unfit for internal administration."

#### Wisconsin

*Bill Introduced.*—A. 478, to amend the workmen's compensation act, proposes that, where an employer has knowledge of an injury to a workman and the necessity for treatment, his failure to tender treatment shall constitute neglect and refusal on his part. Where an employer neglects or refuses to provide medical attention for his injured workman the same may be provided at the employer's expense by any physician selected by or on behalf of the workman.

## Council on Medical Service and Public Relations

### CONFERENCE ON RADIOLOGY IN PREPAYMENT PLANS

"With the proper presentation of the facts, a majority of the members of Congress will have too much common sense to put over a compulsory health insurance plan," Dr. John H. Fitzgibbon, Chairman of the Council on Medical Service and Public Relations of the American Medical Association, said at a conference of the Commission on Hospital Standards of the American College of Radiology at the Drake Hotel February 10. The conference dealt with "Radiology in Prepayment Plans," and Dr. Fitzgibbon's paper and those of other speakers will appear in the "Proceedings of the American College of Radiology, 1945."

"Responsibility for the health of the American people is an individual responsibility of every physician," Dr. Fitzgibbon continued. "We must reach individual physicians everywhere in order to develop unity of purpose, which is so essential in carrying out policies and plans for the future. Provision of good medical care to all the people is a problem without end. It will continue as long as medicine is practiced and as long as there are physicians. I am quite sure the medical profession will outlive any government or group of governments. The effects of our actions today will be felt long after we are gone. As I have said elsewhere, we must view ourselves as a link between the past and the future of medicine and realize our importance and responsibility."

"In making medical care available to every person in the nation we must get down to bedrock and discover the things that are necessary to provide good medical care. Certain steps will be required."

These steps, according to the speaker, were (1) the provision for proper personnel and facilities, (2) sound American methods, (3) education of the public as to the value of good medical care and (4) requirement that the plan is acceptable to physicians to work.

"Some of the difficulties of the problem are becoming more widely appreciated by our lawmakers," the speaker continued. "Personally, I believe that, with a proper presentation of the facts, a majority of the members of Congress will have too much common sense to put over a compulsory plan."

"It is up to the medical profession to see that the facts are properly presented. That is one of the functions, not only of medical organizations, but also of individual physicians everywhere, without whom there would be no organization."

"Returning for a moment to the matter of prepayment medical plans, the Council wishes to do everything possible to strengthen the many medical society sponsored plans now operating throughout the country. Some are doing very well. Others are having difficulties. In some cases too much altruism has upset business methods. At times there has been a tendency to appease socialistic forces. My impression is that experience is solving many problems."

"The Council has planned a conference on prepayment plan problems to be held at the time of the next meeting of the House of Delegates. This conference is to deal with 'head-aches' only. When I say a conference, I mean a conference and not a formal program crowded with papers. We intend to take up individual problems just as you today are discussing the problems of radiology. There are a great many difficulties that can be overcome by conference between experienced individuals from all over the country."

"The Council hopes to increase its activities in this line. Lack of personnel has been our chief handicap. Our regional conferences have shown widespread interest in society sponsored prepaid plans of all kinds. Regardless of differences of opinion about some of the features of various plans, we have found a unanimous desire on the part of the profession to extend good medical care."

"We are frequently asked whether the American Medical Association has a plan. Actually, in our platform, we have the foundation for accomplishing the objective of making good medical care available to all. Unfortunately the objective and plans in the platform are not widely known outside the medical profession. It is one of the functions of the Council to disseminate information in this regard."

"Solution of the problem of providing good medical care to all is not the responsibility of the medical profession alone. There are a great many people vitally interested and their opinions must be considered. Industry is an important part of American life. When medicine can enter into friendly and constructive discussions with management, labor, hospital groups, insurance people and representatives of the public, this problem can be solved on a sensible, basically sound basis. We are gradually reaching that point."

## Woman's Auxiliary

### Arizona

Many of the county auxiliaries in Arizona are sponsoring the cancer project this year. The Maricopa auxiliary is sponsoring a series of educational programs conducted by the Field Army of the Arizona Cancer Society, the first of which was held on October 17.

Yavapai County is promoting the cancer project in the schools and women's clubs. Scientific material is being placed in all the high schools in the county.

Pima County also sponsored a cancer meeting for the presidents and program chairmen of the women's clubs in Tucson.

## Washington Letter

(From a Special Correspondent)

March 26, 1945.

### House Discusses Veterans Administration Probe

Whether the Veterans Administration investigation will be independent or restricted is being decided now by the House. But there will be an inquiry, following charges of mismanagement of Veterans Administration hospitals throughout the country. Representative John Rankin, Democrat of Mississippi, chairman of the House Veterans Committee, wants to have his committee investigate, confining the probe to matters under direct jurisdiction of the Veterans Administration. Representative Philip J. Philbin, Democrat of Massachusetts, proposes a broader inquiry by a special eleven member committee, including five Veterans Committee members. Representative Philbin asks an examination into hospitals and other servicemen's facilities operated by the Army, the Navy and other government agencies. Representative Rankin has been battling nearly three weeks to head off the full dress inquiry proposed by Representative Philbin. He won the first round Saturday when the House Rules Committee reported 4 to 3 giving his resolution precedence over the Philbin measure. Representative Rankin said that one of the authors of charges against the Veterans Administration had been mentioned eleven times in the last Dies committee report, whereupon Representative Howard Smith, Democrat of Virginia, said he wouldn't like to see the inquiry directed at men making the charges. Representative Rankin was accompanied to the hearing by General Hines, who earlier told the Veterans Committee that charges of maladministration in Veterans Administration hospitals were unfounded. Representative Philbin said that he had received many complaints from veterans and their families about hospital conditions.

### Voluntary Admissions to Mental Hospital Advocated

The District of Columbia Medical Society has approved the recommendation of its subcommittee on mental health that legislation be enacted in Congress providing for voluntary admissions to St. Elizabeths Hospital. It was pointed out that only fifteen states fail to provide for voluntary admissions. A bill has been introduced by Senator Pat McCarran, Democrat of Nevada, covering District cases. Dr. Winfred Overholser, chairman, stated that "admission to hospitals for the early treatment of mental difficulties should be as simple as possible. Many patients in the early stages of such troubles, when most responsive to treatment, recognize their illness and are ready to seek help. Yet such a person in the District of Columbia, in order to gain the benefit of hospital care, must be judicially determined to be 'dangerous to himself or others' and 'of unsound mind.' Furthermore, such a finding deprives him of his status as a citizen—he cannot legally sign a check, make a contract or engage in business." He said there is no danger of "railroading" a voluntary patient.

### Speed in Obtaining Nurses Urged by Stimson

"We cannot ask our wounded and sick soldiers to wait for relief," Secretary Stimson has written Senator Albert D. Thomas, Democrat of Utah, who presided at hearings before the Senate Military Affairs Committee of the nurse draft bill, passed by the House. Major Gen. Norman T. Kirk, Surgeon General of the Army, describing nurse assignments in general hospitals in the United States, said that "at night each patient can receive six minutes of nursing care—surely we cannot spread our nursing service any thinner." Under Secretary of War Robert P. Patterson reported that since May 1 patients in army hospitals have doubled, while increase in nurses has been less than 20 per cent. Army hospitals at home and abroad now have 520,000 patients, and unless more nurses are obtained it will not be possible to give leaves to those who have been overseas for three years.

### Penicillin, Under Quantity Production, Has Big Sale

Rapid sales of penicillin, now on its way to quantity production, are reported by retailers. As the drug is received by wholesale druggists it is moved from warehouses, first to hospitals which have priorities and then to druggists for prescrip-

tion sales. Scarcely are new shipments stored away in cooling vaults before orders stream in to exhaust these supplies. Hospital patients have first claim on the drug, which is given in controlled daily dosages.

### Bill to Ban Animal Experimentation in District Asked

Following passage by the New York State senate, by 39 to 9, of the Di Constanzo bill making it a crime to experiment on living dogs, and notwithstanding its failure to emerge from committee, Representative Lemke, Republican of North Dakota, has asked the House District Committee for hearings on his pending bill to ban animal experimentation on dogs and other animals in the District of Columbia. Representative Lemke said that there was much interest among members of the House in the measure.

## Official Notes

### CONTRIBUTION OF N. B. C. TO DOCTORS LOOK AHEAD

The National Broadcasting Company makes significant contribution to the success of the American Medical Association network program Doctors Look Ahead. Miss Judith Waller, director of the N. B. C. Central Educational Division, makes arrangements for time and in general supervises the program for the National Broadcasting Company. Miss Waller, formerly director of radio station WMAQ before it became the central key station for the National Broadcasting Company, has been connected with many educational programs, including Music and American Youth, Parent-Teacher Association programs, Student Opinion and High School Studio Party, and is author of a book, Radio the Fifth Estate, and has received the annual award of merit from the School Broadcast Conference for her contribution in radio. She has taken deep interest in all American Medical Association broadcasts and her advice has influenced the form and character of the program in many ways.

In the next three weeks Doctors Look Ahead will include the following programs:

March 31. In cooperation with the National Safety Council, Doctors Look Ahead will broadcast a program calling attention to home accidents and some remedies for this situation, which is of growing seriousness. The program will be summarized by a guest speaker, Forrest E. Long of the National Safety Council.

April 7. Doctors Look Ahead will broadcast in relation to the tuberculosis situation in wartime and postwar with special reference to visit in drug therapy of this disease.

April 14. Cancer will be the subject, since April is cancer month, designated as such by resolution of Congress and proclaimed by the President. New hope for cancer patients, with special emphasis on cancer education for youths, will be broadcast with a summary by Dr. Frank L. Rector, cancer consultant, Michigan Department of Health.

Doctors Look Ahead is heard on one hundred and twenty-three stations of the National Broadcasting Company network each Saturday at 4 p. m. Eastern War Time (3 p. m. Central War Time, 2 p. m. Mountain War Time and 1 p. m. Pacific War Time). Some stations may record the program and broadcast it at a time which suits their schedule better. Local newspaper radio announcements should be consulted.

### BUREAU OF INFORMATION

Those state and county medical societies which have not yet returned the completed county summary sheets sent to them by the Bureau of Information are requested to do so as quickly as possible. The information obtained is of great value to medical officers who are seeking locations for practice. Particular attention is called to the section entitled "Remarks" on the Summary Sheets. Information about local needs for physicians is specially desired under this heading and interval reports of the needs of communities for physicians will be helpful. This and other services of the Bureau of Information are being sought more and more by discharged medical officers, and there is a great demand for information concerning places needing physicians.

## Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST: SUCH AS RELATE TO SOCIETY ACTIVITIES, NEW HOSPITALS, EDUCATION AND PUBLIC HEALTH.)

### CALIFORNIA

**Stanford Medical School Receives \$100,000.**—An anonymous gift of \$100,000 has been accepted by Stanford University School of Medicine, San Francisco. The disposition of the fund has not yet been decided.

**Changes in Status of Licensure.**—The California Board of Medical Examiners at recent meetings in Los Angeles took the following actions:

Dr. Boyajian B. Armen, Dos Palos, license revoked for violation of probation.

Dr. Herman B. Misch, Los Angeles, license revoked for performing illegal operation.

Dr. John Robert Brown, Los Angeles, placed on five years' probation without narcotic privileges or possession.

**New Methods of Art Education.**—Henry Schaefer-Simmern, supervisor of art, New York City schools, gave a group of three lectures at the University of California, Berkeley, March 14, 16 and 19 on "New Methods of Art Education." The individual titles of the lectures, which were sponsored by the department of art of the University of California, were "The Organic Growth of the Artistic Form," "The Inherent Evolutionary Process in Art Education" and "The Therapeutic Implications of Artistic Activity."

**Students Sponsor Meeting on Health Insurance.**—The Student Medical Association of the College of Medical Evangelists, Los Angeles-Loma Linda, held a meeting March 18 to discuss "State Medicine and What It Means to You." Among the speakers were:

V. Orval Watts, Ph.D., economic counselor, Los Angeles Chamber of Commerce.

Dr. Lowell S. Goin, president, California Medical Association.

Dr. Jay J. Crane, president, Los Angeles County Medical Association.

Dr. Louis J. Regan, counsel, Los Angeles County Medical Association.

Dr. Harry Clifford Loos, Roos-Loos Medical Group.

Dr. Stanley Cochems, executive secretary, Los Angeles County Medical Association.

### CONNECTICUT

**Ira Hiscock to Succeed Charles Winslow.**—Charles Edward Amory Winslow, Dr.P.H., Anna M. R. Lauder professor of public health and chairman of the department, Yale University School of Medicine, New Haven, will conclude thirty years service with Yale University when he retires at the end of the current academic year. Dr. Winslow received his doctor of public health degree at New York University, New York, in 1918. For a period in 1898 he was assistant health officer of Montclair, N. J. During the summers of 1898 and until 1902 he did special work for the Massachusetts Department of Public Health. Subsequently he was associated with the Massachusetts Institute of Technology, Cambridge, Mass., and later with the University of Chicago at Chicago. From 1910 until 1914 he was associate professor of biology at the College of the City of New York, New York, serving from 1910 until 1922 as curator of public health of the American Museum of Natural History, New York. For a year in 1914 he was director of the division of public health education of the New York State Department of Health, joining Yale University in 1915 to become Anna M. R. Lauder professor of public health. Since 1932 Dr. Winslow has also been director of the John B. Pierce Laboratory of Hygiene at Yale. Col. Ira V. Hiscock, S. C., A. U. S., professor of public health, now on leave of absence at Yale, has been named to succeed Dr. Winslow as chairman of the department as soon as he concludes his service with the Army. He is currently serving as chief of the public health section of the Civil Affairs Division of the War Department. Colonel Hiscock has been associated with Yale since 1920.

### ILLINOIS

**Personal.**—Dr. Warner H. Newcomb, Jacksonville, is the new president of the Morgan County Public Health Board. —Dr. Norbert C. Barwasser was elected president of the Moline Physicians Club, March 2, succeeding Dr. Herbert H. Liberman. Dr. Barwasser, who is secretary of the Rock Island County Medical Society, also served as president of the Moline group in 1938. Dr. James J. Sraile is the secretary.

### Chicago

**News Wanted of Rush Alumni.**—The officers of the Rush Medical Alumni Association are planning to publish a bulletin during 1945 and, if possible, annually during subsequent years. The association is appealing for news of all Rush men who may be in service, together with their addresses, as well as for news and personal addresses of men not in service. The information should be forwarded to Miss Evelyn Jiroch, Presbyterian Hospital, 1753 West Congress Street, Chicago 12.

**Society News.**—The Chicago Society of Internal Medicine will be addressed April 23, among others, by Drs. Paul H. Wosika and Ladislaus Braun on "Fatal Agranulocytic Angina Occurring During Thiopuracil Therapy."—Dr. Samuel Fomon, New York, will discuss "Functional Restoration Through Rhinoplasty" before the Chicago Laryngological and Otolaryngological Society April 2.—On April 13 the Chicago Orthopaedic Society will be the guest of the Vaughn General Hospital, Hines, Ill., at the invitation of Brig. Gen. Percy J. Carroll, M. C., U. S. Army, commanding officer. The speakers will be Lieut. Col. Morris Thomas Horwitz, M. C., on "Secondary Closure in Treatment of Chronic Osteomyelitis" and Lieut. Richard G. Lambert, M. C., "Treatment of Ununited Fractures of Long Bones: Combination of Graft and Internal Fixation."

**New Medical-Dental Building at Loyola.**—Plans are now under way at Loyola University to construct a new building for its medical and dental schools. The proposed construction will be located in the medical center park area and calls for the housing of the medical and dental schools in a Y shaped building. The schools will be located in the wings, with office space in a two story semicircular entrance lobby. Facilities to be used in common by the dental and medical schools will be in a large central portion of the building such as auditoriums, anatomy and physiology laboratories, photostat rooms, libraries, amphitheater, dining hall and recreation facilities. Clinics will be located on the first two floors of the building. Animal rooms will be located on the roof, with open air runways. The new building, plans for which are being drawn up by Mr. Gerald A. Barry, architect, is being designed to accommodate 400 medical and 400 dental students. It will contain eight stories and basement and will cost about \$1,500,000. Funds for the new building are to be raised through a campaign among alumni and friends of the university. Rev. Joseph M. Egan, S.J., S.T.D., is president of the university, Dr. Italo F. Volini is acting dean of the medical school and Rev. Edward F. Maher, S.J., is regent.

### INDIANA

**Personal.**—Dr. Edgar K. Black, Wabash, has been named as city health officer, succeeding Dr. Laurence E. Jewett, Wabash, resigned.—Dr. and Mrs. Albert C. Yoder, Goshen, recently celebrated their fiftieth wedding anniversary.—Dr. Hubert M. English was elected president of the Gary board of health.

**Rollen Waterson Goes to California.**—Mr. Rollen Waterson, executive secretary of the Lake County Medical Society, Hammond, since 1939, resigned March 12 to accept a similar position with the Alameda County Medical Society, Oakland, Calif. At the time of this report his successor had not been named.

**Physicians Over Seventy Recommended for Place of Honor.**—The *Journal of the Indiana State Medical Association*, in a brief editorial, suggests that after the war is over a list of men over the age of 70 who have maintained their medical practice be given an honored place in the archives of the state medical association. Coincident with the recommendation is the reminder to the "home guard" group to "take good care of themselves" because of the apparent increase in the death rate among physicians.

### KENTUCKY

**Society News.**—Dr. Chauncey W. Dowden discussed "Histamine Headache" before the Louisville Medico-Chirurgical Society February 23 and Dr. William E. Gardner, "Jacksonian Syndrome at Age 48."—Dr. Bruce B. Mitchell addressed the Louisville Society of Medicine February 1 on "Sterility."

**Memorial to John Jackson.**—At a meeting of the Boyle County Medical Society, Danville, February 16, a resolution was adopted announcing that a memorial fund would be given to the Ephraim McDowell Memorial Hospital for the purchase of obstetric, surgical and laboratory equipment in honor of the late Dr. John D. Jackson. The society will also donate a bronze plaque to the hospital in memory of Dr. Jackson.

**Personal.**—Dr. Robert W. Bledsoe, Covington, was recently reelected president of the Northern Kentucky Motor Club for his twelfth consecutive term.—Dr. William F. Fidler has been named director of the Christian County Health Department.—Dr. Gerhard Hecht has resigned from his position in charge of venereal disease treatment at the East Louisville Health Center, effective January 31, to enter practice in Binghamton, N. Y.—Dr. John H. Blackburn, who started the practice of medicine in Bowling Green in 1900, was recently guest of honor at a dinner in acknowledgment of his service to the community.

## MICHIGAN

**Course in Surgical Anatomy.**—An advanced course in surgical anatomy opened at the University of Michigan Medical School, Ann Arbor, March 1, under the direction of Dr. Rollo E. McCotter, professor of anatomy. The course will continue until June 14.

**Edgar Norris Resigns as Dean.**—Dr. Edgar H. Norris, Detroit, has resigned as dean of Wayne University College of Medicine, a position held since 1939, and as director of medical sciences of the Medical Science Center (*THE JOURNAL*, Nov. 18, 1944, p. 780). Newspapers report that Dr. Norris will also resign as professor of pathology, a position that he has occupied since 1938.

**Centennial Celebration of St. Mary's Hospital.**—On May 17 St. Mary's Hospital, Detroit, will observe its one hundredth anniversary with a special program at the hospital and a banquet at the Statler Hotel in the evening. Among the speakers will be:

- Dr. Russell L. F. Cecil, New York, Modern Conception of Arthritis and Its Management.
- Dr. Emil Novak, Baltimore, Functional Tumors of the Ovary.
- Dr. Alexander Brunschwig, Chicago, Extension of Radical Surgery in the Treatment of Advanced Abdominal Carcinoma.
- Dr. William J. Stapleton Jr., Detroit, History of Wayne University College of Medicine—St. Mary's Association.

A round table discussion will be devoted to diseases of the gallbladder with Dr. Frederick A. Collier, Ann Arbor, presiding and Drs. Hugo A. Freund and Charles S. Kennedy, Detroit, in addition to the other guest speakers, participating. Dr. Arturo Castiglioni, assistant professor of the history of medicine, Yale University School of Medicine, New Haven, will be the banquet speaker.

## MISSOURI

**Hal Foster Honored.**—On April 9-10 a special program, including two dinner sessions at the President Hotel, Kansas City, and a scientific meeting at the University of Kansas School of Medicine, Lawrence, will be held to honor Dr. Hal L. Foster, who founded the American Academy of Ophthalmology and Otolaryngology at a meeting in Kansas City in April 1896. A feature of the occasion will be the unveiling of an oil portrait of Dr. Foster as a memento of the fiftieth anniversary year of the national group (*THE JOURNAL*, February 3, p. 287). Dr. Foster drew up the program for the first meeting in Kansas City, April 9-10, 1896, in the Midland Hotel. Among the speakers were the late Drs. John H. Thompson, president of the Kansas City Academy of Medicine, C. Lester Hall, president of the Missouri State Medical Association and Robert S. Black, president of the Kansas Medical Society. Twenty-nine papers constituted the formal program. Dr. Foster is a charter member of the Jackson County Medical Society, the Kansas City Academy of Medicine, the Kansas City Society of Ophthalmology and Otolaryngology and the Kansas City Southwest Clinical Society. *The Bulletin* of the Kansas City Society of Ophthalmology and Oto-Laryngology for April features the coming program to honor Dr. Foster and reviews his past activities.

## NEW YORK

**Animal Experimentation Bill "Buried" in House Rules Committee.**—The New York legislature ended its 1945 session on March 24 without enacting a law prohibiting animal experimentation in the state, newspapers reported. The bill, which for the first time in New York's history has passed one of the law-making bodies, the senate, in the closing hours of the legislative session, appeals to spare dogs from the "indiscriminate experimentation of the cold knife of the scientists" were not heard by Oswald D. Heck, chairman of the committee and speaker of the assembly.

**New Cancer Committee.**—A cancer committee has been created in the Onondaga Health Association to sponsor and supervise cancer education and to promote an all-round coordinated cancer program for Syracuse and Onondaga County. The committee is composed of twenty-four physicians and lay

persons representing all principal agencies and interests in the local field of cancer control. Dr. Oliver W. H. Mitchell, Syracuse University College of Medicine, is chairman. The creation of the committee grew out of a study of local conditions and needs made in 1944 by a special inquiry committee of the health association. One of the primary objectives of the committee, which holds monthly meetings, is the preparation of a functional directory of the existing resources of the community. Syracuse has three tumor clinics: one at the Hospital of the Good Shepherd, Syracuse University, and two at Syracuse Memorial Hospital—one a general tumor clinic and the other a gynecologic cancer clinic. The Visiting Nurse Association provides nursing care for Syracuse patients in their own homes, and the county public health nurses give similar care in the outlying rural areas. Several relief and social agencies, both official and voluntary, also cooperate where their help is required. A confidential roster of the cancer cases in Onondaga County, maintained by the district state health office, and the records of the bureau of vital statistics, Syracuse Health Department, are important adjuncts in the administration of these services.

## New York City

**Long Island Alumni Meeting.**—The annual dinner and business meeting of the Alumni Association of the Long Island College of Medicine, Brooklyn, will be held April 28 at the Knights of Columbus, Brooklyn. The speakers will be Mr. Mark A. McCloskey, director, Community War Services, Federal Security Agency, Washington, D. C., and Dr. Jean A. Curran, president of the Long Island College of Medicine.

**Relatives Organized Into Service Corps.**—The Jewish Sanitarium and Hospital for Chronic Diseases, Brooklyn, has mobilized the relatives of its 525 patients into a volunteer service corps, newspapers reported March 9. The action was described as the first of its kind in the city whereby a major institution caring for incurable-sick persons has called on the relatives of the patients to relieve and assist an understaffed hospital organization.

**Memorial to Physician Featured in Proposed Roosevelt Annex.**—A section of the proposed new building for Roosevelt Hospital will be designated a memorial to Dr. James I. Russell, who died in February 1944 after being identified with the hospital for more than forty years and serving as director of the department of surgery from 1936 to 1942. A campaign to raise a million dollars for Roosevelt Hospital will open on April 1 to finance the new five story building which will be erected on Ninth Avenue between 58th and 59th streets to provide accident and emergency service, outpatient clinics and semiprivate accommodations.

**Health Commissioner to Join Special Mission to Italy.**—A leave of absence has been approved for Dr. Ernest L. Stebbins, health commissioner of New York City, to serve as one of a group to go to Italy under a special medical mission sponsored by the United Nations Relief and Rehabilitation Administration. During his absence the health department will be directed by Dr. Frank A. Calderone, deputy commissioner, who has been with the department since 1938. Other members of the mission will include Dr. James E. Perkins, Albany, director of the division of communicable diseases of the state health department. The purpose of the mission, which will be directed by Drs. Elmer L. Sevringhaus, professor of medicine, University of Wisconsin Medical School, Madison, and Maurice B. Visscher, professor and head of the department of physiology, University of Minnesota Medical School, Minneapolis, is mainly to attempt to determine the relationship of malnutrition and infectious diseases and the methods of prevention and control of both.

**Survey of the Antibiotic Problem.**—The New York Institute of Clinical Oral Pathology will sponsor a symposium on the antibiotic problem at the New York Academy of Medicine, April 30. Among the speakers will be:

- Dr. Daniel Laszlo, Role of Dietetics and Antibiotics in Chemotherapy.
- Dr. Frank Lamont Meloney, Problem of Penicillin in Treatment of Mixed Infections.
- Leo Stern, D.D.S., Treatment of Acute and Chronic Infections of the Jaws with Antibiotics.
- Lieut. Col. Kenneth M. Kahn, M. C., Relative Value of Antibiotics in the Treatment of Otolaryngic Diseases.
- Louis I. Grossman, D.D.S., Evaluation of Antibiotic Agents for Root Canal Treatment.
- Dr. Ludwig von Sallmann, Role of Iontophoresis in Ocular Therapy with Antibiotics.
- Alvin E. Stroock, senior assistant dental surgeon, U. S. Public Health Service Reserve, Treatment of Ulcerative Stomatitis (Vincent's Infection) with Penicillin.

Additional information may be obtained from Mr. G. Roitach, executive secretary, New York Institute of Clinical Oral Pathology, 101 East 79th Street, New York 21.

**Heart Association Seeks Funds.**—The New York Heart Association recently launched a campaign to raise \$150,000. The association, founded in 1915, became a division of the New York Tuberculosis and Health Association in 1926. Recently it returned to its original status of a separate independent organization. To develop a competent staff of field workers, to establish new headquarters, to start a number of projects that have already been too long delayed and to continue the essential work it has been doing are the reasons cited for the start of the campaign. Offices of the association, of which Dr. Edwin P. Maynard Jr., Brooklyn, is president, will be at the New York Academy of Medicine, 2 East 103d Street. Offices of the finance committee, of which Dr. Harold E. B. Pardee is chairman, are at 331 Madison Avenue. In announcing the campaign the *New York Times* reports that the latest statistics released by the Census Bureau in Washington, D. C., show that heart diseases caused 426,391 deaths, or 29.2 per cent of the country's mortalities, in 1943. This is an 8 per cent increase over 1942 and more than two and one-half times the number of deaths reported from the second highest cause of death, cancer and other malignant tumors, which accounted for 166,845 persons.

### OHIO

**Faculty at Ohio College of Medicine Reorganized.**—The board of trustees of Ohio State University has approved a number of major changes in the faculty of the college of medicine, Columbus, in accordance with recommendations of the new dean, Dr. Charles A. Doan (*THE JOURNAL*, Dec. 16, 1944, p. 1041). The former dean of the college of medicine, Lieut. Col. Hardy A. Kemp, M. C., was named to the professorship of public health and hygiene, effective pending his release from active duty in the Army. Rollo C. Baker, Ph.D., former chairman of the department of anatomy and for the past two years acting dean of the college of medicine, was made permanent secretary of the faculty of medicine. He will devote approximately one half of his time to administrative duties in the office of the dean and the remainder of his time to instruction and investigation in the department of anatomy. The newly created office of junior dean will be held by Dr. George H. Ruggy (*THE JOURNAL*, February 3, p. 288). Dr. Ruggy is assistant professor in the department of physiologic chemistry and pharmacology and in the department of medicine. Dr. Ruggy will divide his time about equally between the administrative duties of the new office and teaching in the departments with which he is now associated. Dr. Bruce K. Wiseman, as the new chairman of the department of medicine (*THE JOURNAL*, February 3, p. 288), is formulating plans that will make possible the introduction of new and expanded contacts in the clinical instruction of the junior and senior students. Dr. Henry E. Wilson Jr., associate professor of medicine, was appointed assistant medical director of the Starling-Loving University Hospital and assistant chief of staff. He will work with the superintendent in an advisory capacity with reference to administrative problems in the hospital involving the practice of medicine. Dr. C. Joseph DeLor, assistant professor of medicine, is the new assistant medical director of the outpatient dispensary. Dr. Warren E. Wheeler, assistant professor of pediatrics, Wayne University College of Medicine, Detroit, has been named associate professor of pediatrics at Ohio State and will devote full time to teaching and research, chiefly at Children's Hospital. Dr. Jonathan Forman, lecturer in medicine, has been named professor of medical history. In his new position Dr. Forman will be responsible for the teaching of the history of medicine and for the supervision of the medical archives of the state of Ohio for the medical library. Dr. Frank F. Tallman, state commissioner of mental diseases, has been named assistant professor of neuropsychiatry and will correlate the teaching and research program at the university with his statewide program for the better care and treatment of the mentally ill. According to the *Ohio State Medical Journal* Dr. Doan has announced his policy of administration to include active participation in both teaching and research for all executive officers of the college of medicine, including the dean. Establishment of a medical and health center at Ohio State University at an estimated cost of \$5,000,000 will be asked of the 96th Ohio General Assembly, now in session at Columbus. It is proposed that the legislature appropriate funds for the health center in addition to \$12,500,000 being requested for other postwar building projects at Ohio State University. It is contemplated that the proposed medical center will include a new building to house the college of dentistry, an addition to Hamilton Hall, where the medical and dental colleges now are located, to provide adequate library facilities, and an 800 bed addition to University Hospital to furnish needed hospitalization facilities

ties for central Ohio and to bring clinical teaching opportunities up to minimum standards. At present the college of medicine has 2 teaching hospital beds for each student, instead of 6, as recommended by most medical educators.

### SOUTH CAROLINA

**Medical Society Repudiates Action of Hospital Commissioners.**—On February 22 the Medical Society of South Carolina (Charleston County), trustees of Roper Hospital, Charleston, repudiated recent action of the Roper board of commissioners when it authorized the distribution among members of the general assembly of copies of a statement implying that the medical society was not in agreement with plans to expand the Medical College of the State of South Carolina by construction of a 450 bed clinic. The medical society called a special meeting and adopted a resolution repeating its endorsement of the proposed medical college program. In addition to expressing its approval of the program, the resolution stated "that the board of commissioners of the Roper Hospital, acting as a committee of the medical society, without full cognizance of the interpretation of their actions, has caused to be printed in the press and distributed in the halls of the state legislature certain articles of writing, absolutely contrary to the sentiment and instructions of the said Medical Society of South Carolina." The resolution stated that this action of the board could be interpreted as an effort on the part of the medical society to promote opposition to the expansion program of the medical college and further expressed repudiation "as being contrary to a resolution of endorsement passed Nov. 14, 1944" and further that it was done without the knowledge or consent of the medical society, according to the *Charleston News and Courier*. The Roper Hospital board is appointed by the medical society. Under the will of Thomas Roper the hospital belongs to and is operated by the medical society.

### TEXAS

**Changes in Health Officers.**—Dr. John F. Clark, Georgetown, assistant director of the Central Texas Health Department, including the counties of Bell, Coryell, Williamson and Lampasas, has been named director succeeding the late Dr. Arthur E. Ballard, Belton.

**Dr. James White to Give McReynolds Lecture.**—The John O. McReynolds Lectureship in ophthalmology, recently established at the University of Texas Medical Branch, Galveston, will be inaugurated April 6 by Dr. James Watson White, professor of ophthalmology, New York Post-Graduate Medical School and Hospital, Columbia University, New York. His subject will be "Treatment and Prevention of Neuromuscular Eye Defects." Among the honor guests will be Colonel and Mrs. Frank W. Wozencraft, Washington, D. C., who established the lecture (*THE JOURNAL*, Aug. 21, 1943, p. 1197).

### WEST VIRGINIA

**Budget Appropriations.**—In the budget bill as passed, the division of cancer control of the state health department, which has been in operation since July 1944, is given an annual appropriation of \$50,000 for the biennium beginning July 1. This is the same amount appropriated for the preceding biennium (*THE JOURNAL*, March 4, 1944, p. 660). No change will be necessary in the arrangement made by West Virginia University, Morgantown, with the Medical College of Virginia, Richmond, for the enrolment of twenty students annually from the University School of Medicine. The appropriation for the first year of the biennium amounts to \$40,000, and \$80,000 is appropriated for the second year. The increase is necessary on account of the accelerated program that is in force at the Medical College of Virginia at the present time.

**State Cancer Division Institutes Follow-Up Service.**—A plan providing for follow-up service for patients who previously received medical treatment and care for cancer from the department of public assistance has been put into effect by the division of cancer control of the state health department. Records are being traced back to 1938, and every effort is being made to locate patients treated during the past seven years. If the need is shown, care will be provided for them through the new division, but the main purpose of the investigation is to ascertain whether or not they are under proper supervision at the present time. While it is too soon to provide complete statistical data, it is evident from information already obtained that a surprisingly large number of these patients are under 55 years of age. Many of them are self supporting at the present time. As of March 15, after eight months' operation, the division of cancer control reports that it has provided for treatment and care for 290 persons with cancer.

## PUERTO RICO

**Puerto Rican Election.**—Dr. Carlos E. Muñoz MacCormick, Santurce, is now serving as president of the Puerto Rico Medical Association and Dr. Rafael A. Vilar-Isern, Box 3866, Santurce, is secretary. The association held its annual meeting Dec. 16, 1944, when it was decided to hold the next annual session at San Juan, December 14-16.

**Inter-American Health Conference.**—Under the auspices of the Puerto Rico Health Association a three day Inter-American Health Conference was held, February 14-17, at the School of Tropical Medicine, San Juan, P. R., where a committee was named to organize an inter-American association that will make efforts for malaria control on the Caribbean area. Dr. Pablo Morales Otero, San Juan, was designated as president of the committee, while Major Luis F. Gonzalez, M. C., and Luis D. Palacios, an engineer, who is chief of malaria control division of the Puerto Rican Health Department, will assist Dr. Morales Otero in the organization of the proposed inter-American health association. The purpose of this association is to exchange information on malaria control methods considered the most effective to carry on a campaign throughout the Caribbean countries. The committee will communicate with government officials of the Caribbean area who are interested in malaria control, requesting at the same time their cooperation to coordinate efforts for the success of this campaign. Seven Latin American nations and the United States were represented at the group meetings, and invitations were issued by the U. S. State Department to the ministers of health of Pan American countries. The Office of the Coordinator of Inter-American Affairs sent several representatives to this conference. In addition to Latin American delegates, the following Chinese officials attended the conference: Dr. Ke-fang Yao, director of the sanitation board of Chungking; Dr. Wei Chang, member of the planning board for the post-war of the central government of China, and Dr. Winston Young, official in charge of epidemic control in China.

## GENERAL

**Actions on 1945 Conventions.**—Reports received by the American Medical Association indicate the following action for the 1945 sessions of the respective organizations:

Medical Association of the State of Alabama, canceled.  
American Association of Medical Societies, canceled.  
American Medical Association, for 1945 and until further notice.  
Arizona State Medical Association, application denied.  
Association of Medical and Surgical Societies, canceled.  
Medical Association of Georgia, canceled.  
Illinois State Medical Society, May meeting canceled; plans tentatively to hold session later in year.  
Medical and Chirurgical Faculty of the State of Maryland, meeting canceled; house of delegates meeting, April 24.  
Minnesota State Medical Association, deferred.  
Mississippi State Medical Association, canceled.  
Montana State Medical Association, canceled.  
New Mexico Medical Society, canceled.

The American Association on Mental Deficiency writes that it does not expect to hold its 1945 annual meeting before the fall of 1945.

**Anesthesia Essay Contest.**—A prize of \$100 is offered by the American Society of Anesthetists for the best original essay on some phase of anesthesiology or on a subject closely related to it. The contest is open to postgraduate medical students in anesthesiology anywhere and also to postgraduate medical students in other specialties who have devoted some of their time to anesthesiology or to some phase of clinical or experimental work related to anesthesiology. All manuscripts must be received by the secretary of the American Society of Anesthetists, Dr. McKinnie L. Phelps, 745 Fifth Avenue, Room 1503, New York 22, before October 1. The first prize will be awarded in December 1945. Rules of the contest and other relevant information may be obtained by writing to Dr. Charles Adams, chairman of the committee on awards and honors of the society, Mayo Clinic, Rochester, Minn., or to Dr. Phelps.

**George Pratt Wins Parents' Magazine Medal.**—Dr. George K. Pratt, Westport, Conn., psychiatric examiner at the U. S. Armed Forces induction center, New Haven, Conn., was presented March 21 with the annual Parents' Magazine Medal for his book "Soldier to Civilian." The medal is presented by George J. Hecht, publisher, to the author of the most important book for parents. Dr. Pratt spoke of the wartime experiences which impelled him to write his book. Other speakers at the luncheon at which the presentation was made were the following authors, who received honorable mention for their contributions to the field of child guidance and parental interest: Dr. Milton J. E. Senn, New York, author with Phyllis Krafft Newill of "All About Feeding Children"; Marie Syrkin, author of "Your School, Your Children"; Mrs. Jean

Schick Grossman, author of "Do You Know Your Daughter?"; Clara Lambert, author of "School's Out"; Hortense Powdermaker, Ph.D., New York, author of "Probing Our Prejudices," and Dr. Dorothy V. Whipple, Washington, author of "Our American Babies."

**Narcotic Violations.**—The U. S. Bureau of Narcotics, Washington, D. C., announces that Dr. Joseph F. Aquilino, Philadelphia, was sentenced on January 18, following his plea of guilty to violation of the federal narcotic laws, to serve a term of one year and one day in an institution to be designated by the attorney general. The bureau also reported that Dr. Arthur M. Thomson, St. Peter, Minn., following his plea of guilty in the U. S. District Court at Mankato to violation of the federal narcotic law, was on January 16 fined \$250 and placed on probation for a period of three years. On the same day Dr. Merlyn J. Lindahl, Sherburne, Minn., following his plea of guilty to a similar violation, was fined \$1,200 and placed on probation for a period of three years. Other actions include:

Dr. Edward J. Sunday, Pensacola, Fla., who pleaded guilty January 27 at Pensacola to a violation of the narcotic laws, on one count was sentenced to pay a fine of \$5,000 or serve two years in the state prison and on another count was fined \$2,500 or serve one year in the state prison.

Dr. Walter S. Taylor, Alliance, Ohio, on February 19 was sentenced to a term of two years in prison, following his plea of guilty in the U. S. District Court of Cleveland for violation of the federal narcotic law on two counts, the sentence to run concurrently. The sentence was suspended and the physician was placed on probation for a period of two years.

## CANADA

**Activities of Montreal Medical Association.**—Three prizes will be awarded by the Montreal Medical Association for work on individual and original observations. The prizes have been provided by the Ciba Company and will consist of \$500, \$300 and \$200. Additional information may be obtained from Dr. Origène Dufresne, secretary general of the Montreal Medical Association, 4120 East Ontario Street, Montreal. The association was organized in 1900, incorporated in 1929 and is said to be the oldest medical association in Montreal. Officers include Drs. Paul Letondal, president, Armand Frappier, vice president, Jean Denis, secretary of the scientific sessions, and Edouard Desjardins, treasurer.

## LATIN AMERICA

**Health Activities in Latin America.**—"The United States intends to propose and support measures for closer cooperation among us in public health and nutrition, food supply, labor, education, science, freedom of information, transportation and economic development, including industrialization and the modernization of agriculture," according to Secretary of State Edward R. Stettinius Jr. before the Inter-American Conference, which was held recently at Mexico City. In a report received, this statement was believed to mean that the first objective would be the extension of existing health and sanitation services such as the addition of health centers, the expansion of laboratory services, the adequate training of personnel, public health education, corrected diets for the people and the development of accurate vital statistics. The report stated that in Central America, as in other Latin American areas, the most troublesome problems of health and sanitation are encountered in rural territories. According to a recent estimate two thirds of the villages and towns of Colombia are without hospitals. During the five year period ended with 1936 only 13.68 per cent of the people who died in Mexican towns of 10,000 or less were accorded medical diagnosis. For the entire republic the estimate stands at 39.20 per cent. The state of Querétaro has only one physician for every 52,669 inhabitants. It was also stated that Mexicans claim that only five million beds are available for twenty million Mexicans and that drinking and running water are denied to the homes of seventeen and a half million Mexicans. Another estimate, it was stated, believed that 85 of the 126 millions of Latin Americans are starving and are without houses, beds and shoes and pointed out that in Chile, for instance, meat is completely unavailable to 98 per cent of the peasants and milk has been tasted by only 6 per cent of them. The twelve hospitals in Honduras contain slightly more than 1,000 beds for a population of 1,105,504. The infant mortality rate is 122.6 per thousand births. Another report indicated that addiction to native drugs among the Indians of southern Colombia is methodically encouraged by the landowners. The coca ration is used as wage money, and much of the day's work is paid in coca leaves, which are cultivated on the haciendas. The saliva, filled with alkaloid, of chewers of coca, acts locally, producing a superficial anesthesia of the buccal cavity. Once swallowed, it causes the same effect on the gastric mucosa. All day long the chewer changes the exhausted leaves for new ones and thus maintains

a permanent cocainization of the upper digestive tract. The resulting anesthesia appeases thirst, dulls the appetite and lessens hunger and thus, according to Dr. Cesar Uribe Piedrahita, Bogota, the men fool themselves and live on burning their meager energies. In El Salvador there are 200 physicians and twenty hospitals with accommodations for 2,500 beds. Latin American death rates vary radically from a low of 10 per thousand of population in Uruguay to a high of 25 per thousand in Chile. Colombia's tuberculosis mortality rate is 46.6, Chile's 280 per hundred thousand. Deaths in infancy occur at the rate of 95.6 per five births in Uruguay to 270 in Bolivia. Even though conditions are in great need of improvement, the creation of ministries of public health in Bolivia, Brazil, Colombia, Panama, Paraguay, Peru, Uruguay and Venezuela has done much to better health and health progress.

*Institute of the Inter-American Hospital Association for Hospital Administrators.*—There were 284 registrants from Central and South American countries and the Caribbean Islands in attendance at the second regional institute of the Inter-American Hospital Association for Hospital Administrators in Lima, Peru, Dec. 3-16, 1944. A feature of the meeting was the completion of the constitution and by-laws of the Inter-American Hospital Association, making possible definite organization and functioning of the association through the various countries represented. The institute was held in the 600 bed Hospital Obrero under the auspices of the Pan American Sanitary Bureau. The program consisted of sixty-two lectures and symposiums, six demonstration tours and seven round table conferences, offering a complete review of hospital administration, including planning and construction. Current officers of the Inter-American Hospital Association are Dr. Gustavo Baz, Mexico City, president; Dr. Guillermo Almenara, Lima, Peru, and Mr. James A. Hamilton, New Haven, Conn., vice presidents; Dr. Federico Gomez, Mexico City, secretary; Senior Surgeon John R. Murdock, U. S. Public Health Service, Washington, D. C., treasurer; Drs. Malcolm T. MacEachern, Chicago, and Hugh S. Cumming, Washington, honorary presidents, and Mr. Felix Lamela, Washington, executive director.

#### FOREIGN

*Nuffield Grants for Neurology and Psychiatry.*—*Science* reports that the Nuffield Foundation has established a department of neurology at the University of Liverpool. The services of the department will be available both to voluntary and to municipal hospitals throughout the district. The trust, after considering a report on the proposal by its medical advisory council, has made a grant to the university of £3,000 a year for five years, and the rest of the income required is now being collected. A promise of the capital expenditure which will fall on the university has already been obtained from an anonymous benefactor. The trust will make available financial assistance to the extent of £15,000 to enable the University of Leeds to establish a whole time chair in psychiatry, with which will be associated a complete psychiatric unit. Facilities will be provided for both undergraduate and postgraduate instruction and for research in the various branches of psychologic medicine as well as for treatment.

*Soviet Academy of Medicine.*—In accordance with a decision of the Council of People's Commissars of the U. S. S. R., July 30, 1944, an Academy of Medicine will be formed in Soviet Russia by dividing into a number of independent research institutes the existing All-Union Institute of Experimental Medicine. The academy will consist of twenty-five research institutes in all. It will include three departments: of medicobiologic sciences, of clinical medicine and of microbiology, epidemiology and hygiene. The department of medicobiologic sciences will be entirely made up of institutes formed from VIEM, the name by which the Maxim Gorky All-Union Institute of Experimental Medicine is known and which was organized by special decision of the Soviet government Oct. 15, 1932 to replace the old Institute of Experimental Medicine, the only large research institute in Russia until 1918. Thus the Institute of Experimental Biology will be formed from Dr. A. G. Gurvich's department of general biology and the biophysical laboratory, the Institute of Morphology from the morphologic laboratories of VIEM, and the Institute of General and Experimental Pathology from Dr. Alexei D. Speransky's department of general pathology and a number of pathologic laboratories. The Institute of Biologic and Medical Chemistry will consist of the department of medical chemistry under Dr. Parnas together with a number of biochemical and organic chemistry laboratories and the Institute of Physiology

of the numerous physiologic laboratories of VIEM. The Leningrad branch of VIEM will be reincorporated as the Institute of Experimental Medicine and thus continue the traditions of the old Institute of Experimental Medicine. Finally, the aforementioned department of medicobiologic sciences will also include the Institute of Evolutionary Physiology of the higher nervous activity (which was separated from VIEM in 1938) and the Institute of Pharmacology, Toxicology and Chemotherapy, part of which will be made up from the respective laboratories of the institute. The academy's department of clinical medicine will include the Institute of Neurology, which will be made up of the VIEM clinic of nervous diseases and the Institute of Experimental and Clinical Surgery, which will be formed from a number of surgical clinics, among them the clinic directed by Dr. A. V. Vishnevsky. The academy's department of microbiology, epidemiology and hygiene will include the Institute of Virusology, to be formed from the present department headed by Dr. Anatol A. Smorodintsev. A number of VIEM's microbiologic laboratories will go to make up the Institute of Bacteriology, Epidemiology and Infectious Diseases, which is to be organized under the same department. The Sukhumi branch of VIEM will remain the same broad biologic base for the institutes of the Academy of Medicine and will therefore be part of the academy, according to an article by Dr. N. I. Propper-Grashchenkov in the *American Review of Soviet Medicine*, December 1944, page 108.

## Government Services

### Ringworm of the Scalp Epidemic Stopped

Ringworm of the scalp, which has presented a serious problem for health authorities in many parts of the nation, especially in larger cities, has been successfully treated without the use of x-rays by dermatologists of the Industrial Hygiene Division, U. S. Public Health Service, in a test area. In Hagerstown, Md., the epidemic, which affected between 10 and 15 per cent of the school population of 4,500, has been controlled. Methods used included examination of all school children by means of the Woods light, and referral of infected children to a treatment center. Examination was extended to preschool children in the family of infected patients. Instead of being quarantined at home, infected boys and girls were permitted to attend school but were required to wear protective caps and were not admitted to movies, playgrounds, swimming pools or any other public places. Infection was further controlled through enforcement of rigid sterilization provisions in barber shops and through an educational campaign designed to acquaint parents with the mode of transmission of the infecting agent.

### Health of Federal Employees

Plans to intensify activity in health protection and accident prevention for federal workers in Washington and the field were made at a meeting of the executive committee of the Federal Interdepartmental Safety Council in Washington recently, according to the *Industrial Hygiene News Letter*. Training courses for employees in federal departments not now active in health and safety will be given during the coming year, and check lists are being prepared for health and safety surveys in buildings occupied by governmental agencies. Agencies not at present represented in the council are being asked to appoint representatives in a drive to cut down the cost and lost time due to accidents. Monthly meetings of the executive committee, which includes two members of the U. S. Public Health Service, will be held during the year. A joint meeting of the Federal Fire Council and the Interdepartmental Safety Council is planned for the near future. The Federal Interdepartmental Safety Council was established by directive of the President in 1939 primarily to cope with the high accident rates and high compensation costs in the federal service. With an advisory board consisting of the Secretaries of Labor, Treasury, War, Navy, Interior and Agriculture, and representation from the U. S. Public Health Service and many other agencies having nationwide activity, the council acts as an advisory agency in all health and safety matters. Its Committee on Occupational Health is being developed along the lines of an industrial hygiene unit, with one of its tasks to be development of an understanding among administrators of federal agencies of the need for continuing health and safety surveys.

### LONDON

(From Our Regular Correspondent)

March 1, 1945.

#### The British Council for Rehabilitation

Rehabilitation of the disabled is receiving great attention at present. The advances in orthopedics and modern methods of training have greatly increased the economic potentialities of the permanently disabled. The government has given valuable support to rehabilitation by its recent Disabled Persons Employment Act. A British Council for Rehabilitation has just been formed. Its objects will be to bring together workers in every field of rehabilitation so that all may learn the problems involved and approach them along coordinated lines, to become a source of information and guidance on matters relating to the rehabilitation services, to organize short term courses of study of the various aspects of rehabilitation and to promote research into problems which concern the economic outlook of the permanently disabled. The council hopes to work in close collaboration with government departments. The Ministries of Health, Supply, Labor, Pensions and Fuel and Power have accepted invitations to nominate observers. The chairman of the executive committee of the council is the traumatic surgeon Mr. Watson-Jones.

#### The Restoration and Improvement of the Royal College of Surgeons

The serious damage to the Royal College of Surgeons by German bombs has been described in previous letters to *THE JOURNAL*. Sir Alfred Webb-Johnson, the president, has made an appeal, in the first instance to fellows, for restoration of the damaged buildings, as the sum to be received from the War Damage Commission will not cover the whole cost. A unique opportunity occurs to improve the headquarters of British surgery. It proposes to provide a large conference hall, common rooms, museum, library extensions, rooms for the new professors and more research laboratories at a total estimated cost of \$1,000,000. In order to have a free hand in planning and at the same time to provide space for the sister colleges if they decide to move to Lincoln's Inn Fields, the college has acquired several adjoining properties. The future scientific influence of the college has been assured by the generous endowments received from Sir Buckstone Browne (whose death was recently noticed in *THE JOURNAL*), the Bernhard Baron Trustees, and from the latest and greatest benefactor, Sir William Collins. Past and present members of the council and court of examiners have subscribed over \$40,000, and the appeal has been supported by the American College of Surgeons, the Royal College of Surgeons of Edinburgh, the Royal College of Surgeons in Ireland and many surgical associations.

#### Health Officers and the Government Scheme for a National Health Service

The Society of Medical Officers of Health has made a recommendation that the medical and health functions of the various government departments be brought within one central health ministry, with a cabinet minister as the responsible head. This recommendation is made in a brochure analyzing the government proposals for a national health service. Pending the formation of suitable local government units, the society suggests that area hospital councils should be established to advise authorities and the minister on the distribution of hospitals in the areas. Any additional hospital accommodation required should be provided and maintained by the existing hospital authorities, municipal or voluntary, singly or jointly, as may be necessary, in accordance with the plan approved by the minister.

#### Sir Buckstone Browne: Death of a Great Benefactor of Surgery

Sir Buckstone Browne, who in a previous generation was the leading practitioner of genitourinary surgery, has died at the age of 94. He attained his position without a hospital appointment or the higher surgical qualification of F.R.C.S., a truly remarkable feat, for these are generally considered essential. He distinguished himself as a student at University College, London, and on qualifying in 1874 became private assistant of Sir Henry Thompson, the most famous genitourinary surgeon of the day. He filled that post with such success that his chief never operated without his assistance and left the after-care of patients almost entirely in his hands. From 1884 he worked alone and so hard that for twenty-six years he never took a holiday. He attained a large and fashionable practice. Among his many distinguished patients were Robert Louis Stevenson and George Meredith. The latter gratefully inscribed to Browne his novel *Lord Ormont and his Aminta*. His later years were shadowed by the death of his only son in the first world war. His only daughter married Sir Hugh Lett, surgeon to the London Hospital and past president of the Royal College of Surgeons.

Browne's gifts to surgery were munificent. In 1927 the anatomist and anthropologist Sir Arthur Keith, who was then curator of the museum of the Royal College of Surgeons, made an appeal for the preservation of Down House, in Kent, the residence of Darwin for forty years. Browne immediately responded by buying the estate and establishing a fund for its upkeep. He transferred it to the British Association as a national memorial to Darwin. In 1911 Browne gave the Royal College of Surgeons \$500,000 for an institution where surgical problems could be investigated. A surgical research farm was established adjoining Down House. In laying the foundation stone Lord Moynahan stated that Browne took his place for all time among "immortal benefactors," whereupon Browne exclaimed that he was happy to bring the spirit of John Hunter alongside that of Charles Darwin. Browne also gave the Royal College of Surgeons \$25,000, the interest on which provides an annual dinner at the College of Surgeons for members and fellows. In 1926 Browne received the Fellowship of the College in recognition of his services to surgery.

#### National Campaign for Immunization Against Diphtheria

The Ministry of Health is organizing throughout the country a national campaign for immunization against diphtheria by means of press advertising, posters, films and broadcasting. A national campaign for immunization, supported by over three hundred local drives, was successful in 1943, but still greater effort is necessary to increase further the number of children immunized to at least three out of every four in the country. In an "Urgent Letter to Parents," issued as a pamphlet, Mr. Willink, minister of health, states that on an average 50,000 cases of diphtheria, mostly in children, are reported in this country, and more than 2,000 prove fatal. Immunization is safe and harmless. Already 5 million children have been immunized in England and Wales, but there are 3 more million that ought to be protected. Children below school age are specially liable to diphtheria, so the younger the child the more important for it to be protected. The best time for immunization is at about the age of 12 months. The Ministry of Health attaches so much importance to the campaign that it is supplying the local health authorities with illustrated leaflets and bearing the cost of advertising in the local as well as the national press. For the advertisements in the local press the local authorities supply local details.

## French Medicine Under German Occupation

The years of the war record a somber chapter in the history of science and culture in France. Among these, medicine has been most cruelly injured, because it is always in direct contact with the life of the nation. It has been deprived of men, of material and of means of action. The organized hostile opposition deprived it of the possibility of functioning and exercising its profession. Many scientists, professors and writers were called to arms. Many were killed or made prisoners. According to the Geneva Convention they were entitled to protection while in captivity. Later, after the armistice, which, in effect, was capitulation, the racial and political persecutions deprived the Jews, the Masons and the liberals of their chairs, laboratories or hospital services without any regard for their professional standing, their services or their contributions. More than 4,000 doctors were compelled to give up their practice and their work. Many professional chairs were reduced or discarded; the research staffs lost their chiefs; the entire physical organization of research was wrecked; the scientific societies were deprived of their members; the medical periodicals were allowed to have paper only on the condition that they glorify Nazi science.

France was divided into two zones, both under German control. The Académie de médecine and the Société médicale des hôpitaux could not assemble more than half their members. All correspondence and even the circulation of the journals between the two zones was prohibited. The hospitals lacked indispensable drugs, whose reserves were used up or removed by German demands. There has been no glycerin, alcohol, benzine or ether for the past four years. Opiates have almost entirely disappeared. Endocrine products, rubber equipment and glassware are either scarce or nonexistent. The same holds true for laboratory animals, which cannot be secured any longer or fed. There are frequent restrictions of transportation, lighting and refrigeration. The amphitheatres in wintertime resembled the North Pole. The professors, in place of the robe and cap, had to wear an overcoat and muffler. The alerts frequently interrupted the lectures and the work in laboratories. Illumination often was restricted to candle light.

## Doctors Aid Maquis

Scientists, and particularly doctors, are traditionally liberal, and all are fervent patriots. Few agreed to practice under the German conqueror. Many of the younger ones joined the resistance movement and became maquis. The invaders soon convinced themselves of the steadfast refusal to collaborate, which the Germans naively included in their program of conquest. In spite of the large number of doctors imprisoned, deported or killed, those who escaped formed a part of that resistance which paralyzed the German plans. They refused the invitation to collaborate and preferred to sabotage. There were heroes in the sanitary corps who sacrificed all they owned for their country, and practically all doctors aided, at the risk of their lives and their liberty, the secret organizations. False certificates to escape deportation, medical help, concealed hospitals, assistance to aviators and parachutists, information given surreptitiously to intelligence services of the Allies—all this was done in order to aid the clandestine army. The doctor, with his opportunities to move about, was the usual liaison agent of the maquis.

The Nazis naturally turned their attention to the universities. Many of those considered unreliable were closed. The University of Strasbourg was removed after the invasion to Clermont-Ferrand, where it continued its investigations and its teaching.

It was brutally suppressed; its professors and students were arrested and deported to Germany, where they still remain. Many hospitals, bombed and pillaged, ceased to exist. More than 2,200 hospital buildings, clinics and laboratories have been destroyed or hopelessly damaged.

## Secret Health Service Organized

Silence reigned. No reports reached France of research from abroad. All scientific intercourse was broken. The only journals permitted were the German journals, edited in French by traitors. It was a miracle of courage and ingenuity on the part of some of the French periodicals, such as the *Presse médicale*, to be able to continue publication. Constantly menaced by the Nazi police, they could survive only through cunning. Proscribed authors published items under assumed names or without a signature. Dilatory methods and evasions were resorted to in order to avoid printing articles imposed on the publication.

Persecutions of doctors were increased in 1943 and 1944. Seizures, domiciliary visits, incarceration without reason, deportations and shooting were common. More than a thousand doctors were assassinated or transported to Germany, of whom there is no news of any kind. Among these were many against whom the Gestapo had no definite accusations but who were considered capable of aiding the resistance movement or injuring the invader. If the doctor succeeded in escaping to the maquis before the arrival of the police, his wife and children were seized. Pillage of houses was the regular procedure. Among the doctors arrested by the Gestapo was Professor Charles Richet. His whereabouts are not known. Professors Pasteur Vallery-Radot and Debré were obliged to flee in order to save themselves, but the courage of the resistance of the medical body never diminished. A health service, covertly maintained but perfectly organized, was gradually formed, reuniting the doctors who were in hiding. This was a clandestine army serving health, and this service was ready on the day of liberation to join the grand national movement which has aided the Allies in chasing out the "boche." With the liberation, these doctors were all assigned to serve during the period of transition bordering on the formation of the provisional constitution. An association under the name of the Comité national des médecins reunites the sanitary groups, the pharmacologists and the dentists who have worked during the clandestine war. The society is presided over by Pasteur Vallery-Radot and Debré, both victims of the Nazi police. The society intends to maintain its place in governmental councils and to be the center of reestablished French medicine in the professional and social sense.

## Marriages

JOSEPH THOMAS PHILLIPS JR., Norfolk, Va., to Miss Anne Blair Pendleton of Newport News, December 30.

SAUL RUBIN, Savannah, Ga., to Miss Audrey Mae Moses of Athens, Tenn., in Fort Knox, Ky., January 28.

HUGH SCHUYLER ROBERTSON JR., Coraopolis, Pa., to Miss Enid Dorothy Belden of New York, March 10.

WILLIAM P. THOMPSON to Mrs. Ellen Douglas Whitehead Hebard, both of New York, February 3.

MORTON A. JACOBSON, Yonkers, N. Y., to Lieut. Elizabeth Banks in England, October 31.

IRA L. FAITH JR., Indianapolis, to Miss Norma Lee Helm of Evansville, Ind., January 4.

BERNARD T. FEIN, Milwaukee, to Mrs. Vera S. Kalb in San Antonio, Texas, February 11.

ROBERT GWYN SCHULTZ to Miss Edna Lee Schaaf, both of Richmond, Va., January 30.

MARSHALL J. FEELEY to Miss Norma Hastings, both of Detroit, February 3.

## Deaths

**Frank Worthington Lynch** ☉ San Francisco; Johns Hopkins University School of Medicine, Baltimore, 1899; assistant instructor and associate in obstetrics at his alma mater from 1900 to 1904; in 1905 joined Rush Medical College, Chicago, as an instructor in obstetrics, serving as assistant professor of obstetrics and gynecology from 1909 to 1915; for many years on the staffs of the Presbyterian and St. Joseph's hospitals in Chicago; professor of obstetrics and gynecology at the University of California Medical School from 1915 to 1942, when he became professor of obstetrics and gynecology emeritus; on the staff of the University Hospital, where in 1941 friends and students presented his portrait to commemorate his twenty-five years as professor in the medical school; chairman of the Section on Obstetrics, Gynecology and Abdominal Surgery of the American Medical Association, 1923-1924; in 1922 chairman of the section on obstetrics and gynecology, California Medical Association; member of the advisory board of the Committee on Prenatal and Maternity Care, White House Conference; honor guest of the Pan Pacific Surgical Congress in 1936; fellow, member of the board of governors and in 1937-1938 vice president of the American College of Surgeons; served as first vice president in 1927 and president in 1933 of the American Gynecological Society; past president of the San Francisco Obstetrical and Gynecological Society and the Pacific Coast Obstetrical and Gynecological Society; member of the San Francisco Pathological Society and the Pacific Coast Surgical Society; member of the obstetric advisory committee of the Children's Bureau, U. S. Department of Labor; member of the advisory board of the National Committee on Maternal Health; honorary member of the Seattle Surgical Society, Los Angeles Obstetrical Society and the Central Association of Obstetricians and Gynecologists; member of the executive committee of gynecology and obstetrics of the Pan American Medical Association; served as editor, vice president and president of the Chicago Gynecological Society from 1908 to 1914; specialist certified by the American Board of Obstetrics and Gynecology, Inc.; on the editorial board of *Surgery, Gynecology and Obstetrics*, the *American Journal of Obstetrics and Gynecology* and the *Western Journal of Surgery, Obstetrics and Gynecology*; co-author of "Pelvic Neoplasms"; contributed chapters to *American Practice of Surgery*, 1911, *Oxford Surgery*, 1921, *Nelson's Loose Leaf Surgery*, 1928, *Davis's Obstetrics and Gynecology*, 1933, and *Curtis's Obstetrics and Gynecology*, 1933; died January 12, aged 73, of coronary thrombosis.

**John Lemuel Jelks** ☉ Memphis, Tenn.; Memphis Hospital Medical College, 1892; in 1911 delegate of the American Medical Association; member and at one time president of the American Proctologic Society; past president of the Memphis and Shelby County Medical Society; served as a member of the board of trustees of the Tennessee State Medical Association; member of the National Gastroenterological Association, Southern Medical Association, American Association for the Advancement of Science and the Tennessee Academy of Science; fellow of the American College of Surgeons; served on the staffs of St. Joseph's, Memphis Baptist, Methodist and Gantly-Ramsay hospitals and the Veterans Administration Facility; assistant surgeon in chief of the Sons of Confederate Veterans and formerly commander and surgeon of the Tennessee Department of Confederate Veterans; contributor of chapters to the *Cyclopedia of Medicine and Hirschman's Hand Book of Diseases of the Rectum*; died in St. Petersburg, Fla., February 27, aged 74, of coronary occlusion.

**Sigmund S. Burg**, San Antonio, Texas; Medizinische Fakultät der Universität Wien, Vienna, Austria, 1888; member of the American Medical Association; honorary member of the State Medical Association of Texas; served as city health officer of San Antonio and as chief physician at the old City Hospital; medical officer in the Austrian army for one year; charter member of the Bexar County Medical Society and the Bexar County Medical Library Association; died in St. Joseph's Hospital, Houston, December 25, aged 83, of toxic hepatitis and arteriosclerosis.

**Albert Sidney Abernathy**, Pulaski, Tenn.; Vanderbilt University School of Medicine, Nashville, 1891; died January 25, aged 82.

**Albert S. Albert**, West Frankfort, Ill.; Reliance Medical College, Chicago, 1911; died in the Barnes Hospital, St. Louis, January 27, aged 64, of bronchopneumonia following a prostatectomy and of arteriosclerotic heart disease.

**John Lenne Aleshire**, Plainville, Ill.; University Medical College of Kansas City, Mo., 1900; Keokuk (Iowa) Medical College, College of Physicians and Surgeons, 1905; member

of the American Medical Association; served overseas during World War I; died January 25, aged 69, of coronary occlusion.

**Isaac James Archer** ☉ Black Mountain, N. C.; Northwestern University Medical School, Chicago, 1896; member of the American College of Chest Physicians; founder and medical director of the Fellowship Sanatorium of the Royal League; died in Charlottesville, Va., February 19, aged 82.

**Abraham B. Ball**, Albany, N. Y.; Albany Medical College, 1914; member of the American Medical Association; served during World War I; on the staffs of the Albany Hospital and the Brady Maternity Home; died January 24, aged 56, of coronary thrombosis.

**John Thomas Barry**, Oxford, Miss. (licensed in Mississippi in 1890); died February 13, aged 77.

**Carl Frederick Bassow**, Fort Benton, Mont.; Jefferson Medical College of Philadelphia, 1912; member of the American Medical Association; died January 5, aged 61, of lobar pneumonia.

**William Joseph Baumann** ☉ Brooklyn; Baltimore University School of Medicine, 1901; died January 23, aged 67, of acute myocarditis.

**Charles Bailey Bell**, Nashville, Tenn.; University of Nashville Medical Department, 1897; at one time instructor in physiologic anatomy of the nervous system at his alma mater; died in the Protestant Hospital February 6, aged 75, of carcinoma of the colon.

**Harry Berkowitz**, Neponsit, N. Y.; University and Bellevue Hospital Medical College, New York, 1909; member of the American Medical Association; died December 8, aged 57.

**Victor Louis Bigler** ☉ Albemarle, N. C.; University of Pittsburgh School of Medicine, 1925; interned at the James Walker Memorial Hospital, Wilmington; on the staff of the Yadkin Hospital; served in the U. S. Army in France during World War I; died in the Medical College of Virginia, Hospital Division, Richmond, January 21, aged 51, of brain tumor.

**William Atkins Bishop** ☉ Watertown, Mass.; Tufts College Medical School, Boston, 1913; interned at the Hospital Santo Tomas, Panama, Canal Zone; captain in the medical corps of the U. S. Army during World War I; since 1930 medical director of the American Mutual Liability Insurance Company in Boston; formerly medical director of the Travelers Insurance Company; served on the staffs of the Massachusetts General and Faulkner hospitals, Boston; died suddenly February 14, aged 56, of coronary embolism.

**Franklin Rutherford Blake**, Marquette, Kan.; Kansas City (Mo.) Medical College, 1904; member of the American Medical Association; served during World War I; died January 30, aged 67, of coronary occlusion.

**Harry Morton Bowen**, Aquasco, Md.; Georgetown University School of Medicine, Washington, D. C., 1893; member of the board of Prince Georges County commissioners; died February 15, aged 73, of coronary thrombosis.

**Samuel Gordon Brooks**, Anacortes, Wash.; University of Michigan Homeopathic Medical School, Ann Arbor, 1909; member of the Washington State Medical Association; served during World War I; formerly mayor of Anacortes; acting assistant surgeon in the U. S. Public Health Service; physician for the draft board; on the staff of the Anacortes Hospital; died January 16, aged 57, of coronary occlusion.

**Frances Hurd Brown**, Minisink Hills, Pa.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1891; member of the American Medical Association and the Medical Society of the State of New York; died January 24, aged 77.

**Hugh Graham Bruce** ☉ Erie, Pa.; McGill University Faculty of Medicine, Montreal, Que., Canada, 1924; physician at the General Electric Company; died January 24, aged 44, of coronary thrombosis.

**Howard Joseph S. Buchanan**, Monmouth, Ill.; Northwestern University Medical School, Chicago, 1919; interned at St. Luke's Hospital in Chicago; member of the American Medical Association; at one time served as a medical missionary; died January 2, aged 54, of coronary thrombosis and hypertension.

**Eugene E. S. Carrigan**, Point Pleasant Beach, N. J.; Baltimore Medical College, 1896; died in Touisset, Mass., January 21, aged 76, of hypertensive heart disease.

**Le Roy Chapin**, Canton, Ill.; Northwestern University Medical School, Chicago, 1897; secretary of the medical staff of the Graham Hospital, where he died February 3, aged 81, of uremia.

**Julius A. Childs**, St. Petersburg, Fla.; Medical College of the State of South Carolina, Charleston, 1888; died in a local hospital February 11, aged 86.

**Richard Coe** @ West End, N. J.; University of Vermont College of Medicine, Burlington, 1900; died January 2, aged 70.

**Michael Aloysius Conboy**, Buffalo; College of Physicians and Surgeons, Baltimore, 1901; member of the American Medical Association; died in Auburn January 14, aged 66, of a skull fracture, incurred in a fall against a radiator, and hypertension.

**George Isaac Cowan**, Long Island City, N. Y.; University of Toronto Faculty of Medicine, Toronto, Ont., Canada, 1916; member of the American Medical Association; served in the medical corps of the Canadian army during World War I; died January 3, aged 56.

**Martin Van Buren Creagan**, Fort Worth, Texas; Baylor University College of Medicine, Waco, 1903; also a pharmacist; for three years a professor of chemistry at his alma mater; for many years on the staff of St. Joseph's Hospital, where he died December 14, aged 71, of hypertensive heart disease.

**Walter Emmett Crumpler** @ Port Arthur, Texas; University of Texas School of Medicine, Galveston, 1909; fellow of the American College of Surgeons; served during World War I; a director of the First National Bank of Port Arthur; on the staff of St. Mary's Hospital, Gates Memorial, where he died January 8, aged 58, of a fractured vertebra received in a fall.

**Charles Gilman Currier**, Jersey City, N. J.; Harvard Medical School, Boston, 1880; died January 3, aged 89.

**Nathaniel Chesley Daniel**, Oxford, N. C.; North Carolina Medical College, Davidson, 1895; member of the American Medical Association; for many years physician for the Southern Pacific Railway; medical director of the Oxford Orphanage; acting Granville County health officer; died in the Granville Hospital February 4, aged 72.

**Fred Louis Darnall**, Harrisburg, Ill.; University of Illinois College of Medicine, Chicago, 1934; died January 30, aged 43.

**Bonaparte P. Davis**, Fort Jennings, Ohio; Jefferson Medical College of Philadelphia, 1913; member of the American Medical Association; secretary of the Putnam County Medical Society in 1938; on the staffs of the Lima Memorial Hospital and St. Rita's Hospital in Lima; died January 21, aged 54, of coronary thrombosis.

**Francis DeCaria** @ Bradford, Pa.; University of Pennsylvania School of Medicine, Philadelphia, 1918; served as examiner for the local draft board; on the staff of the Bradford Hospital; died February 3, aged 55, of angina pectoris.

**Henry Jefferson Defrees**, Nappanee, Ind.; Rush Medical College, Chicago, 1888; member of the American Medical Association; for one term mayor of Nappanee; helped to organize the Citizens' Building, Loan and Savings Association, serving as one of its directors and as president; served on the board of the State Bank of Nappanee; died February 6, aged 83, of ventricular fibrillation and coronary heart disease.

**John Elmer Detamore**, Union City, Ohio; Ohio Medical University, Columbus, 1898; died in the Union City Hospital, Union City, Ind., January 31, aged 77, of diabetes mellitus.

**James Franklin Dixon**, Mount Erie, Ill.; St. Louis College of Physicians and Surgeons, 1905; died in the Olney Sanitarium, Olney, aged 69, of coronary sclerosis and hypertensive cardiovascular disease.

**Louis Walter Dodson**, Jersey City, N. J.; Bellevue Hospital Medical College, New York; 1891; chief medical examiner for the Prudential Insurance Company and medical director of the Expressmen's Mutual Life Insurance Company; formerly secretary of the Hudson County Medical Society; Hudson County physician for the state athletic commission; served on the staffs of the Christ and St. Francis hospitals; died January 9, aged 74.

**William Turner Eatherly**, Nashville, Tenn.; University of Tennessee Medical Department, Nashville, 1888; died in a local hospital January 14, aged 82.

**D. Mal Embry**, Louisville, Ky.; University of Louisville School of Medicine, 1924; member of the American Medical Association; on the staff of St. Joseph Infirmary, where he died February 10, aged 55, of cerebral hemorrhage.

**Francis C. Evers**, Mount Vernon, N. Y.; Fordham University School of Medicine, New York, 1917; served during World War I; medical director of the New York Life Insurance Company, New York; died February 17, aged 51, of coronary thrombosis.

**Gustave Adolph Fensterer** @ Garden City, N. Y.; College of Physicians and Surgeons, New York, 1888; an Affiliate Fellow of the American Medical Association; also a pharmacist; in 1939 the Medical Society of the County of Nassau presented him with a plaque, honoring him as a founder and the first president of the society; one of the founders of the Nassau Hospital in Mineola; died February 8, aged 77.

**Frederick Hazelwood Ferguson**, Carson City, Mich.; Trinity Medical College, Toronto, Ont., Canada, 1901; member of the American Medical Association; died in the Clinton Memorial Hospital, St. Johns, February 12, aged 71, of cardiovascular renal disease.

**Leo Gerald Flannery**, Philadelphia; Jefferson Medical College of Philadelphia, 1912; member of the American Medical Association; died January 6, aged 64.

**John Edward Fleming**, Marshall, Texas; St. Louis College of Physicians and Surgeons, 1918; died in January, aged 62.

**James Franckum**, Blaine, Wash.; University of Bishop College Faculty of Medicine, Montreal, Que., Canada, 1903; member of the American Medical Association; health officer of Blaine; served as acting assistant surgeon in the U. S. Public Health Service; on the staff of St. Joseph's Hospital, Bellingham; died in Vancouver, B. C., Canada, December 12, aged 67, of coronary thrombosis.

**Samuel Friedheim**, Rock Hill, S. C.; Medical College of the State of South Carolina, Charleston, 1912; served in the medical corps of the U. S. Army during World War I; died in the York County Hospital January 12, aged 54.

**Elmer F. Fuqua**, Atlanta, Ga.; Central Medical College of St. Joseph, Mo., 1903; member of the American Medical Association; died January 6, aged 64.

**John Clarence Gable** @ Windsor, Pa.; Temple University School of Medicine, Philadelphia, 1911; served during World War I; died in the York Hospital, York, January 20, aged 61, of coronary thrombosis.

**Lawrence T. Galphin**, Fernandina, Fla.; Hospital College of Medicine, Louisville, Ky., 1901; member of the American Medical Association; died January 26, aged 73.

**William Edward Gary** @ Hopkinsville, Ky.; University of Louisville Medical Department, 1908; served as vice president and president of the Kentucky State Medical Association; at one time laboratory chief for the health department in Louisville; assistant surgeon of the U. S. Public Health Service in Louisville during World War I; formerly president of the Rotary Club and member of the chamber of commerce; on the staff of the Jennie Stuart Memorial hospital, where he died February 19, aged 62, of leukemia.

**Arthur E. Genius**, Winter Park, Fla.; the Hahnemann Medical College and Hospital, Chicago, 1892; died in New York January 20, aged 77, of leukemia.

**Edward Thomas Glover**, Portsmouth, Va.; Medical College of Virginia, Richmond, 1916; member of the American Medical Association; city coroner; assistant surgeon for the Seaboard Air Line Railway and an examining physician for Selective Service Board number 1; on the staff of the King's Daughters' Hospital, where he died January 11, aged 52, of coronary thrombosis.

**John C. Gose**, Columbia, Ky.; University of Louisville Medical Department, 1894; member of the American Medical Association; died in St. Joseph Infirmary, Louisville, February 4, aged 78, of carcinoma of the prostate, uremia and arteriosclerotic heart disease.

**Lindsey E. Grant**, Batavia, N. Y.; Medical School of Maine, Portland, 1882; formerly mayor of Somersworth, N. H.; died January 12, aged 85, of angina pectoris.

**John Francis Griffin** @ Malverne, N. Y.; Dartmouth Medical School, Hanover, N. H., 1905; specialist certified by the American Board of Urology, Inc.; member of the American Urological Association; fellow of the American College of Surgeons; attending urologist, St. Catherine's Hospital and Hospital of the Holy Family, and consulting urologist, St. Mary's Hospital, all of Brooklyn; died January 23, aged 65, of coronary occlusion.

**John Guttman**, Brooklyn; Medizinische Fakultät der Universität Wien, Vienna, Austria, 1892; formerly assistant professor of otology at the New York Post-Graduate Medical School and Hospital, Columbia University, New York; specialist certified by the American Board of Otolaryngology; member of the American Medical Association and the American Laryngological, Rhinological and Otolological Society; served as assistant surgeon on the staff of the Bellevue Hospital, New York; died December 31, aged 79.

**William Hilary Guy**, Dublin, Texas; University of Texas School of Medicine, Galveston, 1914; member of the American Medical Association; owner and medical superintendent of the Guy Hospital; died in the Methodist Hospital, Fort Worth, January 1, aged 65, of coronary occlusion.

**Peter Hagedorn**, Chicago; the Hahnemann Medical College and Hospital, Chicago, 1891; died February 15, aged 84, of cerebral embolism, arteriosclerosis and chronic myocarditis.

**William Wallace Hall** @ Watertown, N. Y.; Syracuse University College of Medicine, 1917; fellow of the American College of Physicians; on the staff of the House of the Good Samaritan; on the editorial board of the *Northern New York Medical Annual*; died January 3, aged 57, of coronary occlusion.

**Henry Baxton Hardy**, Greenbrier, Ark.; College of Physicians and Surgeons, Little Rock, 1911; member of the American Medical Association; served as a member of the House of Representatives and as state senator; on the staff of the Conway Memorial Hospital, Conway; died January 3, aged 71, of cerebral hemorrhage.

**Oaka Sheridan Hare** @ Bluefield, W. Va.; Maryland Medical College, Baltimore, 1904; served as president of the city board of health; died in a local hospital January 22, aged 64, of congestive heart disease.

**James Lewis Heffernan** @ Jellico, Tenn.; University of Louisville (Ky.) Medical Department, 1887; died in Battle Creek, Mich., January 21, aged 78, of coronary thrombosis, uremia and prostatitis.

**Walter Heinrich Otto Hoffmann** @ Chicago; Thüringische Landesuniversität Medizinische Fakultät, Jena, Thuringia, Germany, 1897; Rush Medical College, Chicago, 1915; joint author of a book on the care of babies; on the staffs of the Children's Memorial Hospital and the Presbyterian Hospital, where he died February 11, aged 72, of pneumonia and coronary occlusion.

**Clarence Floyd Holtegel**, Monticello, Ky.; University of Louisville Medical Department, 1917; served for many years in the medical corps of the U. S. Navy, receiving the presidential citation for bravery; later stationed at Louisville with the Naval Recruiting Station; formerly health officer of Johnson and Wayne counties; died January 14, aged 53, of angina pectoris.

**Levi W. Horting**, Myerstown, Pa.; Jefferson Medical College of Philadelphia, 1886; died November 21, aged 81.

**Atto C. Housh**, East St. Louis, Ill.; Missouri Medical College, St. Louis, 1899; member of the American Medical Association; served as president and for many years historian of the St. Clair County Medical Society and author of its history; member of the staffs of St. Mary's and Christian Welfare hospitals; oldest director of the Southern Illinois National Bank; died January 14, aged 71.

**Isaac M. Howard**, Ranger, Texas; Gate City Medical College, Texarkana, 1905; member of the American Medical Association; died November 12, aged 74, of coronary thrombosis.

**Charles R. Huggins**, Belleville, Ill.; Marion-Sims College of Medicine, St. Louis, 1892; at one time vice president of the St. Clair County Medical Society; member of the American Medical Association; died in St. Elizabeth's Hospital January 26, aged 82, of uremia and arteriosclerosis.

**Benjamin Franklin Hunt**, Mechanicsburg, Pa.; Baltimore Medical College, 1897; member of the American Medical Association; formerly a member of the school board of Mechanicsburg; died in the Harrisburg (Pa.) Hospital March 4, aged 78,

of burns received when his clothing became ignited from a cigar which he had been smoking when he fell asleep.

**Frank Blair Ireland**, Washburn, Ill.; Bennett Medical College, Chicago, 1898; served during World War I; died January 11, aged 73, of angina pectoris.

**William Olney Jenks**, Cleveland; University of Wooster Medical Department, Cleveland, 1874; died in the Huron Road Hospital, East Cleveland, January 9, aged 95.

**Chauncey Bentley Jones** @ Everett, Wash.; American College of Medicine and Surgery, Chicago, 1905; died December 23, aged 64, of coronary thrombosis.

**Owen Glass Jones**, Smith Mills, Ky.; Kentucky School of Medicine, Louisville, 1898; died in the Henderson Hospital, Henderson, January 12, aged 77, of heart disease.

**William Percy Jones** @ Urbanna, Va.; Medical College of Virginia, Richmond, 1898; served during World War I; died January 22, aged 68, of ruptured gastric ulcer.

**Andrew Frederick Kennedy**, Miami, Fla.; Barnes Medical College, St. Louis, 1901 and 1902; practiced in St. Louis for many years; served overseas during World War I; died in a local sanatorium January 4, aged 81, of cerebral hemorrhage and arteriosclerosis.

**Thomas Bigelow Lacey**, Glenwood, Iowa; John A. Creighton Medical College, Omaha, 1906; member of the American

Medical Association; at one time assistant professor of pathology at his alma mater; served in the Iowa National Guard and during World War I; medical superintendent of the Glenwood State School; died December 30, aged 64, of carcinoma of the gall-bladder.

**Junius Ruth**, Risor, Ark.; University of Nashville (Tenn.) Medical Department, 1910; died January 6, aged 59.

**John Henry Sterner**, North East, Md.; Hahnemann Medical College and Hospital of Philadelphia, 1910; formerly associated with the Taylor Hospital, Ridley Park, Pa.; contract surgeon for the U. S. Army at the Aberdeen Proving Ground, Md., from

LIEUT. EDWIN L. TAYLOR (MC),  
U.S.N.R., 1917-1945

July 1, 1943 to Sept. 15, 1943; died in Philadelphia December 10, aged 57, of coronary occlusion.

#### KILLED IN ACTION

**Daniel Joseph Shempa**, Boston; Middlesex University School of Medicine, Waltham, Mass., 1939; interned at St. Anne's Hospital, Fall River; commissioned a first lieutenant in the medical corps, Army of the United States, on Aug. 4, 1942; later promoted to captain; killed in action in Luzon January 19, aged 31.

**Edwin Lawrence Taylor**, York, Neb.; University of Nebraska College of Medicine, Omaha, 1942; served an internship at the Kansas City General Hospital, Kansas City, Mo.; began active duty as a lieutenant (jg) in the U. S. Naval Reserve on July 8, 1943, stationed at Faragut, Idaho; sent to the Southwest Pacific in November 1943; went first to Australia; later assigned as squadron surgeon with a group of motor torpedo boats at New Guinea, where he took part in two major invasions; served in the invasion of Leyte, where his squadron received high commendation for its part in the battle for Leyte Gulf; on Nov. 1, 1944 promoted to full lieutenant, assigned to the amphibious forces; died aboard a hospital ship in the Pacific area January 13, aged 28, of multiple wounds.

CAPT. DANIEL J. SHEMPA, M. C.,  
A. U. S., 1913-1945

# Current Medical Literature

## AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1935 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (\*) are abstracted below.

## Annals of Surgery, Philadelphia

121:1-128 (Jan.) 1945

- \*Resplitting Split Thickness Grafts with Dermatome: New Method for Increasing Yield of Limited Donor Sites. H. A. Zintel.—p. 1.
- Comparative Studies of Cancerous versus Noncancerous Breasts. F. W. Foote and F. W. Stewart.—p. 6.
- \*Curling's Ulcer in Experimental Burns. F. W. Hartman.—p. 54.
- Trans thoracic Esophagogastronomy for Carcinoma of Middle Third of Esophagus: Report of Successful Resection. D. E. Clark.—p. 65.
- Effect of Chemotherapy on Ileum Subjected to Vascular Injury. S. J. Sarnoff and J. Fine.—p. 74.
- Diverticulitis of Cecum: Method of Management. S. Frehling.—p. 83.
- Multiple Polypoid Disease of Colon and Rectum. H. L. Pugh and J. P. Nesselrod.—p. 88.
- Portal Vein Thrombosis Following Removal of Ruptured Spleen. J. A. Guis, J. D. McGovern and W. R. McMurry Jr.—p. 100.
- Roentgenologic Examination of Abdomen as Aid in Early Diagnosis of Splenic Injury. J. F. O'Neill and J. P. Rousseau.—p. 111.
- Sulfonamide Therapy in Clean Thoracoplasty Cases. E. K. Johnson, W. I. Wolff and A. V. S. Lambert.—p. 120.

**Resplitting Split Thickness Grafts.**—In order to cover a large skin defect with a relatively small amount of donor skin, Zintel used "split-split" grafts. The principle of the method is to split a Padgett skin graft into layers. The donor skin is cut as thick as possible without interfering with the regeneration of the epithelium of the donor area. In adults this depth ranges from 0.020 to 0.028 inch. In children, and when the abdomen or medial surface of the thigh is used in women, the depth of the graft is limited to between 0.012 and 0.018 inch. When the graft has been cut and the skin is still adherent to the dermatome drum the knife blade is adjusted to half the original distance from the drum. Rolling or separation of the leading edge of the skin from the dermatome is prevented by passing over the first quarter of an inch of skin before adjusting the knife blade to the proper distance for resplitting the skin. At times it is possible to cut a Padgett graft into three layers. Thus the skin from a given donor area can be used to cover an area 200 to 300 per cent as large. The individual "split-split" grafts may vary in thickness from 0.006 to 0.012 inch. The inner layer of a "split-split" thickness graft becomes completely epithelized in about the same period required for epithelization of the Padgett donor area. In 5 of 6 patients 90 to 100 per cent of the "split-split" thickness grafts remained viable. In 1 case in which an ordinary Padgett split-thickness graft was unsuccessful, "split-split" thickness grafts were also unsuccessful.

**Curling's Ulcer in Experimental Burns.**—Hartman reports experimental investigations on burns carried out at the Henry Ford Hospital for the National Research Council. Fifty animals had third degree burns of 50 to 60 per cent of the body surface dressed with petrolatum or a similar substance. Curling's ulcer was a complication in 32. Thirty animals had third degree burns of 50 to 60 per cent of the body surface dressed with tannic acid or other tanning agents. Curling's ulcer was a complication in 2. Thus ulceration of the duodenum occurred in 34 of the 80 animals, but the incidence was strikingly higher in animals treated with bland dressings, such as sterile petrolatum, than in those treated with tannic acid, ferric chloride, silver nitrate and other tanning agents. The described experiments indicate loss of plasma, autolysis with infection and acidosis as etiologic factors in Curling's ulcer. These conditions occurred in the first group of the animals, which were treated with bland dressings. In these the incidence of Curling's ulcer was 57 per cent higher than in the second group.

**Diabetes and Tuberculosis.**—Banyai and Cadden say that an analysis of the reports of ten American clinicians based on the observations of 17,358 cases of diabetes indicates a higher incidence of tuberculosis in diabetic persons than in the general population. The authors found that in tuberculous diabetic patients who were given a well planned diet and adequate amounts of insulin slight glycosuria and hyperglycemia were compatible with favorable therapeutic response as far as pulmonary tuberculosis is concerned. The results in this group of patients compare favorably with those recorded for tuberculous patients whose blood sugar was maintained on practically a normal level. Because of the frequency with which empyema complicates artificial pneumothorax in persons with predominantly exudative recent tuberculous lesions, the use of this measure is greatly limited for tuberculous diabetic patients. Observations on 115 tuberculous diabetic patients in Muirdale Sanatorium showed that the therapeutic results are less favorable than those recorded for nondiabetic patients with pulmonary tuberculosis.

**Effect of Malaria on Serologic Tests for Syphilis.**—Positive Kahn and Wassermann reactions may occur in malaria, but their incidence has been variously reported. At a large army hospital where many cases of malaria were available Rosenberg investigated which of the serologic tests gave the least proportion of falsely positive reactions and whether it was possible to distinguish malaria from syphilis on the basis of definite patterns of positivity among the different tests. The standard flocculation tests described by Kahn, Mazzini, Eagle, Hinton and Kline and the standard complement fixation test of Kolmer were employed in this study. More than 8,000 serologic tests were performed on individuals whose histories were negative for syphilitic infection. The species and stage of the life cycle of the malaria parasite, the temperature of the patient, the variety of chemotherapy and the lapse of time between the positive smear and the reversion of the serum reaction to negative were all considered. The Hinton test yielded the lowest proportion of falsely positive reactions (5.8 per cent). The standard Kahn test as employed in army laboratories gave positive reactions in 47.5 per cent of the malaria cases. The pattern of positivity in malaria, i. e. positive Kahn and Mazzini tests, doubtful Kolmer and Kline tests and negative Eagle and Hinton tests, can usually be differentiated from that of syphilis. Persistence of positive serum reactions by any test beyond six weeks, in the absence of continued evidence of malarial infection, should arouse the suspicion of syphilis.

**Angulation in Lower Third Humeral Fractures.**—Kelly and Riley report varus deformity at the fracture site in 16 of 24 unselected cases of fractures of the lower third of the humerus at Ashford General Hospital. This deformity was associated with a degree of disability in rough proportion to the amount of deformity present. The authors illustrate the mechanics of this fracture. They feel that fractures through the lower third of the humerus should be treated by immobilizing the hand and forearm in full pronation to prevent lateral bowing of the distal humeral fragment.

**Removal of Bacteria from Blood in Bacterial Endocarditis.**—Beeson and his associates studied the quantitative arterial and venous blood cultures of 6 patients with bacterial endocarditis. Blood was obtained not only from peripheral arteries and veins but also from such locations as the right auricle, the venae cavae and the hepatic and renal veins. To obtain blood from the right auricle, venae cavae and the renal

and hepatic veins the technic of right auricular catheterization developed by Cournand and his associates was used. In this procedure a special flexible radiopaque ureteral type catheter is inserted into an antecubital vein and is passed, under fluoroscopic guidance, through the veins of the arm and axilla into the superior vena cava and from there on into the right auricle. By an extension of the foregoing method specimens of blood were obtained also from the hepatic and renal veins. Paired samples were collected approximately simultaneously from two different locations in the circulatory system, and colony counts were determined. As many as 48 specimens were taken for culture during a single period of study. Colony counts were highest in arterial blood. Blood from the antecubital veins gave colony counts only slightly lower than arterial blood. In the femoral veins, on the other hand, there were appreciably fewer organisms. This difference is attributed to the type of tissues drained by the two veins. Colony counts in blood from the superior and inferior venae cavae were also lower than arterial counts, the ratio being comparable to that found in femoral vein blood. In the renal veins colony counts were only slightly below the arterial level, indicating that few organisms are removed from the blood during passage through the kidneys. The greatest reduction in bacterial content was found in hepatic vein blood. In 3 of the 6 subjects this reduction amounted to more than 95 per cent, and in all subjects the difference was great. Mixed venous blood in the right auricle of the heart gave colony counts which were usually a half to two thirds as high as in corresponding samples of arterial blood. The bacterial content of arterial blood showed a remarkable constancy during periods of one or two hours. Despite the fact that a considerable portion of the bacteria which leave the heart in arterial blood appear to be removed during a single circuit of the body, the number of bacteria in successive samples of arterial blood shows little change. This indicates that in bacterial endocarditis organisms are discharged into the blood from the endocardial vegetations at a comparatively even rate.

**Penicillin in Leptospiral Infections in Guinea Pigs.**—Alston and Broom found that nine strains of *Leptospira icterohemorrhagiae*, the causative organism of Weil's disease, and one of *Leptospira canicola*, the cause of another form of leptospiral infection of men and dogs, were sensitive to penicillin, which has a lethal as well as an inhibitory effect on multiplication. Penicillin has a curative action on leptospiral infections in guinea pigs, provided administration is begun very soon after infection. The action of penicillin does not prevent the development in guinea pigs of serum antibodies or resistance to reinfection. Toxic action of penicillin in guinea pigs, which has been reported by others, was looked for but not found.

**Weil's Disease Treated with Penicillin.**—A man aged 26 was at first diagnosed as having pneumonia and was treated with sulfamerazine, which did not effect improvement. Later the patient became jaundiced. *Leptospira icterohemorrhagiae* was not detected in the urine until the twenty-second day. Penicillin therapy was begun several days later and this resulted in rapid disappearance of the organisms, but recovery was not hastened. Hart suggests that in a case in which recovery is already taking place spontaneously this might be anticipated, since obviously the damaged liver will take some time to resolve. The value of penicillin treatment at this stage might be to render the patient free from the risk of infecting others earlier than might otherwise be the case and in preventing a relapse—sometimes spoken of as "after-fever," which occurs in from 25 to 40 per cent of cases during the convalescent period.

**Nutrition and Diet in Wartime.**—Davidson reviews the British government's wartime nutritional policy, the scientific basis on which it was developed and the effects produced on the nation's health. He shows that the more fortunate members of society have had their intake of many of the essential nutrients reduced as a result of the war, but the evidence adduced regarding national health shows that these reductions have done no material harm. In the small proportion of people who con-

sistently ate and drank too much there has probably been an actual improvement in health. Improved economic circumstances, the more even distribution of essential foodstuffs brought about by rationing, the introduction of national flour and the fortification of certain foodstuffs have certainly prevented further deterioration in the diet of the less fortunate section of the population, who before the war could not afford an adequate diet and in certain categories, at least, have led to improvement. Millions of young men and women have spent several critical years of their lives in the armed forces, during which they enjoyed the benefits of fresh air, physical exercise and adequate nutrition to an extent which would have been available to few in their peacetime occupations. The success of the government's wartime food policy can be attributed largely to the sound scientific basis on which it was founded.

**Cancellous Chip Bone Grafts.**—It became necessary to replace part of the frontal bone of a child aged 11. A section of cancellous tissue from the ilium was cut into fragments and inserted through a small incision in the frontal region to fill the cranial defect. The bone chips were applied so that they overlapped both the exposed bony margins of the defect and each other. No endeavor was made to produce a continuous surface, but care was taken to create a smooth contour. The chips were arranged in at least two layers, those in the outer layer covering the gaps between the chip in the lower layer. The wound was closed without drainage, and in ten days the whole mass was clinically sound and firmly united with the cranium. Over a period of months no absorption was seen; in fact, the condition now is indistinguishable from that seen at the time of discharge over three years ago. This experience completely altered the outlook in the technic of bone grafting and from that time on Mowlem has applied the principle of fragmentation of cancellous bone to other areas. The ilium is exposed, and its crest and outer plate are freed from their muscular and aponeurotic attachments. A block of bone of sufficient bulk is then removed with an osteotome, and its cortical covering is discarded. The remaining cancellous mass is divided into chips of various sizes, usually about 1 by 0.5 by 0.2 cm. Seventy-five cases of cancellous chip grafting for the restoration of contour and of continuity in fractures of facial and cranial bones, mandible and tibia are reported. All have been successful.

**Problems of Diphtheria.**—Kollath states that several problems in the control of diphtheria remain to be solved because, while Behring's serum has reduced the case mortality, it has not prevented recurrences of epidemics. Diphtheria in Germany has shown an alarming rise since 1940. There is, however, no definite change in mortality. There is probably no increase in the virulence, but modes of infection have probably changed. In vitro experiments revealed that the effect of the sulfonamides on the bacilli varies with the type of the bacilli. The bacilli may differ with regard to their lack of p-aminobenzoic acid. Acetyl sulfanilamide in higher concentration is apparently effective in severe and moderate as well as in the mild types of diphtheria. Anaerobic strains were found in 4 cases of malignant diphtheria within the first four days of the disease. Aerobic bacilli capable of toxin formation appeared on the fifth day and serum administration proved ineffective. The anaerobic strains may form a different type of toxin against which the typical antitoxin is ineffective. Sulfonamides seem to be indicated in cases of malignant diphtheria, since in anaerobic infections these drugs have proved to be effective. The value of active immunization was demonstrated by a reduction in the incidence of severe and moderate cases to from one third to one fifth of the previous incidence. The mortality likewise was reduced. The reaction to the Schick test may be influenced by exhaustion from prolonged marching, lack of sleep, excitement and other psychic causes, which may change a negative reaction to a positive one. The Schick negative carrier may suddenly become sick. Susceptibility to diphtheria bacilli should be differentiated from susceptibility of the infected person to the toxin. The number of carriers cannot be reduced by active immunization; it is likely to be increased by it. One third of the population of a large city may be considered to be carriers. Ninety per cent of the school children proved to be carriers in a class in which several cases of diphtheria occurred. A study of the source of infection demonstrated that healthy carriers were responsible for 97 per cent of the cases of diphtheria in Berlin and for 90 per cent of the cases in Vienna. The carrier therefore is considered to be the most important danger focus. Diet probably does not play an important part in the susceptibility, but experience with a diet deficient in vitamin C suggests that it may affect the susceptibility to the toxin.

**Diphtheria Necropsies.**—Fischer reports 123 postmortem cases of diphtheria. The age distribution was as follows: 45 per cent of the cases since 1940 were in the group up to 5 years of age, as compared to 30 per cent prior to 1940; 34 per cent of the cases since 1940 were in the age groups between 5 and 15 years, as compared to 64 per cent prior to 1940; 21 per cent of the cases since 1940 were in the group over 15 years of age, as compared to 6 per cent prior to 1940. In 1943 there were 30 per cent of cases in the group over 15 years of age, with a great number of persons over 50 years of age and with 4 persons over 60 years. The classic picture of diphtheria with extensive patches deep into the bronchi was well defined in these adults. Twenty-five per cent less women than men were affected both after 1940 and prior to 1940. The majority of deaths occurred in fall and winter after a duration of the disease of from five to seven days and not seldom after three to four days. Tracheotomy was performed in 25 of the patients, mostly in children under 5 years of age. Characteristic cardiac lesions were present in 17 of these 25 cases. Such lesions were absent in 13 of the total of 123 cases. Interstitial myocarditis was demonstrated in 79; myocarditis was associated with myolysis or fatty degeneration in many. Eleven cases presented myolysis and fatty degeneration in the absence of myocarditis, and the duration of the disease in these cases was from three to five

days. Usually the spleen was enlarged and prominence of the follicles was typical. Cases with so-called status lymphaticus and with hyperplasia of the thymus were rare. Hyaline degeneration of the epithelium of the main portions of the kidneys, except the glomeruli, was demonstrated on microscopic examination. Hemorrhagic lymphadenitis of the cervical nodes occurred in an unusually large number of cases. Small hemorrhages in the mucosa of the stomach and of the intestine were observed in a few. Changes in the spleen may clarify the diagnosis in cases with incomplete history in which a sudden death was caused by a myocardial lesion. That applies to some of the war casualties in the army. The classic clinical and anatomic picture of diphtheria may be caused by streptococci in the absence of diphtheria bacilli, and the streptococcus may even be the causative agent in carriers of diphtheria bacilli. During the last fifteen years the death ratio from diphtheria amounted to from 4 to 5 per cent, not only in Germany but likewise in Switzerland and in the Netherlands. This big reduction in the fatality is considered to be the result of serum therapy, although not all the toxic substances of the causative agent are neutralized by the serum. That applies particularly to the toxic substance, which causes paralysis and which may likewise be responsible for myocardial lesions. Not a single child that had previously been vaccinated against diphtheria was found among these necropsies.

**Hunger and Pain Brought on by Ingestion of Epinephrine.**—Brun produced dyspeptic symptoms of varying intensity three to eight minutes after ingestion of 2 mg. of epinephrine in 4 cc. of 35 per cent alcohol in 6 persons with achylia refractory to histamine. Vomiting occurred in 2 and excessive hunger in 1. A single dose of 3 mg. of epinephrine in 6 cc. of 35 per cent alcohol or one repeated three times produced either hunger or cardialgia or both in 18 of 20 healthy persons. Four of the subjects grew so hungry that they did not remember ever having felt similar hunger before. Ingestion of 5 cc. of nupercaine with 25 cc. of water before the administration of epinephrine or ingestion of epinephrine in a 1 per cent solution of nupercaine hydrochloride did not prevent the symptoms. As an explanation of the mechanism it is suggested that epinephrine causes constriction of the blood vessels of the mucosa, which is followed by dilatation and an increase in the amplitude of these vessels. This stimulates the sensitive end organs in and about the arterial walls and this is felt as hunger or pain. To explain the fact that this sensation of hunger may be produced in some persons but not in others, it is suggested that a closely adjusted nervous regulation in the latter prevents the constriction of the capillaries. The hunger contractions increase the sympathetic tonus, reduce the vagus tonus or both. In some cases sensations of discomfort following ingestion of epinephrine recurred several hours later, just as the symptoms now and then persisted beyond the time in which the effect of the epinephrine might be supposed to assert itself. The dyspeptic symptoms induced by the epinephrine probably involved a more protracted disturbance by reflex action in the tonus of the gastric vessels. In three of the experiments the subject smoked a cigaret after epinephrine had been twice administered. The pronounced giddiness taking place in 2 of the subjects, 1 of whom presented signs of a mild collapse, would seem to indicate that the gastric symptoms had reduced the tolerance for tobacco.

## Book Notices

**Arthritis and Allied Conditions.** By Bernard I. Comroe, A.B., M.D., F.A.C.P., Associate in Medicine, University of Pennsylvania, Philadelphia. Third edition. Cloth. Price, \$12. Pp. 1,359, with 329 illustrations. Philadelphia: Lea & Febiger, 1944.

The author's purpose is to present to the general practitioner the essential points in the diagnosis, differential diagnosis and treatment of arthritis and allied conditions. In this edition he has added thirteen chapters including 100 new illustrations. Almost every page has been revised in order to present the latest information on the subject. New chapters have been added on penicillin, psychogenic factors in rheumatic diseases, rheumatic manifestations of tropical diseases, recent advances in arthritis and allied conditions, and common mistakes in arthritis and allied conditions. Summaries have been boxed, so that they are easily available for persons with limited time for reading. Diagnostic features and therapy have been written primarily for the general practitioner, so that he can diagnose and care for his patients with arthritis. The sections on gold therapy, sulfonamides and penicillin include important recent developments in these fields. One feature of this edition is the chapter that presents a diagnostic digest of the arthritis problem. The sections on orthopedic care, roentgen diagnosis and therapy and physical therapy have been expanded.

The subjects of rheumatoid arthritis and degenerative joint disease are discussed in detail. In controversial subjects, such as massive doses of vitamin D, gold therapy and roentgen therapy, authoritative opinions have been summarized. The value of occupational therapy, physical therapy, massage, exercises, transfusions, diet, endocrine products, climate, psychogenic factors, iontophoresis, removal of focal infections and such therapy as chaulmoogra oil, sulfur, bee venom, snake venom, foreign protein therapy, fever therapy and vaccines are discussed in detail. Chapters are also included on specific infectious forms of arthritis such as gonococcal, pneumococcal, tuberculous, syphilitic and other specific forms of arthritis, as well as important details on rheumatic fever, spondylitis, fibrositis, gout, intermittent hydrarthrosis, traumatic arthritis and other conditions. The causes and treatment of painful shoulder, bursitis, painful feet and backache are discussed. Herniated intervertebral disks and other causes of sciatic pain are presented. A section is included on the organization of an arthritis clinic and on typical case summaries, as well as on tumors of joints and related structures. The chapter on penicillin presents the details of therapy, diseases amenable to therapy, dosage, mode of administration and complications. The chapter on sulfonamides brings this subject up to date. There is a chapter on recent advances in arthritis and allied conditions and another on mistakes in the diagnosis and handling of arthritic patients. The publishers use a larger page, which makes possible the expansion of the text by approximately 15 per cent without increasing the size of the volume. The book has many excellent features. It is clearly written. It presents the author's point of view based on a large experience. It is a valuable addition to the library of any physician, who undoubtedly will find himself using it more and more.

**Vital Statistics and Public Health Work in the Tropics.** By P. Granville Edge. Foreword by Major Greenwood, D.Sc., F.R.C.P., F.R.S., Acting Dean and Professor of Epidemiology and Vital Statistics, London School of Hygiene and Tropical Medicine, University of London. Cloth. Price, \$5. Pp. 188. Baltimore: William Wood & Company, 1944.

This little volume is packed full of valuable practical information for the physician and sanitarian in tropical countries. It is not a mathematical treatise with involved formulas which only an expert biometrician can utilize but an introduction to "human bookkeeping," with innumerable illustrations showing the pitfalls in the collection and interpretation of statistical data. In each of the fifteen chapters there is a straightforward statement of what the author is endeavoring to present, followed by detailed examples. Time and again reference is made to the pioneer worker in British vital statistics, the haberdasher John Graunt (1620-1674), and to the first interpreter of registration data of England and Wales, Dr. William Farr (1807-1883). The author shows how census and medical statistics differ in

their purpose and states the minimum requirements for the collection of crude statistics on population, marriage, births and deaths. He indicates, however, that these are not sufficient for the control of disease, which depends first of all on a knowledge of the kinds and amounts of disease in a particular population and the methods of propagation and of control. In tropical countries, primarily populated with primitive tribes of diverse social and religious cults, where there are relatively few skilled physicians, the problem of collecting accurate crude data is much more complex than in more advanced civilizations.

The extensive experience of the author in interpreting vital statistics throughout the vast colonial possessions of the British Empire gives the reader confidence in the presentation. The fluid style, free of technical detail, makes the little volume easy to read. The ample footnotes and extensive bibliography add much to its usefulness. It is clearly printed, almost wholly free of typographic errors and suffers from only one minor fault, namely the frequent use of the split infinitive.

**El enfisema pulmonar: Estudio clínico, radiológico y terapéutico.** Por los doctores Egido S. Mazzel, profesor adjunto de clínica médica de la Facultad de medicina de La Plata, y Jorge M. Remolar. Trabajo laureado por la Facultad de medicina de Buenos Aires. Premio "Luis Agote," al mejor trabajo de clínica médica del biénio 1940-1941. New edition. Cloth. Pp. 259, with 50 illustrations. Buenos Aires: Librería Hachette S. A., Palacio del Libro, [1943].

The "Luis Agote" prize is given by the Faculty of Medicine of Buenos Aires to the authors of the best work on clinical medicine during a two year period. The authors of this monograph won the prize for their work carried on during the two years 1940 and 1941, which is summarized in this book. The monograph is the result of observations carried on by the authors in two clinics for diseases of the respiratory tract in Buenos Aires. The fifteen chapters include the clinical significance, pathologic anatomy, pathogenesis, clinical symptoms, diagnosis, course, roentgenologic aspects, prognosis and medical therapy of the various clinical forms of either obstructive (bronchogenous) or postural (thoracogenous) pulmonary emphysema either simple or complicated by respiratory, cardiovascular and nervous diseases. Gigantic-bleb emphysema is regarded as an advanced phase of obstructive pulmonary emphysema. Senile emphysema is regarded as an acute form of thoracogenous pulmonary emphysema. The book is completed by thirty-three pages of bibliography and an index of authors mentioned in the bibliography.

**A Pathology of the Eye.** By Eugene Wolff, M.B., B.S., F.R.C.S., Ophthalmic Surgeon, Royal Northern Hospital, London. Second edition. Cloth. Price, £2 2s. Pp. 285, with 211 illustrations. London: H. K. Lewis & Co., Ltd., 1944.

Ten years ago the first edition of this practical little book was published, originating from the lectures and demonstrations given by the author in his capacity as pathologist to the Royal Westminster Ophthalmic Hospital. In the preface to the first edition Wolff emphasizes that it was intended as an introduction to the subject, stressing those portions of pathology which have a direct clinical bearing. In this edition he states that he has curtailed the clinical side and given more attention to morbid histology. Although few of the illustrations are in color, they nevertheless convey excellently the various tissues and cells. Many of the illustrations are those of the author which have appeared in his other works, and not a few are taken from the textbooks of Fuchs, with whom Wolff spent much time. Perhaps the characteristic feature of the book is the short, concise and succinct descriptions of the pathologic lesions. The format is excellent. No ophthalmologist can afford to be without this most desirable work. An ample bibliography and index complete the volume.

**The Art of Anaesthesia.** By Paluel J. Flagg, M.D., Visiting Anaesthetist to Manhattan Eye and Ear Hospital, New York. Seventh edition. Fabrikoid. Price, \$6. Pp. 519, with 166 illustrations. Philadelphia, London & Montreal: J. B. Lippincott Company, 1944.

In this edition of Dr. Flagg's book several new subjects are considered. Anesthesia by refrigeration is described. A consideration of the hazard of fire in the operating room, of continuous spinal and of caudal anesthesia is included. A brief discussion of a few physiologic matters is new. More than twenty-five references have been added.

**Interns Handbook: A Guide, Especially in Emergencies, for the Intern and the Physician in General Practice.** By Members of the Faculty of the College of Medicine, Syracuse University, under the direction of M. S. Dooley, A.B., M.D. (Professor of Pharmacology) and Maynard E. Holmes, M.D., F.A.C.P. (Professor of Clinical Medicine), Co-Chairmen, Publication Committee. Third edition. Fabrikoid. Price, \$3. Pp. 579. Philadelphia, London & Montreal: J. B. Lippincott Company, 1944.

This handbook serves as a convenient guide to the intern staff, particularly in relation to emergencies and general diagnostic and therapeutic procedures commonly encountered in hospital practice. It is organized in five parts which concern hospital relationships, laboratory services, medicine, surgery, therapeutic agencies and procedures. In the first part the intern is guided in his relationship to the hospital, the public and the medical staff. Medical social service functions are included, and also the subject of medical jurisprudence as it relates directly to the intern service. Laboratory and x-ray procedures are described in section two. These include bacteriologic examinations, blood chemistry studies, clinical pathology and directions regarding tissue pathology, necropsies and roentgenologic methods.

Part three, which is devoted to medical subjects, presents first an unusually detailed history and physical examination outline which would seem to be designed primarily for the needs of medical students. Various chest conditions are then described, cardiovascular disturbances, coma, acute abdominal conditions, fever, allergy, endocrine disturbances and therapy, neurologic disorders and technics, care of psychiatric patients, infectious diseases and metabolic disturbances. Helpful directions are also given with reference to dermatology and the treatment of children. Minor surgery, anesthesia, preoperative and post-operative care and various procedures relating to obstetrics, gynecology, eye, ear, nose and throat, proctology and urology are included in part four. The last section deals with diet therapy, vitamins, fluid balance, the use of blood and blood fractions, drug therapy, biologic products, sulfonamides, penicillin, emergency treatment of acute poisoning and resuscitation.

The present edition has been revised to keep abreast of modern medical technics and procedures. Both interns and resident physicians will find this handbook a useful and convenient source of information and reference.

**The Sick African: A Clinical Study.** By M. Gelfand, M.B., Ch.B., M.R.C.P., Medical Officer, Salisbury Native Hospital, Salisbury, Southern Rhodesia. With a foreword by Colonel A. P. Martin, O.B.E., M.D., D.P.H., Director of Medical Services, Chief Health Officer and Medical Director of Southern Rhodesia. Cloth. Price, 25s. Pp. 373, with 123 illustrations. Cape Town: Post-Graduate Press in Association with Stewart Printing Co. (Pty.), Ltd., 1944.

The author has done a much needed piece of work. He has chosen a theme on which volumes could be written, the field is a continent and the subjects covered are vast. It requires much skill to keep such a treatise simple and practical. He shows a thorough knowledge of African life and peoples gained through years of experience. The title "The Sick African" is a fortunate one, for it tells the whole story. In a comparatively small space the author gives a vast amount of practical information. As stated by the publishers, it should meet a very definite need not only for the busy medical practitioner but also for Sisters, missionaries and native medical assistants. Here should be added public health workers, school teachers and other auxiliary services, and especially those in out of the way places.

Chapter I, on the patient, gives a practical background of this "sick African" that we, with our superior European complex, are apt to minimize. The full recognition of the differences between the primitive African and the one already touched and dislocated by the onrush of our European commercialism and civilization is very important. The author states that only one in ten European doctors ever learn the language of those he works with and that this is a great handicap. We agree. He might have mentioned that in numerous parts of Africa hundreds of missionary doctors and nurses and lay workers do learn the real language well and thus have an enormous influence and are able to train hundreds of native assistants so essential to the present and especially to the future of the work. Examples of such work are the famous McCord Zulu Hospital in Durban, the hospitals and medical training center of the Church Missionary Society at Kampala and the medical center

of the United Presbyterians at Assiut, Egypt. Many others equally fine could be mentioned.

As one reads the chapter on nutritional disorders one realizes that these existing medical conditions are inseparably tied up with living conditions, lack of intelligence, customs, superstitions, poor food, water and housing and absence of all sense of sanitation and hygiene, so the problem of the individual is finally that of his social surroundings and economic status. His salvation depends on his opportunities to escape these unfavorable conditions. The author gives some credit to Christianity as changing and improving these conditions. In this he is certainly correct.

The statement that there are likely three quarters of a million cases of leprosy in Africa would not readily be accepted by all authorities. It is anybody's guess. The author gives the impression that much of leprosy is being taken care of in institutions. This may be true in South Africa but it is not in the other areas of Africa. One retains the idea that leprosy is not such an important disease; yet the author illustrates his work with twenty-seven (mostly full page) pictures of persons with leprosy. Leprosy, like all the diseases and other predisposing elements, is an integral part of the problem of "the sick African" that the author so ably discusses. This book should be made available in other languages also.

We agree that the key lies in the further preparation and training of thousands of earnest, reliable African doctors, nurses, assistants, public health workers, dietitians, sanitarians, agriculturists and practical helpers.

**Outline of the Amino Acids and Proteins.** Edited by Melville Saltyun, M.A., Ph.D., Vice President and Director of Research, Frederick Stearns and Company, Detroit. Cloth. Price, \$4. Pp. 251, with illustrations. New York: Reinhold Publishing Corporation, 1944.

The study of the reactions and properties of amino acids and proteins is finding wide and fruitful application in medicine as well as in practically all branches of biology and even in industry. For this reason any book which attempts to give the reader a clear and accurate picture of the present state of our knowledge of these substances is valuable. The purpose of this book is to "outline in a simple and readable manner the essentials of the chemistry and biochemistry of amino acids and proteins." It contains twelve chapters, which cover the whole field of protein chemistry from the discovery of the amino acids to protein structure, methods of analysis for amino acids and proteins, metabolism of amino acids and proteins, and amino acids and proteins in nutrition. There is also an appendix listing United States patents issued on amino acids and related organic compounds. Each chapter was written by an authority in that division of the subject and includes an extensive bibliography listing numerous papers in that field. As is to be expected from a comparison of the great complexity of the subject and the size of this book, there are many important aspects of protein chemistry which are either discussed briefly or omitted entirely. On the whole, however, the book does give the reader a satisfactory insight into modern protein chemistry. It should be found useful and interesting not only by those readers who wish to obtain a broad view of the whole field of amino acids and proteins but also by those who wish to acquire the necessary background for intensive study of more comprehensive works in this difficult and fascinating field.

**The Radiology of Bones and Joints.** By James F. Brailsford, M.D., Ph.D., F.R.C.P., Hunterian Professor, Royal College of Surgeons, England, 1943-4. Third edition. Cloth. Price, \$12. Pp. 410, with 404 illustrations. Baltimore: William Wood & Company, 1944.

The mode of presentation of the bone structures from birth through the developmental periods to adult life is well done. The descriptive manner in which all of these different subjects are handled is worthy of comment. The tracings of x-ray films and the reproductions of x-ray films of descriptive character are good and the author should be commended for the numerous illustrations of the different pathologic processes which he has depicted. The footnotes of the different illustrations are enlightening; the verbal descriptions of the pathologic processes are complete and interesting. The numerous references to other authors show extensive study of the literature. The book is recommended for use by those interested in bone and joint diseases both in the x-ray and in other medical fields.

## Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

### WATER DRINKING DURING STRENUOUS EXERTION

**To the Editor:**—In strenuous athletic contests, particularly basketball, coaches insist that the players should not drink water. What is the effect of drinking water, if any, on the players' efficiency? If detrimental, what is the physiologic explanation? C. J. Meredith, M.D., Valley City, N. D.

**ANSWER.**—This edict by the athletic coaches has some physiologic basis, but as stated it is too absolute since it ignores the quantity of water that may be imbibed. These are the facts: 1. The great nervous tension in the athlete for a period preceding the contest and the great physical exertion during the contest induce profuse sweating and consequent thirst. These conditions also disturb the normal motility of the stomach. There is decreased gastric motility, at times also increased tonus of the pylorus. A large quantity of water (300 to 800 cc.) taken under these conditions will stay longer in the stomach and through pressure caused by the tension of the abdominal muscles may impair the movements of the diaphragm and the heart. 2. There are reports that such large quantities of water (500 to 1,000 cc.) by mouth, followed at once by extreme and prolonged physical exertion, may induce temporary oliguria or anuria, body hydration and some of the symptoms of water intoxication (Hildebrandt and others, *Am. J. Physiol.* 116:168, 1936). There is other evidence of more severe renal injury from extreme and prolonged physical exertion, especially in persons not trained for such contests. 3. The edict of the athletic coach that even a mouthful of water, permitted to moisten the mouth just before or during athletic contests, must not be swallowed is not based on reliable evidence; negligible damage to or impairment of the individual from such small quantities of water is to be expected. Such a ruling is a tradition; perhaps it is easier to enforce or observe total prohibition than strict moderation.

### STRETCHING AND RELIEF FROM MUSCULAR CRAMPS

**To the Editor:**—For many years I have suffered occasional painful cramps in the calf muscles following stretching in bed. These cramps disappear spontaneously in fifteen to thirty seconds and relief does not appear to be hastened by massage. Accidentally I discovered that forceful dorsal flexion of the foot would stop this spasm within a few seconds and also that the spasm could be avoided if this position of the foot was assumed before stretching. Similar observations have been made by several of my acquaintances. Would this procedure prove effective in cramps of the calf muscle which occur while swimming?

Lieutenant Colonel, M. C., A. U. S.

**ANSWER.**—The observation that the stretching of a muscle relieves muscular cramps appears to be sound. The mechanism of the relief, however, is not completely understood. When the muscle is stretched a large volley of afferent impulses is thrown into the central nervous system, and such a maneuver may result in a stretch reflex with a twitching of the muscle. If one assumes that the pain of a muscle cramp is due to an abnormal stimulation of the pain endings of the sensory nerves on the basis either of a mechanical or of a vascular factor, it is a common clinical observation that the muscle thrown into action by stretching will eliminate the sensory phenomena. One would believe, therefore, that stretching of cramped calf muscles while swimming, could this maneuver be effected, would tend to make the cramp disappear.

The American Red Cross, in connection with its water safety instruction, has employed the following teaching for some years: "If a person is seized with a cramp in the calf of the leg while swimming in deep water, he is instructed to fill the lungs with air, immerse the face and, while floating just beneath the surface, to flex the foot, stretch the muscles, and knead them gently with both hands." According to Mr. Carroll L. Bryant, assistant administrator of first aid, Water Safety and Accident Prevention of the American Red Cross, "a cramp in the calf of the leg in swimming is considered a spastic contraction of a portion of the muscle fibers in the gastrocnemius, due to fatigue combined with chilling. The pain is believed to be caused by the violence of the contraction and the imbalance of the shortening of the muscle fibers only. Although there is no scientific proof, it is believed that the pain is induced wholly mechanically."

### MASSIVE PLASMA TRANSFUSIONS

**To the Editor:**—In this war area patients with severe burns are treated by administration of pooled plasma, morphine and dressings of white petrolatum. We attempt to maintain a nearly normal hematocrit by administration of large volumes of pooled plasma. Generally the results are unsatisfactory in burns of over 50 per cent. Recently we treated 2 patients with severe burns of about 75 per cent. One received 2,700 cc. of plasma in the first eight hours, after which the hematocrit was 59 per cent; after he had received 7,800 cc. of plasma in forty-eight hours the hematocrit was 45 per cent. This man recovered; his blood was type O. The second patient, who was type A, received 4,800 cc. of plasma in the first eight hours, after which the hematocrit was 66 per cent. A total volume of 9,000 cc. of plasma was administered to this patient before he died, twenty-three hours after being burned. He took fluids well by mouth until stupor, coma and shock developed. Eight hours after being burned he received 1,000 cc. of isotonic solution of sodium chloride. In the reading material available there is a scarcity of the latest publications. It is assumed that pooled plasma is harmless. Our observations using our limited laboratory facilities indicate that the volume of plasma that may be given to types A, B and AB is small; we studied dilutions of pooled plasma in typed plasmas and the effect on cells. Our estimate is that 1,500 cc. of pooled plasma is the maximum safe volume for all blood types except for type O. Various factors are involved: the circulating plasma is replaced to an undetermined degree from the tissues (this hypothesis would tend to increase the amount of pooled plasma safe to administer); the burned patient loses most of his own plasma in the first few hours after a burn (this theory would decrease the amount of pooled plasma safe to administer). Other factors involved are changes in the blood which cause considerable increase in sedimentation time and in coagulation time. It seems possible that these factors would decrease the safe volume of pooled plasma that may be given. Is pooled plasma in unlimited amounts a safe treatment of burns? Do not large volumes of plasma inevitably agglutinate the patient's cells?

Captain, M. C., A. U. S.

**ANSWER.**—When massive plasma transfusions are given, certain problems arise which do not exist in the case of small plasma transfusions.

1. Theoretically, the cumulative effect of incompatible isoagglutinins could injure the erythrocytes of patients not belonging to group O, as discussed in the query. However, it must be emphasized that this is only a theoretical danger, because no evidence has been published that this has ever occurred in an actual case. If hemolysis occurs, jaundice should result; but no mention is made in the inquiry that the group A patient who died was icteric. Moreover, before death this patient's hematocrit was high, which would hardly be possible if extensive hemolysis had occurred. Finally, it should be mentioned that while test tube agglutination usually means incompatibility, the correlation between in vitro and in vivo reactions is not absolute. Thus weak, irregular isoagglutinins may cause cross agglutination of bloods of subgroups A<sub>1</sub> and A<sub>2</sub>, yet if such apparently incompatible blood is transfused little or no untoward reaction results. On the other hand, in vitro tests may show apparently perfect compatibility, and yet the transfusion may be followed by a severe or fatal reaction because of Rh incompatibility.

2. In massive transfusions of citrated blood or plasma it has been held that the toxic effect of the large dose of citrate may seriously injure the patient. In practice, however, this apparent danger has not materialized, apparently because the citrate ion is rapidly oxidized and eliminated by the body, so that citrate is not a cumulative poison. The theoretical dangers from incompatible isoagglutinins and citrate can both be obviated by the use in massive transfusions of purified plasma albumin prepared by the method of E. J. Cohn and his associates.

3. The only proved danger from massive plasma transfusions is from circulatory embarrassment. A number of such cases with death from pulmonary edema have been described in the literature, following massive or too rapid infusions of saline solution, blood, plasma or purified plasma albumin.

### BLOOD GROUP O AS A "UNIVERSAL DONOR"

**To the Editor:**—May blood group O be given with safety to those having the other blood groups, provided cross matching shows no agglutination on either side? Some good hospitals make a regular practice of selecting their donors for any blood group from blood group O, provided the blood cross matches. I have found considerable difference of opinion, mostly among surgeons, as to the use of donors having blood group O as universal donors. I would appreciate comments on this subject. M.D., Georgia.

**ANSWER.**—The use of universal donors, those having blood group O, is widespread. Such donors may be used in emergency transfusions as a time saving measure or if bank blood or a donor of the other groups, A, B and AB, is not available. The use of universal blood, group O, is considered fairly safe, provided the following precautions are taken, as in all transfusions: 1. Identification of the O donor by means of high titered serums (group A and group B). 2. Rh grouping of female patients who are pregnant or who have a history

of previous miscarriages and of all patients who are receiving massive or periodic transfusions. 3. Compatibility testing between serum of patient and cells of the blood donor. 4. Slow introduction of the blood (drip method). According to reports from medical centers where large numbers of transfusions are given, very few hemolytic reactions have so far been reported. The cause of such a reaction, which may prove fatal, is believed by Hesse to be due to high titer of the agglutinins in the group O blood. However, Rosenthal and Vogel have used universal blood of high titer without any reaction. Since hemolytic reactions are no greater in number, and possibly less than those that have been reported from transfusions of the same group, the Rh factor may possibly be responsible for the hemolytic reactions.

At the present time the practice in large hospitals is to use donors of the same group and to check the blood by cross matching. However, blood of group O may be safely used in emergency or when a donor or bank blood of the same group is not available.

### STERILIZATION BY SECTION OF OVIDUCTS— ELECTIVE STERILIZATION

To the Editor:—When it is necessary to sacrifice parts of the oviducts and the ovaries, and sterilization is effected, is it usually regarded as better practice to remove the uterus also? Would removal of the uterus lessen the incidence of cancer of the cervix? Would this procedure have any other advantages for the future when undertaken before the menopause? I am perfectly clear on the universal aim to conserve ovarian tissue wherever and whenever possible. Can a woman be expected to get along as well with the uterus removed, if some ovarian tissue is left, as with the uterus left intact, in the late second and in the third and fourth decades of life? Is it the general practice to allow a woman and her husband to elect whether she may be sterilized or not when abdominal or pelvic surgery is undertaken? Can the choice of a man and wife be considered as the sole indication for sterilization of the woman?

M.D., Virginia.

ANSWER.—When sterilization is effected by section of the oviducts, the uterus should not be removed unless it is diseased. Complete hysterectomy, that is removal of the cervix as well as the body of the uterus, would, of course, eliminate the possibility of future cancer of the cervix, but this advantage is more than offset by certain drawbacks: 1. This radical procedure converts a relatively simple operation into a serious one, and, in any extended series, complete hysterectomy would carry with it a higher immediate mortality than simple oviductal section. 2. Hysterectomy frequently injures the blood supply to the ovaries, so that an artificial menopause is inadvertently produced. Statistics indicate that hysterectomy, even with conservation of both ovaries, is followed by menopausal symptoms in at least 40 per cent of cases (Dippel, A. L.: The Role of Hysterectomy in the Production of Menopausal Symptoms, *Am. J. Obst. & Gynec.* 37:111 [Jan.] 1939).

It is not accepted practice to allow a woman and her husband to elect sterilization when abdominal or pelvic surgery is undertaken unless some clearcut medical indication exists.

### ADENOMA OF THYROID

To the Editor:—What is the recommended treatment of small asymptomatic adenomas of the thyroid in young people (20 to 40 years) who have normal basal metabolic rates? Should they be removed because of the possibility of malignancy or should they be left undisturbed unless causing symptoms or growing rapidly?

M.D., Michigan.

ANSWER.—When a good surgeon is available who has had an extensive experience in surgery of the thyroid, it is probably wise to have adenomas of the thyroid removed routinely; under these circumstances it is probably fair to say that the risk of surgery is less than the risk involved in letting the adenoma or adenomas remain in the neck. Recent figures indicate that the incidence of malignant degeneration in adenomas of the thyroid may be higher than has been suspected in the past. The criteria for malignancy, of course, vary somewhat from clinic to clinic. If surgeons are not available who have had an extensive experience in the field of thyroid surgery, the incidence of complications and the mortality may be high enough so that the risk involved in the routine removal of adenomas of the thyroid is greater than the risk involved in waiting to see whether or not carcinoma or thyrotoxicosis will develop.

### BONE MARROW INFUSIONS IN PEDIATRICS

To the Editor:—To what extent may intramedullary (bone marrow) infusions be used in pediatrics? Is there any limit as to the frequency of infusion into one particular area such as the sternum or the tibia? Would you kindly discuss these two questions and also the problem of bone marrow versus intravenous infusion (as to volume) in pediatrics. Are there any real dangers involved in the practice?

Charles Varga, M.D., Jersey City, N. J.

ANSWER.—The principal indication for use of the intramedullary route is when intravenous infusions or injections are needed and the peripheral veins are not available. This is sometimes the situation in infants and young children. The method should not be resorted to unless the indication mentioned clearly exists, as the marrow, when so used, only supplies an alternate route to the general circulation. The upper portion of the tibia is the site of election in children under 5. The sternum should not be used in such children. If the infusion has to be repeated, it is preferable to use the other tibia or, in older persons, another portion of the sternum; the needle may be placed a few millimeters away from the original site. The same bone should not be used within twenty-four hours after the end of an infusion. As many as three infusions have been given in the same bone. The general rules governing the volume of fluid to be injected intravenously apply to substances injected or infused through the bone marrow. The risk associated with the method is small if the operator has acquainted himself thoroughly with the technique by studying anatomic landmarks and practicing on the cadaver.

No one should attempt this form of therapy without having preliminary training, even though he may be adept at intravenous work. A stillborn fetus is a suitable subject for these preliminary trials.

### LATE EFFECTS OF METHYL CHLORIDE POISONING

To the Editor:—What are the systemic effects of exposure over a period of three or four years to methyl chloride gas as used in refrigeration? A patient states that seven years ago while a repair man for a refrigeration plant he inhaled methyl chloride daily. He was finally forced to quit because of ill health. He complains of a chronic cough, failing memory, nausea, dizziness, twitching of the muscles of the legs and prostration. He was told by some physician that his condition was the result of exposure to methyl chloride and that nothing could be done for him. The man has been unable to work for the past three years; hence I do not want to subject him to any unnecessary expense. For this reason I have not examined him or had any laboratory work done on him as yet. Any information relative to the effects of this gas or any advice as to handling the patient will be greatly appreciated.

M.D., Indiana.

ANSWER.—Only limited information is available on the nature of chronic methyl chloride poisoning or the sequelae of acute poisoning. In the acute phase methyl chloride acting as a chemical entity produces anesthesia akin to that from chloroform. In chronic poisoning a different effect is produced: Within the body methyl chloride, unlike most other chlorinated hydrocarbons, decomposes into methyl alcohol and hydrochloric acid; the latter is quickly transformed into sodium chloride, so that every gram of methyl chloride decomposed in the body yields 0.63 Gm. of methyl alcohol and 1.16 Gm. of sodium chloride. Chronic methyl chloride poisoning, therefore, is probably methyl alcohol poisoning. Based on this assumption the manifestations connected with remote exposure to methyl chloride must represent the sequelae of methyl alcohol poisoning. These are associated with the optical system, the pituitary body, the heart, the liver and the kidneys. Although damage to any of these tissues may arise from causes other than methyl alcohol, due significance should be attached to visual disturbances, abnormal color fields, cardiac damage or impaired function of the liver or kidneys. Injury to the optic tract is substantially characteristic. Without such manifestations any causal connection between the symptoms mentioned in the inquiry and exposure to unknown quantities of methyl chloride seven years ago must be regarded as doubtful.

## POTENTIAL DANGERS OF NONTOXIC NODULAR GOITER

WARREN H. COLE, M.D.  
DANEY P. SLAUGHTER, M.D.  
AND  
LEWIS J. ROSSITER, A.B.  
CHICAGO

Although the indications for surgical therapy are quite definite and generally agreed to in toxic diffuse goiter, the indications are less clear and urgent in nontoxic nodular goiter. Nevertheless it is well known that nontoxic nodular goiter may develop toxicity or be the site of carcinoma, although the incidence of these changes is not fully realized nor are the dangers appreciated. A study of patients in our clinic with carcinoma of the thyroid and nontoxic nodular goiter has convinced us that numerous complications (including particularly the two just mentioned) developing in this type of goiter may make surgical therapy quite urgent in this seemingly harmless lesion.

### TYPES OF COMPLICATIONS RESULTING FROM NONTOXIC NODULAR GOITER

1. *Carcinoma*.—It is now agreed that carcinoma of the thyroid gland arises in adenomatous growths in the majority of instances; some workers make the rather dogmatic statement that 80 to 85 per cent of carcinomas arise in fetal adenomas, but we agree with Pemberton<sup>1</sup> that it is impossible to arrive at an accurate estimation of this relationship, largely because the tumor will overgrow the site of origin and thereby make it impossible to identify the original lesion where the carcinoma originated. In our series of 38 carcinomas (which represents a very small series encountered during the past seven years) we could with reasonable accuracy determine that the tumor arose in a fetal adenoma on 14 occasions (37 per cent). However, on many other occasions it is probable that the site of origin was likewise in a fetal adenoma, although the tumor had invaded the area so widely as to prevent identification of the original tissue. As indicated by Brenner and McKnight,<sup>2</sup> cancer may arise also in colloid adenomas and diffuse adenomatous types, though perhaps less frequently. Lahey<sup>3</sup> has recently emphasized the importance of aberrant thyroid nodules in the development of carcinoma; in his series of 34 patients with aberrant thyroid tissue cancer was present in 35 per cent.

In our series the average duration of the thyroid mass in the patients with carcinoma was 7.1 years compared to 11.0 years in nontoxic nodular goiter and 13.9 years in toxic nodular goiter; in the former group there is commonly a history of sudden gradual growth during the past several months preceding the time when the patient sought medical care. However, this change in size is so commonly absent or ignored that the symptoms bringing the patient to the physician too commonly are voice change, difficulty in swallowing or breathing, or some other manifestation of invasion of carcinoma beyond its site of origin. Many authors writing on the subject make the bold statement that, once a carcinoma of the thyroid produces symptoms, it is beyond the possibility of a five year cure. Although this may not be entirely true, all would agree that the chances of a five or ten year cure are far better if the tumor is so early that it is not yet producing manifestations other than enlargement of the thyroid lobe.

Incidence: Carcinoma occurs so rarely in diffuse toxic goiter that inclusion of this type of lesion in the statistical study really confuses the issue. Ward<sup>4</sup> encountered only 1 carcinoma in 1,900 cases of toxic diffuse goiter; we encountered 1 in 435 cases of toxic diffuse goiter. Goetsch<sup>5</sup> found 8 carcinomas in toxic diffuse goiter but remarked that all arose in small adenomas.

The incidence of thyrotoxicosis (of all types) in our series of 38 cases of carcinoma encountered during the past seven years was 13.2 per cent. In a large series of carcinoma of the thyroid studied by Pemberton and Lovelace<sup>6</sup> thyrotoxicosis was present in 33.5 per cent of the group. However, the figure encountered in our series appears to be closer to the average, since many authors have encountered few or no instances of thyrotoxicosis. When thyrotoxicosis is present it is difficult to determine what tissue is responsible for it. However, after a study of 396 cases of carcinoma of the thyroid, with reference to thyrotoxicosis, Friedell<sup>7</sup> arrived at the conclusion that the carcinomatous area itself does not have the function of hyperthyroidism. We concur in this conclusion, believing that, when thyrotoxicosis is present, areas other than the carcinoma are responsible for the toxicity. This area might be either in the benign portion of the nodule or elsewhere in the parenchyma.

The incidence of carcinoma in nodular goiter varies somewhat throughout the country, suggesting that geographic sites play a role in development of malignant changes. In 2,324 patients with nodular goiter (toxic and nontoxic) Brenner and McKnight<sup>2</sup> noted an inci-

dence of carcinoma of 4 per cent; in 3,539 cases of nodular goiter Ward<sup>4</sup> encountered carcinoma in 4.8 per cent of the group whereas we encountered carcinoma in 7.2 per cent of 523 patients with nodular goiter (table 1). These three reports illustrate the relative incidence in the widely distributed areas of the environs of North Carolina, California and Illinois, respectively.

TABLE 1.—Incidence of Carcinoma in Various Types of Nodular Goiter (1936-1944)

Of 523 nodular goiters (including toxic, nontoxic, benign and malignant).....	7.2% were carcinoma
Of 330 nodular toxic goiters (including carcinoma) .....	1.2% were carcinoma
Of 247 multinodular toxic goiters.....	1.6% were carcinoma
Of 67 solitary nodular toxic goiters..	0% were carcinoma
Of 192 nodular nontoxic goiters (including carcinoma) .....	17.1% were carcinoma
Of 100 multinodular nontoxic goiters.....	11.0% were carcinoma
Of 92 solitary nontoxic goiters.....	24.0% were carcinoma

There is also considerable variation in the age of the patients with carcinoma. Most authorities state that the age is similar to that of other types of carcinoma; for example, Pemberton and Lovelace<sup>6</sup> noted an average age of 48.1 in women and 52.8 years in men. On the other hand, the average age in our series, with a much higher incidence of carcinoma, was 42 years, indicating that as the incidence of cancer increases the tumor afflicts younger persons. It is, of course, well known that carcinoma of the thyroid, unlike carcinoma in most other organs, may appear in young people, including children. In 62 children 14 years of age or under with nodular goiter, Kennedy<sup>8</sup> encountered carcinoma in 12 cases, or 19.3 per cent of the group. All these carcinomas were in nontoxic nodular glands, indicating the serious aspects of nontoxic nodular goiter in childhood.

Goiter of all types is more common in women than in men, although the incidence in men is increased slightly in the carcinoma group over the incidence in nodular goiter. For example, in our series the incidence in women of toxic nodular goiter, nontoxic nodular goiter and carcinoma was 92.4, 89.3 and 84.0 per cent, respectively. Ward noted a ratio of 1 man to 7 women in benign nodular goiter but a ratio of 1 man to 3.5 women in carcinoma of the thyroid.

The incidence of carcinoma of the thyroid is much higher in nontoxic nodular goiter than in toxic nodular goiter, as illustrated by an incidence of 17.1 per cent

in 193 cases of the former group and only 1.2 per cent in 330 cases of the latter group (table 1). Another very important feature seldom mentioned in the literature, though referred to by Lahey,<sup>3</sup> is the fact that the solitary nodule is much more dangerous from the standpoint of malignant change than is the multinodular gland. Table 1 reveals that whereas only 11.0 per cent of cases of multinodular nontoxic glands were malig-

nant, the astounding figure of 24.0 per cent of the nontoxic solitary nodules were the seat of carcinoma. In other words, every fourth patient in our series of solitary nontoxic nodular goiter (which constituted 70 per cent of the entire nontoxic nodular group) had a carcinoma, thus convincing one of the danger of conservative therapy particularly in this group.

Classification: Of the 38 cases of thyroid carcinoma herein reported, the distribution as to pathologic types is as listed in table 2. Details of classification of thyroid carcinoma may be found in a report by Warren.<sup>9</sup>

The relationship of fetal adenomas to the genesis of these malignant tumors cannot be accurately determined. As previously stated, it seems certain that at least 14 (37 per cent) of our cases had their origin in such a lesion. It is probable that several others did also, but the disease was so advanced in these cases that evidences of histogenesis were obliterated. In 2 of the cases of diffuse adenocarcinoma there were multiple benign fetal adenomas in the opposite thyroid lobe. At least 6 other cases arose from preexisting solitary, unilateral thyroid swellings which had been present from two to twenty-five years. These were more than likely fetal adenomas. Cases which we believe definitely arose in fetal adenomas varied histologically. The majority were of the type classified as "adenoma malignum," but others showed the histopathologic picture of papillary adenocarcinoma, diffuse adenocarci-

noma and one of Hurthle cell carcinoma. Besides the 5 instances of Hurthle cell carcinoma reported here, there are in our files 4 cases of benign Hurthle cell adenoma.

The 12 cases of "adenoma malignum" constitute the equivocal pathology of thyroid cancer. The cases reported here were selected after careful study, in process of which a larger number of lesions were classified as hyperplastic fetal adenomas and discarded. The two criteria of invasion of the capsule and demonstrable tumor thrombi in veins (as emphasized by Graham<sup>10</sup>) were the bases of diagnosis in the doubtful cases. The most innocent looking lesion of the lot was in a patient whose symptoms were those of spinal cord compression. At laminectomy a thyroid tissue metastasis was found, and attention was directed to a small thyroid mass which turned out to be "adenoma malignum," eventually causing the patient's death.

Diagnosis: It is not our purpose in this paper to discuss the manifestations of carcinoma of the thyroid. Besides the presence of the tumor, which is usually firm, voice changes, difficulty in swallowing or breathing, "choking" attacks, cough and pain in the neck may be related to the local presence of the tumor itself. After metastasis has taken place numerous additional manifestations such as pain in the back or pelvis.

hemoptysis, loss of weight or the development of masses elsewhere may appear.

Through coincidence alone a large percentage of asymptomatic thyroids will reveal carcinoma in its early stage. In our series the diagnosis was made only in the surgical pathology laboratory in 58 per cent of cases, in 21 per cent it was first made in the operating room and in another 21 per cent it was made clinically before therapy.

**Treatment and Prognosis:** It is agreed that operation combined with irradiation, preferably with radon seeds, is the treatment of choice in carcinoma of the thyroid. If any nodes are palpable elsewhere in the neck or if the tumor has invaded the capsule with penetration of adjacent tissue, a neck dissection is indicated. This operation should include excision of the strap muscles, the jugular vein and the sternomastoid muscle along with the lymphatics of the neck. Although the mortality rate in thyroidectomy for asymptomatic and clinically undiagnosed carcinoma will be no higher than in benign goiter, the rate will be considerably higher when a radical neck dissection is made necessary by invasion of adjacent tissue. Considering all types of operation for carcinoma of the thyroid, the mortality will vary from 1 to 4 per cent, depending largely on the frequency of radical neck dissections and the incidence of asymptomatic tumors.

Although irradiation is probably to be advised in the treatment of all thyroid carcinomas, yet it is really effective only in the papillary tumors, which fortunately are slightly more common than any other group, comprising 30 to 40 per cent of the entire group. In general, papillary carcinoma metastasizes more slowly than most other types, five year cures being obtained by many authors in 70 to 80 per cent of this type. The five year survival rate in 231 cases as reported recently by Hare<sup>11</sup> and Lahey<sup>3</sup> is so significant that it is reproduced in table 3.

The important role of early diagnosis and treatment on ultimate results is borne out by the observations of Ward,<sup>4</sup> who noted that five year cures were obtained in only 20 per cent of cases diagnosed before operation, in 40 per cent if the tumor was diagnosed at operation and in 80 per cent when the diagnosis was first made in the Surgical Pathology laboratory.

**2. Development of Toxicity.**—It is well known that thyrotoxicosis may be superimposed on nontoxic nodular goiter. In our study, which included 326 cases of benign toxic nodular goiter, the average duration of the nodule before toxicity developed was 9.37 years; the average duration of symptoms was 3.53 years. Symptoms of toxicity develop so insidiously in toxic nodular goiter that the patients usually have symptoms quite some time before they come to the physician. No doubt toxicity was present in many of these patients long before they actually detected any of its manifestations. Development of toxicity in nodular goiter in children is practically unknown, in contrast to the high incidence of development of carcinoma in nodular goiter in children. It is very difficult to estimate just what proportion of patients with nontoxic nodular goiter would develop toxicity. Naturally, the percentage would change with the duration of the mass. The fact that 11 per cent of our patients with nontoxic nodular goiter were past 50 and that 29 per cent of our patients with toxic nodular goiter were past 50 is definitely suggestive

that as the patient becomes older there may be a definite increase in the trend toward development of toxicity. Wetherell<sup>12</sup> has estimated that 50 per cent of patients with nontoxic nodular goiter would ultimately become toxic if left untreated. The authors agree that this figure would appear reasonable. The fact that we encountered almost twice as many toxic nodular goiters as nontoxic nodular goiters in a given period cannot be considered as an indication of the frequency of toxicity, since there will be less tendency for patients with nontoxic nodular goiters to seek medical aid.

There is considerable controversy as to the frequency of development of thyrotoxicosis in nodular goiter under iodine medication. In reality there should not be any indication for giving iodine to a patient with nontoxic nodular goiter, since goiter of this type does not regress

Large nontoxic nodular goiter in a Negro woman aged 32. Goiter of this type is much less likely to produce serious compression symptoms than would a much smaller carcinoma. However, this patient had mild interference with breathing, particularly when lying down.

under iodine as usually occurs in nontoxic diffuse goiter. However, many patients themselves will take iodine, having heard that iodine is good for goiter; on other occasions physicians prescribe it under the impression that the goiter is of the diffuse nontoxic type, which does respond to iodine. In general, it may be said that development of toxicity secondary to iodine is quite uncommon. However, one of us (W. H. C.) observed its occurrence in a woman aged 23 who developed severe toxicity from a nontoxic nodular goiter under iodine medication, which completely disappeared with cessation of iodine therapy.

**3. Local Effects of Nodular Goiter.**—Although the local effects produced by nontoxic nodular goiter are

11. Hare, H. F.: Radiation Treatment of Cancer of the Thyroid, Am. J. Roentgenol. 46: 451, 1941.

12. Wetherell, F. S. Inherent Dangers in Nodular Goiter, J. Internat. Coll. Surgeons 4: 248, 1941.

much less common than those encountered in carcinoma of the thyroid, yet a significant percentage of patients with nontoxic nodular goiter coming for treatment will complain of pressure manifestations. In our experience about 20 per cent complain of pressure symptoms in addition to the mere presence of the mass. This incidence may be rather high, since our patients are charity patients and therefore come to the physician relatively late. The most common and earliest complaint is a choking sensation which frequently awakens the patient from his sleep. During the relaxation of sleep, certain muscles which tend to maintain an adequate airway become relaxed and allow the mass to compress the trachea or larynx. A few of the patients actually complain of difficulty in breathing and may actually have a stridor. Less commonly, difficulty in swallowing is a complaint. Voice changes are not infrequent and may be due either to pressure on the larynx or to pressure on the recurrent laryngeal nerve with a consequent paresis or paralysis. Actual paralysis of the nerve is relatively uncommon in nontoxic nodular goiter but does occur. Pain is rarely complained of except that it may be produced when the neck is turned in certain directions. In many patients the cosmetic appearance alone is sufficient to bring them to the surgeon for removal of the mass.

4. *Systemic Manifestations.*—Ordinarily one thinks of nontoxic nodular goiter as producing few or no systemic manifestations. Yet the gradation between nontoxic and toxic nodular goiter is so narrow that it is extremely difficult to set up criteria which can be used to identify borderline cases specifically as toxic or nontoxic. In the classification herein discussed we have adopted the same criteria as have others, namely that the nontoxic nodular group has a basal metabolic rate less than plus 10 or 15 and has no symptoms such as significant nervousness, cardiac decompensation or sweating. Nevertheless in about 20 per cent of our nontoxic nodular group one or more mild symptoms such as slight nervousness, tachycardia, weakness, dyspnea and increase in sweating were encountered. These symptoms develop so insidiously and may be so mild that

TABLE 4.—*Characteristics of Various Types of Nodular Goiter, Including Carcinoma (1936-1944)*

they are scarcely appreciated by the patient until after operation, when pronounced improvement is noted. Most of these patients have large degenerating goiters and are in the latter decades of life. Many surgeons, including Lahey,<sup>13</sup> Wetherell<sup>12</sup> and Hicken,<sup>14</sup> have expressed the same or similar thoughts. The development of heart disease, including decompensation with or without fibrillation, is quite common in toxic nodular goiter and in that disease represents the most serious complication or sequela. Heart disease supposedly should not exist in nontoxic nodular goiter, although

Hertzler<sup>15</sup> has been a strong advocate of the removal of this type of growth for its beneficial effect on the heart itself. The question immediately arises as to whether or not these patients with supposedly nontoxic nodular goiter who are relieved of symptoms by removal of the growth might not actually be toxic. In going over the patients in our series we were amazed at the large number of cases which presented difficulty in diagnosis from the standpoint of toxicity. As stated, about 20 per cent of our group of patients with non-

TABLE 5.—*Carcinoma of the Thyroid (Total Cases 38)*

33, or 86.8%, were in nontoxic nodular goiters (22 in solitary nodular goiters and 11 in multinodular goiters)
4, or 10.5%, were in toxic nodular goiters (all were in multinodular goiters)
1, or 2.6%, was in toxic diffuse goiter

toxic nodular goiter had a few symptoms, such as nervousness, slight tachycardia and sweating, which were suggestive of hyperthyroidism but by no means conclusive. In this group the basal metabolic rate is of little diagnostic value. We are convinced, however, that the great proportion of these should be classified as toxic goiters, realizing that almost every disease manifests itself in different stages, including very mild degrees as well as severe degrees of intensity.

#### SUMMARY

In view of the wide variation of opinion as to the indications for operation in nontoxic nodular goiter, we have made a clinical study of "goiter" patients admitted to Illinois Research Hospital, hoping to obtain information which might determine how urgently we should advise surgical therapy in this lesion. The development of four major types of complications, including (1) carcinoma, (2) thyrotoxicosis, (3) local (pressure) symptoms and (4) systemic manifestations, is encountered. Of this group carcinoma is unquestionably the most significant. In the entire group of 523 patients with nodular goiter (including benign, malignant, toxic and nontoxic) encountered in our hospital during the past seven and one-half years there was an incidence of carcinoma in 7.2 per cent of the cases. In 330 toxic nodular glands there was an incidence of only 1.2 per cent of carcinoma; in this toxic group carcinoma was not encountered in a single patient with a solitary nodule. In 192 patients with nodular nontoxic goiter there was an incidence of carcinoma in 17.1 per cent of the cases. The most astounding feature is that in the group of patients with nontoxic nodules carcinoma was found in 24.0 per cent. In patients with multinodular nontoxic goiters the incidence was 11.0 per cent. Since all of our patients are charity patients, the incidence of carcinoma would no doubt be higher than in a similar study conducted in a private hospital, because charity patients tend to neglect their diseases much longer than private patients. In the patients with solitary carcinoma the average duration of the mass before admission was 7.1 years. The average age was 42.0 years, almost identical to the average age of the patients with nontoxic nodular and toxic nodular goiter, and distinctly lower than the average age in cancer of most other organs; the frequent occurrence of carcinoma of the thyroid in young people, including children, is well known.

Although most authorities believe that carcinoma of the thyroid arises from adenomas (primarily the fetal type) in 60 to 90 per cent of cases, it is impossible to

13. Lahey, F. H.: Surgery in Hyperthyroidism, Tr. Am. A. Study Goiter, 1938, p. 297.

14. Hicken, N. F.: Should Quiescent Adenomatous Goiters Be Removed? Rocky Mountain M. J. 37: 94, 1940.

15. Hertzler, A. E.: Diseases of the Thyroid, New York, Pa.: F. Hoeber, Inc., 1941.

arrive at a correct decision as to frequency, since the tumor so often has overgrown the original site. In 37 per cent of our cases of carcinoma we were able to discern with accuracy that the tumor arose in a fetal adenoma. Without question it arose from a fetal adenoma in many other cases (perhaps twice as many) although proof cannot be obtained.

Goiter of all types is more frequent in women than in men; about 90 per cent of patients with nodular goiter (nontoxic and toxic) are women. In carcinoma the feminine incidence is slightly lower, women constituting 84 per cent of the group.

Fortunately, if the policy of removing a great portion of nontoxic nodular goiters is adopted, many instances of carcinoma will be found when no clinical manifestations of the tumor existed. In our series 58 per cent were diagnosed only after examination in the Surgical Pathology laboratory; the diagnosis was made on the operating table in 21 per cent of cases and before operation in 21 per cent.

The results of treatment which consists primarily of excision and radiation (preferably radon seeds) in patients with carcinoma of the thyroid are remarkably good. Of the major types of carcinoma treated as just described, a five year cure can be expected in over 50 per cent of cases. Needless to say, the five year cure figure will be much higher in the group showing no clinical manifestations. Ward's figures of 20 per cent five year cure in patients diagnosed before operation and of 80 per cent in patients diagnosed only after examination of the specimen in the Surgical Pathology laboratory proves emphatically the advantages of early or prophylactic therapy.

There is no way of arriving at a correct figure as to the likelihood of development of toxicity in a nontoxic nodular goiter. However, we would estimate that, if left untreated, about 50 per cent of nontoxic nodular goiters would ultimately develop some degree of toxicity. This tendency toward development of toxicity is entirely absent in childhood and appears to increase with increase in age, particularly in the latter decades of life.

After completion of this study we have reached the conclusion that, in general, solitary nontoxic nodular goiters in young people should be removed surgically, because of the danger of development of carcinoma or thyrotoxicosis, particularly the former.

#### ABSTRACT OF DISCUSSION

DR. FRANK H. LAHEY, Boston: The mortality of removal, particularly in the type of adenoma that is likely to become malignant, ought to be zero because it is a discrete adenoma and easily removed. These patients are in the hospital not over a week, so why trade the hazards of malignancy in a thyroid adenoma of this type when there is no risk and the hospital stay is so short? My associates and I have had a large experience with thyroid adenomas that have become malignant. The size of these adenomas is of no importance. We have seen an adenocarcinoma in a discrete adenoma the size of my little fingernail. Age is of no importance. We have had a boy of 9 years die of carcinoma of the thyroid, and several patients were 12, 13 and 14 years of age. More mistakes are made as relates to malignancy in the diagnosis of aberrant thyroid glands than in almost any single factor in thyroid states. Adenomas should not be ruptured in removing them because it is not known at the time of removal whether or not they are malignant. A particular characteristic of malignancy of the thyroid is to invade veins, and Allen Graham has emphasized that in any radical removal all adjacent veins must be removed. If carcinoma of the thyroid has eroded through the capsule with

parenchymatous involvement, then not only is there involvement of lymph nodes but often extension into the neighboring veins. If we find a carcinoma of the thyroid involving one lobe we take out the sternomastoid on that side and the internal jugular from above to below the gland and all of the lymph nodes and thyroid on that side. The ideal treatment of carcinoma of the thyroid is the combination of radical surgery and high voltage x-rays. If these dissections are extensive, we carry out tracheotomy at the time of operation because a well done tracheotomy situated low on the trachea will not cause trouble. If tracheotomy is not done and intense radiation is given, there will be severe reactions and tracheotomy will have to be performed as an emergency. When a prophylactic tracheotomy is done the patient is comfortable, and one can do as much as one chooses in the way of postoperative irradiation. Patients with toxic adenomas are in the group in which the greatest number of unexpected fatalities occur, and so in these cases the greatest surgical judgment must be employed. Thiouracil will lower the metabolic rate in patients with toxic adenomas as it will in patients with primary hyperthyroidism. By the use of thiouracil we do not change the histologic picture of hyperthyroidism in the least; the drop in the metabolic rate which is obtained by its use is an extra thyroid effect and probably but a temporary one and not a method of curing patients of hyperthyroidism but a method of preparing them for safer operation. We have now employed thiouracil for patients with toxic thyroids for over a year and we know the great difficulty of operating on these patients since thiouracil does not involute the thyroid gland. Although it lowers the metabolic rate it makes the operation of subtotal thyroidectomy as technically difficult as it was when we used to operate on patients before we had Lugol's solution. The bleeding is almost uncontrollable and the gland is so friable in these thiouracil patients that the operation is definitely prolonged. Dr. Bartels, in our clinic, has now for some time employed a plan for these cases which overcomes these difficulties, first dropping the metabolic rate with thiouracil and then giving Lugol's solution for about two weeks. The Lugol's solution will so devascularize and involute the gland that these disadvantages are overcome. If thiouracil is given indiscriminately it possesses the danger of producing agranulocytosis, kidney damage, allergic reactions and skin changes, but it is valuable and will prove to be a useful addition to our armamentarium.

DR. GEORGE M. CURTIS, Columbus, Ohio: There is a complication which should receive our attention: that of hemorrhage into the nodular goitrous gland. Along with nodule formation occur vascular degenerative changes. In regions where nodular goiter is common these may occur early in life. Resultant hemorrhages of a mild degree are often seen during the dissection of the goitrous mass removed by thyroidectomy. In their more severe form these hemorrhages are the principal cause of cyst formation. The content of these larger cysts, and particularly of those developing within the mediastinum, is high in iron and low in iodine, indicating the hemorrhagic origin. The mechanical effects of these larger cysts, especially by pressure on the trachea, is obvious. Atherosclerotic changes may often be demonstrated in the arteries of older nodular goiters. Rupture of these damaged thyroid vessels with resultant acute severe hemorrhage is uncommon but well recognized. About 50 instances have been reported in which death resulted from the resultant pressure on the trachea. The recognition of incipient toxicity and of the lesser degrees of hyperthyroidism has long presented a problem. Determinations of the basal metabolic rate are not wholly sufficient, since hypermetabolism does not necessarily mean hyperthyroidism. Definite progress has been made in developing determinations of the protein bound iodine of the blood. These, more nearly than anything else I know, give an index of the degree of thyroid activity. This represents an approach to the determination of the circulating thyroid hormone. Although this method is well developed, it is difficult to apply. Nodular goiter now appears largely as a preventable disease. Of the various goitrogenic agents now known, the principal one is an insufficiency of available iodine. In geographic regions where goiter is common the iodine intake is low. Moreover, the excretion of iodine is considerably less than that of individuals in regions where goiter is infrequent. Since thyroxine is two thirds iodine, the thyroid gland must have

an adequate iodine supply properly to make sufficient thyroid hormone. We should consider iodine deficiency as related to the incidence of nodular goiter. Geographic studies, the determination of the usual rate of thyroxin formation and decay and human iodine balance studies have given a fairly clear idea of human iodine requirements. Allowing for some reserve for extra demands, this is daily about 3 micrograms of iodine per kilogram of body weight. More is required during pregnancy, since the developing fetus should also have a sufficient supply. This need is more than adequately supplied by the use of the current iodized salt. Since nodular goiter appears to be a genetic disease, it is even more important to such families or in those regions where the endemism is severe and the consequent incidence of nodular goiter with its complications is high.

DR. BRIEN T. KING, Seattle: I have operated with 100 per cent cure on 35 persons with carcinoma of the thyroid, all of whom are still living and well, and I do not treat them with any radiation thereafter. I do not think I have cured a single patient with diffuse carcinoma of the thyroid, though a number of them are still living after years. I suspect that those that are living sooner or later, if they don't die of an intercurrent condition, will have a recurrence of carcinoma of the thyroid. The time of recurrence depends on the degree of malignancy. I would further subdivide the encapsulated carcinomas in children. I make an arbitrary age of 12 years instead of 14, because adolescence certainly begins to play an earlier and effective role on the changes that take place in the dormant adenomas that sometimes exist in children prior to that age, and of the single discrete adenomas of the thyroid that have occurred in certain children in my experience under 12 years of age a large percentage have been malignant, but only one of them has been a diffuse malignancy. By that I mean that the carcinoma extended through the capsule and invaded the rest of the glands, and among the 35 who are cured some were children. Two of them were children under 10 years of age and 3 or 4 more under 12 years of age. The diagnosis of nontoxic adenoma is much more often made erroneously than the diagnosis of simple and nontoxic adenoma, and the only way one can really make a diagnosis of a nontoxic nodular goiter is by the clinical history, particularly if one finds that that patient is 45 or 50 or 55 or 60 years of age. If one finds that in some time during the last ten or fifteen or twenty years there has existed a goiter and there is a history of toxic goiter one had better get it out. I wish to call attention to an increased heart consciousness in the presence of adenomatous goiter and to the irregularity of the heart. A majority of all the auricular fibrillations that occur in the state of Washington are due to toxic goiter. Extrasystoles are often the prodrome of auricular fibrillation. If one finds a patient with an adenomatous goiter or nodular goiter and an irregular heart action, remove it. My experience has been that in 99 per cent of them that irregularity of the heart will disappear in from ten to ninety days.

DR. DANIEL P. SLAUGHTER, Chicago: There are few epithelial organs in the body which produce such a variety of tumors as does the thyroid. There are many different classifications of thyroid tumors, but the most equivocal pathologic condition is that of the so-called encapsulated adenomas. In the doubtful cases our criteria for diagnosis of these malignant adenomas, or the encapsulated lesions which we have considered as cancer, are those of invasion of the capsule and demonstrable tumor thrombi in the veins. The definitive treatment of thyroid cancer is surgical. The results of irradiation alone have been very poor. With external x-radiation it is almost impossible to sterilize thyroid cancer. Unquestionably a small residual or irremovable area of carcinoma can be completely obliterated by radon seeds. Enough seeds can be put in any area of tissue in the body to destroy it completely. It is the residual tissue which one can't see that so often defeats one. I don't believe in postoperative irradiation after removal of a so-called encapsulated carcinoma. If a cancerocidal dose is delivered into the neck, considerable damage to the tissue results without definite evidence that any cancer has been treated. Since these solitary nontoxic adenomas are the dangerous type from the standpoint of cancer, it would be better that we deliberately do a total hemithyroidectomy rather than simply "shell out the tumor." When thyroid carcinoma has been diagnosed clinically we would recommend a formally planned total thyroidectomy and radical

neck dissection on the side involved. The radical neck dissection should include removal of the internal jugular vein, the sternomastoid muscle and a complete dissection of the neck on that side. It is impossible to do a complete neck dissection without removing the internal jugular vein, and any one who tries it is in for a difficult operation. On the other hand, the radical neck dissection as outlined is a straightforward anatomic dissection. Few surgeons will agree on what constitutes a precancerous disease in the breast, yet we all agree that a lump in the breast should be removed to see if it is cancer. On the other hand, practically everybody agrees that the solitary nontoxic thyroid adenoma of the fetal type is a precancerous condition; therefore I think we should advise surgical excision of all such lesions.

## SOME ROENTGENOLOGIC CONSIDERATIONS PERTAINING TO UPPER EXTREMITY PAIN

CAPTAIN CHARLES F. BEHRENS (MC), U.S.N.

Chief of Radiologic Service, U. S. Naval Hospital  
BETHESDA, MD.

It probably seems a bit odd and perhaps disappointing that a naval medical officer should deal with such a topic as upper extremity pain in times of war, when the fury of combat dominates the scene and the reek of gunpowder or trinitrotoluene fills the atmosphere. One would naturally expect or hope for a consideration of matters more specifically military.

In extenuation of my offense, I would like to point out that we can now afford less than ever to neglect the more prosaic and less glamorous fields of medical activity, for such neglect means the sapping of efficiency. The incidence of pain and disability involving the upper extremity is fairly high—just how high is difficult to say, since many cases are treated in an outpatient status and are not reflected in vital statistics with any approach to full measure. Many of these patients are seriously handicapped, are thoroughly miserable and at the same time have important duties. With all this in mind, I hope you will not take my efforts amiss.

Not so very long ago the etiologic differentiation of pains involving the extremities and the spine was in a rather rudimentary state. The tendency was to herd practically all of them together under the broad coverage of that ancient, patched and time worn umbrella—namely, rheumatism. The labor and studies of a generation or more of physicians has done much to clarify the situation and in latter years special advances have been made regarding the causes of low back pain and pain involving the lower extremities. I refer naturally to the discovery of the part played by disk injuries and hypertrophy of the ligamentum flavum; also misalignments especially at the lumbosacral articulation. These conditions have been thoroughly presented in numerous articles and textbooks. The matter of upper extremity pain, however, involves some conditions not so well clarified, and it appears well to take up a few of these from the standpoint of roentgenology.

Numerous indeed are the causes of the upper extremity pain, disability and abnormal sensation. A good many are of course obvious: contusions, sprains, fractures, dislocations, acute infections, rheumatic fever and the like. These seldom present diagnostic problems. Less obvious is the etiology in other cases, and naturally

Read before the Section on Radiology at the Ninety-Fourth Annual Session of the American Medical Association, Chicago, June 14, 1944.  
This article has been released for publication by the Division of Publications of the Bureau of Medicine and Surgery of the U. S. Navy. The opinions and views set forth in this article are those of the author and are not to be considered as reflecting the policies of the Navy Department.

increased recourse is had to radiography for aid in the diagnosis. From this group a large number will be easily and promptly separated as cases of so-called "bursitis" or, as frequently designated nowadays, para-arthritis or peritendinitis, depending on the preference of the roentgenologist as to terminology. The main thing is that in these cases calcium deposits are often noted near the shoulder joint in the soft tissues, usually just above the greater tuberosity of the humerus and mostly located in or about the supraspinatus tendon. The matter has been well presented in a number of articles, including one by Pinner and Staderman<sup>1</sup> and earlier in one by Sandström.<sup>2</sup> There is no need for further detail here. I should like only to remind you that pain and disability are often most exceedingly severe and that furthermore roentgen therapy is usually most efficacious, often in sensational fashion. This condition, be it remembered, is quite frequently encountered in the service and at times in comparatively young persons. It should always be borne in mind.

In a disappointingly large number of cases, however, we will find roentgenograms of the shoulder negative. In such case one does well not to shrug the matter off as just another perplexing case of neuralgia, neuritis, fibrositis, rheumatism or what not but to proceed further and have studies of the cervical spine and upper thorax made. In occasional cases one will find such things as tumors of the vertebrae, tumors of the cord and its membrane, superior sulcus tumors, infectious processes, more or less extensive synostoses, possibly to the extent of the Klippel-Feil variety, anomalies of various types, and so on, not forgetting a possible ruptured disk and, what is fairly common, cervical ribs. However, it might be noted here that most cases of cervical ribs are found incidentally and appear to occasion symptoms only on more or less rare occasions. Now the differential diagnostics of the various unusual conditions is a very interesting and fascinating subject, but on this occasion I should like to come down to humbler, more everyday, fare and ask your attention to the troublesome matter of symptoms referable to changes in the vertebrae and thinning of the intervertebral disks consequent on arthritic changes of degenerative hypertrophic type. These are well worthy of particular consideration, if for no other reason than that the relationship of the symptomatology in these cases to the underlying pathologic condition and also to possibilities of therapy do not appear generally to be realized or else tend to be forgotten.

As mentioned by Mettler and Capp<sup>3</sup> in a study on neurologic symptoms in cervical arthritis, relationship between pain in the upper extremity and cervical arthritis was described some years ago by von Bechterew, Strümpell, Marie and others. These early writers noted, moreover, that there was little relation between the symptoms and the degree of arthritic involvement. It does not appear that much attention was paid to these observations then or, indeed, later. It seems that most of us tend to think of cervical arthritis as a remote and unlikely cause of upper extremity pain. On the contrary, it is a fairly frequent cause and the mechanism has been thought to involve the factors of narrowing of the intervertebral foramina due to productive osteoid changes and thinning of one or more disks, with irrita-

tion of or pressure on nerve roots. An explanation of the lack of correspondence between the degree of hypertrophic changes and the severity of symptoms becomes possible thereby: Arthritic changes of productive type need not and frequently do not affect the intervertebral foramina. If they are limited to the body margins they are relatively painless. In fact Oppenheimer and Turner<sup>4</sup> in their study on discogenic disease and segmental neuritis have placed all emphasis on disk narrowing. I myself feel that either narrowing of the disk or productive changes significantly located may be factors. In addition I would suggest that there may well be factors of round cell infiltration, passive congestion and perhaps some degree of fibrosis; in other words, that there is often some degree of chronic inflammation, and I believe that this factor may often be more important than osteoid proliferation and thinning of the disks.

As for treatment, Mettler and Capp mentioned that some victims were relieved to some extent by the manipulations of irregular practitioners; also that in general the syndrome has been inadequately treated. The patients, bewildered and discouraged, only too often drift from one physician to another and from clinic to clinic, obtaining little if any relief. Treatment recommended by Mettler and Capp is along the conventional lines of massage, manual traction and manipulation. This, they say, has relieved the majority of the patients. At the present time I believe that the most frequently applied remedy, aside from strictly medical measures, is diathermy. My own experience with diathermy indicates that it has been of little value in these conditions; indeed, it often seems to aggravate symptoms. Careful manipulation, traction and massage produce much better results and, finally, excellent results are to be expected from roentgen therapy if earnestly followed.

Coming to my own experience, I am not able to furnish a large statistical series chiefly because, as usually happens in naval practice, we lose track of too many of our patients. However, I have seen perhaps a hundred or so of such cases, and these enable me to come to certain conclusions: (1) These cases are frequently encountered; (2) they are quite resistant to the usual medical methods of treatment; (3) diathermy is seldom helpful, but, as already mentioned, other physical therapy procedures are; (4) treatment by x-rays is one of the most effective methods we have.

This brings me to the matter of a more detailed consideration of roentgen therapy and naturally to the manner in which this type of radiation operates to relieve symptoms and effect any curative benefits. People in general appear mystified and skeptical that anything might be expected from this form of therapy.

It is often noted in cases of peritendinitis that calcium deposits, particularly of the amorphous and less compact types, are absorbed after or during a course of x-ray therapy. However, relief of symptoms in these cases is nearly always extremely prompt, often within a few hours after the first irradiation; it is far in advance of any considerable absorption of calcium. Moreover, relief of pain occurs even when calcium deposits fail of any absorption. Thus we see that improvement is not dependent on melting away of calcium and that other factors must be concerned. Further, it is obvious that the roentgen ray is not apt to rebuild a thinned disk. These other factors, as I hinted before, are probably related to inflammation. As is now well known

and has been well reviewed by Drs. Pendergrass and Hodes,<sup>5</sup> x-rays exert a potent beneficial effect on most inflammatory conditions. Although the exact details of the mechanisms involved are not too well understood, there appears to be more or less disintegration of white cells, particularly lymphocytes, with liberation of antibodies. However, changes in circulation likewise take place and, in fact, it is probably these changes which are of the most profound importance. Owing to the presence of an inflammatory reaction, we see infiltration by leukocytes, coagulation of lymph, appearance of fibroblasts and eventually formation of fibrous tissues in more chronic cases. All these tend to interfere with proper circulation and produce passive congestion. The effect of x-rays in appropriate dosage is to break up this type of reaction, which, although beneficial in walling off infected and damaged areas, none the less tends to be excessive, as only too often happens in natural processes. The end result of roentgen therapy is that an active circulation is substituted for passive congestion, thereby producing relief of pain and diminution in swelling along with encouragement of recovery. This relief of congestion is probably what accounts for the prompt relief of pain in so many cases, and of course it is the reactivated circulation which favors the absorption of calcium deposits. Naturally x-rays of themselves will not melt calcium.

Reverting to my cases of cervical arthritis and thinned disk, the main influence of x-rays doubtless is on the irritated and congested soft tissues about the affected segments. Reduction of swelling and improvement of circulation reduce the pressure on the nerve roots, and naturally symptoms improve. Any effect on the purely mechanical pressure from arthritic spurs or due to the thinned disks is not to be expected. It is notable too that the symptoms from these disorders of the cervical vertebrae are often slower to respond to x-rays than those from the so-called subdeltoid bursitis. Why this is so seems obscure, but the main thing is that they generally do respond in time and I usually caution these patients not to become discouraged if improvement is slow. Changes in the roentgenographic appearance of these cervical lesions have, in my experience, been negligible in contradistinction to the usual experience with shoulder calcification.

In connection with this form of therapy to the cervical spine it is interesting to note that hypertensive persons will commonly show a drop in blood pressure of substantial degree as the result of the effects of x-rays on the cervical sympathetic, chiefly the carotid ganglions. Unfortunately this improvement is not permanent.

As to plan of treatment and dosage employed, I have generally used moderate doses of 75 to 100 roentgens twice a week at first and later weekly. After six to eight treatments a rest period of about six weeks is given, followed by a second course. I have usually employed high voltage therapy (200 kilovolts, 0.5 mm. of copper and 3 mm. of aluminum filtration at 60 cm. distance). If this is not available a lower voltage with 3 mm. of aluminum or, better, 0.25 mm. of copper and 1 mm. of aluminum filtration will be usually found efficacious either in the cervical cases or in the cases in which the pathologic changes are limited to the shoulder proper.

As a word of caution it is necessary to point out that we are not going to help all cases and that accord-

ingly if x-rays in adequate dosage fail to produce benefit we should desist and revert to the more usual methods, such as heat, massage, traction, manipulation and support. Naturally the usual medical approach is not to be overlooked in any case. As far as the roentgen ray is concerned, we must avoid either extremes of giving up before an adequate amount has been given (even up to 2,000 roentgens in stubborn cases) or, on the other hand, of persisting unduly in the face of poor response.

Before closing there is one more cause of upper extremity pain I should like to mention, and that is herpes zoster. Not infrequently there is a brachial distribution. The pain and discomfort from this disease surely need no emphasis. However, it should be emphasized and reemphasized that out of all the various remedies x-rays will generally do the most. Further, one has to remember that in elderly patients pain is likely to be unusually severe and resistant and that radiation therapy needs to be pushed with some persistence. These problems, I might add, are well considered by Drs. Carty and Bond<sup>6</sup> in a study on roentgen radiation as an analgesic agent.

#### SUMMARY

In many cases of pain and dysfunction involving the upper extremities, the roentgen ray will not only open the door to diagnosis but also frequently provide a most potent and welcome therapeutic agent.

## TOXIC REACTIONS TO THIOURACIL

### REPORT OF CASES WITH ONE FATALITY

SAMUEL L. GARGILL, M.D.

AND

MARK FALCON LESSES, M.D.

BOSTON

The introduction of thiouracil in the treatment of thyrotoxicosis has occasioned renewed interest in the nonsurgical therapy of the disease. In 1941 Kennedy and Purves<sup>1</sup> observed that rapeseed and allyl thiourea were potent goitrogens. Subsequently the MacKenzies and McCollum<sup>2</sup> and Astwood<sup>3</sup> showed that thiourea and thiourea derivatives, especially 2-thiouracil, produced morphologic thyroid hyperplasia associated with inhibition of hormone production.

Astwood<sup>4</sup> first employed thiouracil in the treatment of patients with toxic goiter. This chemical compound is 2-thiouracil with the structural formula of  $\text{NHCSNHCOCHCH}$ . He found that the drug produced complete remission of symptoms and return of the basal metabolic rate to normal in most cases. These findings were confirmed by Williams and Bissell.<sup>5</sup> Our own experience is in accord with these reports.

Early observations quickly showed the toxicity of thiouracil. Astwood,<sup>6</sup> reporting the first 30 cases of hyperthyroidism treated with the drug, noted 1 case of nonfatal agranulocytosis and 2 cases of drug fever. He felt that this 10 per cent incidence of toxic reactions might be due to excessive dosage. Williams and Bissell,<sup>5</sup>

Fig. 1 (case 1).—Sternal marrow smear on April 18, 1944 at onset of agranulocytosis. Almost complete absence of white blood cells. One plasma cell is seen. Reduced from a photomicrograph with a magnification of 720 diameters.

in discussing complications of treatment, noted swelling and tenderness of the submaxillary salivary glands in 1 case. Gabrilove and Kert<sup>7</sup> described 3 cases with toxic manifestations in a total of 9 treated. One developed fever, lymphadenopathy and dermatitis; a second exhibited fever and dermatitis and a third showed moderate leukopenia.

Since February 1943 thiouracil<sup>8</sup> has been employed by us in the treatment of 43 cases of toxic goiter. The dosage employed has ranged from 0.1 to 1.0 Gm. daily. In this series of cases there have occurred the following toxic reactions: 1 fatal case of agranulocytosis, 2 cases of jaundice, 2 cases of drug fever and 2 cases of swelling of the submaxillary salivary glands. Also granulocytopenia occurred in a patient with severe heart failure who was given the drug in an attempt to produce myxedema.

#### AGRANULOCYTOSIS

**CASE 1—History and Course.**—F. M., a white woman aged 56, a housewife, was admitted to the hospital on March 31, 1943 because of increasing fatigue and nervousness of seven months' duration and dyspnea, frequency of urination and weight loss of 25 pounds (11 Kg.) in the preceding three months. Frequent episodes of palpitation and trembling of the hands and knees had also occurred.

The patient was hyperactive, with staring, shiny eyes and flushed facies. The skin was moist and warm. There was widening of the left palpebral fissure but no other eye changes. There were fine tremors of the extended tongue and hands. The thyroid gland was symmetrically and diffusely enlarged to about twice the normal size. The pulse rate was 100 and the blood pressure was 110 systolic and 70 diastolic in millimeters of mercury. The weight was 123 pounds (56 Kg.).

The urine, blood cells, nonprotein nitrogen, sugar, cholesterol and serologic reaction showed no abnormalities. The basal metabolic rate was plus 30 per cent on admission.

The patient was given 0.6 Gm. of thiouracil for the first seventeen days, 0.4 Gm. for the next six days and 0.2 Gm. daily thereafter. The basal metabolic rate gradually fell until it was minus 2 per cent. The patient left the hospital on April 25, twenty-six days after entry. The symptoms and most of the signs of thyrotoxicosis had disappeared. The thyroid gland was smaller and softer, and the weight had increased steadily.

Following discharge from the hospital the patient was observed at weekly intervals in the Endocrine Clinic. At these visits the leukocyte count, basal metabolic rate, weight and pertinent clinical features were noted. The patient was maintained on 0.2 Gm. daily of thiouracil. Thirty days after the beginning of treatment her basal metabolic rate was minus 9 per cent and her weight 125 pounds (57 Kg.). The thyroid gland felt smaller and firmer. By the end of the second month of therapy the basal metabolic rate had dropped to minus 19 per cent and, although the patient was asymptomatic, puffiness of the eyelids had begun to appear. After ten weeks the basal metabolic rate was minus 18 per cent, the weight 134 pounds (61 Kg.) and the blood cholesterol 329 mg. per hundred cubic centimeters. The eyelids and face were puffy, and only the lower pole of the left thyroid lobe was palpable. After three months of therapy the patient complained of irritability and sluggishness. She showed considerable facial puffiness and a thick, dry skin. The basal metabolic rate was minus 24 per cent and the blood cholesterol was 367 mg. per hundred cubic centimeters. Thiouracil was omitted because of myxedema. The leukocyte count throughout the first three months had numbered between 6,400 and 10,500 per cubic millimeter, with abundant polymorphonuclear cells always present.

No thiouracil was administered for the subsequent four and one-half months. During this period the basal metabolic rate gradually rose to plus 9 per cent, the weight decreased 12 pounds (5.4 Kg.) and the patient developed mild symptoms of thyrotoxicosis. Thiouracil was readministered on October 15 in doses of 0.2 Gm. daily. After two weeks the basal metabolic rate had dropped to minus 4 per cent, the weight had increased

Fig. 2 (case 1).—Sternal marrow smear at necropsy. Myeloblasts and myelocytes are abundant. One neutrophil is seen at edge of field. Reduced from a photomicrograph with a magnification of 720 diameters.

by 2 pounds (0.9 Kg.) and her thyrotoxic symptoms had disappeared. At this time the thyroid gland was barely palpable. At the end of four weeks of the second period of thiouracil ingestion the basal metabolic rate was minus 13 per cent. At the end of eleven weeks the patient looked slightly myxedemic. The basal metabolic rate was minus 19 per cent and the blood cholesterol 312 mg. per hundred cubic centimeters. Thiouracil

was accordingly reduced in dosage to 0.1 Gm. daily. After twenty days on this dosage thiouracil was again omitted on Jan. 27, 1944 because of increasing signs and symptoms of myxedema. Three weeks later the basal metabolic rate had risen to plus 3 per cent and the patient felt and looked well. However, when the patient had not taken thiouracil for seven weeks mild thyrotoxic symptoms reappeared and the basal metabolic rate had risen to plus 21 per cent.

A third course of thiouracil in a dosage of 0.2 Gm. daily was accordingly begun on March 16, approximately one year after the initiation of treatment with the drug. Four weeks later, on April 15, the basal metabolic rate was plus 13 per cent and the patient still showed mild signs and symptoms of thyrotoxicosis. The leukocytes at this time numbered 6,500 per cubic millimeter. Thiouracil was continued in the same dosage.

The following day, April 16, the patient had new dentures fitted and noted pain and tenderness in the roof of her mouth. The next day, April 17, a sore throat developed followed by a severe, shaking chill and a temperature of 103.5 F. The patient appeared acutely ill, with flushed facies, gray coated tongue, large reddened tonsils covered with a grayish exudate and tender swollen lymph glands at the angles of the jaw. The leukocytes numbered 1,000 per cubic millimeter and the smear showed no polymorphonuclear cells. Thiouracil was omitted and the patient entered the hospital the next day. Treatment consisted of three blood transfusions, sodium sulfadiazine 5.0 Gm. and sodium sulfamerazine 9.0 Gm. intravenously, 270 cc. of pentnucleotide intramuscularly, liver extract and 150,000 units of penicillin. Ulcerations developed in the throat and tonsils. The white blood cells ranged between 900 and 1,650 per cubic millimeter. The hemoglobin was 11.3 to 12.5 Gm. per hundred cubic centimeters and the red blood cells averaged 4,000,000 per cubic millimeter. No polymorphonuclear cells appeared at any time, but on the day before death 1 myelocyte was seen in a count of 25 cells. Two sternal aspirations and bone marrow biopsies were done on the second and fourth days of hospital stay; both showed a hypoplastic marrow with granulocytic aplasia. The patient died suddenly on the sixth hospital day.

*Postmortem Examination* (Dr. M. J. Schlesinger).—*Pertinent Gross Findings:* The peritoneal cavity contained 500 cc. of slightly cloudy, straw-colored fluid. The surfaces were smooth and somewhat soggy. The right pleural cavity contained 400 cc. and the left 200 cc. of slightly cloudy, straw-colored fluid. The pleural surfaces were normal. The mediastinal tissues were edematous. The pericardial cavity contained 85 cc. of clear, straw-colored fluid. The heart weighed 315 Gm. When first exposed it seemed very large, the apex extending to the axillary line on the left. On incision of the blood vessels the heart collapsed, as the enlargement was due to manifest dilatation of the right auricle and ventricle; the left ventricle was small and contracted. Otherwise the heart was normal. The lungs were soft, flabby, atelectatic and free of pneumonic patches or edema. The trachea was almost completely filled with a slightly yellowish, clear, gelatinous mucoid plug extending to the tracheal bifurcation and for a slight distance into the left major bronchus and into the main branches of the right middle and right lower lobe bronchi, and to an advanced degree into the right upper lobe bronchus. The plug was not firmly adherent. The spleen was slightly enlarged, weighing 340 Gm. The base of the tongue, the tonsils and the pharynx were angry, raised and purplish red. The mucosal surfaces presented numerous superficial ulcers 1 to 2 mm. in diameter, covered with yellowish white exudate. The underlying tissues were edematous and congested. There were no pharyngeal abscesses and no laryngeal congestion or edema. Starting below the vocal cords a gelatinous plug was found in the trachea, similar in appearance to that found in the trachea and bronchi. There was a bilateral chain of enlarged cervical glands. The thyroid was about twice normal in size, uniform in texture and appearance and firm. The cut surface had a uniformly meaty, purplish red appearance. Embedded deeply in the left lobe was a small, light-colored nodule about 6 mm. in diameter. The bone marrow of the vertebrae, sternum, ribs and middle of the shaft of the left femur was examined. The femur marrow was

yellow and fatty. Elsewhere the marrow was abundant, pasty and slightly brownish.

*Pertinent Microscopic Findings:* The lungs showed congestion without hemorrhage or edema, small areas of atelectasis and small emphysematous blebs. In the larger bronchi the epithelium was either desquamated or filled with mucous blebs. The splenic pulp was moderately congested, with small and inactive corpuscles. The liver sinusoids were dilated without cell necrosis. The pharyngeal ulcers were filled with necrotic plugs containing large numbers of bacilli and cocci. Thrombosed lymphatics were present in the immediate neighborhood of the ulcers; otherwise there was no cellular reaction to the necrotic tissue.

The thyroid, fixed in Zenker's solution and stained with eosin-methylene blue, showed a uniform picture of small acini, tightly packed together and separated by a small amount of stroma without lymphoid infiltration: a rare acinus contained hyaline-staining colloid. In the lumens of most of the acini there was only a small amount of very fine granular material. Most of the lining cells of the alveoli were desquamated into the alveolar lumen; an intact lining was rare. Where intact, the lining cells were high, columnar and broad, with an indistinguishable cell wall where they touched and a ragged luminal surface. The cytoplasm was thin and pale blue, with loose hydropic texture. The nuclei were large, round or oval, with uniformly distributed chromatin. Thyroid sections fixed in solution of formaldehyde and stained with hematoxylin and eosin showed a contrasting picture to the foregoing. No epithelial cells in situ were found, as they were all desquamated, with shrunken, pyknotic nuclei and a cytoplasm of stringy material attached to the nucleus. Two nodules were noted in one of the sections stained with hematoxylin and eosin; one enclosed in thick connective tissue, the second unencapsulated but clearly demarcated. The thyroid tissue in these nodules was composed of small acini, many containing colloid, and lined with fairly well preserved, low cuboidal cells in striking contrast to the cellular disintegration outside the nodule.

The bone marrow in the shaft of the femur was largely composed of fat with a few tiny islands of marrow cells. The sections from the ribs were at least half fat; the remainder consisted of marrow-forming cells. These nests of marrow cells were composed of an equal mixture of large undifferentiated cells with a bluish cytoplasm and of definite normoblasts. No eosinophilic myelocytes were found.

This patient with thyrotoxicosis was treated with three courses of thiouracil over a period of approximately one year. The first course of thiouracil, which lasted three months with an average daily dose of 0.2 Gm., was followed by the development of myxedema and a remission which lasted four and one-half months. The second course of thiouracil, with an average daily dose of 0.2 Gm., lasted fourteen weeks and was followed by the reappearance of myxedema and a remission which lasted seven weeks. In the third and final course the patient received a daily dose of 0.2 Gm. of thiouracil for four weeks, when agranulocytosis suddenly appeared, followed by death in six days in spite of transfusions, penicillin, sulfadiazine, sulfamerazine, liver extract and pentnucleotide. Postmortem examination showed extensive granulocytic hypoplasia of the marrow, ulcerative pharyngitis, an occluding tracheobronchial mucous plug, pulmonary congestion and atelectasis, and acute dilatation of the right auricle and ventricle. The thyroid gland showed alveolar hyperplasia and hydropic degeneration with absence of colloid and lymphocytic infiltration.

*CASE 2.*—Granulocytopenia with dermatitis. J. S., a white man aged 57, an upholsterer, with a previous admission four months earlier for congestive heart failure, entered the hospital on Sept. 3, 1942 because of severe angina pectoris and heart failure unimproved by adequate digitalization and bed rest. The patient was dyspneic, orthopneic and cyanotic. The neck veins were engorged. The heart was enlarged downward to

the left and had a loud mitral systolic murmur. There were medium moist rales over both lung bases. The liver was enlarged to four fingerbreadths below the right costal margin; ascites and moderate ankle edema were present. The blood pressure was 140 systolic and 110 diastolic. Urinalyses showed specific gravities ranging between 1.010 and 1.020 (uncorrected for albumin), heavy traces of albumin, no sugar and varying numbers of red and white cells, with occasional hyaline and granular casts in the sediment. The blood nonprotein nitrogen varied between 45 and 64 mg. per hundred cubic centimeters. The blood cholesterol varied between 404 and 500 mg. per hundred cubic centimeters. The blood carbon dioxide combining power was 46 volumes per cent. The total protein of the serum ranged between 5.97 and 7.46 Gm. per hundred cubic centimeters with a normal albumin-globulin ratio. Numerous electrocardiograms showed normal rhythm with defective intraventricular conduction, left axis deviation and prominent Q waves in leads 1, 2 and 3. Hematologic examination showed a hemoglobin value of 110 per cent (15.95 Gm.), erythrocytes numbering 5,600,000 per cubic millimeter and leukocytes numbering 7,900 per cubic millimeter, with 64 per cent polymorphonuclear leukocytes, 34 per cent lymphocytes and 2 per cent monocytes. Roentgenologic examination of the chest showed a hypertensive heart with pronounced congestive changes in the lungs.

Despite the reduction in dosage leukopenia continued, and three days later the leukocytes numbered 2,100 per cubic millimeter with 7 per cent neutrophils, 72 per cent lymphocytes and 21 per cent monocytes. The hemoglobin dropped to 90 per cent (13.05 Gm.) and the erythrocytes dropped to 4,000,000 per cubic millimeter. Thiouracil was omitted, a transfusion with 750 cc. of whole blood was given and pentnucleotide 40 cc. administered daily. The following day the leukocytes numbered 3,300 per cubic millimeter with 11 per cent neutrophils, 68 per cent lymphocytes and 20 per cent monocytes. Thereafter there was a steady increase in the neutrophil percentage and total white count, so that by the end of six days the total white count was 6,700 per cubic millimeter with 64 per cent neutrophils, 29 per cent lymphocytes and 7 per cent monocytes, as shown in the table.

Three days after leukopenia had developed urticaria appeared, first over the right wrist, progressing in the next two days to involve the lower lip and eyes. These skin manifestations disappeared after omission of the drug.

Throughout the period of granulocytopenia the patient was afebrile except for a single temperature rise to 101.4 F. Pruritus, associated with the urticaria, was the only symptom noted. No change in the basal metabolic rate occurred as a result of the administration of thiouracil. The patient was discharged from the hospital on Oct. 31, 1942.

\* Based on 100% = 14.5 Gm.

The patient was treated with bed rest, a low salt diet, digitalis, diuretics and glyceryl trinitrate. Since this regimen did not materially benefit his angina pectoris or adequately control his heart failure, and because of previous prolonged disability from heart failure, total thyroidectomy was considered. Because of impaired renal function, this procedure was not undertaken and an attempt to produce myxedema by the use of thiouracil was substituted. The basal metabolic rate was first determined and found to range between plus 9 and plus 18 per cent in a series of five determinations. This elevation was due to heart failure, as the blood velocity measurements (arm to tongue) were prolonged to an average of 35 seconds and the venous pressure increased to an average of 15 cm.

The drug was started on September 25 in doses of 0.8 Gm. daily. At this time his erythrocytes were 5,150,000 per cubic millimeter, hemoglobin 112 per cent (16.2 Gm.) and leukocytes 8,000 per cubic millimeter with 75 per cent neutrophils, 23 per cent lymphocytes and 2 per cent monocytes. After seven days the dose of thiouracil was reduced to 0.6 Gm. daily. At this time the hemoglobin was 114 per cent (16.5 Gm.), the erythrocytes were 5,900,000, and the leukocytes were 9,300 per cubic millimeter with 61 per cent neutrophils, 31 per cent lymphocytes, 3 per cent monocytes, 4 per cent eosinophils and 1 per cent basophils. After eighteen days the dosage was again reduced to 0.4 Gm. daily because on the preceding day the leukocytes were found to number 3,300 per cubic millimeter with 32 per cent neutrophils, 50 per cent lymphocytes, 17 per cent monocytes and 1 per cent basophils. The hemoglobin was 104 per cent (15.1 Gm.) and the erythrocytes numbered 5,250,000 per cubic millimeter.

He reentered the hospital on Feb. 10, 1943 because of recurrence of heart failure. Therapy with bed rest, diet, digitalis and diuretics was unavailing and the patient died on April 29. Postmortem examination showed aneurysm of the left ventricle, coronary sclerosis, left ventricular hypertrophy, bronchopneumonia, bronchiectasis, a bronchiectatic cavity with small lung abscesses, chronic glomerulonephritis and chronic passive congestion. The thyroid gland was entirely normal on gross and microscopic examination. The bone marrow was also normal, showing active formation of red and white blood cells.

This patient with chronic heart failure and angina pectoris was given thiouracil in doses of 0.8 Gm. daily for six days, 0.6 Gm. daily for eighteen days and 0.4 Gm. daily for two days. On the twenty-fifth hospital day he developed leukopenia and neutropenia and on the twenty-seventh day severe neutropenia associated with slight reduction in the hemoglobin values and red blood cell count. At this point the drug was omitted. An urticarial dermatitis appeared simultaneously with the onset of the neutropenia. Complete recovery ensued, following treatment with transfusions and pentnucleotide.

#### JAUNDICE

CASE 3.—R. F., a white woman aged 54, a housewife, entered the Beth Israel Hospital on May 12, 1943 because of increasing dyspnea, orthopnea, substernal pain, weakness and a weight loss of 16 pounds (7.3 Kg.) in the preceding three months. Three years previously the patient had been hospitalized for

hypertensive heart disease. On examination the patient showed orthopnea, a warm moist skin, moderate exophthalmos, distended neck veins and moderate diffuse enlargement of the thyroid gland. The heart was considerably enlarged downward and to the left, with a loud systolic murmur in the second left interspace and regular rhythm; the blood pressure was 230 systolic and 90 diastolic. The lung bases showed a few fine rales; there was no enlargement of the liver or peripheral edema. Urinalyses were uniformly negative. The leukocytes, erythrocytes and hemoglobin values were within the normal range. The blood nonprotein nitrogen was 30 mg. per hundred cubic centimeters. The electrocardiogram showed the pattern of chronic left ventricular strain. The arm-to-tongue circulation time (calcium gluconate) was 15 seconds. The basal metabolic rate was plus 64 per cent initially and in a repeated determination four days later.

On May 23 auricular fibrillation developed and the patient was digitalized. Because of the elevated basal metabolic rate and the clinical signs of thyrotoxicosis, Lugol's solution was administered on May 25. Six days later the basal metabolic rate was plus 31 per cent. On June 5 the basal metabolic rate was plus 25 per cent. On June 9 the basal metabolic rate was plus 30 per cent and on June 22 it was plus 17 per cent. Because of a persistently normal pulse rate, averaging 70 per minute at all metabolic levels, and despite the good clinical and metabolic response, Lugol's solution was omitted in order conclusively to establish the diagnosis of thyrotoxicosis. The patient was discharged on June 30 and was thereafter followed in the Endocrine Clinic. Maintenance doses of digitalis were continued. Approximately one month later the patient developed aggravation of the thyrotoxicosis with an increase in the basal metabolic rate to plus 48 per cent. Iodine was therefore readministered in the form of saturated solution of potassium iodide, 10 drops daily, and reduced the basal metabolic rate to plus 33 per cent after three weeks. Because the patient was not clinically improved, thiouracil 0.8 Gm. daily was added on August 13. One week later the basal metabolic rate was plus 25 per cent and there was noticeable improvement. Thiouracil was reduced to 0.6 Gm. daily and after two weeks, on September 3, the basal metabolic rate was plus 28 per cent, but the patient complained of generalized itching. On examination there were multiple linear scratch marks and questionable scleral icterus. Because a dermatologic consultant felt that scabies was the cause of the

During the next ten days there was increasing jaundice with a rise in the icterus index from an initial value of 85 to 180. The stools were clay colored. The urine contained large amounts of bile and no urobilin. The patient experienced one episode of upper abdominal pain, colicky in nature, of one hour's duration. Except for pruritus and nausea the patient was otherwise asymptomatic. Radiographic examination of the chest and gastrointestinal tract gave normal results. The galactose

Fig. 4 (case 3).—Section of liver. Magnification of window in figure 3. Normal hepatic cells, periportal cellular infiltration. Large bile ducts with open lumens clearly visible. Reduced from a photomicrograph with a magnification of 720 diameters.

tolerance test, blood urea concentration, blood total protein and albumin-globulin ratio, blood cholesterol and cholesterol esters were normal. The alkaline phosphatase of the blood was 16 units (Bodansky). The basal metabolic rate was plus 35 per cent and plus 29 per cent on two occasions.

Since the jaundice appeared obstructive in nature, laparotomy was done on September 24. At operation the gallbladder was thin walled, normal in appearance and free of palpable stones. The common duct was thin, soft and nondistended. Aspiration revealed dark, clear bile containing no sediment. The pancreas felt normal. Biopsy of the liver was taken and the operation was terminated. Common duct exploration and cholangiography were not performed. The liver was shrunken and green.

The microscopic examination of the liver showed prominent central veins and normal parenchymal cells. The sinusoids were clearly demarcated and empty, well lined with prominent Kupffer cells. The bile capillaries between the cells of the liver cords were manifestly distended. Those in the outer half of the lobule were distended but empty, while those in the inner half of the lobule were distended and plugged with yellow-green bile pigment. In the portal areas the larger bile ducts were empty but showed evidence of recent distention by the prominence of their open lumens. The portal areas were infiltrated with some mononuclear and rare polymorphonuclear cells. The histologic picture described is that usually associated with acute bile stasis.

Following operation the jaundice gradually lessened and bile appeared in the stool on the fourth postoperative day. The patient left the hospital on October 15 with an icterus index of 33; the index finally became normal on December 10. The total duration of jaundice was one hundred days.

Throughout her hospital stay the patient received iodide medication and this was continued during her supervision in the outpatient department. The basal metabolic rate gradually rose, in spite of iodine, from plus 23 per cent to plus 54 per cent, with increasing signs of thyrotoxicosis. A second trial with thiouracil was therefore begun on Feb. 11, 1944. Extreme dizziness and weakness developed on that day, after she had taken 0.6 Gm. of thiouracil in divided doses. On the following day she took 0.8 Gm. and developed itching of the extremities and diarrhea. She felt feverish and drowsy and perspired excessively on these two days. Thiouracil was omitted. She

Fig. 3 (case 3).—Section of liver. Dilated central vein, normal hepatic cells, clearly defined and empty sinusoids. Cellular infiltration about the portal area. Bile thrombi and distended bile capillaries not clearly apparent at this magnification. Reduced from a photomicrograph with a magnification of 180 diameters.

pruritus, thiouracil was continued in the same dosage. Within the next week the patient noted diarrhea, dark urine and clay-colored stools, and continued severe pruritus. There was no abdominal pain, epigastric distress, nausea, vomiting or colic. On examination there was deep generalized icterus without enlargement of the liver or spleen. Thiouracil was omitted and the patient reentered the hospital on September 13.

was not seen in the clinic until February 16, at which time no jaundice was apparent; the leukocyte count on that day was 7,850 per cubic millimeter with abundant polymorphonuclear cells.

Subsequently the patient was treated with potassium iodide alone and underwent thyroidectomy on March 13. Because of operative injury to the recurrent laryngeal nerve, only hemithyroidectomy was performed. The thyroid histologically showed hyperplasia and involution. Mild thyrotoxicosis has persisted since this operation and has been controlled with iodine.

This 54 year old woman with hypertensive heart disease and toxic diffuse goiter developed severe jaundice three weeks after the administration of thiouracil in doses of 0.6 to 0.8 Gm. daily. Omission of the drug failed to alleviate the jaundice, which in fact increased until the icterus index was 180. Because the jaundice appeared obstructive in nature, laparotomy was performed, with the finding of a normal gallbladder and common bile duct. The liver biopsy, however, showed the histologic picture of acute bile stasis without hepatitis. The jaundice disappeared after one hundred days. Readministration of thiouracil for two days produced toxic symptoms. Thyroidectomy was eventually performed for the control of the thyrotoxicosis.

CASE 4.—J. B., a man aged 30, a shipyard worker, entered the hospital on June 7, 1944 complaining of nervousness, tremors, diarrhea, palpitation, increased irritability and hyperhidrosis of two months' duration. He had lost 15 pounds (6.8 Kg.) in spite of a good appetite. On examination he appeared hyperactive, with a warm, moist skin and tremors of the tongue and hands. The eyes were staring but otherwise normal. The thyroid was diffusely enlarged to twice normal size and felt firm. The heart had a forceful apex impulse but was not enlarged and showed a regular rhythm at a rate of 120. Both breasts were moderately enlarged, nodular and tender. The blood pressure was 120 systolic and 70 diastolic.

Four urine analyses were negative. Hematologic studies were normal. The fasting blood sugar was 103 mg. per hundred cubic centimeters and the blood cholesterol was 294 mg. per hundred cubic centimeters. The basal metabolic rate on June 8 was plus 59 per cent and on June 9 was plus 54 per cent.

On June 8 thiouracil 1.0 Gm. daily was administered and continued in that dose until June 15, when it was reduced to 0.6 Gm. daily. On that day the basal metabolic rate was plus 11 per cent and the patient left the hospital. Clinical improvement occurred coincidentally with the lowering of the basal metabolic rate. The thyroid decreased in size and became softer.

The patient continued to take 0.6 Gm. daily of thiouracil for the next fifteen days. When seen on June 30 he was free from all symptoms and signs of thyrotoxicosis and stated that he had been doing full time work since June 20. His basal metabolic rate was minus 14 per cent, with a pulse rate of 80. The leukocyte count was 5,400 per cubic millimeter, with a normal differential count. Thiouracil was reduced to 0.4 Gm. daily.

Three days later, on July 3, pruritus of the extremities, without dermatitis, developed and thiouracil was stopped. The following day clay-colored stools and dark urine were noted and there was increased pruritus. On July 5 the patient was moderately jaundiced, with bilirubinuria and an icterus index of 18. The leukocyte count was 12,150 per cubic millimeter. Saturated solution of potassium iodide was begun on that day and has been continued to the present. By July 7 the pruritus had ceased, although the stools remained acholic until the next day, when the icterus index was 15. Bilirubinuria, without urinary urobilin, continued until July 11. On July 21 the icterus index was still elevated to a level of 16, although by this date the stools contained bile; the urine was bile free and contained urobilin. The basal metabolic rate on this date was minus 5 per cent, and the leukocytes numbered 6,500 per cubic millimeter. The patient was asymptomatic. The icterus index returned to normal on July 31.

This 30 year old patient with thyrotoxicosis and gynecomastia developed symptoms and signs of obstructive jaundice following the administration of thiouracil for twenty-four days. The pruritus disappeared four days after omission of the drug, but the icterus index remained elevated for twenty-six days. Thiouracil was not readministered, as in case 7, to prove the etiologic relationship, but the coincidental occurrence of catarrhal jaundice in this case seems adequately excluded by the fairly prompt recovery following omission of the drug.

#### DRUG FEVER

CASE 5.—J. B., a white woman aged 60, a housewife, with a history of toxic goiter in 1 brother and a past history of nodular nontoxic goiter treated at another hospital by a right hemithyroidectomy in 1939, was admitted to the Beth Israel Hospital on Nov. 29, 1943 because of palpitation, nervousness, easy fatigability, sleeplessness, diarrhea and sweating of three months' duration. During this period she had lost 15 pounds (6.8 Kg.) in weight.

The menopause had occurred ten years previously, and since then she had had mild hypertension. She had borne five children, all of whom were alive and well except for one daughter with diabetes.

The patient was an alert, jumpy woman with flushed facies, shiny eyes and warm moist skin. There was no exophthalmos or lid lag. There was a hair line thyroidectomy scar. The left lobe of the thyroid was three times the normal size; the right lobe was not felt. The extended hand showed a fine tremor. The heart rate was 120 and the blood pressure was 160 systolic and 76 diastolic.

Examination of the blood and urine showed no abnormalities. The leukocytes ranged between 6,150 and 9,650 per cubic millimeter and neutrophils averaged 75 per cent. The fasting blood sugar was 77 mg. per hundred cubic centimeters and the blood cholesterol was 171 mg. per hundred cubic centimeters. The basal metabolic rate was plus 38 per cent on November 30 and plus 35 on December 1.

Thiouracil was started on December 1 in doses of 1.0 Gm. daily. During the ensuing three days striking aggravation of symptoms and signs occurred, the patient complaining of palpi-

Fig. 5 (case 5).—Febrile reaction to thiouracil. Following subsidence of fever due to sore throat, note drug fever accompanied by chill on December 18 and 19, with defervescence on omission of drug and recurrence of fever with readministration.

tation, weakness and restlessness and showing an increase in pulse rate and in skin hyperemia. On December 4 improvement began to appear, and on the 7th the basal metabolic rate had dropped to plus 15 per cent and the pulse rate to 105. Thiouracil was decreased to 0.6 Gm. daily.

On December 11 the patient complained of sore throat. Her temperature rose to 101 F. and her pulse rate to 130. The throat showed diffuse bright redness throughout the fauces and pharynx. The throat culture showed weakly hemolytic strepto-

cocci. The leukocyte count was 6,800 per cubic millimeter, with 76 per cent neutrophils. She was treated with acetylsalicylic acid and hot saline throat irrigations. Thiouracil was continued in the same dosage. The throat symptoms improved steadily during the following four days, and the temperature was normal on December 15.

On the evening of the 18th the patient had a chill and her temperature rose to 102 F. She complained of headache, general malaise and restlessness. Physical examination revealed no cause for this change in the patient's condition. The leukocyte count was 9,300 per cubic millimeter, the urine showed no abnormalities and a blood culture showed no growth of any organisms. The next morning the temperature rose to 102 F. The patient complained of headache and of generalized aches and pains and was restless. The leukocyte count was 9,600 per cubic millimeter and the physical examination remained negative. The fever persisted during the following day and the patient continued to have headache. Thiouracil was omitted on December 21, whereupon the temperature promptly dropped to normal, and the patient felt better.

The basal metabolic rate on December 23 was plus 10 per cent. On the following day thiouracil was again administered. After the second dose of 0.2 Gm. the temperature rose to 101 F. and the patient complained of restlessness, headache and nausea. Thiouracil was stopped and the temperature promptly dropped.

Despite omission of thiouracil, improvement in the thyrotoxicosis continued. The basal metabolic rate on December 27 was  $\pm 0$ , and the patient was discharged without further administration of thiouracil.

This patient, with toxic diffuse goiter and mild arterial hypertension, showed an initial aggravation of signs and symptoms following the administration of thiouracil. In spite of this the drug was continued, and after one week striking clinical and metabolic improvement had occurred. On the eleventh day of drug administration she developed a streptococcic sore throat associated with fever and a normal leukocyte count. By the fifteenth day she had recovered from this episode. On the eighteenth day chills and fever developed and persisted until the twenty-first day, when prompt remission occurred following the omission of thiouracil. On the twenty-third day thiouracil was readministered, with prompt rise in temperature followed by remission when the drug was again omitted. Since then the patient has been adequately controlled with potassium iodide.

CASE 6.—D. K., a white man aged 36, a salesman, was first seen on March 17, 1944 with the complaints of tremors of the hands and legs, intolerance to warm environments, diarrhea and palpitation, beginning one year previously when he had undergone cholecystectomy for chronic cholecystitis and cholelithiasis. At operation a chronic duodenal ulcer was noted. Symptoms from the ulcer were well controlled with diet and alkalis. On examination there was hyperemia of the face and chest, warm moist palms and pronounced tremor of the hands. The eyes showed slight lid lag but no exophthalmos. The thyroid was firmly and diffusely enlarged to twice normal size. The heart rate was 104 and the blood pressure 160 systolic and 70 diastolic. The examination of the urine showed no abnormalities. The leukocyte count was 7,500 per cubic millimeter, with 60 per cent neutrophils. The basal metabolic rate on three occasions was plus 50, 49 and 49 per cent.

Thiouracil was started on March 24 in doses of 1.0 Gm. daily. One week later the basal metabolic rate was plus 34 per cent, the pulse rate 84 and the leukocyte count 8,400 per cubic millimeter. Thiouracil was continued in the same dosage. On the ninth day of therapy the patient developed a choking sensation in the throat and chest, nausea and vomiting, and temperature elevation to 102 F., with copious sweating and generalized aches and pains. This continued on the tenth day, when thiouracil was omitted with prompt defervescence

and remission of symptoms. Examination on the eleventh day showed no change in the patient's signs, except that the blood pressure was 130/70 and the weight had increased 4 pounds (1.8 Kg.). The leukocytes numbered 8,600 per cubic millimeter and the hemoglobin was 100 per cent (14.5 Gm., Sahli). Thiouracil was readministered in doses of 0.6 Gm. daily on the eleventh day. One hour after 0.2 Gm. had been taken, burning of the eyes and a temperature rise to 99.0 F. occurred. The patient, however, continued to take the thiouracil on that day and one hour after 0.6 Gm. had been taken he developed choking sensations in the throat, chilliness, a persistent nonproductive cough, severe burning of the eyes, dyspnea and a fever of 102.5 F. The fever and symptoms persisted all night. Examination on the twelfth day showed evident conjunctival injection and moderate splenomegaly. The leukocyte count was 9,000 per cubic millimeter with 60 per cent polymorphonuclear cells, 12 per cent lymphocytes and 18 per cent monocytes. The red blood cells and platelets appeared normal. Thiouracil was omitted, and prompt remission of symptoms occurred.

On the thirteenth day the daily administration of 10 drops of saturated solution of potassium iodide was begun. On the sixteenth day the patient was admitted to the Beth Israel Hospital. At this time the temperature was normal, pulse rate 92 and the blood pressure 125 systolic and 65 diastolic. There were fine tremors of the hands, slight lid lag, diffuse firm enlargement of the thyroid and a palpable spleen. The basal metabolic rate was plus 10 per cent. The hemoglobin was 112 per cent (17.4 Gm.), the red blood cells numbered 5,400,000 and the white blood cells 11,900 per cubic millimeter with 55 per cent neutrophils, 38 per cent lymphocytes, 5 per cent monocytes, 1 per cent eosinophils and 1 per cent basophils. Four urine examinations revealed no abnormalities.

Medication with potassium iodide was continued, and on April 21 subtotal thyroidectomy was performed because of incomplete control of thyrotoxicosis with iodine. The splenomegaly had disappeared by the time of operation.

The operation was performed after the patient had received iodine for nineteen days and twenty-three days after the omission of thiouracil. Microscopic examination of the thyroid showed areas of extensive hyperplasia and accentuated hyperinvolvement with lymphoid tissue scattered about in small and large groups, often containing germinal centers.

Following operation the patient's recovery was uneventful. One month postoperatively the basal metabolic rate was minus 8 per cent, with a pulse rate of 66.

This second case of drug fever caused by thiouracil developed on the ninth day of administration. The causal relationship to thiouracil was proved by readministration of the drug. In this case there were definite constitutional reactions, splenomegaly and monocytosis.

#### SUBMAXILLARY SALIVARY GLAND SWELLING

CASE 7.—A. G., a white man aged 59, a carpenter, with toxic nodular goiter and auricular fibrillation, developed a painful, egg-sized swelling of both submaxillary salivary glands after one month of thiouracil medication with a daily dose of 0.4 Gm. He showed a temperature rise to 99.8 F. and a leukocyte count of 15,000 per cubic millimeter at the height of the swelling. The drug was continued in the same dosage, but he was kept in bed and fluids were forced. One week later there was decided reduction in the size of the glands and absence of tenderness. After two weeks the submaxillary glands were impalpable. There was no recurrence of this complication despite continuation of thiouracil for over six months.

CASE 8.—M. K., a woman aged 28, a housewife, with toxic diffuse goiter, developed painful, moderate sized swelling of both submaxillary salivary glands after one month of thiouracil medication with a daily dose of 0.4 Gm. No fever or leukocytosis occurred. Although thiouracil was continued, the swelling subsided and did not recur during subsequent administration of the drug over a period of several months.

## COMMENT

Before utilizing thiouracil in the treatment of toxic goiter in man, Astwood<sup>9</sup> investigated the chemical nature and toxic effects of antithyroid substances and found well defined individual variations in toxicity as well as in antithyroid effect. Thiourea and thiouracil were low in toxicity and active in depressing thyroid function. Of thiouracil he noted that "when this compound was fed at a level of 1 per cent in the food [of rats], concretions in the urinary tract were noted in about one third of the animals." Subsequently Williams<sup>10</sup> found a few instances of distinct leukopenia and anemia in rats receiving thiouracil, although bone marrow sections were normal.

The toxic manifestations of thiouracil in animals gave little clue to the range of harmful effects which were later observed in man. When these effects began to appear, the dosage of the drug or idiosyncrasy was implicated as an etiologic factor. Astwood<sup>4</sup> early warned that thiouracil might prove to be disadvantageously toxic as compared with thiourea. However, thiourea, with a very simple formula ( $\text{NH}_2\text{CSNH}_2$ ) and the basic drug of the thiourea group of antithyroid substances, has already proved seriously toxic. Because of its unpalatability it has not received extensive trial; nevertheless Astwood<sup>6</sup> noted a skin rash in several instances, and Newcomb and Deane<sup>11</sup> noted severe granulocytopenia and thrombocytopenia in a patient with toxic goiter who had received the drug over a period of five weeks.

Thiouracil has been reported to produce the following toxic effects in man: agranulocytosis and granulocytopenia, drug fever, varied types of dermatitis, swelling of the submaxillary salivary glands, arthritis and arthralgia, edema of the legs and nausea with vomiting. The incidence of these complications has been between 10 and 20 per cent.

**Jaundice.**—To the preceding list of complications we add jaundice, which was encountered twice in our series. In both instances this complication occurred during the second or third week of drug administration. The jaundice had the clinical and laboratory characteristics of obstructive jaundice. Laparotomy in 1 case, however, showed no extrahepatic biliary tract obstruction, but liver biopsy revealed evident biliary stasis and pericholangitis with normal liver parenchyma. These clinical and pathologic findings resembled in every detail the syndrome of postarsphenamine jaundice apparently due to obstruction of the intrahepatic biliary tract, first described by Hanger and Gutman.<sup>12</sup> In their 12 cases it is noteworthy that the hepatotoxic reaction developed after the second or third intravenous arsenical injection. Jaundice appeared within several days and persisted for weeks or months, unaccompanied by other symptoms except pruritus. This sequence developed in our cases also, 1 case showing jaundice for one hundred days and the other for twenty-six days. More recently Turner and his associates<sup>13</sup> in a report of their experience with 4,083 cases of acute hepatitis following yellow fever

vaccination noted two types of hepatic reaction: one consisted of the usual hepatitis and was of brief duration; the other showed biliary obstruction of prolonged duration.

Thus it is clear that both drugs and infectious agents may produce a clinical and pathologic picture of obstructive jaundice as well as the more common hepatitis. Moreover, it is probable that a late stage of this hepatic injury may be the "intrahepatic cholangitic biliary cirrhosis" recently discussed by Karsner.<sup>14</sup> This end picture is especially characterized by cellular infiltration about the portal spaces and bile plugs in the biliary capillaries and canaliculi.

**Granulocytopenia.**—In the present series this complication occurred twice, with one fatality. Moderate granulocytopenia occurs with some frequency in thyrotoxicosis, expressing itself through a relative lymphocytosis. This, however, is probably not contributory to thiouracil granulocytopenia, since 1 of our patients had arteriosclerotic heart disease without thyrotoxicosis.

Astwood<sup>6</sup> noted this complication once in a series of 30 thyrotoxic patients treated with thiouracil and attributed it to excessive dosage. Williams and Clute<sup>15</sup> observed granulocytopenia at least twice in their series of 72 cases and noted other instances of leukopenia and granulocytopenia, which they ascribed to thyrotoxicosis as such. Gabrilove and Kert<sup>7</sup> noted 1 case of leukopenia in their series of 9 cases, but this case exhibited no percentile decrease in granulocytes.

The occurrence of granulocytopenia and agranulocytosis seems unrelated to the dosage level of thiouracil, since it has occurred in patients receiving as little as 0.2 Gm. daily or as much as 2.0 Gm. daily. The duration of therapy seems also not to be significant, as it has occurred from a few days<sup>15</sup> to many weeks following the inception of treatment. Intermittence of treatment is also not a factor, since it has occurred during uninterrupted therapy and has resulted fatally following remittent treatment. In addition, Williams and Clute<sup>15</sup> observed occurrence and disappearance of granulocytopenia during continued administration of thiouracil.

This toxic manifestation of thiouracil is therefore not predictable and certainly not always controllable, as evidenced by our 1 fatal case. In this patient correlative studies of the circulating blood, bone marrow sections and bone marrow smears<sup>16</sup> were carried out. These elucidate somewhat the mechanism of hemopoietic injury and recovery.

On April 1, 1943, when the thyrotoxicosis was first diagnosed and before any treatment had been given, the patient's hemoglobin was 95 per cent (13.8 Gm.), the red blood cells numbered 4,730,000 per cubic millimeter and the white blood cells numbered 5,600 per cubic millimeter, with 49 per cent neutrophils, 48 per cent lymphocytes, 11 per cent monocytes and 3 per cent eosinophils. Thus she exhibited the characteristic lymphocytic increase of thyrotoxicosis. As thiouracil controlled the thyrotoxicosis there was an increase in the leukocyte count to an average level of 8,000 per cubic millimeter. This normal level was maintained until her final admission to the hospital on April 17, when the leukocytes numbered 1,000 per cubic millimeter, with complete absence of granulocytes. On April 18 the leukocytes numbered 1,300 per cubic milli-

16. Dr. Benjamin Alexander of the Hematology Clinic and Laboratory made the bone marrow studies.

meter, without any granulocytes. On this day a smear of the sternal marrow showed an appreciable reduction in the granulocytic series of cells with a conspicuous shift to the left. The few granulocytes present were chiefly in the myeloblast stage with exceedingly rare myelocytes. There was increased fragility of the white cells, as shown by large numbers of disintegrating cells with poorly staining nuclear material and vacuolated cytoplasm. All other elements in the bone marrow appeared normal.

On April 19 the leukocytes numbered 950 per cubic millimeter and the sternal marrow smear was unchanged. The bone marrow section showed increased fatty marrow and decreased red marrow. The predominating cells were normoblasts and erythroblasts. Only a rare granulocytic myelocyte was seen.

On April 21 the leukocytes numbered 1,150 per cubic millimeter, without granulocytes. At this time the sternal marrow smear showed an increased number of nucleated granulocytic cells with more promyelocytes and occasional myelocytes. The more mature forms of granulocytes were still greatly reduced. The bone marrow section showed a relative increase in fat cells and a noticeable absence of granulocytes.

On April 22, about twelve hours before death, the leukocytes numbered 1,650 per cubic millimeter, with 4 per cent myelocytes. A sternal marrow smear obtained post mortem showed an improving picture with more myelocytes, occasional metamyelocytes and even some young neutrophils.

The toxic effect of thiouracil on the bone marrow appears to be characterized by disappearance of mature granulocytes. This disappearance may be due to two factors: a disturbance in maturation at the promyelocyte stage or direct destruction of cells beyond the promyelocyte stage by the drug. As evidence of this destruction, one may note the large numbers of disintegrating forms seen in the bone marrow smears. It is, of course, also possible that similar destruction of granulocytes may have occurred in the peripheral blood, adding to the rapidity of onset of the agranulocytosis. Destruction of leukocytes in the blood stream as a possible mechanism of leukopenia has been discussed by Lawrence.<sup>17</sup>

The course followed by this patient was similar to that described by Plum<sup>18</sup> as generally true of all cases of agranulocytosis. He postulated three stages of the disease as regards the bone marrow: one with a bone marrow depleted in cells, another with a cell rich marrow characterized by early regeneration without mature myeloid forms and a third stage with a normal marrow picture found in patients dying of complications in spite of hematologic recovery. Our patient died of tracheal obstruction as she was entering Plum's third stage of marrow recovery.

**Drug Fever.**—In the present series 2 cases of typical drug fever reactions occurred on the ninth and eighteenth days respectively. Astwood<sup>6</sup> observed 2 instances of this complication in the first 30 cases of hyperthyroidism treated with thiouracil. Gabilove and Kert<sup>7</sup> observed 2 instances of drug fever in their series of 9 cases of toxic goiter. Williams and Clute<sup>15</sup> refer to only 1 instance of drug fever in their series of 72 patients.

The mechanism of drug fever caused by thiouracil is as obscure as that caused by the sulfonamides. Some

type of drug allergy must be predicated because readministration of the drug caused reappearance of the fever. As has been noted with other sensitizing drugs, such as arsphenamine or the sulfonamides,<sup>19</sup> dermatitis and lymphadenopathy may occur as additional signs of sensitization. In our series 1 patient had an urticarial dermatitis prior to the onset of granulocytopenia but associated with fever (case 2), while a second patient had splenomegaly (case 6). As with the sulfonamides, fever may be the precursor of more serious toxic reactions.

**Swelling of the Submaxillary Salivary Glands.**—Swelling of the submaxillary salivary glands was noted in 2 cases in the present series. While the reaction was fairly severe in 1 case, thiouracil was continued and the swelling subsided. Williams and Clute<sup>15</sup> report similarly. Obviously this manifestation is not a serious one and by itself no contraindication to thiouracil treatment.

As one reviews the toxic manifestations of thiouracil a noteworthy analogy to the sulfonamides emerges. The sulfonamides possess some antithyroidal and goitrogenic properties but to a lesser extent than thiourea derivatives. In the development of granulocytopenia and agranulocytosis, dermatitis, drug fever, jaundice and probably anemia, there is much parallelism. Both are sensitizing drugs, and this is the likely explanation of their similar toxic effects, since they are quite unrelated in chemical structure.

Thiouracil is a potent agent in the treatment of thyrotoxicosis, but it has dangerous toxic effects which so far have proved unavoidable and unpredictable, thus seriously limiting the use of the drug. Goldsmith and his co-workers<sup>20</sup> have suggested the addition of liver or folic acid to prevent thiourea-induced granulocytopenia on the basis of satisfactory protection in rats. The high percentage of rats which developed granulocytopenia and anemia following thiourea is striking. The validity of their suggestion in man, as well as its applicability to thiouracil, remains to be demonstrated and is at least open to the criticism that the normal percentage of neutrophils and lymphocytes in the rat's blood is exactly the inverse of that normally found in man.

#### SUMMARY AND CONCLUSIONS

1. Thiouracil was administered to 43 patients with toxic goiter and to 1 patient with hypertensive and coronary heart disease without thyrotoxicosis. Eight of these patients developed toxic reactions, as follows: 1 fatal case of agranulocytosis and 1 nonfatal case of granulocytopenia, 2 cases of jaundice, 2 cases of drug fever and 2 cases of submaxillary salivary gland swelling.

2. Thiouracil is an effective drug for the treatment of thyrotoxicosis.

3. It is also an unpredictably toxic drug which may produce serious and uncontrollable effects, especially on the bone marrow and liver.

4. Its use should be carefully controlled until there are satisfactory methods of preventing or controlling its toxic properties.

USE OF ALUMINUM HYDROXIDE  
AND OTHER NONABSORBABLE  
ANTACIDS

IN TREATMENT OF PEPTIC ULCER

E. N. COLLINS, M.D.

CLEVELAND

During the past eight years at the Cleveland Clinic aluminum hydroxide gel has been the principal substitute for absorbable alkalis in the antacid therapy of peptic ulcer. It has been included in the treatment of more than 3,000 patients. A report on this subject was given before this association four years ago.<sup>1</sup> My purpose in this communication is to show a trend in management, to report the experience of our group to date and to reemphasize a method of treatment which continues to give satisfactory results.

Obviously, each patient presents an individual problem. All clinicians are agreed that first attention should be given to the patient's general health, including his hygienic needs, such as living habits, physical and mental rest and proper nutrition. Since the cause of peptic ulcer is unknown, additional measures have been used in its treatment. The work of B. W. Sippy, published in 1915,<sup>2</sup> is familiar to all clinicians. Extensive experimental work since that time, summarized by Palmer,<sup>3</sup> has confirmed the value of antacid therapy.

Approximately eight years ago we saw a number of patients with peptic ulcer having renal calculi or other renal complications, and aluminum hydroxide gel was substituted for the usual Sippy powders. These patients made satisfactory progress, even though the number of interval feedings and doses of antacid per day were reduced. Since that time aluminum hydroxide gel or other nonabsorbable antacids have been used routinely, and the results of therapy have seemed as satisfactory as those obtained formerly with a more rigid plan of treatment.

Evaluation of any therapy in a disease of unknown cause which is subject to spontaneous remissions is, of course, difficult. Jordan<sup>4</sup> has said that "the statistics which concern living patients with ulcer are never final, since in this disease, so characterized by recurrences, the cures of today may be nullified tomorrow. The life history of ulcer can be said to end only with the life of the patient." Palmer has pointed out that the results depend on the location and size of the lesion as well as the complications present, on the patient's willingness and ability to cooperate and on the physician's knowledge, enthusiasm and painstaking care in the management of the case at hand.

During the past eight years the incidence of peptic ulcer based on total registration each year has increased 100 per cent.<sup>5</sup> Nevertheless the percentage of patients having operations for duodenal ulcer during the same

period has not notably increased, as shown in the chart. Although it is realized that this curve deals with a consultation practice, that a certain percentage of patients have operations elsewhere, that indications for surgery change from time to time and that more patients with surgical problems may be seen in some years than in others, it shows a trend in the management of this problem.

PRESENT PROCEDURES IN MEDICAL  
MANAGEMENT

The intensity of therapy naturally varies with the severity of the disease and must be individualized. Although hospital observation at the beginning of treatment has many advantages, in these wartimes most of our patients with peptic ulcer continue with their work during treatment.

*Diet.*—Except for patients having pyloric obstruction, the diet has been liberalized in recent years. The gain in weight in undernourished persons has been gratifying. During the first week a bland diet is used. For patients having massive hemorrhage, ground meat is used at the beginning of treatment. Otherwise meat,

Percentage of cases of duodenal ulcer treated surgically.

cooked vegetables and fruit are added during the second week, and within one month the patient has a well balanced diet except for the avoidance of seeds, skins and coarse fibers. Supplemental vitamin therapy is adjusted to the nutritional requirements of the individual.

*Interval Feedings.*—A glassful of milk and cream, malted milk tablets or other foods selected from the diet list are used at least once between meals, and the patient is advised to continue interval feedings the rest of his life.

During the first month's treatment most of our patients have interval feedings every second hour during waking hours. The patient is advised to resume two hour feedings each year at the times of seasonal recurrences, upper respiratory infections and emotional disturbances, even though there is a continued absence of symptoms.

*Aluminum Hydroxide Gel.*—Method 1. This antacid is usually given every two hours during waking hours in the first month's treatment and on alternate hours with the feedings, so that every hour the patient takes either food or antacid. The size of the dose depends on determinations of gastric acidity and the severity of the symptoms but is never less than 2 drachms

(8 cc.), and the bedtime dose is never less than 1 ounce (30 cc.). If the patient has severe night pain associated with continuous night secretion, the bedtime dose is repeated at midnight and at 3 a. m. during the first week's treatment.

In certain cases the continuous intragastric drip, first advocated by Winkelstein<sup>6</sup> and modified by Woldman and Rowland,<sup>7</sup> is used in administering aluminum hydroxide gel during the first one or two weeks' treatment.

Method 2. On the other hand, patients having uncomplicated ulcer with minor symptoms may continue working and may take the antacid only six times daily from the start of management, i. e. one hour after meals, one hour after the interval feedings and at bedtime.

Constipation is prevented by adding equal parts of heavy magnesium oxide and calcium carbonate to the evening doses of aluminum hydroxide gel. This enhances the antacid effect, and usually 1 drachm taken two or three times during the evening hours proves adequate. The amount is reduced as the residue in the diet is increased. For patients having temporary pyloric obstruction fluidextract of cascara sagrada and small enemas, if needed, are used. If narcotics are used at the start of treatment, particular care is given to bowel function. When the patient is on a well balanced diet he seldom needs the addition of any laxative substance. If constipation is unusually troublesome, combinations of aluminum hydroxide gel and magnesium trisilicate are used.

*Complications of Peptic Ulcer.*—Our experience in the medical management of massive hemorrhage and temporary pyloric obstruction due to spasm and inflammatory edema has been reported elsewhere.<sup>8</sup>

*Jejunal Ulcer.*—In the treatment of jejunal ulcer medical management undergoes a severe test. In previous years jejunal ulcer was considered a surgical problem as soon as the diagnosis was established. Although surgical procedures were used for patients having subacute perforation with abscess formation and gastrojejunal fistulas, 18 patients made satisfactory progress while using medical management.<sup>9</sup> These patients were observed and had follow-up studies during the years 1930 to 1941.

Based on the work of Ivy and his co-workers<sup>10</sup> in 1941, we now commonly use aluminum phosphate gel subsequent to any surgical procedure for peptic ulcer for a period of two or three months, particularly for patients who have had recurrent jejunal ulcer. Aluminum phosphate gel is also used for patients with peptic ulcer who have diarrhea or evidence of pancreatic deficiency and have been placed on a low phosphorus diet. However, most patients with peptic ulcer

use a diet containing adequate phosphorus and have normal bowel function. Therefore, in most cases aluminum hydroxide gel is used, particularly in view of the fact that it has higher antacid properties.

#### CHECK-UP EXAMINATIONS

The aim in treatment is, of course, more than the immediate relief of symptoms. In order to have assurance that response to medical treatment is satisfactory, ulcer craters must disappear by progress roentgen examinations and also by gastroscopy for patients having gastric or anastomotic ulcers. These progress examinations are timed according to the severity of the initial problem. If they are unfavorable, the patient's condition is considered to be a surgical problem. If they are favorable, medical management is continued, but the patient is advised to have further check-up examinations during the first year's treatment and at least once a year during the next several years.

#### FOLLOW-UP THERAPY

If the patient continues medical management, he is advised to use method 2 as outlined, during the second and third months. During the remainder of the first year he is advised to use method 3, which includes one interval feeding between meals and the use of aluminum hydroxide gel or some other nonabsorbable antacid four times daily, i. e. one hour after meals and at bedtime. Furthermore, he is advised to resume method 3 each year at the times of seasonal recurrences, upper respiratory infections or emotional disturbances for at least five years, even though there is a continued absence of symptoms.

In recent years many forms of nonabsorbable antacids have become available. In our experience liquid alumina gel preparations, their combination with magnesium trisilicate, and the liquid form of magnesium trisilicate are more effective antacids than powder, tablet or capsule preparations. After the first month the patient continues to use the liquid preparations at least while at home. If convenience while working in a factory is important and his condition continues to be satisfactory, adequate dosage of one of the other preparations is permitted during working hours.

#### COMMENT

The treatment described does not completely neutralize gastric acidity. Originally, hourly gastric aspirations were made on hospital patients over twenty-four hour periods, and the dosage of antacid adjusted accordingly. The aim was to keep the level of free acidity low enough to prevent activation of pepsinogen, the proteolytic neutralization point emphasized by Hollander.<sup>11</sup> However, Eyerly and Breuhaus,<sup>12</sup> in measuring acidity and protein digestion within the human stomach, were unable to detect any eggwhite digestion in the stomach when its contents were maintained at a  $pH$  of 3.5 or higher over a three hour test period. The Komarovs<sup>13</sup> and Schiffrin and Komarov<sup>14</sup> demonstrated the pre-

cipitation and inactivation of pepsin in vitro and in vivo in dogs by the alumina gels without excessive reduction of acidity.

James Flexner and his associates,<sup>15</sup> using a method for the continuous recording of gastric  $p_H$  in situ, which included a pumping system to maintain circulation of the mixture around the glass electrode, studied the efficacy of numerous antacids and found that aluminum hydroxide gel had a prolonged antacid effect when given in suitable dosage. Therefore fewer but larger doses are used each day than formerly, which is more convenient for the patient.

Aside from their acid combining power and the power of inactivating pepsin, the alumina gels have advantages over the usual alkalis. Their astringent and demulcent properties are of value and, unlike sodium bicarbonate, they do not cause a compensatory stimulation of acid secretion. They are not absorbed and therefore can be given without the hazards of alkalosis. In none of our cases was there a disturbance of the acid-base balance or urinary complications.

#### SUMMARY

1. A plan of medical management of peptic ulcer at the Cleveland Clinic has proved satisfactory in 3,000 cases during the past eight years.

2. Nonabsorbable antacids, principally aluminum hydroxide gel, have been included in this treatment. Aluminum phosphate gel has had increasing use, particularly in patients on a low phosphorus diet who have pancreatic deficiency or give a history of recurrent jejunal ulcer.

3. During the same period the incidence of peptic ulcer has increased 100 per cent, while the percentage of patients having operations for duodenal ulcer has not notably increased.

4. Supervised management over the lifetime of the patient should be adopted.

2929 East Ninety-Third Street.

#### ABSTRACT OF DISCUSSION

DR. JAMES FLEXNER, New York: Duodenal ulcer occurs in susceptible persons who become conditioned to their environment in such a way that there is an excessive outpouring of vagal substance (acetylcholine), which causes hypermotility, hypersecretion and altered circulation. This represents trauma, which, when uninterrupted, results in ulcer formation. The approach to the problem, therefore, may be divided into three phases: (1) environment, (2) the patient's response to the environment and (3) the resulting abnormal physiology. The environment may be temporarily altered by hospitalization or bed rest, but permanent alteration of the environment is often not practical. For the second phase of the problem, the patient may be given mild sedation and insight into his difficulties, but again lasting changes, even with psychoanalysis, are not practical and never too successful; therefore the remaining and most practical therapeutic approach is to attempt to correct the abnormal physiology. This entails interruption of the cycle of hypersecretion, irritability and spasm, which perpetuate the ailment and cause the patient's symptoms. I agree with Dr. Collins in the liberalization of the diet, as it is important that the diet be balanced. Antispasmodics are helpful, but our chief weapon, as Dr. Collins indicates, is buffer therapy. The most useful of all buffers are

those which have a prolonged effect but which tend to keep the range in  $p_H$  between 7 and 3.5, though the efficacy probably persists to a  $p_H$  of 2.5. Both in practical experience and in experimental studies I have found colloidal aluminum hydroxide with half portions of magnesia magma in a glass of water to be the most satisfactory therapeutic agent. The average dose employed is aluminum hydroxide  $\frac{1}{2}$  ounce and milk of magnesia 1 drachm after meals, and, when necessary, a double dose at the hour of sleep. It is imperative, however, that each case be adequately buffered even if it is necessary to employ three or four times the dosage stated. In obstructive cases, after careful lavage, large doses of this mixture are administered for twenty-four to forty-eight hours, with parenteral feedings, and for weeks or months in addition the patient should receive postprandial buffer mixture and the stomach should be emptied at night with a large tube, followed by a double dose of the medication. With this procedure remarkable medical rehabilitation is possible in obstructive cases.

DR. WALTER L. PALMER, Chicago: I too have enjoyed this paper and I also enjoyed Dr. Flexner's discussion of it. I should like to ask Dr. Collins and also Dr. Flexner why they consider aluminum hydroxide to be superior to that very cheap and universally available preparation calcium carbonate?

DR. EVERETT N. COLLINS, Cleveland: We started using aluminum hydroxide gel in peptic ulcer patients having renal calculi or other renal complications because our urologists insisted on an acid urine and no disturbance in the acid base balance. They said "Do not give chalk to these patients because they will have a strongly alkaline urine and in the absence of adequate vitamin therapy they may develop more stones." We found that we could maintain an acid urine with aluminum hydroxide gel because it was not absorbed. A second reason for our using this preparation in preference to our former use of calcium carbonate was that hourly gastric aspirations during twenty-four hour periods of treatment demonstrated that the antacid effect was maintained over a longer period of time than with calcium carbonate. Fewer but larger doses of aluminum hydroxide gel had a prolonged effect which was not obtained with calcium carbonate. Since then treatment has been simplified for the patient, as compared with strict Sippy management. As mentioned in the text, we add a laxative powder consisting of calcium carbonate and heavy magnesium oxide as needed to prevent constipation at the start of treatment. When the patient is on a well balanced diet its use is seldom necessary.

Sigmund Freud.—In paying tribute to the memory of Sigmund Freud, the task of the neurologist differs in some measure from that of the psychoanalyst in that the former is more organically minded and possibly more objective scientifically. To say that Freud was a great man or that he made important contributions is somewhat of a platitude, which from the mouths of certain critics represents only an ill concealed hostility. It is doubtful whether the time has yet arrived to permit objective criticism; and yet a certain degree of detachment is not altogether impossible. Like all great men, perhaps more than most, Freud has been both reviled and misunderstood in his own day. Many of his opponents did not actually read all his works, and those who did approached them with a bias which made sympathetic understanding extremely difficult. Others, who merely did lip service to psychoanalysis, did Freud great injustice with their ambivalent praise. Many critics and some outright opponents appropriated much of what he contributed, then proceeded to belabor him with his own weapons. But even greater injustice was done to Freud by those of his followers who swallowed uncritically much that was scientifically indigestible. Many of the hypotheses and theories of Freud are not at all solid, and to accept all of them and defend them foolishly as facts is to do violence not only to the greatness of the man but to much which promises to be of enduring worth. Some of Freud's followers seemed to thrive on borrowed wisdom and donned a cloak of omniscience which did not altogether conceal the barren spaces beneath it. Since all argumentum ad hominem is generally fallacious and frequently evasive, it is obviously unfair to judge Freud's contributions either by his opponents or by his followers.—Wechsler, I. S.: *The Neurologist's Point of View*, New York, L. B. Fischer, 1945.

## PHYSICAL IMPAIRMENT AND JOB PERFORMANCE

A COMPARATIVE STUDY OF ACCIDENT EXPERIENCE, PRODUCTION AND EFFICIENCY, SICK ABSENTEEISM AND TURNOVER AMONG 2,858 PHYSICALLY IMPAIRED AND 5,523 ABLE BODIED WORKERS IN GOVERNMENT INDUSTRY

VERNE K. HARVEY, M.D.

Medical Director, U. S. Civil Service Commission  
AND

E. PARKER LUONGO, M.D.

Assistant Medical Director, U. S. Civil Service Commission  
WASHINGTON, D. C.

A comparative study of 2,858 physically impaired workers and 5,523 able bodied workers employed in forty-three establishments of the War and Navy Departments, situated in various parts of the country, has been conducted by the Medical Division of the United States Civil Service Commission. It has yielded information which will be of assistance to the commission in carrying out its responsibilities for placement of disabled veterans and will contribute to the solution of problems affecting many thousands of physically impaired civilians and war veterans seeking employment in the federal service.

Men and women in the armed forces are being injured in a maiming war. Advancements in medical science are saving lives, but the number and severity of the injuries being sustained by members of the armed forces are such that this nation will be faced with the greatest problem of rehabilitation in its history. Rehabilitation is not complete unless it results in employment of feasible cases through judicious placement.

Many disabled veterans of the last war were employed without regard to their highest skills or to their physical and mental capacities or to the satisfaction of the employer. Lack of consideration given to these factors in placement caused dissatisfaction on the part of the employer, the employee and organizations interested in the welfare of veterans. The aftermath was the stigmatizing of the disabled veteran because of his disability; the truly pertinent factors, such as the veteran's skills and capacities, became secondary considerations.

The placement of the disabled veteran in a suitable position involves proper consideration of his mental, vocational and physical capacities as they relate to the requirements of the job. In this connection there still will be a need for educating personnel officials on the employment of the physically impaired, and it can be expected that difficulty of the impaired in securing employment may be again accentuated when present wartime labor shortages are relieved.

Policies leading to the employment of the physically impaired should not be merely emergency measures; rather, the objective of these policies should be to bring forward a contribution to the solution of the overall problem which will be of even greater significance after the war. Notions concerning job performance of the impaired based on theory or opinion must give way to those based on factual information. The former have been used in the past as a guide by many personnel officials and their medical and safety advisers in recommendations for the employment or nonemployment of physically impaired individuals. This contributed to

the development, on the part of labor groups, of an antagonistic attitude toward the idea of preemployment examinations, and some of these groups have gone so far as to forbid their members to submit to such examinations.<sup>1</sup> Equal antagonism of veteran organizations can be expected in the postwar era if unjustifiable restrictive employment policies relating to the physically impaired persist, either in federal or in private employment.

Never before has the commission been presented with a more favorable opportunity to develop data on job performance of the physically impaired. Studies<sup>2</sup> of the physical demands of jobs in the federal service, together with wartime demands for workers in all types of trades and crafts, have caused a lowering of physical standards for employment and have brought about a nationwide program for the judicious placement of impaired workers in the federal service. More than 44,000 persons with severe physical defects (table 1) were placed in government industrial establishments between October 1942 and December 1944. The majority of these persons were placed according to (1) their educational, training and experience qualifications and (2) their physical capacities, which were matched with the physical demands of the job as determined by job analysis.

Several studies of job performance of the physically impaired have been conducted in private industry. The Western Electric Company's study demonstrated that among 652 impaired workers there were fewer absences because of illness and a lower accident rate than among employees with all their physical faculties; production records of the impaired were found to be satisfactory, and in individual cases the impaired displayed superior ability.<sup>3</sup>

In 1943 the U. S. Office of Education invited a number of employers of rehabilitated workers in private industry to report on the general efficiency of this group as compared with that of able bodied workers. The employers were asked to compare their impaired workers with the able bodied workers on the basis of (1) rate of production, (2) rate of absenteeism, (3) rate of turnover and (4) frequency rate of accidents. Replies were received from more than 100 employers, most of whom are executives of large corporations engaged in the manufacture of war materials and equipment; most of them employ a considerable number of persons with physical impairments. These replies indicated conclusively that the physically impaired workers produced as much as, or possibly a little more than, the able bodied workers. A more significant fact, however, was that they were practically unanimous in reporting that the physically impaired are dependable, regular in attendance and careful in observance of safety regulations.<sup>4</sup>

On the basis of a canvass by mail of employers of impaired workers in industry, the Division of Industrial Hazards, Bureau of Labor Statistics, U. S. Department

of Labor, reported that these workers are just as efficient in the jobs they hold as their unimpaired fellow workers. With regard to absenteeism, injury frequency rate and labor turnover, the physically impaired were rated as superior to the unimpaired.<sup>5</sup>

The Minneapolis Artificial Limb Company's study of 145 employees, 95 per cent of whom were disabled, showed work absences caused directly or indirectly by physical disability to be practically unknown, and labor turnover was negligible.<sup>6</sup>

An excellent productivity and attendance record was demonstrated among impaired workers in Brooklyn's Sheltered Industries and in the Illinois Industry for the

placed in industry, compensation, production and personnel costs generally are not increased as a result of the disability.

#### METHOD

Within the limitations placed on the Civil Service Commission by time, statistical material available and personnel which could be assigned to the project, the study in War and Navy Department establishments was conducted with the greatest possible objectivity. In this sample study the first step was to obtain a list of impaired workers in each establishment or plant. This was accomplished before going to the plant by reviewing placement reports of the physically impaired

\* Since Oct. 1, 1942. † Since July 1, 1943 and included in placement totals.

Blind, which employed groups of physically impaired men and women, more than half of whom were blind. These workers were awarded the Maritime Commission's M for excellence in workmanship; a factor in the award was the noteworthy attendance record (98.5) achieved by the group during the winter months.<sup>7</sup>

More recently Poole and Bent,<sup>8</sup> Lockheed Aircraft Corporation, undertook an extensive study of workers in the cardiac group and demonstrated that, when impaired workers with cardiac lesions were judiciously

which the commission receives from appointing officers on a semimonthly basis and, to bring the list up to date, by securing additional names from state and local rehabilitation agencies and from the plant itself.

In selecting impaired workers for the study, only serious physical defects were considered. Stress was laid on those physical defects most likely to be encountered in the placing of disabled veterans—orthopedic defects (including amputations and deformities), visual and hearing defects and arrested tuberculosis.

In selecting able bodied workers to be matched with the physically impaired, the records of all such workers employed on the same jobs, and under the same supervisors, as the impaired were examined. For the purpose of control, from 1 to 3 of these able bodied workers were selected at random and matched with physically

8. Poole, F. E., and Bent, J. R.: The Employment of Cardiacs, Indust. Med. 13: 479 (June) 1944.

impaired workers according to (1) sex, (2) age (within ten years unless more than 50 years of age, in which case, within five years), (3) length of experience on the job and (4) salary. In the matching process two schedules were filled out for each worker and one schedule for each section<sup>9</sup> of the plant, from which samples were selected.

The sectional report was an overall control on the attendance, accident rate and turnover records of the section. It provided general information with regard to the kind of work performed in the section, job titles and physical activities required. It showed the total number of employees in the section at the time of the survey (also the yearly average) and the approximate number of disabled employees in the section, both at the time of the survey and by yearly average. Where an industrial medical service was available in the establishment, the report indicated whether it was full time or part time or consisted simply in providing for a physician on call. Sectional reports described procedures used in assuring that appropriate work assignments were given to physically impaired workers.

The individual schedules—two were used for each worker in the groups being compared (physically impaired and able bodied)—furnished information on

supervisors or foremen on the impaired as a group, or on the able bodied as a group, and made it possible to consider each individual worker from the standpoint of job performance.

Reports were obtained through cooperation of personnel officials, safety officers, safety engineers and

Chart 1.—Percentage distribution of physically impaired (black columns) and able bodied (stippled columns) workers by age groups.

(1) title of present position, (2) annual salary at beginning of employment and salary at time of survey, (3) period of employment on present job, (4) attendance records (days lost because of sickness, annual leave and other causes), (5) efficiency ratings, (6) accident records from the standpoint of lost time injuries,<sup>10</sup> the number of days lost because of injuries and, in the case of the physically impaired, the relationship of lost time injury to preexisting impairment, and (7) quantity and quality productivity (as compared with that of other workers).

In the case of the physically impaired, the schedules show in addition (1) the foreman's or supervisor's opinion on the relationship of the physical impairment to the performance of the work, (2) his comments with regard to job tailoring which may have been necessary, and special considerations which may have been given to the worker, because of the worker's disability, and (3) a complete description of the worker's disability.

The use of individual schedules for each worker sampled eliminated consolidated general opinions of

medical officers. All establishments had safety officers. 80 per cent of the establishments reported full time medical supervision, and 20 per cent reported a part time medical officer or a physician on call. Supervisors and foremen, although given complete instructions with regard to filling out the reports, were not given information to the effect that the purpose of the study was to evaluate the job performance of physically impaired workers. The reports received as a result of the survey were processed and statistically evaluated centrally by the Medical Division and the Statistical Services Section of the Commission in Washington, D. C.

Out of approximately 3,300 physically impaired worker cases received, 442 were invalidated for various reasons, such as physical defects of a nature that raised

a question as to whether these defects were handicaps, job experience variations not in accord with the control method of the study, insufficient information on various aspects of job performance, wide variations in age of matched workers, inclusion of both men and women in groups to be matched and contradictory reporting. When cases of physically impaired workers were invalidated, the cases of able bodied workers matched with them also were discarded.

9. In many plants, sections are equivalent in number of workers to divisions or departments in private industry.  
10. An injury causing death, permanent impairment or absence from work beyond the day or shift on which the injury occurred.

## CHARACTERISTICS OF WORKERS SAMPLED AND STUDIED

*Age.*—Table 2 and chart 1 show the percentage distribution of physically impaired and able bodied workers by sex and age. A remarkable occurrence is to be noted in the median for impaired workers (39.9) and the median for the able bodied workers (39.9). The median for female workers shows a variation of only two years, which is not thought to be significant in the age group considered from the standpoint of job performance.

The question of age is a factor of utmost importance in a study of this kind, since age may affect statistics on job performance for reasons which are unrelated to the presence or absence of physical defects. Farmer<sup>11</sup> in 1932, and more recently Kossoris,<sup>12</sup> have demonstrated that older workers have a lower accident frequency rate than younger workers but have a greater severity rate (with a longer average healing period) and a greater death rate and lose more time as a result of accidents. Mann<sup>13</sup> has demonstrated that the highest rate of accidents exists in the younger age group and that there is a progressive decline in rate as age increases.

From the standpoint of productivity, beyond 50 years of age there may be expected a diminution of productivity in certain types of trades involving repetitive manual tasks.<sup>14</sup>

With regard to absences, short term absences can be expected to be greater in the younger age groups since such groups can be expected to have a larger number of whims, diversions and social activities which are important as the underlying causes of short term absences. Schwartz<sup>15</sup> has demonstrated the existence of this tendency among younger groups of workers. Actual valid sickness absenteeism can be expected to be higher with advancing age because of the appearance of those diseases the incidence of which rises with advancing age.

In view of the median ages both for the male and for the female workers surveyed, it is believed safe to assume that the percentage of error in the job performance statistics because of age variation in the sample is negligible.

*Sex.*—Tables 3 and 4 present the percentage distribution of physically impaired and able bodied workers by sex and occupation. From the standpoint of statistics on attendance, accident experience and turnover rates sex, like age, has a relationship to job performance outside of any consideration of the presence or absence of physical defects.

In general, the rate of absenteeism of females due to sickness, and of turnover due to "quits," can be expected normally to be higher.<sup>16</sup> With regard to accidents, aside from the fact that females, as a group, are placed in less hazardous occupations, they normally can be expected to have a lower accident rate since, as a group, they are more painstaking and fastidious in

job performance and they fear the consequences of accidents and, therefore, do not "show off." Further, they are more adaptive to routine and monotonous work.<sup>13</sup>

In the commission's study, 2,380 physically impaired males were matched with 4,427 able bodied males, and 478 physically impaired females were matched with 948 able bodied females. With this ratio of matching by sex, it is believed that the percentage of error in the

job performance statistics for reasons extrinsic to physical condition is negligible.

*Industry.*—The establishments coming under this study represented diversified types of government industries with variations in occupational hazard exposure, production and employee relations policies and working conditions from the standpoint both of physical activities and of environmental factors.

The distribution of sampled workers by industry was as follows (table 5):

1. Of the physically impaired 43.8 per cent and of the able bodied workers 40.8 per cent were engaged in air-

M.: Sickness Absenteeism Among Male and Female Industrial Workers During 1943, and Among Males During First and Second Quarters of 1944, with Note on Respiratory Epidemic of 1943-44, Pub. Health Rep. 59: 1267 (Sept. 29) 1944. Labor Turnover in Manufacturing, Mining, Telephone and Telegraph Industries, U. S. Department of Labor, Bureau of Labor Statistics, August 1943.

craft industry, involving the manufacture, repair, storage and inspection of aircraft and aircraft parts.

2. Of the physically impaired 27.9 per cent and of the able bodied workers 26.4 per cent were engaged in ordnance activities, including the manufacture, assembling and storage of ammunition and explosives, including artillery ammunition, small arms ammunition, metal shell components, torpedoes and all types of firearms, including large guns and their mounts and carriages. These activities were centered in arsenals, ordnance works and depots, armories, ammunition depots and torpedo stations.

3. Of the physically impaired 17.0 per cent and of the able bodied workers 21.8 per cent were engaged

Chart 2.—Length of time in present job

in shipbuilding and ship repair. These naval activities were centered in navy yards and naval drydocks.

4. Of the physically impaired 2.8 per cent and of the able bodied workers 4.0 per cent were engaged in manufacturing of types other than those mentioned. These workers were engaged in the manufacture and inspection of textiles, leather goods and clothing and were centered in quartermaster depots of the War Department and the clothing depot of the Navy Department, New York City.

5. Of the physically impaired 1.3 per cent and of the able bodied workers 1.2 per cent were engaged in procurement, inspection and supply. This activity excludes storage and supply for aircraft, ammunition, explosives, firearms and guns and also excludes manufacturing depots of the Army Quartermaster Corps

and of the Navy. The army activities in this category included such facilities as army procurement and inspection districts or zones, purchasing offices and quartermaster depots, holding and reconsignment points and backup storage facilities. For the Navy, it included such facilities as matériel centers, supply depots and naval inspector offices.

6. Of the physically impaired 4.4 per cent and of the able bodied workers 3.7 per cent were employed in field administrative offices of the War and Navy departments, and a small number were employed in the Departmental Service, Veterans Administration, Washington, D. C.

7. Of the physically impaired 2.8 per cent and of the able bodied workers 2.1 per cent were in camps, forts and naval training stations; for the Army this includes such facilities as camps, forts, ordnance training centers, recruiting and induction districts, replacement depots and centers and reclassification centers; for the Navy it includes such facilities as naval training stations.

*Occupation.*—Tables 3 and 4 show the percentage distribution of workers by type of occupation. It is to be noted that the percentage distribution for the impaired and for the able bodied are approximately the same, with the heaviest distribution in both groups among craftsman, laborer, professional and service occupations.

The craftsman classification includes carpenters, cabinet makers, painters, machinists, millwrights, tool-makers, sheet metal workers, shipfitters, patternmakers, modelmakers, mechanics, repairmen, apprentices to skilled crafts and similar occupations.

The laborer group of occupations represents helpers and unskilled, semiskilled and skilled laborers; many of these occupations are closely related to those of craftsmen.

Included in the operative occupations are machine shop operatives, welders, flame cutters, sewing machine operators and related occupations, printing operatives, chauffeurs and drivers, learners and operators of motor vehicles.

The clerical group consists mainly of stenographers, typists, secretaries, telephone operators, statistical, technical and research clerks, accounting, fiscal and payroll clerks and purchasing and supply clerks.

The service workers are mainly janitors, charwomen, elevator operators, guards, watchmen and policemen.

The administrative, professional and related workers consist mainly of technical and scientific assistants, draftsmen, inspectors and procurement and supply officers.

*Job Experience.*—Table 6 and chart 2 present the percentage distribution of physically impaired and able bodied workers by length of time on the present job or job experience as demonstrated. The table shows comparable job experience for the two groups, with, however, a higher percentage of able bodied with experience on the job of two years or more. These figures are significant in evaluating the results of this survey, since it is axiomatic that experience on the job often determines how well, and in many instances how safely, a job is performed.

*Physical Defects Among Impaired Workers.*—The presence or absence of physical defects among the workers who were sampled was determined on the

basis of a complete physical examination. Table 7 shows the percentage distribution of the physically impaired by sex and by type of disability. Of the male impaired workers 58 per cent and of the female impaired workers 53.6 per cent had orthopedic defects. Included among the orthopedic defects were deformities and amputations of arms, hands, fingers and feet and deformities of the back, hip and shoulder joints. In some cases studied there were multiple defects. Of the deformities, the majority were due to poliomyelitis; approximately 90 per cent of the amputations were due to accidents; the cause of disabilities of the back, hip and shoulder joints ranged from congenital deformities to chronic disease (arthritis and tuberculosis) and traumatic injuries.

As has been indicated, the commission wishes to study job performance of persons with physical defects which were likely to be found among a large number of disabled veterans. It is believed that the preponderance of orthopedic cases coming under this study accomplishes this objective.

Vision defects, including total blindness, industrial blindness and blindness in one eye, accounted for 20.2 per cent of the defects among physically impaired males

TABLE 6.—Percentage Distribution of Physically Impaired and Able Bodied Workers by Length of Time in Present Job

Length of Time on Job	Physically Impaired	Able Bodied
Total: Number.....	2,858	5,375

and 17.4 per cent among physically impaired females. In studying the totally blind persons, cases were limited to those having not more than 20/200 visual acuity in the better eye, with correction, or visual acuity greater than 20/200 but with limitation of the field of vision such that the widest diameter of the visual field subtends an angle not greater than 20 degrees. The industrially blind group included persons with vision of not more than 20/100 in the better eye with optimum correction up to total blindness as described. Cases of blindness in one eye were limited to those with vision of 20/200 or less with best correction in the defective eye and with good vision in the other eye. No statistics were reported on causes of blindness in any of the visual defect groups described.

Hearing defects occurred at a rate of 7.6 per cent among physically impaired males and 12.4 per cent among females. The hearing defect group included both the deaf and the hard of hearing.

With regard to the deaf, cases were limited to those in which the residual hearing was nonfunctioning for ordinary purposes of life, the residual hearing in these cases being less than 1/20 in either ear. Practically all cases were without normal speech function; the cause was approximately evenly distributed between adventitious and congenital causes.

Cases of hard of hearing were limited to those in which there was some hearing but insufficient to carry on ordinary conversation at 10 feet or less without a

hearing aid. This group included a large number of cases in the older age range in which the hearing defect was due to otosclerosis; however, in the great majority of these cases the hearing defects resulted from complications of childhood infectious diseases and to meningitis.

Heart disease was reported in 7.7 per cent of the physically impaired males and in 10.9 per cent of the females. Cardiac cases studied were limited to those with organic heart disease fully compensated; coronary and syphilitic heart disease were excluded. The majority of these cases were rheumatic in origin; a small

number, however, were congenital in nature and some were due to hypertension.

Tuberculosis was listed as a defect in 5.4 per cent of the physically impaired males and in 5.2 per cent of the females. These cases included pulmonary tuberculosis, arrested according to National Tuberculosis Association standards. The majority were minimal in type; 10 per cent of these workers were reported to be receiving collapse therapy or to have undergone, in the past, operative procedures for permanent collapse.

A small miscellaneous group of defects, including dwarfism, diabetes, epilepsy and pulmonary disease other than tuberculosis, were reported in the study; these defects were found in 1.1 per cent of the male physically impaired workers and in 0.4 per cent of the female.

(To be continued)

## EPIDERMAL AND DERMAL SENSITIZATION

(COEXISTING IN THE SAME  
INDIVIDUAL)

HARRY J. TEMPLETON, M.D.

OAKLAND, CALIF.

The clinical pictures of epidermal sensitization and dermal sensitization and the mechanisms of their production are well known to students of these problems. In their pure forms they constitute separate entities.

When the epidermis alone is sensitized it has generally been brought into this state of sensitization by previous contact of its surface with some external agent capable of producing sensitization. Such an agent may have been either a primary cutaneous irritant or a cutaneous sensitizer. The resulting clinical picture is known by the old name dermatitis venenata or the newer term contact dermatitis. It might well be called "epiderma-titis" because this term accurately describes the location of the shock tissue, which is the epidermis.

When the dermis alone is sensitized, the offending substance, the allergen, has generally reached it from within the body by way of the blood vessels or lymphatics. The allergen will generally have entered the body by way of inhalation or ingestion. Sometimes, however, it arises from substances elaborated within the body and, more rarely, by means of transepidermal absorption. The reaction of the sensitized dermis to allergens coming in contact with it expresses itself morphologically in different forms such as toxic erythemas, urticaria, erythema multiforme and various forms of dermatitis. Among the latter is that form of flexural dermatitis known under various names as neurodermatitis or atopic dermatitis. All of these represent reactions of the shock tissue, the dermis, and constitute true "derma-titis."

While in most instances these two processes are separate and distinct entities there are many times when the one process merges into the other, when both the epidermis and the dermis are sensitized. It is my purpose in this paper to discuss such cases from the clinical and pathogenic points of view.

### EPIDERMAL AND DERMAL SENSITIZATION FROM DRUGS

Probably the most frequently seen examples of epidermatitis and dermatitis coexisting in the same patient are from sensitization to drugs:

Mrs. H., aged 35, consulted me because of severely edematous dermatitis of the scalp and face following the use of a new hair tonic. These areas rapidly developed the type of dermatitis that is so characteristic of epidermal involvement, i. e. a fine pebbly superficial vesiculation, which went on to oozing and crusting. This hair tonic was found to contain chloral hydrate, and a patch test to this substance was strongly positive. Under conservative treatment the dermatitis entirely disappeared. Three years later another physician prescribed chloral hydrate as a sedative. Within a few hours after ingestion of the first dose the patient noted pebbly, vesicular dermatitis of the scalp and face. At the same time extensive areas of typical urticaria developed elsewhere on the body. This could mean nothing but dermal sensitization also.

This case represents an example of epidermal sensitization from surface application of a drug. Later when the drug was taken by mouth enough of it reached the sensitized epidermis, from within, to produce a severe recurrence. The fact that the dermis had also become sensitized was evidenced by the urticaria.

Mrs. L., aged 40, came under my care because of a recalcitrant pustular eruption of the palm. Her former physician reported that dermatitis venenata of the palm developed following the use of sulfathiazole ointment. After this phase of her trouble had entirely subsided the same ointment was inadvertently used again, with the result that the dermatitis venenata immediately returned. This disappeared. Several weeks later, because of the spreading of the pustular element over the hand, sulfathiazole tablets were prescribed to be taken by mouth. Within an hour following the ingestion of the first 7½ grain (0.5 Gm.) tablet the palm and hand became swollen and edematous. The drug was discontinued. By the next day there were many evanescent lesions typical of urticaria scattered over the body.

This again is an example of epidermal sensitivity to a drug applied to the skin, followed later by a second attack produced by ingestion of the same drug and associated with a dermal sensitization reaction (urticaria).

Miller<sup>1</sup> reported an almost identical reaction to sulfathiazole given by mouth six months after this drug had produced dermatitis when used as an ointment. Such examples are now of almost everyday occurrence. There are no better examples of the phenomenon of epidermal and dermal sensitization existing in the same individual than those which follow the external application of the various sulfonamide drugs. These drugs are powerful sensitizers and, when applied externally, indiscriminately, in the form of ointments, proprietary combinations, nasal sprays, nose drops and ophthalmic ointments, all too frequently set in motion the mechanism of double sensitization. The fact that they sensitize the epidermis to future external applications is bad enough, but the frequently associated dermal sensitization is far more serious in that it deprives the patient of the use of a valuable internal remedy in case of grave systemic infections in the future.

That epidermal sensitization, as well as dermal sensitization, takes place occasionally following the internal administration of arsphenamine is proved by those patients who react with a vesicular reaction to patch tests to arsphenamine solution following attacks of arsphenamine dermatitis.

### EPIDERMAL AND DERMAL SENSITIZATION FROM PLANTS

Sensitization of the epidermis to poison oak is extremely common. In nearly all instances such sensitization arises from external contact with the plant. However, the common practice of giving poison oak extract by mouth or by injection as a prophylactic or therapeutic measure occasionally furnishes us with examples of combined epidermal and dermal sensitization.

Some time ago I pointed out<sup>2</sup> that the hypodermic injection of poison oak extract into patients already suffering from poison oak epidermatitis occasionally produced a generalized urticarial (dermal) reaction. I have seen the same urticarial reaction following the:

1. Miller, J. Lewis: Use of Sulfanilamide and Its Derivatives in Ointment Form, *Arch. Dermat. & Syph.* **46**: 379 (Sept.) 1942.  
2. Templeton, H. J.: Untoward Reactions Following Toxic Treatment for Dermatitis Venenata, *Arch. Dermat. & Syph.* **20**: 83 (July) 1941.

oral ingestion of poison oak extract. Such cases are excellent examples of combined epidermal and dermal sensitization. There is little doubt that the same phenomenon could occur from other sensitizing plants such as primrose.

Fivoli<sup>3</sup> reported a case of dermatitis of the back of the hands from picking camomile in which a positive patch test indicated epidermal sensitivity. An anaphylactic attack following oral ingestion of a decoction and a positive passive transfer test with vesicle fluid indicated systemic sensitization.

#### EPIDERMAL AND DERMAL SENSITIZATION TO FOODS

Examples of patients who develop epidermatitis from external contact with foods and also dermal reactions such as urticaria or atopic dermatitis from the ingestion of that same food are relatively rare. I have seen only a few such cases in my own practice but have been able to gather together some from the files of my colleagues.

A girl aged 22 months had had eczema of the face, the arms and the cubital and popliteal spaces since the age of 6 months. Clinically this was typical neurodermatitis. The ingestion of egg had repeatedly produced an exacerbation of this condition. Removal of egg from the diet helped but did not entirely cure the condition. The mother reported that, whenever egg white touched the skin, dermatitis appeared within a few minutes. I had her repeat the experiment (as an equivalent of a patch test) and the resulting dermatitis had, to me, the clinical appearance of epidermatitis.

Deissler<sup>4</sup> reports:

I found, somewhat to my surprise, that we seem to have only 1 case on record in which double sensitization was actually proved. A man in his early thirties, working in an Italian sausage factory, had hay fever and eczema in childhood. His mother had asthma. In mixing the sausage dough he handles daily large quantities of sausage mix which contains in solution among other things casein and wheat flour. Such contact will produce a dermatitis on exposed areas but no other symptoms. However, the eating of either wheat or milk will produce a papular skin lesion and severe asthma. This sequence of events has been tested by repeated exposing and withholding. Patch tests to milk and wheat were positive.

Rowe<sup>5</sup> reported the following case to me:

I. C., a woman whose brother has hay fever, developed dermatitis of the hands which was proved to the satisfaction of the physician and the patient to be due to the ingestion of tomatoes. The patient reproduced this condition by experimentally eating tomatoes. After her dermatitis had entirely disappeared she reproduced epidermatitis of the hands by peeling and slicing tomatoes without eating any.

Urbach<sup>6</sup> reported the case of an 18 year old girl with papular urticaria. Withdrawal of lemon controls the disease, ingestion of lemon juice or skin of lemon provokes severe pruritus and urticaria. A vesicular reaction to a patch test with lemon proved that epidermal sensitivity also existed.

Mauser<sup>7</sup> reports the following case:

A boy aged 2 years, with a history of atopy on both sides of his family, developed swelling of the face around the eyes almost immediately following the ingestion of eggs; this reaction

disappeared in three or four hours (dermal type of sensitization). This phenomenon was repeated experimentally several times following the ingestion of eggs. The white of egg seemed to produce the worst reaction. He has inadvertently had eggs in food several times with the same result. A scratch test to egg gave a 3 plus reaction. Application of egg or egg shells to the face caused a swelling and blotching of the face immediately at the site of contact lasting for an hour.

The rapid appearance and disappearance of the dermatitis following contact of the skin with egg probably represents an example of transepidermal absorption and a resulting epidermal-dermal reaction rather than an uncomplicated epidermal reaction.

Mrs. K. B., aged 30, was treated for a dermatitis of the hands and face which was thought, clinically, to be a contact dermatitis. However, at the same time she suffered from rather typical neurodermatitis of the flexures and the neck. After long observation it was found that the contact dermatitis of the hands occurred after handling wheat flour and that one of the causal factors in her neurodermatitis was related to the ingestion of wheat.

#### EPIDERMAL AND DERMAL SENSITIZATION FROM AUTOGENOUS PRODUCTS

That type of dermatitis in which the epidermis and dermis around the site of chronic irritation (for example, leg ulcers) becomes sensitized to the local discharges, which process is followed after varying intervals of time by a severe generalized dermatitis of the toxic or urticarial type, is a good example of combined sensitization. For example, a patient will give the history of having a leg ulcer for a long time. He will have noticed that the serous discharge from the ulcer has superficially irritated the skin around the ulcer (epidermal reaction). Then suddenly a toxic erythema or urticaria will have developed, with explosive violence, over his whole body. This process, which I have seen in scores of patients, is an example of what Whitfield<sup>8</sup> aptly named "autosensitization." In it the patient's epidermis probably first becomes sensitized to his own altered tissue proteins or to bacterial antigens produced by contaminating infection. In due time enough of these autogenous products become absorbed to sensitize his whole dermis (and epidermis?) to them and then a violent dermal reaction results from the blood or lymph borne allergens. As a related example, I was called in consultation to see a patient with a severe generalized toxic erythema and evanescent urticarial lesions. He gave the history of having received a second degree burn about three weeks previously, which involved the right side of his chest. A week after the accident typical vesicular epidermatitis appeared around the burn at the site of application of butesin picrate ointment. Eight days later the toxic erythema and urticaria appeared over his entire body.

This patient presented both epidermal and dermal reactions. It seemed quite evident that the original epidermatitis was caused by the butesin picrate, but it is difficult to say whether the allergen which produced the generalized dermal reaction was butesin picrate, burned tissue proteins or a combination of the two. I have seen a number of cases identical in mechanism with this one.

#### COMMENT ON MECHANISM OF PRODUCTION

Combined epidermal and dermal sensitization may occur from allergens reaching the skin from without or from within. In my experience the primary sensi-

5. Rowe, Albert H., Oakland, Calif.: Personal communication to the author.

6. Urbach, Erich, Philadelphia: Personal communication to the author.

7. Mauser, Carl L., Oakland, Calif.: Personal communication to the author.

8. Whitfield, Arthur: "Autosensitization" in *Eczema*, Cong. internat. de dermat. et de syph., 1930 p. 142.

tization has nearly always been from allergens applied to the surface of the epidermis. Dermal sensitization has been secondary to the epidermal involvement. This concept implies that the dermis has become sensitized to exogenous materials that must have penetrated unchanged through the epidermis to reach the deeper layers or that the dermis has become sensitized to inflammatory products formed in the epidermis consisting of a union of the offending externally applied allergen and the tissue protein of the epidermal cells.

The first of these theories, that of transepidermal absorption as the route of dermal sensitization, is easy to accept, as transepidermal absorption of drugs, plants and allied substances is well known. One of the oldest examples is that of the absorption of mercury from inunctions. Macht<sup>9</sup> has shown that plant substances such as essential oils are easily absorbed through the intact epidermis. It has been demonstrated by Walzer<sup>10</sup> that proteins can penetrate the epidermis to produce a positive allergic reaction in a remote area of the skin previously sensitized by intracutaneous injection of the same protein. It can be shown both experimentally and clinically that endocrine substances such as testosterone are absorbed through the epidermis. Sulzberger has demonstrated transepidermal penetration.

The second idea, that of the dermis becoming sensitized to a chemical-epidermal protein product, is more difficult to prove or illustrate. Dennie<sup>11</sup> felt that this was what happened when an originally localized picric acid dermatitis became generalized over the body. He spoke of the absorbed allergen as a "protein-picricinate."

As stated previously, Whitfield<sup>8</sup> has demonstrated that the epidermis may become sensitized to products of cutaneous irritation such as vesicle fluid and react with epidermatitis when this fluid trickles over the skin. Every dermatologist has seen numerous examples of dermal reaction (toxic erythema and urticaria) from the absorption of altered tissue proteins from ulcers and burns, named by Whitfield "autosensitization."

Examples of combined epidermal and dermal sensitization in which the dermis was first sensitized from endogenously applied substances do exist, in my opinion, but are rare. In such cases the dermis would probably have to have been sensitized first by allergens reaching it by the blood stream and then the epidermis would have become secondarily sensitized by absorption of products from the altered dermis.

In those patients who develop epidermatitis from handling a certain food as well as some dermal reaction from eating it, it is impossible to be certain of the mechanisms involved. The epidermis may have become sensitized by contact with the food and the dermis, independently, from its ingestion. We also have to consider the possibility of both structures having been initially sensitized ab externis, but it seems to me that the most likely possibility is that they have both become sensitized ab internis following ingestion.

#### SUMMARY

Although epidermal and dermal sensitizations are quite well known as distinct entities, little has been written concerning the combinations of the two processes.

Probably the most important of these combined sensitizations which we are seeing today are those resulting from topical applications of drugs, particularly the sulfonamides. Since the sulfonamides so used are powerful cutaneous and systemic sensitizers, their indiscriminate use in ointments, sprays and powders should be discouraged.

3115 Webster Street.

#### ABSTRACT OF DISCUSSION

DR. EDWARD A. OLIVER, Chicago: Before any of the numerous reports on sulfathiazole sensitization had been published I learned a valuable lesson. A patient of mine consulted me for the treatment of several large furuncles on one leg. They were a peculiarly resistant type of lesion, and one day at the insistence of a druggist friend he applied sulfathiazole powder to his leg. The skin became badly irritated, but eventually it cleared up and the furuncles disappeared. Three months later he appeared with several new furuncles of the same resistant type. I advised him to go home, apply warm boric acid compresses to the parts and prescribed sulfathiazole tablets 0.5 Gm. to be taken four times daily. After he had taken the second tablet his face became swollen, his hands and feet began to itch and burn, subsequently numerous vesicles and bullae appeared on these areas, and he developed a generalized toxic erythema of the entire body. This, I consider, a typical case of combined epidermal and dermal sensitization. These cases are reported quite commonly now. I have seen intense flare-ups develop during the treatment of rhus dermatitis following the therapeutic injection of rhus antigen, and, while I have seen no examples of sensitization from external contacts with foods in patients who have developed urticaria of atopic dermatitis from ingestion of that food, one of my friends, a pediatrician, has told me that 2 babies with infantile eczema in which he found a distinct allergy to eggs were completely relieved from their eczema when eggs were removed from the house. There is a distinct odor emanating from eggs, and he is convinced that epidermal sensitization occurred through inhalation. As to the case of butesin picrate sensitization, I am inclined to believe that the generalized dermal reaction is due to butesin picrate alone. In patients allergic to that material I have seen most annoying generalized toxic dermatitis develop after the use of butesin picrate on minor injuries, cases in which there was no possibility of toxic products at the site of the wound being responsible. I feel that Dr. Templeton's explanation of the mechanism of this sensitization is a satisfactory one.

DR. ADOLPH ROSTENBERG, Washington, D. C.: The late Dr. Karl Landsteiner did a tremendous amount of work on the mechanism of sensitization and studied the production of sensitization by the simple application of surface chemicals, then determining whether sensitization was simultaneously induced in shock tissues other than the epidermis. In brief he found that the simple cutaneous application of chemicals such as dinitrochlorobenzene and picryl chloride often simultaneously caused the development of the anaphylactic type of sensitivity as well as the epidermal eczematous type. Landsteiner conjugated his chemicals with various proteins. Now he injected those protein conjugates intravenously and found that the animals would often die in anaphylactic shock and that this state had been induced by the mere surface application of the simple chemical. Ordinarily the substances we meet as contacts (and which are capable of eliciting an eczematous sensitization) are not taken internally. The sulfonamides, as has been mentioned, are a more or less notorious exception to this. Fortunately we don't ordinarily imbibe nickel or paraphenylenediamine or meet them as conjugates. These simple chemicals may cause varieties of sensitization in addition to the epidermal, but for the nonepidermal varieties they act similarly to what we call a hapten, although I am not using this word in its technically correct sense. As simple chemicals they are able to elicit or cause the reaction only in the epidermis, but if they have the opportunity to conjugate and act as the hapten of the conjugate it is then that we get the reaction in the other shock tissues. It may be,

as has been mentioned here, that when there is infection present concomitantly with an epidermal sensitization it favors the production of conjugates; in fact, there has been some experimental work done by Haxthausen of Copenhagen to show this. Accordingly, I think the phenomena that Dr. Templeton mentions may be a little more common than we ordinarily realize. We in the Food and Drug Administration are much concerned with the indiscriminate use of the sulfonamides. I think it would be an act of public service if this section would go on record as condemning the promiscuous use of the sulfonamides for banal dermatoses.

DR. CHARLES C. DENNIE, Kansas City, Mo.: Dr. Templeton mentioned my name in reference to some of the original work done along this line. The work was done in 1929 on the mechanism of sensitization. The experiments were carried out as pure experimental procedures concerning the effect of picric acid on the uninjured human skin. We found that 4 per cent of all individuals that we tested were sensitive to this material, and that 2 of these cases developed very queer phenomena, in that not only did they secure a local reaction but this reaction spread up through the lymphatics into the general blood stream. The patients developed a severe generalized dermatitis which put 1 of them in the hospital for several weeks. We then carried out some experiments on dogs. We tested them with picric acid. Under proper chemical procedures we ground up the skin and leached with alcohol to remove the picric acid, dialyzed the ground-up skin and were able to split the picric acid from the protein. It was my opinion that the protein might form a basis for the sensitization and that the sensitization occurred primarily not because of the picric acid but because of the proteins that had been broken off from the picric acid so that the former was again available for producing new protein picri-nate. This process kept up for a long time. We found that the picric acid in the system was excreted very slowly. We could demonstrate the picric acid in the urine and in the blood after a certain length of time. I have worked a good deal on that concept since then. There is no doubt that double sensitization takes place. I just want to report 1 case of a medical officer who was a resident surgeon in the Kansas City General Hospital. He became sensitized to rubber gloves. He was forced to give up surgery. He was then inducted into the Army Air Forces. The first time he put on a gas mask he broke out on his face very badly. The second time he put on the gas mask the original areas on the backs of his hands broke out in all of their former intensity.

DR. HOWARD FOX, New York: I don't agree with the statement that nothing can be done through publicity to stop the indiscriminate local use of sulfonamide drugs. I think something can be done by calling attention to this subject frequently. A resolution from this section of the American Medical Association would certainly carry weight with the medical profession. Such a resolution should refer to the present indiscriminate local uses of sulfonamide drugs by physicians and the fact that these drugs are often used in cases in which safer drugs are equally efficacious.

DR. JOHN G. DOWNING, Boston: There is an industrial aspect to this type of sensitization. I recently treated an expert pastry cook who suffered a dermatitis not only from external contact to the eggs mixed with pastry flour but also to the ingestion of eggs. He showed positive skin tests to the powdered egg. I have seen similar instances in salad makers who are sensitive not only to the contact with the lettuce but also to the ingestion of this substance. This also happens in workers exposed to tomatoes and fish.

**Medieval Medicine.**—In medieval medicine the onion was held in highest regard, an idea later revived by Sydenham, who recommended the vegetable for use in smallpox. Lord Bacon believed that the odor of onions would sustain life in the absence of food and water; while Nicolas Lemery, one of the most celebrated chemists of the seventeenth century, wrote that water in which garlic has been steeped has the power of shattering glass. Lind, the conqueror of scurvy in the British Navy, held that "vinegar and garlic are no contemptible preservatives in times of infection."—Gordon, Benjamin Lee: *The Romance of Medicine*, Philadelphia, F. A. Davis Company, 1944.

## Clinical Notes, Suggestions and New Instruments

### EFFECT OF THE ADMINISTRATION OF CHOLINE CHLORIDE ON THE HEMATOLOGIC PICTURE IN HUMAN BEINGS

G. E. CARTWRIGHT, M.D., AND M. M. WINTROBE, M.D.,  
SALT LAKE CITY

Davis<sup>1</sup> recently reported that the administration of choline chloride orally to dogs in a dose of 10 mg. per kilogram of body weight three times a day for several months resulted in the development of a macrocytic hyperchromic anemia. The anemia responded to anti-pernicious anemia liver extract, ventriculin and atropine sulfate although the reticulocytes rose during therapy only 1.5 to 2.3 per cent. Davis advances the theory that choline depresses erythropoiesis by increasing the blood and oxygen supply to bone marrow through its vasodilator action.<sup>2</sup>

#### Results of the Blood Studies on Three Patients Receiving Choline Chloride in a Dose of 30 Mg. per Kilogram Daily

Patient	Days of Experiment	Red Blood Cells, Millions per Cu. Mm.	Hemoglobin, Gm. per 100 Cc.	Hematocrit, Cc. per 100 Cc.	Mean Corpuscular Volume, Cubic Microns	Mean Corpuscular Hemoglobin, Micrograms	Mean Corpuscular Hemoglobin Concentration, per Cent	White Blood Cells, per Cu. Mm.
E. C.	0	5.77	14.8	47.5	82	26	31	8,800
	30	5.86	15.4	51.0	87	26	30	7,250
	60	5.64	15.4	49.0	87	27	31	9,030
	90	5.44	15.0	47.0	87	27	32	12,100
H. B.	0	4.90	14.7	44.0	90	30	34	9,100
	30	5.30	14.9	47.0	89	28	31	9,650
	60	5.46	16.0	47.8	88	29	33	9,400
	90	5.37	14.2	48.0	89	26	30	12,800
C. D.	0	5.57	14.3	46.0	83	26	31	8,300
	30	5.73	14.4	49.1	86	25	29	6,500
	60	5.87	14.7	50.0	85	25	29	5,220
	90	5.80	14.5	49.5	85	25	29	7,400

The implications of this experiment are extremely important<sup>3</sup> and for this reason it seemed desirable to ascertain the effect of the administration of choline on the blood of human beings.

#### PROCEDURE

Three men were used. One (E. C.), aged 47, was suffering from multiple sclerosis. The second (H. B.), aged 75, had a hemiplegia of several years' duration due to a cerebral vascular accident. The third (C. D.), aged 60, had generalized arteriosclerosis. The patients were given approximately 30 mg. per kilogram of body weight of choline chloride orally per day. This was made up in an aqueous solution and given in divided doses at 8 a. m., 1 p. m. and 6 p. m. daily for ninety days. The hematologic determinations were done according to the methods of Wintrobe.<sup>4</sup>

The results are presented in the accompanying table.

#### CONCLUSION

Choline chloride given in doses of 10 mg. per kilogram of body weight orally three times daily to 3 adult human males for ninety days failed to produce either anemia or macrocytosis. 175 East 21st South Street, Salt Lake City 5.

# COUNCIL ON PHARMACY AND CHEMISTRY

## REPORT OF THE COUNCIL

For over fifteen years poison ivy preparations have been included in New and Nonofficial Remedies. There is evidence that people sensitive to poison ivy can be desensitized temporarily by the use of such preparations, but the method requires expert supervision and the careful selection of patients because of possible unfavorable reactions. On the basis of evidence available to it, the Council is of the opinion that the extract may be made by extracting the fresh twigs or leaves of *Toxicodendron radicans*, *diversilobum* or *quercifolium*, dried rapidly at a low temperature immediately after collection, then extracted in absolute alcohol, ether or acetone; the extract, solid or liquid, should be standardized for potency by determining the weakest solution or dilution which will give a positive patch test in from 50 to 60 per cent of an average sample of the normal adult exposed population; this solution or dilution should be used as a reference standard for the preparation of a series of doses graded in increasing strengths for parenteral injection, the initial dilution or solution being one which will not give a patch reaction in any sensitive subject; and no claim for treatment of the acute dermatitis should be allowed.

Dr. Franklin A. Stevens has prepared for the Council a review of the status of poison ivy preparations. This report, which has been adopted for publication, should be especially useful to the general practitioner.

AUSTIN SMITH, M.D., Secretary.

### STATUS OF POISON IVY EXTRACTS

FRANKLIN A. STEVENS, M.D.  
NEW YORK

The Council on Pharmacy and Chemistry admitted rhus preparations to New and Nonofficial Remedies in 1926. This recognition was based chiefly on the favorable reports of Schamberg,<sup>1</sup> Strickler,<sup>2</sup> Alderson,<sup>3</sup> Bivings<sup>4</sup> and Williams and MacGregor,<sup>5</sup> all of whom believed that patients with "rhus dermatitis" were remarkably benefited by the administration of the extracts. In 1926 the classification of species of poison ivy was in confusion, very little was known about the chemistry of the irritant causing the dermatitis, and knowledge of its mode of action and of the mechanism of the immunity induced by the administration of the extracts was meager. Subsequent botanic, chemical and immunologic studies have solved some of these problems. On the other hand, there has been a growing controversy regarding the real value of rhus preparations. In spite of contradictory clinical reports showing a real division of opinion on the subject, accepted brands of poison ivy, oak and sumac extracts have been carried continuously in New and Nonofficial Remedies since 1926. The favorable results obtained therapeutically by some clinicians could not be entirely discounted.

#### CLASSIFICATION OF SPECIES OF POISON IVY: THE MORPHOLOGIC SIMILARITY OF THE SPECIES

Botanists have described about fifty species of poison ivy native to North America.<sup>6</sup> Since the chief point of differentiation has been the shape of the leaflets, which vary greatly in contour in different plants and sometimes in the same plant of any of the species, it is not surprising that the species described have been so numerous. The terms "poison vine," "ivy" and "oak" have been used to describe plants of any species if they had vinelike or shrublike characteristics or had

a tendency to grow like a tree. On the other hand the term "poison oak" is also used to designate certain species with indented oaklike leaves. When Warren<sup>7</sup> enumerated the poisonous species of the genus *Rhus* and of the parent family, he stated specifically that many of the synonyms and subvarieties had been omitted. To avoid the confusion caused by the use of synonyms given the same species in different classifications, Spain<sup>8</sup> employed the classification of Kuntze as adopted by the United States Herbarium in Washington, D. C. According to this classification *Rhus toxicodendron* (L) or *Rhus quercifolia* (Steud.) becomes *Toxicodendron toxicodendron* (L) Britton. The term *Toxicodendron radicans* (L) Kuntze is given to the eastern ivy. The western poison oak, *Rhus lobata* (H) or *Rhus diversiloba* (T. and G.), is known as *Toxicodendron diversilobum* (T. and G.) Greene. The poison or swamp sumac, *Rhus vernix* (L) or *venenata* (D. C.), is classified with the ivies as *Toxicodendron vernix* (L) Kuntze. Recently Shelmire<sup>6</sup> transplanted plants representing three species of ivy from their normal habitat to Texas, where they were grown under similar physical conditions. After observing the growth of these plants, he concluded that *T. toxicodendron* (L) (*quercifolium* [Steud.]), *T. radicans* (L) and *T. diversilobum* (T. and G.) should be treated taxonomically as a single pleomorphic species with more or less consistent geographic variations.

When extracts of ivy were first popularly employed therapeutically, the proponents of the therapy considered the species of ivy distinct botanically and biologically. Unfavorable results were<sup>9</sup> sometimes attributed to differences in species.<sup>10</sup> Possibly for these reasons extracts of ivy, oak and sumac were accepted by the Council. From chemical and biologic evidence available today, it seems most probable that the same chemical substance is the active agent in the saps of the poisonous varieties of ivy, oak, sumac and the lac trees. Until convincing contradictory evidence is brought forth, it is believed that a single extract can be used in the prophylaxis of the dermatitis caused by contact with any one of these plants. The evidence supporting this belief is found in succeeding paragraphs.

URUSHIOL: THE ACTIVE SUBSTANCE COMMON  
TO THE POISON IVIES, POISON SUMAC  
AND THE LAC TREES

Poisoning by ivy was first thought to be due to an emanation from the plant. According to Thompson (quoted from McNair<sup>11</sup>), the North American Indian and the Negro shared in this belief. The Japanese and Chinese apparently had a similar conception concerning the toxic effects of the lac trees (quoted from Toyama<sup>12</sup>) because they believed that people passing them could be poisoned. Influenced by these impressions and probably by the hard dying doctrine of the middle ages that disease was caused by vapors, most chemists of the eighteenth and nineteenth centuries directed their attention to a search for a volatile poison. Their opinions were divided on this question, and now their observations have no relevant bearing on the modern chemistry of the poisonous factor in ivy.

In 1897 Pfaff<sup>13</sup> published the results of a chemical study of the irritant of *Rhus toxicodendron* (L) and *venenata* (D. C.). An oily material was extracted from the plants with alcohol and precipitated as a lead compound ( $C_{21}H_{30}O_4Pb$ ). It was called toxicodendrol. This substance was nonvolatile, insoluble in water, soluble in alcohol and lipid solvents and caused dermatitis. Between 1905 and 1909 Tschirch and Stevens,<sup>14</sup> Stevens,<sup>15</sup> Stevens and Warren<sup>16</sup> and Warren<sup>17</sup> obtained clear stable "oils" which they believed were identical from the saps of the Japanese lac tree, of sumac and of poison ivy. McNair<sup>17</sup> later undertook a similar study of western poison oak (*Rhus diversiloba* [T. and G.]). By successive extractions through alcohol, petroleum ether and alcohol, he obtained a material called "lobinol." The dermatitis occurring when lobinol was applied to the skin was similar to that following exposure to poison ivy. It was thought to be an unsaturated compound of the aromatic series, polyphenolic in character with two hydroxy groups in the orthoposition. Further analysis was not done. These investigators isolated similar substances from ivy, lac and sumac and oak but failed to prove that the compounds were identical.

In 1907 Majima and his associates<sup>18</sup> undertook a chemical study of the active substance in Japanese lacquer. This lacquer is the sap of *Rhus vernicifera*, the Japanese lac tree, and is called "kiurushi." The investigation extended over more than a decade. They isolated a nonvolatile oil soluble in alcohol, benzene, chloroform, petroleum ether and so on. It was a skin irritant. This oil, called urushiol, proved to be a mixture of o-dihydroxy benzene derivatives with a normal fifteen carbon side chain with two unsaturations. The different components varied only in the number and position of the double bonds. There were two unsaturated fractions with two double bonds, some fully saturated oil (hydrourushiol) and probably a fraction with more than two unsaturations. None of the components could be separated by distillation, and all on

reduction formed 1, 2 dihydroxy, 3n-pentadecyl benzene. The dimethyl ether of this substance was synthesized. Toyama<sup>12</sup> believed that urushiol and the toxic oil from ivy were identical, but no further chemical study of ivy extracts was made until 1934. Then Hill, Mattacotti and Graham<sup>19</sup> published analyses of derivatives of a substance obtained by the extraction of the bark of *Rhus toxicodendron* with alcohol. The alcoholic extract was evaporated and the residue extracted with xylene. The oil obtained had the same molecular weight, boiling point and analysis as urushiol. Since the unsaturated dimethyl ether, the reduced substance and the dimethyl ether, diacetate and dibenzoate of the solid obtained by reducing the oil extracted from ivy had the same constants as similar derivatives of urushiol, the oils from Japanese lacquer and from ivy were believed to be identical. The accepted formula for this benzene compound is  $C_{21}H_{32}O_2$ . It is fluid and boils at 210 degrees (0.4-0.6 mm.), if unsaturated, but on reduction precipitates. Hydrourushiol, the reduced substance, is soluble in the unsaturated component.

THE OXIDATION OF URUSHIOL: LACCASE, THE  
CATALYZING ENZYME

Darkening, precipitation and loss of toxicity occur when the saps of poison ivy, swamp sumac and lac trees are exposed to the air. These physical changes are the result of oxidation, rearrangement of the molecular structure and an aggregation or condensation of the molecules of oxidized urushiol. Oxidation, which proceeds rapidly in warm moist air, is catalyzed by laccase, a blue copper-protein enzyme first investigated by Yoshida<sup>20</sup> (from *Rhus vernicifera* [L], Japanese lac tree) and subsequently by Bertrand<sup>21</sup> (from *Rhus succedanea* [L], Indo chinese lac), Stevens and Warren<sup>16</sup> (*Rhus vernix* [L]), Suminakura,<sup>22</sup> McNair<sup>23</sup> (from *Rhus diversiloba* [T. and G.]) and by Keilin and Mann<sup>24</sup> (from *Rhus succedanea* [L]). This enzyme is insoluble in ether and is precipitated by approximately 50 per cent acetone but requires stronger solutions of alcohol. It is said the enzyme is still active in 50 per cent ethanol. If the enzyme is destroyed or urushiol is isolated free from the catalyst, oxidation may occur spontaneously but very slowly if water is present. Spontaneous oxidation is enhanced in alkaline solutions. Orthophenols and paraphenols are first oxidized to the corresponding quinones. Experiments with derivatives of urushiol seem to indicate that its toxicity depends on the integrity of the hydroxyl groups. Hill, Mattacotti and Graham<sup>19</sup> and Toyama,<sup>12</sup> although not in perfect agreement as to the degree of detoxification, discovered that reduction slightly lessened the toxicity of urushiol, monomethylation or dimethylation rendered it almost or completely inert, and dimethyl hydrourushiol was nontoxic. In 1917 McNair,<sup>23</sup> familiar with the work of Yoshida and of Bertrand, studied an enzyme from *R. diversiloba* (T. and G.). It was similar to the one isolated by Keilin and Mann because it catalyzed the oxidation of orthophenols and paraphenols and of paraphenylenediamine. McNair hesitated to attribute the gradual loss of toxicity, which

occurs simultaneously with the darkening of rhus sap to the catalyzing properties of laccase.

The physical and chemical properties of urushiol are such that many beliefs concerning poison ivy dermatitis are found untenable and at the same time other common observations are fortified. One old and prevalent idea held by excellent authority<sup>25</sup> even as late as 1934,<sup>26</sup> that the poison could be wind borne, has never been confirmed by any chemical or physical study of the properties of urushiol. The only identified volatile substance found in the sap in any quantity is acetic acid,<sup>27</sup> which was once isolated, wrongly identified, called "toxicodendric acid" and believed to be the toxic chemical.<sup>28</sup> On the other hand, it appears that enough oil can be carried on soot particles<sup>29</sup> in the smoke<sup>30</sup> from burning plants to cause dermatitis in sensitive people and that sufficient amounts will adhere to dust particles in shops where lacquer is used and be carried out in drafts to give dermatitis to passers-by.<sup>12</sup> These observations are understandable since it is said that 0.001 mg. of urushiol will cause dermatitis in very sensitive people.<sup>16</sup> Although never proved, the concept that insects feeding on the broken leaves may be transmitting agents seems plausible. There is no doubt that animals, tools and contaminated clothing act as conveyors. Apparently thick deposits of dried sap on clothing,<sup>31</sup> the lacquer on varnished articles<sup>12</sup> and lacquer dried in mass resist complete oxidation for months and possibly for centuries.<sup>12</sup> The outer hardened shell presumably protects inner layers from moisture and air and prevents complete oxidation. McNair<sup>23</sup> observed that demonstrable oxidation of very thin films of sap on glass continued in moist air for at least a month.

The solubilities of urushiol and its laccase in various solvents account for some of the variations in the potency and stability of different therapeutic extracts. Although pure urushiol has been considered stable, in slightly alkaline solution it oxidizes slowly spontaneously and rapidly if laccase is present even if slightly acid. Spain<sup>8</sup> used extracts of fresh leaves made by covering the leaves with 95 per cent alcohol. The proportions were not stated. These precipitated. Subsequently<sup>32</sup> 1 Gm. of fresh leaf was covered with 3 cc. of alcohol; later absolute alcohol was used and finally, to obtain a stable product, the leaves were dried before immersion in absolute ethanol. Spain and Cooke<sup>32</sup> thought that deterioration may have been caused by chlorophyllase, an alcohol soluble enzyme, and so dried the leaves and then extracted them with absolute alcohol to avoid traces of water. Their extracts of fresh leaf contained, according to the author's calculation, approximately 15 to 20 per cent of water. Laccase is said to be active in 50 per cent ethanol; whether it will act in stronger concentrations appears not to be stated in the literature. Since a black precipitate settled out of their concentrates made from fresh leaves, it is possible that laccase was present and active in these extracts. From extracts of dry leaves evaporated in the absence of oxygen, they obtained a clear oily substance active in dilutions of 1 to 100,000. They found this substance stable.

Acetone and ether were later used as extractives of fresh leaves and twigs. Fifty per cent solutions of acetone precipitate laccase and dissolve urushiol. However, ether will dissolve this substance without extracting laccase from fresh material. It appears from the chemistry and solubilities of urushiol and the associated polyphenolase that the laccase must be inhibited from acting from the time the leaves are broken and the natural inhibition ceases until the oil is separated from the catalyst in a suitable differential solvent. This end might be accomplished if leaves which had been macerated with solid carbon dioxide were dried while frozen and then extracted with ether.

#### SENSITIVITY TO POISON IVY EXTRACTS: CLINICAL ASPECTS

All observations indicate that ivy dermatitis occurs only after a person has been exposed and sensitized. Sensitization to Toxicodendron differs in many respects from that responsible for asthma and allergic rhinitis but is similar to the cutaneous sensitization developing after exposure to other plants and plant extracts, to chemicals and to metals. The differences between these two varieties of allergy have been described in detail in the literature.<sup>33</sup> The characteristic features of dermal sensitization responsible for dermatitis are as follows: No serum antibodies have so far been satisfactorily demonstrated by passive transfers and no protective antibodies<sup>34</sup> similar to those developing after the treatment of hay fever have been described; there is no apparent hereditary predisposition<sup>35</sup> to the acquisition of the sensitivity causing dermatitis venenata; anaphylactic shock with edema and bronchospasm does not occur because the skin is by far the most sensitive tissue and appears to be the chief shock organ. Our meager knowledge about cutaneous sensitization to plants, chemicals and metals has been obtained through clinical and experimental use of the contact or patch test. First used to demonstrate cutaneous sensitivity to mercury by Jadassohn,<sup>36</sup> it was later employed by all chemists to test the toxicity of chemical substances extracted from ivy, sumac and lac plants and saps. More recently this test has been employed by clinicians to determine susceptibility to Toxicodendron, to follow experimental sensitization induced in man and animals and to study variations in sensitivity during oral or parenteral prophylactic therapy.

Infants at birth<sup>37</sup> and with rare exceptions children under 5 years of age<sup>38</sup> give negative reactions to extracts of *T. radicans* (L.). On the other hand, infants have been experimentally sensitized. Strauss<sup>37</sup> sensitized 72.9 per cent of 48, some of whom retained their sensitivity for eighteen to twenty months. He induced sensitization by cutaneous contact combined with ingestion but could not sensitize infants by either the oral or the intramuscular administration of extracts alone.<sup>39</sup> With one or two exceptions, reports indicate that boys and girls of camp age give a higher percentage of positive reactions than adults. Among children in camps.

Clarke and Hanna<sup>40</sup> and Simon and Lotspeich<sup>41</sup> obtained respectively 85 and 82.1 per cent of positive reactions. Spain<sup>8</sup> in a small group averaging about 15 years of age found 84 per cent reactive. On the other hand, Molitch and Poliakoff<sup>42</sup> found that only 22.9 per cent of a group of 292 white boys were positive. Either the extracts used for testing this group were not as potent as those employed by the other observers or, since the group tested was presumably from a different social stratum, the groups tested by these different observers represent extreme and not average samples in regard to previous exposure and sensitization. Among adults the percentage of susceptibles as determined by the patch test is remarkably uniform in groups from various parts of the country. Spain<sup>8</sup> in a group predominantly of adults, Spain, Newell and Meeker<sup>43</sup> and Deibert, Menger and Wigglesworth<sup>44</sup> in two separate racial groups of adults obtained 65 per cent, 60 per cent and 58.2 and 56 per cent respectively. Shelmire<sup>45</sup> found that approximately 50 per cent of a group of medical students reacted. While the patch test cannot be employed with certainty to determine whether or not a person is clinically sensitive to casual exposure, the results of the tests are said to parallel the clinical histories fairly accurately.<sup>8</sup> Simon and Lotspeich<sup>41</sup> observed 19 children with negative tests through one summer in camp. Only 2 had dermatitis. From the data given, it is possible that these 2 may have been sensitized by previous testing. Spain tested 13 boys, of whom 11 were reactive. On rigorous exposure, only 1 boy with a weakly positive reaction and the 2 with negative tests escaped ivy dermatitis.

In addition to these observations decreased susceptibility has been found to parallel diminished sensitivity to patch tests brought about by oral hyposensitization. An unquestionable relationship is evident between the frankly positive test and susceptibility to ivy after rigorous exposure. On the other hand the casually exposed person may not succumb even though his test is positive. Shelmire estimates that 25 per cent of the population in the neighborhood of Dallas is clinically sensitive and Zisserman<sup>46</sup> observed that 36.4 per cent of nearly 1,300 adult men whose susceptibility and reactions to tests were not known developed dermatitis on casual exposure in the field. Of known susceptibles, 52.8 per cent had rashes.<sup>46</sup> These incidences are approximately those obtained after prophylactic treatment in some groups of patients mentioned in following paragraphs in whom the skin test was not modified. Apparently, when casually exposed, only about half of a group with positive tests contract dermatitis.

All the chief races appear to be equally susceptible if they have been equally exposed. Deibert, Menger and Wigglesworth<sup>44</sup> obtained almost identical percentages (58.8 and 56 respectively) among adult white subjects and American Indians living west of the Mississippi River. One racial exception so far encountered is the Eskimos on Baffin Island, none of whom

reacted to tests with ivy extracts.<sup>47</sup> It is believed that these Eskimos have never been exposed and sensitized. Some adults with negative tests can be sensitized experimentally<sup>48</sup> while others are extremely refractory.<sup>49</sup> Apparently sensitivity may also be lost. Strauss<sup>50</sup> found that some infants whom he had sensitized had lost their artificially acquired sensitization after eighteen to twenty months. Shelmire<sup>45</sup> has also attributed an extremely low proportion of positive tests, 8.5 per cent, among patients averaging 70 years of age in a convalescent home to continuous confinement with resultant lack of exposure.

#### SENSITIZATION WITH URUSHIOL: EXPERIMENTAL DATA

Experiments with primulin ( $C_{14}H_{18}O_3$  or  $C_{14}H_{17}O_2OH$ ) carried out between 1924 and 1930 formed the ground work for similar experiments with ivy. Primulin is the active chemical substance causing dermatitis from contact with *Primula obconica*. Both man and animals have been sensitized with extracts and the isolated active principle.<sup>50</sup> In 1934 Rackemann and Simon<sup>51</sup> and the Simons and Rackemann<sup>52</sup> reported that the skin of guinea pigs could be sensitized by treating it with extracts of *Toxicodendron*. Sensitization did not follow intraperitoneal, intramuscular or subcutaneous inoculations. Simon<sup>53</sup> found that, if an area of skin was treated with extract and then excised within twenty-four hours, the sensitizing antigen had already been distributed and the skin of the animal would become uniformly sensitive. No tissues other than the skin appeared to be sensitized. Landsteiner and Jacobs<sup>54</sup> sensitized guinea pigs with urushiol. They confirmed the observation that application of the antigen to the skin was surprisingly superior to any other method of sensitization and demonstrated cross sensitization with urushiol and ivy extracts. Because people sensitive to ivy are equally sensitive to oak and sumac, some observers have assumed that the active substances in all these plants are identical.<sup>55</sup> Spain, Newell and Meeker<sup>43</sup> tested adults with extracts of ivy and oak (*T. radicans* [L.] and *T. toxicodendron* [L.]). From their data, consisting of series of tests on many subjects with dilutions of extracts, they concluded that people who were sensitive to ivy and oak varied in degree of sensitivity to the concentrations of extract used in a definitely mathematical manner. When curves of the varying degrees of sensitivity were plotted against the percentages of positives, the curves for ivy and oak were practically superimposed. However, these data obtained from patch tests can be considered only contributory evidence to the possibility that the irritants from oak, ivy and sumac are identical, just as the occurrence of similar polyphenolases in the saps of these plants suggests that the substrates are chemically similar but are not necessarily the same.

Although Landsteiner and Jacobs observed cross reactions between urushiol and ivy extracts, they obtained cross reactions with other catechols, such as geranyl and 4 tetradecylcatechol, as well. These catechols have side chains similar to but not identical with the side chain of urushiol. Apparently too much reliance should not be placed on skin tests or immunologic evidence alone as a means of establishing chemical identity.

#### THE EVOLUTION OF PROPHYLACTIC AND PHYLACTIONIC IVY TREATMENT BY THE ENTERAL AND PARENTERAL ADMINISTRATION OF EXTRACTS

Chewing ivy leaves to prevent dermatitis has been a folk treatment in this country for generations. Although this practice supposedly was common among the Indians, it does not appear to have been a universal custom.<sup>56</sup> Some practitioners<sup>57</sup> have advocated this preventive measure even in recent years.<sup>58</sup> In 1917 Schamberg,<sup>59</sup> who popularized oral prevention and treatment, stated that the ingestion of increasing doses of alcoholic ivy extract would prevent and cure the dermatitis. He maintained that no necessity for injections existed, because oral therapy was sufficiently satisfactory.<sup>10</sup> But Strickler<sup>2</sup> advocated the combined method of treatment, that is, the oral and parenteral administration of dilutions of the alcoholic extract in increasing doses, and this soon became the method of choice. Between 1921 and 1927 Spain and Cooke<sup>32</sup> treated patients with alcoholic extracts orally, by injection and some by the combined method. During the course of the study the extraction of the material used was modified to some extent. Extracts of the fresh leaf in alcohol deteriorated possibly because of the water in the final extract,<sup>8</sup> so the leaves were then dried and extracted in absolute alcohol.<sup>32</sup> From subsequent studies<sup>43</sup> it would appear that extracts prepared by them must be fairly uniform. The injection of alcoholic extracts proved to be painful, so the extract was diluted with salt solution just before it was injected. In 1925 Clock<sup>60</sup> suggested almond oil as a diluent. Most commercial preparations have been diluted in oil since that time, but the oils employed have varied. Acetone and ether<sup>61</sup> have also been introduced as extractives of the fresh leaf. The ether extracts in oil and in pills and capsules have been used for oral and parenteral treatment. It is believed by some that acetone and ether are superior extractives.<sup>62</sup> This may be true for the fresh leaf because of the differing solubilities and activity of laccase in varying concentrations of acetone, alcohol and ether. With leaves rapidly dried at low temperatures these solvents should be equally satisfactory, because urushiol is readily soluble in all. Conclusions in the earlier literature regarding the comparative value of these extracts for treatment and for prophylaxis as well as the comparative value of oral and of parenteral therapy are difficult to evaluate,

because prevention and treatment of the acute dermatitis were frequently confused and Strickler's combined method of administration was most commonly employed. In recent years several concrete questions have arisen concerning the use of these extracts. First, as determined by patch tests, can the sensitivity of the skin be sufficiently modified to account for some of the excellent prophylactic results reported in the past following oral or intramuscular therapy? Second, even though the test does not show lessened sensitivity after therapy, is the clinical evidence pointing to greater resistance to dermatitis satisfactory and sufficient to justify the use of the extracts? Third, should extracts be used in the treatment of the acute dermatitis?

#### THE EFFECT OF THE ADMINISTRATION OF IVY EXTRACTS ON THE CUTANEOUS TEST

In 1925 Krause and Weidman<sup>63</sup> studied the effect of Strickler's combined injection and oral method on the skin sensitivity of 7 susceptible persons. Ten days after the course was finished, application of the extracts to the arms gave severe reactions. The extracts used were potent, because most of these subjects developed perianal dermatitis and the extracts had been used for testing. In 1927 Spain and Cooke<sup>32</sup> reported that sensitivity to the test was unchanged after protracted series of injections of alcoholic extracts. Blank and Coca, convinced by previous experiments that tests were unmodified by prophylactic inoculations, omitted testing both control and inoculated groups in their study of preventive therapy. In 1939 Simon and Lotspeich<sup>41</sup> observed that inoculations with acetone extracts failed to decrease the dermal sensitivity of 8 patients. According to Greenberg and Mallozzi,<sup>64</sup> no convincing variations in skin sensitivity were obtained in a control series and in one composed of patients inoculated with acetone extracts in oil (one or two inoculations). In these previous experiments, with the possible exception of those of Blank and Coca and of Greenberg and Mallozzi, who used measured quantities of acetone extracted solids in oil, standardization of the doses of extract given were based only on the proportion of leaf to the solvent and the potency of the dilutions on skin testing. The exact amount of active extracted urushiol was not determined. Recently Shelmire<sup>6</sup> tried oral therapy with ether extracts of both fresh and slowly dried leaves. He believed that the extracts from the fresh leaves were five to ten times more potent. The ether was evaporated and the solid residue was diluted 1 to 10, 1 to 25 and 1 to 50 in corn oil. These dilutions were given in increasing doses over several months. He found that the skin sensitivity to tests was definitely diminished in 20 patients who ingested from 1 to 3 cc. of the ether extractable residue in the course of seven or eight months.<sup>65</sup> Gold and Masucci<sup>66</sup> likewise have used ether extractable residue in pills. Twenty patients with positive reactions were given increasing doses of ether extracted residue increasing from 0.5 to 15 mg. daily over a period of forty-five days. Seventeen of these showed diminished reactions after the course was finished. When the patients with lessened sensitivity

were tested ten months later, 5 had returned to the original level of sensitivity, 5 showed no change, and the rest showed slight or definite increases. These patients ingested between 2.9 and 3.7 Gm. of residue during "immunization." Apparently if the doses of residue given orally are sufficiently large the test sensitivity as well as the clinical susceptibility are diminished and parallel each other. In the last experiment mentioned, rigid field controls in which a control group with positive tests all were found susceptible, 10 of the "immunized" group were completely and 6 partly protected. Protection occurring clinically as the result of injections when the skin sensitivity has not been modified has not been explained. It is possible that the test as it is used will not detect minor degrees of hyposensitization sufficient to protect mildly sensitive people to slight and casual contacts. Until this discrepancy is satisfactorily explained, some doubt must linger in the minds of critical therapists concerning the real value of preventive parenteral therapy with ivy extracts.

#### PROPHYLACTIC INOCULATION WITH IVY EXTRACTS: CLINICAL DATA

Most of the literature previous to 1925 on clinical results obtained with ivy extracts is difficult to evaluate. Strickler's method was most commonly employed. He believed the active substance was a glucoside and followed the procedure of Syme<sup>67</sup> in extracting with alcohol. Schamberg, who had first aroused interest in the ivy problem, advised oral prophylaxis but later advocated phylactic treatment as well. Strickler gave his patients alcoholic extracts orally and by injection, a method which Schamberg<sup>10</sup> never endorsed. The prevalent procedure at that time seems to have been to treat the patient during the acute stages of the dermatitis by injections and to continue oral therapy for prophylaxis, but some treated patients phylactically both by injection and by mouth. The word "treatment" was used loosely and might imply remedial measures either for prevention or for cure. Unfortunately, although some of the authors referred only to prevention and some only to treatment of the acute rash, their publications have been quoted as references for either phylactic or prophylactic therapy, the distinction originally drawn having been lost. In 1919 Schamberg<sup>68</sup> advocated immunization with tincture, beginning with small doses daily and increasing up to a uniform dose, which was continued daily throughout the summer. Strickler apparently treated the acute dermatitis by injections and followed with orally given tincture for prophylaxis.<sup>69</sup> Later he advised this combined mode of therapy as a preventive.<sup>70</sup> Alderson and Pruett<sup>71</sup> and Bivings<sup>4</sup> reported satisfactory protection using this method. On the other hand, when Krause and Weidman<sup>63</sup> found that the injections and the oral tincture failed to modify the intensity of patch tests with ivy extracts, they doubted the efficacy of the procedure. None of the clinical reports had control data. Furthermore, it appears that the remarks and

articles<sup>72</sup> of some authors commenting favorably on treatment have since been construed as favorable to prophylactic therapy.

Previous to 1925 most authors stressed treatment, but subsequently the reports have been concerned chiefly with prevention and only occasional investigators have advocated phylactic injections. Spain and Cooke<sup>32</sup> reported a series of cases in 1927 treated prophylactically with injections of alcoholic extracts diluted with salt solution. Beginning about April with the weakest dilution which gave a satisfactory skin test, they gradually increased the size of the doses and continued at weekly intervals through the summer with a standard dose of the strongest tolerated dilution. Although the reactions to patch tests were not diminished in intensity following ordinary exposure to ivy such as occurred in everyday life, according to collected reports 59 per cent of 98 patients were symptom free and 37 per cent improved over previous years. Subsequent to this report several investigators have studied groups of patients inoculated prophylactically according to this procedure with similar alcoholic extracts. In 1936 Molitch and Poliakoff<sup>73</sup> gave 40 boys nine to twenty weekly injections. All of these boys were sensitive to patch tests with ivy but none who were inoculated had a rash. In a skin sensitive control group 9 of 14 contracted dermatitis. In midsummer the following year the same investigators<sup>42</sup> gave similar courses of injections to 42 boys who had suffered from dermatitis in the preceding ten weeks. In the treated group only 1 had dermatitis subsequently, in contrast to 8 controls all of whom were afflicted. In 1938 Biederman<sup>74</sup> selected 30 subjects who had had ivy or oak dermatitis in the two preceding summers. Thirteen were given ivy extracts and 13 oak extracts according to the procedure of Spain and Cooke except that inoculations were begun in January. Inoculations were given at weekly intervals for six weeks and then continued monthly through the summer. Only 4 of the 26 subjects inoculated contracted rashes, but all of a small control group (4) had dermatitis on exposure. Clarke and Hanna<sup>40</sup> followed 82 boys, 86 per cent of whom were positive to tests, after giving five injections of alcoholic extract previous to departure for camp. Of 35 who had had dermatitis previously 16 escaped, while the others had some dermatitis, 7 as severely as before. Of the 47 inoculated subjects remaining, none of whom had had ivy rashes before, 7 had mild eruptions. Protection in this group was better among the boys who had never had ivy dermatitis. Among those with ivy rashes in preceding summers the five preseasonal injections given appear not to have protected as well as courses of inoculations continued through the season.<sup>75</sup> There appears to be no unfavorable report on this method of prophylactic therapy. The favorable evidence, however, is all clinical, the exposure to ivy was usually casual, and the skin test sensitivity was not modified. If recent experimental evidence is correct, subjects in whom the skin sensitivity is not diminished by prophylactic therapy will not withstand rigorous controlled exposure.

Injectations with alcoholic extracts are painful even when salt solution is used as a diluent. Clock<sup>76</sup> suggested that oil be used instead of saline solution. Subsequently alcoholic extracts<sup>77</sup> and extracts in acetone<sup>78</sup> and with ether<sup>79</sup> were diluted with oil and used parenterally and orally in attempts to establish protection. Since absorption from oil is delayed, larger doses of extract could be given in one inoculation, so the customary course of ten to fifteen injections was shortened to a few, each dose containing correspondingly greater amounts of concentrated extract. In recent years the tendency has grown to measure the dose in cubic centimeters or milligrams of solid substance obtained by the evaporation of the extracting solvent from the concentrated extract. There is no evidence to suggest that the oily material procured in this way approaches the purity of urushiol. Gowen<sup>80</sup> prepared an alcoholic extract in almond oil similar to that with which Clock<sup>81</sup> had obtained favorable protective results. He believed that 5 of 8 patients given one or two inoculations were protected for one or two years. In 1936 Blank and Coca<sup>82</sup> criticized all previous reports on preventive therapy because no control groups were included with the data. They divided a number of men in a camp in three groups. One group was given four weekly injections of oil containing in all 2 mg. of solids extracted from ivy leaves with acetone, a second group 26.4 mg. of solids, while the third was used as a control. The groups were intermingled while at work. In these groups the incidence of dermatitis was 20, 7 and 66.7 per cent respectively. Bachman<sup>83</sup> selected 14 children, to whom he gave two injections each containing 6.6 mg. of acetone extracted solids. All had had rashes previously. Of 13 who were exposed, 85.7 per cent were unprotected and, although an additional 6.6 mg. was given, 7, or 57 per cent, of these were still susceptible.

In 1937 and 1938 Caulfeild<sup>84</sup> reported that he had injected solutions in oil of solids obtained by evaporating ether extracts of ivy. The method was similar to that previously employed in making extracts of tulip bulbs for the treatment of tulip fingers.<sup>85</sup> The solids were diluted by volume, but the amount of solids given each patient cannot be calculated from the data given. From a small group of patients without controls, he concluded that recurrences were prevented and the skin sensitivity was diminished in intensity. More recently Gold<sup>86</sup> encountered complete failure to protect with ether extracts injected prophylactically through one summer. Shelmire<sup>87</sup> has concluded from his experience that intramuscular injections are of no prophylactic value, sometimes because the material injected is not potent but chiefly because the total amount of solids injected is too small either to modify the skin test or to reduce susceptibility on clinical exposure. All the literature so far suggests the possibility that, whether the administration of extracts is oral or parenteral, the

doses must be sufficiently large to cause a series of mild dermal reactions if the skin test is to be modified or the patient protected against rigorous exposure.

#### RECENT ORAL PROPHYLACTIC TREATMENT WITH IVY EXTRACTS

Galenic tinctures and alcoholic extracts are administered commonly for oral prophylactic therapy. Although stable triturates from alcoholic extracts were prepared as early as 1927,<sup>82</sup> it was believed that patients would forget to take oral preparations and the course required to establish "immunity" was too long in comparison to the time necessary for a similarly effective course of injections. Using the ether extractable solids diluted in corn oil enterally Shelmire<sup>87</sup> was able to reduce skin sensitivity to ivy extracts. From 1 to 3 cc. of the solids diluted and given in increasing daily doses were ingested in the course of several months. Zisserman<sup>46</sup> administered enteric coated capsules, each containing 0.01 mg. of ether extracted solids to 100 men; 0.01 mg. was given daily for seven days, then weekly until each subject had taken from 0.15 to 0.30 mg. Of this group 32 per cent contracted dermatitis on normal field exposure, as compared to an incidence of 36.4 per cent among a very large control group similarly exposed. The protection afforded by this prophylaxis was considered nihil. In the following year, 1942, Gold and Masucci<sup>88</sup> selected 20 subjects for oral prophylaxis with a control group of 8, all with positive skin tests. Beginning with 0.5 mg. of ether extracted solids daily in pills, they increased the daily dose to 150 mg. in the course of forty-five days. Ten of the group of 20 were completely protected, 6 partially and 4 not at all. By the end of the course, each of the 20 people had ingested between 2,900 and 3,700 mg. of solids. The control group was 100 per cent susceptible. In a subsequent statement<sup>89</sup> additional data on 13 more men were submitted. In the first group studied toxic rashes were observed in 80 per cent in the first three or four weeks of therapy when the daily dose was being increased. In the second group the dose given daily was increased more slowly in the early part of the course and the whole period of ingestion was extended to two months. Ten of this group developed toxic rashes during the first few weeks, even with this added precaution. Although these investigators proved that complete protection could be established in about half dermal sensitive subjects and some others partly protected, and that the skin sensitivity could be reduced in intensity by oral administration of ivy extracts, the method was not considered safe or practical because of the high percentage of reactions. They thought these toxic reactions might be avoided if the course was made still longer and the doses increased more gradually. However, on retesting several of the group a few months after the courses were completed they discovered that the sensitivity in some had reverted to the former levels and so questioned the advisability of an extensive course to obtain such temporary hyposensitization.

#### EXPERIMENTAL APPROACH TO IVY IMMUNIZATION

In the preceding sections, suggestions and conclusions have been based on factual data found in the reports of the various investigators cited. Possibilities still open for

experimental approach so far not satisfactorily covered in the literature were not discussed. Two methods for ivy prophylaxis—the oral and the parenteral administration of extracts—have been studied extensively. Recent studies, where small oral doses were given, showed no effect on the resistance of the patients to ivy dermatitis, but large doses given on a graduated ascending scale both modified or reversed the positive skin test and temporarily protected many of the patients against rigorous exposure to ivy. Severe reactions were encountered when the course was short but these were less severe when the same amount of solid oleoresin was given orally during the course of several months. In fact, although occurring, the reactions were said to be negligible with the longer period of administration. Since no careful statistical study of the perennial method of oral administration is available in the literature, this experimental study should be attempted. None of these more potent products have been marketed and none have been submitted to the consideration of the Council. The tinctures so commonly used are unstandardized and according to the literature of questionable and variable potency.

Extracts for parenteral administration have been marketed and several brands have been accepted by the Council. Hitherto, these have been unstandardized. Available published statistical evidence suggests that these parenteral inoculations, with carefully prepared and potent extracts intelligently given, protect the patient to some extent against casual or clinical exposure, even though the skin test sensitivity is not apparently modified. So far no extensive study of prophylaxis by perennial inoculations is available. Since this method appears to be the most satisfactory procedure for pollen prophylaxis, it should be tried for ivy. Shelmire found that even though the positive skin test was not completely reversed, varying degrees of hyposensitization to the test afforded some protection to clinical or casual exposure to ivy. The sensitivity of patients given pre-seasonal and perennial prophylactic injections should be studied further. Differences in sensitivity before and after prophylaxis might be detected if the patients were tested with a single dilution applied to the skin for varying periods of time. Testing has previously been done with several dilutions of varying strength. The duration of the application may be important. So far the literature suggests that when the skin test has been modified by oral prophylaxis, the patient has been desensitized. The possibility that an immune reaction similar to that occurring after pollen inoculations may also occur after inoculations with ivy has not been investigated.

#### REACTIONS FOLLOWING THE ADMINISTRATION OF IVY EXTRACTS

Reactions have frequently been reported in the literature both from oral and from parenteral administration of ivy extracts. With extracts given by mouth, perianal dermatitis has been the commonest complication. It was reported by Dakin<sup>91</sup> over a hundred years ago in patients who had chewed fresh ivy leaves. Warren<sup>90</sup> tried taking the tincture himself in 1919 but developed severe pruritus ani. Although the mucous membranes according to most observers have appeared insensitive to ivy and ivy extracts, stomatitis has been observed along

with perianal rash after fresh leaves were chewed.<sup>91</sup> Whether the mucous membranes are actually sensitive to strong solutions of ivy extract or whether the stomatitis sometimes observed results from an escharotic action of urushiol cannot be decided from reports and experiments made so far. It is believed by some<sup>92</sup> that urushiol and strong concentrations of ivy extracts are primarily irritating when applied to the skin of man and animals. Simple polyphenols, although they darken the skin, lack this effect.<sup>12</sup>

The gastrointestinal tract is irritated by the ingestion of ivy extracts. According to Gold and Masucci, many of the group whom they treated orally suffered from abdominal symptoms during the first few weeks of therapy but became tolerant as the doses were increased. Occasionally, when proper precautions have not been observed during oral therapy, the mucous membranes of the mouth and esophagus have sloughed following the ingestion of strong solutions. Toxic rashes occurred in almost all of the group studied by Gold and Masucci<sup>88</sup> and have been observed by Shelmire<sup>6</sup> following large oral doses of ether extracts. When intramuscular therapy was first used, several physicians reported rashes following injections. The tender skin of the ankles and wrists was most commonly affected, but generalized pruritus was reported. Spain and Cooke<sup>22</sup> observed that when the parenteral doses were increased in size too rapidly the sites of old ivy tests might flare up and rashes might occur even though the site of the inoculation was neither tender nor swollen. Although ordinarily when alcoholic extracts were used a certain amount of momentary pain was experienced, there was no prolonged inflammatory reaction at the site. With the introduction of larger doses of ivy extract in oily vehicles for intramuscular therapy, intense pain, swelling and edema have been encountered in some patients, especially in those treated phylactically. Since the absorption of the larger dose is delayed by the nature of the vehicle, the reaction—swelling and inflammation—may continue over several days. Since ivy dermatitis is obviously a sensitization phenomenon, local, focal and general reactions should be anticipated after the injection of large doses of ivy extract in very sensitive patients. While solutions of extracts in oil permit the administration of relatively larger doses because absorption is delayed, in sensitive subjects absorption of this larger dose often causes severe incapacitating local reactions. One well established principle in the therapy of diseases resulting from sensitization is that the symptoms and clinical characteristics of the disease can often be reproduced by inoculation with certain doses of the antigen. This dose varies in different patients according to their degree of sensitivity. Accordingly, treatment of the acute symptoms by injections of antigen is against all accepted scientific and therapeutic principles unless the patient has previously been well immunized and small doses, well within the tolerance of the patient, are given to maintain immunity through a long season of exposure. Severe local reactions and exaggeration of symptoms are signs of dangerous overdosage. In this connection Corson's observations on Strickler's method of phylactic therapy are interesting. He found that many times when he employed oral and parenteral

therapy for acute dermatitis the rash was intensified. Unfortunately, as most extracts are now supplied commercially, there is but one dose, which is intended for either prophylaxis or treatment and is given without regard to the level of sensitivity of the individual to whom it is administered. Furthermore, no opportunity is commonly afforded to give serial doses of increasing strength, which are essential in the proper "immunization" or "desensitization" of the sensitive patient.

#### PHYLACTIC TREATMENT WITH IVY EXTRACTS

When phylactic treatment was first popularized, the clinical results were considered brilliant.<sup>93</sup> There were, however, a few contradictory reports.<sup>94</sup> Although some of these authors who reported extensive series of patients treated for acute lesions had a few failures, nearly all who were treated were considered improved clinically. The itching seemed to subside and the course was believed shortened. These were only clinical impressions, and no data were offered to show that, in comparison with untreated patients, the course of the disease was actually modified. In 1925 Donald<sup>95</sup> offered some statistical data, not on the duration of the disease but on the length of time required for treatment among groups of patients who were given ivy extracts and those who were not. In the infirmary of the University of California 638 students were seen for ivy dermatitis within twenty-two months. The average number of days of treatment of all kinds, either with or without ivy extracts, in this group was 3.1 days. Severe dermatitis was treated by oral, parenteral or combined therapy. The average time of treatment in this group was 2.9 days. Donald states further that the average duration of treatment among those not given this therapy was four days. According to McNair,<sup>96</sup> the average number of days of hospitalization of 76 patients for ivy dermatitis previous to 1921 was three days in this same infirmary. These figures are offered for comparison. The differences are considerable. In more recent literature, prophylaxis and not phylactic therapy has been stressed, although occasional favorable reports have appeared<sup>97</sup> within the last decade. No further statistical evidence has been offered in these later reports that the course of the disease has been shortened or modified. In 1938 Sompayrac<sup>98</sup> studied the effect of alcoholic extracts given intramuscularly on the duration and symptomatic course of local dermatitis induced by patch test. Nine of twenty-three skin sensitive subjects were given three or four injections in the course of two days after a local skin reaction has been induced. The course of the induced reaction was not modified, nor did it differ in any respect from the course of the local rash induced in 14 control subjects. The injected sites were painful and swollen. In 1 subject generalized pruritus followed an inoculation. The data offered in the literature are not convincing in regard to the phylactic value of treatment with antigens of ivy orally or parenterally.

Ivy dermatitis is a self-limited disease of short but indefinite duration with variable symptoms, and no satisfactory evidence has been brought forth to show that the course has been changed for the better by this therapy. Since it is known that many patients are made worse because severe reactions occur when large doses of extracted solids are injected and since the practice is not in conformity with theory, it is believed that the treatment of acute ivy rashes either parenterally or orally with ivy extracts should be vigorously discouraged.

#### SUMMARY AND CONCLUSIONS

Although more than fifty species of poison ivy, oak or vine have been described as native to North America, only three, classified as *Toxicodendron*, are described by conservative botanists and accepted by the U. S. Herbarium in Washington. According to some observers, these species might be considered subvarieties of a single species which has been modified by climatic and geographic environment. Poison or swamp sumac has also been included in this classification as a species of *Toxicodendron*. The poisonous substance in at least one species of ivy has been chemically identified as urushiol, the active factor in the sap of the lac trees of Japan, China and Indo-China, and the chemical properties of the dermallergens isolated from the other species of ivy or oak and from swamp sumac are such that it is highly probable that urushiol is the irritant common to ivy, sumac and the lac trees. Immunologic evidence supports this view, so it is believed that a single extract can be used in any attempted prophylactic therapy for the dermatitis caused by any one of these plants. Urushiol is readily oxidized and precipitates in the presence of laccase, a polyphenolase occurring in the saps of all these plants, but is apparently quite stable in slightly acid solution once it has been fractionally separated from this enzyme. Ether is probably the most satisfactory extractive because it readily dissolves urushiol but not the enzyme. Since laccase is activated as soon as the leaves and twigs of the plants are injured and exposed to air, before extraction the leaves should be dried quickly to prevent oxidation with resulting detoxification of the urushiol. Probably the only satisfactory method of drying to prevent partial oxidation would be to freeze the fresh leaves with solidified carbon dioxide and extract the water in vacuo while the leaves are still frozen.

All observers believe that the typical dermatitis is the result of contact after previous exposure and sensitization to the active substance in the plants. Infants, adults and certain animals have been sensitized with the plant extracts or with urushiol. There is also some evidence that this sensitization resulting from either experimental or natural contact diminishes in intensity if not maintained by repeated exposure.

Persons who show strongly positive skin tests with ivy extracts and are susceptible to the dermatitis can be rendered dermally insensitive to the test and also resistant to rigorous exposure to the plants by the daily ingestion of large increasing doses of ivy extracts. All the evidence suggests that these subjects are desensitized rather than immunized, but unfortunately most are only temporarily "resistant" or "protected" against ivy. If the period of ingestion is short, that is six weeks or less, the doses of extract required to accomplish "desensitization" are so large that rashes and gastrointestinal symptoms have occurred in almost all experimental subjects. These reactions are said to be

negligible when the same amount of extract is administered in smaller doses over a period of seven or eight months. So far, none of these potent extracts for oral therapy have been marketed or submitted to the Council for consideration. There is no satisfactory evidence that the skin test or resistance against ivy on rigorous exposure has ever been modified except by the aforementioned procedure, a procedure which its instigators imply is possibly unsafe except under experienced supervision and probably not worth while because the resistance seems but temporary. There is clinical evidence supported by statistics that intramuscular inoculations have conferred resistance on susceptible persons. The inoculations were begun well before the ivy season and the dose was increased at weekly intervals. But the subsequent exposure was casual in most instances and the sensitivity to the patch test was not modified. While this clinical evidence cannot be disregarded, the fact that the skin test has not been modified and the inoculated subjects have not been rigorously exposed under supervision casts some doubt on the validity of the evidence purporting to show protection afforded by intramuscular inoculation. Since there is no controlled statistical evidence that the daily ingestion of small amounts of extract over a long period will modify the dermal test or give protection and the ingestion of large doses within a period of a few months is still experimental, the method of choice, if one must "immunize" against ivy, appears to be by inoculation with repeated doses of extract begun well before the season and increased in strength at frequent intervals within the tolerance of the patient. This appears to be the method of choice, not because it is believed that the experimental evidence is entirely satisfactory, but because the favorable statistical evidence outweighs the unfavorable, and the objections and queries raised may be satisfactorily explained by subsequent observations.

So far no accepted method of standardization of ivy extracts has been evolved. Since urushiol is a mixture of several components of varying saturation and possibly differing toxicity and there is no evidence that a uniform product has yet been obtained by the different methods of extraction employed, standardization by weight of leaf or by volume or weight of extracted solids can be only an approximation. In experienced hands, extracts of considerable uniformity can apparently be obtained, because different extracts prepared by the same method have given approximately the same percentages of positive skin reactions in similar groups of people. By testing an individual prior to immunization with varying dilutions of such an extract, the strength of the initial dose can be made to conform with the sensitivity of the individual. With commercial extracts, since such adaptation to the individual is scarcely feasible, the initial dose of a standard series should be one adapted to the most sensitive individuals in the population. If the weakest dilution of a preparation which will give a satisfactory skin response in 50 to 60 per cent of an average sample of the exposed adult population is accepted as a standard and inoculations are started with a five or ten fold dilution of this standard solution, this requirement should be satisfied. The series of doses used for "immunization" should be prepared so that the practitioner may have sufficient latitude to meet the requirements of the individual patient. The treatment of the acute rash with ivy extracts should be discouraged, because many patients are made worse and there is no satisfactory evidence that any are helped.

## NEW AND NONOFFICIAL REMEDIES

The following additional articles have been accepted as conforming to the rules of the Council on Pharmacy and Chemistry of the American Medical Association for New and Nonofficial Remedies. A copy of the rules on which the Council bases its actions will be sent on application.

AUSTIN SMITH, M.D., Secretary.

**SYRUP OF AMMONIUM MANDELATE.**—A syrup containing approximately 40 Gm. of mandelic acid and approximately 4.5 Gm. of ammonia per hundred cubic centimeters. It contains ammoniated glycyrrhizin, anethol or menthol and other flavoring agents and is sweetened with sugar and saccharin.

**Actions and Uses.**—Ammonium mandelate is used to provide mandelic acid therapy without concurrent use of ammonium chloride as a urine acidifier. In some cases supplementary therapy with ammonium chloride is necessary.

**Dosage.**—The daily dose for adults should provide 12 Gm. of mandelic acid, administered in divided doses.

### Tests and Standards.

Syrup of ammonium mandelate occurs as a dark brown viscous liquid, possessing a characteristic odor and a bitter taste, with a sweet, licorice-like after-taste. The pH of syrup of ammonium mandelate is not below 5.0 nor above 7.0; the specific gravity is between 1.2 and 1.4.

Transfer 2 cc. of syrup of ammonium mandelate to a separator; add 5 cc. of water, 5 cc. of diluted sulfuric acid, and extract the mixture with 25 cc. of ether, filter the ether solution through a cotton plug and evaporate the ether in a stream of warm air: the melting point of the residue is from 118 to 120 C. and it responds to the tests of identity for mandelic acid-U. S. P. Warm 2 cc. of syrup of ammonium mandelate with 5 cc. of sodium hydroxide solution: a strong odor of ammonia is evolved. Ash 1 Gm. of syrup of ammonium mandelate: the residue found is not more than 0.1 per cent.

Transfer an accurately weighed portion of syrup of ammonium mandelate, equivalent to about 20 cc. of the syrup, to a 500 cc. calibrated flask, dilute to the mark with water and mix thoroughly.

Transfer 25 cc., accurately measured, of the prepared solution to an automatic extractor (liquid-liquid), acidify with 5 cc. of diluted sulfuric acid and extract with ether for four hours. When the extraction is complete, evaporate the ether extract to a volume of about 10 cc., and finally complete the removal of ether in a stream of air. Add 25 cc. of neutral alcohol and titrate with tenth-normal sodium hydroxide, using phenolphthalein as the indicator. The amount of mandelic acid found corresponds to not less than 39 per cent (W/V) nor more than 41 per cent (W/V) of the undiluted syrup.

### WYETH INCORPORATED, PHILADELPHIA

**Syrup Ammonium Mandelate:** 480 cc. bottles, accompanied by a supply of chlorphenol red test papers.

### ALLERGENIC PREPARATIONS (See New and Non-official Remedies, 1944, p. 35).

The following additional pollen extracts have been accepted:  
**HOLLISTER-STIER LABORATORIES, SPOKANE, WASH.**

**Pollen Extracts:** *Acacia, Alfalfa, Ash (White), Beech, Bermuda Grass, Careless Weed, Cedar (Mountain), Clover, Cocklebur, Corn, Cottonwood (Common), Dock (Yellow), Elm, Fescue (Meadow), Goldenrod, Johnson Grass, Kochia, Maple (Hard), Oak (White), Olive, Pine (Yellow), Short Ragweed, Sage (Common), Sage (Pasture), Sage (Prairie), Spear Scale, Sugar Beet, Sweet Vernal Grass, Sycamore, Walnut (English), Wheat (Cultivated), Western Water Hemp and Wormwood.*

### CHORIONIC GONADOTROPIN (See New and Non-official Remedies, 1944, p. 445).

The following dosage form has been accepted:

**GEORGE A. BREON & Co., INC., KANSAS CITY, MO.**

**Chorionic Gonadotropin, 1,000 and 5,000 International Units:** 10 cc. vials. A powdered preparation of chorionic gonadotropin packaged in vials which, when treated with the accompanying 10 cc. of phosphate buffer solution, furnishes solutions having a potency of 100 and 500 international units per cubic centimeter, respectively.

### DIPHTHERIA TOXOID (See New and Nonofficial Remedies, 1944, p. 560).

The following dosage form has been accepted:

**NATIONAL DRUG CO., PHILADELPHIA**

**Diphtheria Toxoid (Fluid-Ramon):** 30 cc. vials. Preserved with 1:10,000 merthiolate.

### ANTI-ERYSIPELOID SERUM (See New and Non-official Remedies, 1944, p. 547).

The following dosage form has been accepted:

**PITMAN-MOORE CO., INDIANAPOLIS**

**Anti-Erysiploid Serum (Refined):** 10 cc. vial. Preserved with merthiolate 1:10,000.

## A GROWTH PROMOTING SUBSTANCE FOR INDOLENT WOUNDS

In 1911 Carrel<sup>1</sup> employed embryonic tissue extract as the basic element in his tissue cultures. Saline extracts of proliferating tissues added to a culture medium, he found, increased the rate growth of cell colonies in vitro. Carrel believed that this growth promoting property was possessed by the embryonic tissue alone. Maximov, von Moelendorf and others demonstrated that extracts of adult tissue, which they used in their tissue culture experiments, likewise exhibited the growth stimulating property. However, the tissues with which they worked were of the growing type, either neoplastic or bone marrow. Carrel demonstrated in 1913 that extracts of adult tissues, such as the spleen, liver, connective tissue, kidney, heart, blood cells, thyroid and muscle, stimulated the growth of connective tissue cells in vitro.

Doljanski, Hoffman and Tenenbaum<sup>2</sup> demonstrated that extract of heart muscle of a hen exerted a pronounced growth stimulating effect on a culture of fibroblasts. This effect was much more pronounced than that of embryonal tissue derived from a 7 day old chick embryo. These authors further demonstrated that the growth promoting ability of adult tissue is not restricted to homologous cells but is present also in heterologous adult tissues. They further demonstrated that human epithelium in vitro is stimulated by extracts of heart muscle from adult fowl.

Waugh<sup>3</sup> described in 1940 the clinical application of "epicutan," an embryonic material prepared by an agency in Copenhagen. In 18 cases the time of healing, as determined by Du Nouy's formula, was reduced by 30 per cent. Goldberg<sup>4</sup> summarized two years' experi-

ence of Soviet clinicians with embryonic emulsions by stating that 15 or 25 per cent ointment appeared to stimulate the growth of epithelium and fibroblasts and that discharges from wounds diminished, granulation tissue appeared earlier and epithelization was prompt.

Mandl and Maybaum,<sup>5</sup> using a dry powder prepared from adult tissue extracts by the method of Werner and Doljanski, obtained healing in 65 out of 94 indolent wounds. They believed that the stimulating effect concerned the formation of granulation and probably even to a higher degree stimulation of epithelization. Kerr and Werner<sup>6</sup> have reported the use of a powdered preparation of sheep's heart prepared by Werner and Doljanski at the Department of Experimental Pathology of the Hebrew University, Jerusalem. The patients had infected, nonhealing ulcers; they were first subjected to accepted methods of treatment, such as occlusive, elastic dressings, sulfanilamide powder with tulle gras, petrolatum dressings, plaster of paris and skin grafting. Of 36 cases which fulfilled their criteria of intractability to orthodox methods, 33 fulfilled their criteria of success. These authors feel that no other method or combination of methods could have accomplished the same results within the periods quoted: recovery occurred in over 90 per cent of these 36 failures with the usual methods.

## ASPERGILLUS ANTIBIOTICS (TUBERCULOCIDINS)

In 1942 Wilkins and Harris<sup>1</sup> of the Department of Botany, Oxford University, England, examined 100 species of fungi for the production of bacteriostatic or bactericidal substances, *Escherichia coli*, *Staphylococcus aureus* and *Pseudomonas aeruginosa* being used as test organisms. About 25 per cent of the *Penicillium* strains and 40 per cent of the *Aspergillus* strains yielded antibiotics. *Aspergillus fumigatus* yielded particularly active filtrates, apparently superior to the bacteriostatic substances produced by *Penicillium*. From *aspergillus* filtrates Chain and his associates<sup>2</sup> of the Sir William Dunn School of Pathology, Oxford University, subsequently isolated a crystalline antibiotic, "helvolic acid," the name being derived from the variety of *Aspergillus fumigatus* yielding the best product.

This crystalline product is sufficiently stable to resist boiling for fifteen minutes. It inhibits the growth of gram positive organisms (including gas gangrene) in dilutions as high as 1:1,280,000. Its bacteriostatic power is not reduced by the presence of pus, serum

2. Chain, E.; Florey, H. W.; Jennings, M. A., and Williams, T. I.: *Brit. J. Exper. Path.* 24: 108, 1943.

or other normal or pathologic tissue products. The product is excreted in the urine much more slowly than penicillin. After a single intravenous injection an effective therapeutic level is maintained for over ten hours in the blood stream, penicillin disappearing within two hours. The substance is sufficiently low in toxicity to be of clinical promise. Injected into mice, "helvolic acid" has distinct therapeutic value in the treatment of experimental staphylococcal or streptococcal infections.

A year later Waksman and his associates<sup>3</sup> of the New Jersey Agricultural Experiment Station demonstrated a somewhat similar substance in other varieties of *Aspergillus fumigatus*. This second product ("fumigacin") is both bacteriostatic and bactericidal for the routine test organisms and can be obtained in relatively pure form as needle shaped crystals from alcoholic solutions. Unfortunately it is so highly toxic as to be without practical clinical interest.

Research interest in aspergillus antibiotics was stimulated by the subsequent demonstration that other strains of *Aspergillus* yield products active against the tubercle bacillus. Soltys<sup>4</sup> of the Institute of Animal Pathology, Cambridge University, named his product "aspergillin." His product is inactive against staphylococci but inhibits the growth of *Mycobacterium tuberculosis* even when tested in high dilutions. Soltys's antibiotic is nontoxic for experimental animals and is sufficiently stable to withstand boiling for one hour.

More detailed studies of this (or a similar) tuberculocidal substance are now reported by Asheshov and Strelitz<sup>5</sup> of the University of Western Ontario, Canada. The *Aspergillus fumigatus* strain used by them was originally isolated as a laboratory contaminant. Grown at room temperature on Czapek-Dox medium containing 2 per cent corn syrup, the strain produces substances active against gram positive, gram negative and acid fast bacteria. After fifteen to eighteen days' growth the culture filtrate inhibits growth of staphylococci in a dilution as high as 1:40. Activity against *Escherichia coli* varied independently from this and was never higher than 1:20. The substance active against staphylococci is apparently identical with that active against acid fast bacteria. This tuberculocidal substance can be obtained in relatively pure form by extracting the culture medium with chloroform, or the substance may be adsorbed on animal charcoal and subsequently eluted with chloroform. As a third method, the substance may be precipitated with other products by saturating the culture medium with ammonium sulfate and then extracted from the mixed precipitate with chloroform.

Tuberculostatic action of this product was tested by serial dilutions of the resulting crude product in Kirchner's<sup>6</sup> medium and inoculating the tubes with a suspension of tubercle bacilli. Final examination for growth was made after six weeks. Thus tested, the partially purified substance inhibits the multiplication of human type tubercle bacilli in dilutions as high as 1:1,400,000. Tuberculocidal action was estimated by incubating a heavy suspension of tubercle bacilli with different dilutions of the substance for twenty-four hours and then testing quantitatively for viability. Thus tested, the crude product often kills human type tubercle bacilli in a dilution 1:500,000. Bacteriostatic or bactericidal action was not demonstrated with avian type tubercle bacilli.

Animal experiments on toxicity, topographic distribution and therapeutic activity have been postponed till this antibiotic can be obtained in greater purity. Several other as yet unidentified molds have been found to produce tuberculostatic and tuberculocidal substances of equal potency.

### MORE LIFE FOR YOU

On page 930 of this issue of THE JOURNAL will be found an announcement of a new series of electrically transcribed radio programs made available on loan for use by local medical societies or by local public health agencies when approved by the local medical societies. "More Life for You in the Best Years of Your Life" is the theme and title of these programs, in which twenty-three prominent specialists are interviewed on health problems facing adults. These transcriptions added to other series, Dodging Contagious Diseases, Before the Doctor Comes, Medicine Serves America, Live and Like It, and a special series for elementary school use entitled Health Heroes, represent the development of an extensive coverage of the health field planned by the Bureau of Health Education under authorization of the Trustees of the American Medical Association. In addition to the series now available, which constitutes sixty-three weeks of continuous broadcasting exclusive of the Health Heroes series for schools, transcriptions planned and soon to be released include one on summer health hints under the title Keep Cool, ready about May 15, on public health problems, entitled Guardians of Your Health, ready approximately July 15, and a series in dramatized form dealing with mental adjustment problems under the tentative title In Step with Life. By the end of 1945 there will be available a sufficient supply of transcribed programs prepared by radio professionals from authentic medical sources to keep any local medical society or health department on the air continuously for more than two years with a minimum of local effort. If acceptance and use of these programs justifies, it is hoped to keep a continuous supply of new material available. Experience of more

4. Soltys, M. A.: Nature, London 154: 550, 1944

5. Asheshov, I. N., and Strelitz, F.: Science 101: 119 (Feb. 2) 1945.

6. Kirchner, O. Zentrallbl. f. Bakt., I. Orig. 124: 403, 1932.

than one thousand local broadcasts from available platters in 1944 indicates that these transcriptions are meeting a need. With one third of available physicians in the armed forces, remaining doctors are too busy to write and broadcast health information. Yet there was never a time when medical advances, food shortages and other wartime factors rendered health education more essential than now. The American Medical Association is providing this growing library of electrically transcribed health broadcasts to keep our people informed through their local medical societies. They are made available without charge to any responsible local group approved by the county medical society; the only expense is the nominal cost of returning the used records.

#### GEORGE COLMER'S REPORT OF AN OUT- BREAK OF EPIDEMIC POLIOMYELITIS IN 1841

In medical history epidemic poliomyelitis appears first in sporadic form. Characteristic deformities of the limbs have been found on Egyptian mummies, and they are clearly shown by the well known Egyptian stele of the eighteenth dynasty as well as on Spanish and other paintings several hundred years ago. Quite likely the brother of Catherine the Great was attacked and left a cripple when a year and a half old. He was born in 1734. And Walter Scott in 1773, when he was of the same age, suffered an attack which resulted in paralysis of the right leg. The descriptions by Underwood (1789) in England and Heine (1848) in Germany of the paralytic stages of poliomyelitis were based on observations of sporadic cases. These facts indicate the long existence of the virus of poliomyelitis over widely separated areas. Only since the latter part of the last century, beginning about 1881, has the epidemic form of the disease become known. Since then the number and the extent of the epidemics have steadily increased in the temperate zones. Of much interest is a definite outbreak of infantile paralysis recorded by George Colmer, 1807-1878, of Springfield, La., in 1841, whose report,<sup>1</sup> word for word, was as follows:

Medical Notes. By George Colmer.—Paralysis in Teething Children.—Whilst on a visit to the parish of West Feliciana, La., in the fall of 1841, my attention was called to a child about a year old, then slowly recovering from an attack of hemiplegia. The people (who were people of intelligence and unquestionable veracity) told me that eight or ten other cases of either hemiplegia or paraplegia had occurred during the preceding three or four months within a few miles of their residence, all of which had either completely recovered or were decidedly improving. The little sufferers were invariably under two years of age, and the cause seemed to be the same in all—namely, *teething*.

Dr. Colmer was greatly beloved and respected as physician and citizen. Fortunately a good account of his life and work has now been published<sup>2</sup> and reveals need for further investigation. His note, frequently mentioned as the earliest report of epidemic poliomyelitis, illustrates again the wide spread of the virus of the disease.

#### RESEARCH COUNCIL TO INVESTIGATE PROSTHETIC DEVICES

At the request of the Surgeon General of the Army, as indicated elsewhere in this issue (Medicine and the War, page 925), the National Academy of Sciences and the National Research Council have organized a Committee on Prosthetic Devices. Here for the first time experts in the field of engineering will combine with surgeons and inventors to apply to the manufacture of artificial limbs the knowledge that has been gained in the fundamental sciences. The history of prosthetic devices indicates that there has been a failure to apply much of the knowledge that has become available. The tendency has been for manufacturers of devices to hold strictly to models which they have themselves developed and on which they might be able to establish patents. Brace makers and makers of artificial limbs frequently have held as trade secrets some of the improvements which they have developed and would teach them only to their own apprentices. Many new discoveries have been made in alloys of metals which would provide light weight, malleability, freedom from rust and other desirable factors. These have, however, been incorporated too infrequently in the making of prosthetic devices. The committee will aim to incorporate these new advances into the making of artificial limbs and to bring about as much standardization as possible in parts and mechanisms so as to assure simplification of maintenance and repair. The auspices under which this committee has been established and the inclusion of such names as those of Kettering, Magnuson, McClure and Wilson mean that progress will be made. The chairman is Dr. Paul E. Klopsteg, professor of applied science at Northwestern University, who gives assurance that the points of view of engineering, production, fitting and servicing, as well as the medical and surgical points of view, will prevail in the work of this committee.

#### HYPOTENSION IN CUNA INDIANS

Blood pressure readings were taken by Kean<sup>1</sup> according to the recommendations of the American Heart Association on 408 Cuna Indians ranging in age from 16 to 66 years. The average pressure in the entire group was 105.2 systolic and 69.3 diastolic. There was no tendency for the pressure to rise with age. The highest recorded were two systolic pressures of 144; all the others were below 140. Four Indians had diastolic readings between 90 and 99. A large proportion had a hypotension. Kean in previous studies showed that hypertension occurred seven times more frequently in West Indians (Negroes) than in Panamanians (mostly mestizos) living on the Isthmus of Panama. These figures, together with others previously obtained, suggest a fundamental difference between these peoples which leads to the development of hypertension in West Indians, a low incidence of hypertension in mestizos and the complete absence of what is considered high blood pressure in Cuna Indians.

# MEDICINE AND THE WAR

## ARMY

### A. A. F. CLINICAL REFRESHER TRAINING

The establishment of clinical refresher training for A. A. F. Medical officers returning from overseas and for others whose assignments have provided them a minimum of clinical experience has been announced by Major Gen. David N. W. Grant, the Air Surgeon of the Army Air Forces.

The training covers a twelve week period and consists of a two week didactic course at the A. A. F. School of Aviation Medicine, Randolph Field, Texas, and a ten week clinical course in one of the larger A. A. F. regional hospitals.

The purpose of the training, said General Grant, is to give medical officers who for a period of twelve months or more have had a minimum of active clinical work as the result of assignment to administrative, dispensary or tactical positions an opportunity (1) to study the newer methods of medical and surgical treatment and (2) to qualify for clinical positions in A. A. F. hospitals.

"It is the nature of war to prevent a great many of us from doing what we want to do," said General Grant. "Much of the flight surgeon's work is not medicine per se, yet the practice of aviation medicine is a vitally important mission requiring the scientific training and humanitarian interest of the medical officer and, with competent performance, constitutes preventive medicine of the highest order.

"The flight surgeon's success in the aero medical extension of the airman's sphere of action should be ample reward for any sacrifice of clinical interest. There have been complaints, however, that the flight surgeon does not find sufficient opportunity for enhancing his professional competence in clinical medicine and surgery. This is true. The wing, group or squadron surgeon who has been overseas for one, two or three years has had little or no opportunity for experience as a practitioner.

"A few tactical air forces which have hospital facilities as a part of their organization have been able to remedy this situation to a certain extent by rotating medical officers between field and hospital service."

For medical officers returning home, he said, clinical refresher training has been introduced in line with his long-held intent to do everything within his power to secure the futures of the men to whom he is personally as well as officially obligated for the outstanding success of the A. A. F. Medical Service.

The new postgraduate training in the A. A. F. is described as a logical sequence to the resident training provided for more than 600 young medical officers in A. A. F. hospitals accredited for this purpose by the Council on Medical Education and Hospitals of the American Medical Association.

The refresher training is given on a voluntary basis to officers for whom a hospital assignment is contemplated, preference being given to those with the longest terms of overseas service, regardless of rank.

If vacancies are not filled by returnees, medical officers assigned to administrative, dispensary or tactical positions in the zone of interior will be considered for this training.

The plan of training, as described in A. A. F. letter 50-97, dated Feb. 20, 1945, provides in the didactic phase for clinical conferences and lectures in medicine, surgery and the subspecialties, with parallel reading in textbooks and periodicals prescribed. In the second, or hospital, phase the student medical officers will perform the duties of ward officers, receive special instruction in x-ray interpretation and laboratory diagnosis and have opportunity to work in the operating room in such capacity as may be determined by the chief of surgery. All hospital training will be of an on the job character in which fullest utilization will be made of the officers' services for essential medical duties.

Facilities for training in the following specialties are available in A. A. F. hospitals: general medicine, cardiology,

gastroenterology, dermatology, bacteriology, general surgery, anesthesiology, orthopedic surgery, otolaryngology, urology, ophthalmology, roentgenology and psychiatry.

"While the primary purpose of clinical refresher training is to prepare the medical officer for an A. A. F. hospital assignment, it is obvious that the offered course will be of postwar value to the individual," said General Grant.

### ESTABLISH COMMITTEE ON PROSTHETIC DEVICES

A study of the problems associated with providing war veterans with artificial limbs has been initiated, on request of the Surgeon General of the Army, by the National Academy of Sciences and the National Research Council, through a newly established Committee on Prosthetic Devices. The committee will represent jointly the Division of Engineering and Industrial Research and the Division of Medical Sciences of the council, and its activities, including the necessary research entailed in the project, are supported by the Office of Scientific Research and Development, through the latter's Committee on Medical Research.

Chairman of the committee is Dr. Paul E. Klopsteg, professor of applied science at Northwestern University and director of research of the Northwestern Technological Institute. Dr. Klopsteg states that it is the intention of the committee to consider the problems from the points of view of engineering, production, fitting and servicing as well as from their medical and surgical aspects. Its purpose is to make certain that veterans will be provided with the best possible prosthetic appliances that can be devised.

In considering mechanisms and parts of limbs the committee has no intention of disregarding all the good work that has been done but, rather, it will analyze objectively every meritorious device. Any new development will begin on the foundation of experience already available, as manifested in the many ingenious mechanisms now in use and in the success that has been achieved in the fitting and use of limbs by both military and civilian personnel. Another aim of the committee is to bring about as much standardization as possible in parts and mechanisms, to assure simplification of maintenance and repair.

In view of the magnitude of the task, the work being undertaken by the committee is expected to continue for many months; but it is likely that results and findings that may be immediately applicable will be released as soon as they are available. To assure the utmost utility and practicality of any developments done under the auspices of the committee, close working relationships are being established with government amputation centers in the hospitals of the armed forces.

Serving with the chairman are the following committee members: Dr. Harold Conn, surgeon in chief, Goodyear Tire & Rubber Company, Akron, Ohio; Mr. Mieth Maeser, research engineer of the United Shoe Machinery Corporation, Beverly, Mass.; Dr. Paul B. Magnuson, chairman of the Department of Bone and Joint Surgery, Northwestern University Medical School, Chicago; Dr. Robert R. McMath, director of the McMath-Hulbert Observatory of the University of Michigan; Mr. Edmond M. Wagner, chief of the engineering section of the National Defense Research Committee, Washington, D. C., and Dr. Philip Wilson, clinical professor of Orthopedic Surgery, Columbia University College of Physicians and Surgeons, New York.

Dr. Charles F. Kettering, head of General Motors Research Division, Detroit, and Dr. Roy D. McClure, chief surgeon of Henry Ford Hospital, Detroit, are consultants to the committee.

The operating headquarters of the committee are at Northwestern University, Evanston, Ill.

## FIVE ARMY NURSES DECORATED, ONE COMMENDED

The War Department recently announced that five members of the Army Nurse Corps have been decorated and one has been awarded a commendation for professional skill, determination and high sense of service exhibited.

Major Louise M. Fitzgerald, Jacksonville, Fla., was awarded the Legion of Merit for exceptionally meritorious conduct in the performance of outstanding service as chief of the Nurse Section, Headquarters, Persian Gulf Command, from July 15, 1943 to May 26, 1944. She contributed in a high degree to the success of the mission of the command by establishing the administration, training and control of the members of the Army Nurse Corps of that command and by keeping the morale of the command at a high level in spite of great handicaps.

First Lieut. Retha O. Rodgers of Hubbard, Iowa, and 1st Lieut. Joseph F. Sansone of Milwaukee were awarded the Air Medal for services rendered while acting as flight nurses from Feb. 21, 1943 to July 23, 1944 on unarmed and unarmored troop carrier aircraft on air evacuation missions in the Mediterranean and European theaters of operation. They administered to the needs of wounded personnel being evacuated from combat zones in near areas in the Mediterranean and European theaters of operation. They administered to the needs of wounded personnel being evacuated from combat zones in rear areas in the Mediterranean theater and in northern France. Their aircraft was subjected to the risk of attack from enemy ground installations and hostile aircraft. They are also credited with the training of a large number of air evacuation nurses.

Second Lieut. Bernice V. McDonald of Burkburnett, Texas, as flight nurse from Feb. 19, 1944 to July 31, 1944 with the Army Air Forces was awarded the Air Medal Sept. 25, 1944 for distinguishing herself by meritorious achievement while participating in more than one hundred and fifty hours of operational flight in transport aircraft through the combat zones of Upper Assam, Burma and Southwest China. She helped evacuate sick and wounded from forward air strips in Burma to hospitals in India and China.

Second Lieut. Ruth C. Bimber of Beaver Falls, Pa., was awarded the Soldier's Medal on Sept. 6, 1944 for heroism July 11, 1944. While swimming with a party of officers from her unit, two officers were caught in a treacherous undertow. Lieutenant Bimber quickly went to the help of one of the officers but because of the strong current and rough surf she was unable to tow him to shore. She held his head out of the water until another officer came to her assistance.

First Lieut. Ledore G. Alsop of Fort Worth, Texas, was awarded a commendation on July 9, 1944 for her courageous actions on March 29, 1944 near Anzio, Italy, when she was responsible for the safety of her patients while removing them to safer positions.

## CONSTRUCTION OF GENERAL HOSPITAL FACILITIES AT BROOKE GEN- ERAL HOSPITAL

The War Department recently announced the authorization for the construction of general hospital and convalescent hospital facilities at Brooke General Hospital, Fort Sam Houston, Texas. The construction authorized includes conversion of the redistribution center area, including utilization of fifteen 63 man barracks and consolidation of several other buildings into mess halls and service buildings, installation of operating rooms and clinical facilities and other facilities to provide 1,700 additional beds. Convalescent facilities for 5,000 men will be provided. The work will be supervised by the San Antonio District Office of the Corps of Engineers.

## MAJOR EMIL P. REED RESCUED

Among those rescued recently in the Philippines was Major Emil P. Reed, formerly of Brownsville, Texas. Dr. Reed graduated from the University of Oklahoma School of Medicine, Oklahoma City, in 1931 and entered the service Nov. 8, 1940.

## EXPERIMENTAL ORTHOPEDIC FOOTWEAR CLINIC

Anticipating the need for special footwear for soldiers returning from overseas with foot injuries, the Office of the Quartermaster General, in cooperation with the Office of the Surgeon General, has authorized an experimental cast making unit and orthopedic footwear clinic at the Boston Quartermaster Depot. Accurate casts will be made of deformed feet, and permanent metal molds will be fashioned from these casts. The wooden lasts on which the shoes are built are made from these molds. Casts, molds, lasts and patterns will be marked with the name and serial number of the soldier and held at the depot. Thus, through his Veterans Bureau, the injured man will be able to obtain the special shoes as long as he needs them. The plan calls for the establishment of similar clinics in each service command in the United States.

## ARMY AWARDS AND COMMENDATIONS

### Major James E. Crane

Major James E. Crane of Stamford, Conn., flight surgeon at the Fort Logan Convalescent Hospital, was recently awarded the Bronze Star for his work in the field of aviation medicine. He was cited for "meritorious service in the South Pacific from Jan. 2, 1943 to May 1, 1944. He commanded the first medical air evacuation transport squadron to function in any theater of war and with limited personnel and equipment quickly developed a smooth running unit which met every demand incident to the evacuation of casualties by air from the combat area. Later, as flight surgeon of the Army Air Corps Rehabilitation Center in New Zealand, his professional skill and wide experience in the field of aviation contributed much to the personal welfare and fighting spirit of flying personnel suffering from the strain of sustained combat who passed through the center." Dr. Crane graduated from the University of Vermont College of Medicine, Burlington, in 1939 and entered the service in February 1941.

### Colonel Rexford L. Diveley

The Bronze Star with a special citation was recently awarded to Col. Rexford L. Diveley, formerly of Kansas City, Mo., "for meritorious service in connection with military operations as a senior consultant, Orthopedic Surgery Office of the Chief Surgeon, EPO, on the 25th of August to the 15th of May 1944. Col. Diveley is responsible for development of convalescent and rehabilitative facilities for orthopedic patients." Dr. Diveley graduated from the University of Kansas School of Medicine, Kansas City, in 1917 and entered the service July 22, 1942.

### Major Sol I. Frankel

Major Sol I. Frankel, St. Louis, former regimental surgeon with an infantry division in Italy, now stationed at an army camp in Washington, was awarded the Bronze Star for meritorious service in action near Santa Maria Infante last May. Dr. Frankel graduated from St. Louis University School of Medicine in 1924 and entered the service June 19, 1943.

### Major Irving Favus

The Bronze Star was recently awarded to Major Irving Favus, formerly of Chicago, for "meritorious service." He is serving in General Patton's Third Army and was decorated January 15. Dr. Favus graduated from the University of Illinois College of Medicine, Chicago, in 1937 and entered the service Jan. 25, 1941.

### Lieutenant Colonel George C. Bess

Lieut. Col. George C. Bess, formerly of St. Louis, has been given the second Distinguished Service Badge. He was former chief surgeon of a heavy bomber group but is now serving as chief medical inspector of the Fifteenth Army Air Force in Italy. Dr. Bess graduated from St. Louis University School of Medicine in 1935 and entered the service April 15, 1941.

## NAVY

NAVY PUBLIC HEALTH UNIT TO  
AID GREEK GOVERNMENT

At the request of the Greek government, a navy public health unit left recently for Athens to curb disease, restore and improve sanitary facilities, disseminate public health education and do everything else in its power to ameliorate living conditions among the people crushed by years of enemy occupation. The unit of fourteen men is under the command of Comdr. Theodore R. Meyer of Sag Harbor, Long Island, N. Y. Functioning directly under the naval attaché to the American embassy in Athens, the public health group will direct its attack particularly against tuberculosis, typhoid, malaria, syphilis, typhus and trachoma. The lack of adequate food, clothing, housing, hospitals and sanitary facilities has precipitated conditions whose correction and relief are expected to tax the naval "trouble shooters" to the utmost. With them they took more than a ton of chemicals, drugs, biologic products and other supplies, to be replenished as warranted. Lieut. Comdr. W. J. Dougherty of Beverly Farms, Mass., is second in charge of the unit.

## NAVY AWARDS AND COMMENDATIONS

## Lieutenant Commander Warren Elmer Page

The Silver Star Medal was recently awarded to Lieut. Comdr. Warren Elmer Page, formerly of Oakland, Calif. The citation accompanying the award read "for conspicuous gallantry and intrepidity while serving with a marine force during an aerial attack by enemy Japanese forces at Bougainville, Solomon Islands, on the night of Nov. 7, 1943. Injured and dazed by an exploding bomb, Lieutenant Commander Page heroically left his protected position and rushed to the assistance of the wounded. Working tirelessly in complete darkness and in the face of high explosives and bomb fragments, he fearlessly went from place to place, skilfully administering medical aid to his injured comrades and, with the assistance of a hospital corpsman, moved them to a protected location. His expert professional ability, brilliant initiative and great personal valor in voluntarily risking his life for others directly contributed to the saving of many men and were in keeping with the highest traditions of the United States Naval Service." Dr. Page graduated from the University of Oregon Medical School, Portland, in 1927 and entered the service Oct. 19, 1942.

## Lieutenant Commander Justin Mooney

The Bronze Star was recently presented to Lieut. Comdr. Justin Mooney, formerly of Kansas City, Mo. According to the citation accompanying the award, "he distinguished himself by heroic and meritorious conduct in action with the enemy during a series of air raids on Oct. 27, 1944 on ships at anchor near his ship. He boarded a burning gasoline ship as a member of a fire and rescue party. After ascertaining that casualties were taken care of, he remained on deck and assisted in fighting the blazing gasoline fire. During this period, which was at night, the ship was a natural target for the expected air raids. His actions throughout distinguished him among those performing duties of the same character." Dr. Mooney graduated from the University of Michigan Medical School, Ann Arbor, in 1924 and entered the service Feb. 21, 1944.

## Lieutenant Commander Marcel L. Mooney

Lieut. Comdr. Marcel L. Mooney, formerly of Kansas City, Mo., was recently awarded the Bronze Star with the citation that "he distinguished himself by heroic and meritorious conduct in action with the enemy during a series of air raids on Oct. 27, 1944 on ships at anchor near his ship. He boarded a burning gasoline ship as a member of a fire and rescue party. After ascertaining that casualties were taken care of, he remained on deck and assisted in fighting the blazing gasoline fire. During this period, which was at night, the ship was a natural target for the expected air raids. His actions throughout distinguished him among those performing duties of the same character." Dr. Mooney graduated from the University of Michigan Medical School, Ann Arbor, in 1931 and entered the service Oct. 7, 1942.

## Lieutenant (jg) Robert Thomas Browne

The Navy Cross was recently presented to Lieut. (jg) Robert Thomas Browne, formerly of Peoria, Ill., "for extraordinary heroism while attached to the U. S. S. *Johnston* in action against enemy Japanese forces off the Island of Samar during the second battle of the Philippines on Oct. 25, 1944. Acting with cool initiative when the abandon ship order was given, Lieutenant, Junior Grade, Browne remained on board the *Johnston* supplying injured men with life jackets, assisting to evacuate them from the stricken vessel and ministering to the wounded in the face of terrific salvos from hostile gun batteries. A calm and courageous leader, Lieutenant, Junior Grade, Browne served as an inspiring example of fortitude and loyalty throughout the bitter engagement with powerful units of the Japanese fleet. By his gallant spirit of self sacrifice he rendered valiant service to his shipmates at extreme risk to his own life and upheld the highest traditions of the United States Naval Service." Dr. Browne graduated from the University of Illinois College of Medicine in 1942 and entered the service July 10, 1943.

## Lieutenant Commander Horace Martin Gezon

The Legion of Merit was recently awarded to Lieut. Comdr. Horace Martin Gezon, formerly of Grand Rapids, Mich., "for exceptionally meritorious conduct in the performance of outstanding services to the government of the United States as officer in charge of the Epidemiology Unit of United States Naval Forces, Northwest African Waters, during a typhus epidemic in Naples, Italy, in January 1944. Charged with the vital task of checking a potential typhus epidemic, Lieutenant Commander (then Lieutenant) Gezon performed the exacting duties of his responsible office conscientiously and with untiring effort, skilfully determining and checking the cause of the malady. On one occasion, when a case of typhus on board a merchant ship was suspected, he personally effected preventive measures and inoculated the entire ship's company. Lieutenant Commander Gezon's expert professional ability and loyal devotion to duty throughout this crucial period contributed materially to the successful arresting of the typhus epidemic and the probable saving of many lives." Dr. Gezon graduated from the University of Chicago School of Medicine in 1940 and entered the service in April 1942.

## Lieutenant William C. McClure

Lieut. William C. McClure, formerly of Oklahoma City, was recently awarded the Bronze Star "for meritorious achievement in action against the enemy as regimental surgeon of a Marine infantry regiment on Saipan, and Tinian, Marianas Islands, from June 15 to Aug. 10, 1944. By his cool and capable handling of evacuation facilities and by his experience in the care of the wounded, he was largely instrumental in saving the lives of many badly wounded Marines who might otherwise have died. He displayed great coolness under fire and his conduct throughout was in keeping with the highest traditions of the United States Naval Service." Dr. McClure graduated from the University of Oklahoma School of Medicine, Oklahoma City, in 1936 and entered the service March 9, 1942.

## Captain Cornelius A. Mahoney

The Silver Star was recently awarded, at the recommendation of the Navy, to Capt. Cornelius A. Mahoney of the Army Medical Corps. The award was made "for conspicuous gallantry and intrepidity in action while serving as ship's surgeon aboard the U. S. S. LST 315 during the amphibious invasion of Sicily in July 1943." The citation states that "when a fierce enemy attack left his vessel raging with fires and explosions, making abandonment necessary, Captain Mahoney steadfastly remained on board with utter disregard for his own personal safety to assist in transferring all wounded to another ship, leaving the stricken vessel only when his task had been accomplished. Captain Mahoney's tenacious devotion to duty and cool courage in the face of grave peril undoubtedly saved the lives of many men who otherwise might have perished and were in keeping with the highest traditions of the United States Naval Service." Dr. Mahoney graduated from St. Louis University School of Medicine in 1937 and entered the service in April 1941.

## MISCELLANEOUS

## WARTIME GRADUATE MEDICAL MEETINGS

The following subjects and speakers for Wartime Graduate Medical Meetings have just been announced:

## Nebraska

A. A. F. Regional Hospital, Lincoln: Sarcoidosis, Dr. Olin J. Cameron, April 10; Electrosthethography: The Possible Clinical Value of Visualizing Chest and Heart Sounds, Dr. F. Lowell Dunn, April 10; Clinical Pathologic Conference, Dr. James Tollman, April 10.

## California

Birmingham General Hospital, Van Nuys: Infections of the Mandible, Lieut. E. J. Durling, April 11.

U. S. Naval Hospital, Oceanside: Atypical Pneumonias, Dr. W. E. Macpherson; X-Ray Observations, Dr. Walter Stilson, April 12.

U. S. Naval Hospital, Corona: Intestinal Obstruction Due to Regional Enteritis, Lieut. Col. William G. Sheehan; X-Ray Observations, Major Ralph Poleranz, April 12.

## Illinois

Gardiner General Hospital, Chicago: Malignancies in the Army Age Group: Medical X-Ray and Surgical Diagnosis and Treatment, Drs. Alexander Brunschwig and James P. Simonds, April 11; Management of Malignant Tumors in the Army Age Group, Dr. Danely Slaughter, April 18; Endocrinology, Dr. Willard O. Thompson, April 25.

Station Hospital, Fort Sheridan: Virus and Rickettsial Diseases: Medical and Neurologic Diseases and Treatment, Dr. Francis Gordon and Comdr. W. G. Reddick, April 12; Psychosomatic Medicine, Drs. David Slight and Francis J. Gerty, April 26.

Vaughan General Hospital, Hines: Thrombosis, Thrombophlebitis and Anticoagulants in the Less Common Peripheral Vascular Diseases, Drs. Theodore R. Van Dellen and George W. Scupham, April 11; Tropical Ulcer, Capt. Walter W. Tobin, April 13; Psychosomatic Medicine, Dr. Francis J. Gerty, April 18; Clinicopathologic Conference or X-Ray Conference, Major V. P. Graham, April 18; Ménière's Syndrome, with Case Presentation, Major S. R. Grimes, April 20; Peptic Ulcer, Gallbladder and Liver Diseases, Drs. Lowell D. Snerf and Lester R. Dragstedt, April 25; Newer Concepts of the Treatment of Congestive Heart Failure, Capt. L. M. Schweiger, April 27.

U. S. Naval Hospital, Great Lakes: Nerve and Tendon Injuries, Dr. Sumner L. Koch, April 17.

Mayo General Hospital, Galesburg: Wound Healing and Tendon Surgery, Drs. Hilger P. Jenkins and Sumner Koch, April 11; Mental Hygiene and the Prevention of Neuroses in War, Capt. Charles O. Sturdevant, April 25.

Station Hospital, Camp Ellis, Lewistown: Low Back Pain, Drs. Fremont A. Chandler and Adrien Verbrugghen, April 11; Chest Diseases and Diseases of the Larynx, Drs. Robert G. Bloch and Paul H. Holinger, April 25.

## Wisconsin

Station Hospital, Truax Field: Blood Dyscrasias, Dr. Frederick W. Madison, April 11; Diseases of the Kidneys and Urogenital Tract, Dr. Francis D. Murphy, April 25.

BOOKS FOR THE COLLEGES  
OF DENMARK

In October 1943 a nonprofit, temporary organization, "Books for the Colleges of Denmark," % General Medical Library, 333 Cedar Street, New Haven, Conn., was started in New York with the purpose of collecting funds for the purchase of the scientific periodicals and books which have been published in this country since 1940. When the war is over the accumulated material is to be presented to Denmark as a gift to the public and scientific libraries of that country. The organization is sponsored by His Excellency Henrik Kauffmann, the Danish minister to the United States, and by the American Scandinavian Foundation.

CONFERENCE AT TORNEY  
GENERAL HOSPITAL

A two day medical-surgical conference for medical officers was recently held at Torney General Hospital, Palm Springs, Calif., at which specialists in every branch of medicine and surgery representing army and naval hospitals throughout the Ninth Service Command area attended and participated. Col. A. B. Jones, commanding officer of the Torney General Hospital, opened the conference with an address of welcome. Many papers were read and discussed on various subjects, and clinical exhibits were arranged by 2d Lieut. Carroll N. Jones Jr., M. A. C.

MEDICAL AND SURGICAL RELIEF  
COMMITTEE

In a recent report published by the Medical and Surgical Relief Committee of America (420 Lexington Avenue, New York 17), an eleemosynary organization, it was stated that over \$12,000 worth of medical supplies were donated to people here and abroad. Topping the list of foreign shipments was France, with supplies amounting to more than \$8,300, sent to three different centers, and a fourth shipment on its way to Algeria and southern France for the use of soldiers and families of prisoners of war. In addition to medical supplies and equipment, this last consignment contains baby foods, apples and apricots, handkerchiefs and 10,000 vitamin capsules.

HOSPITALS NEEDING INTERNS  
AND RESIDENTS

The following hospitals have indicated to the Council on Medical Education and Hospitals that they have not completed their house staff quota allotted by the Procurement and Assignment Service:

(Continuation of list in THE JOURNAL, March 31, page 859)

## DELAWARE

Wilmington Delaware Hospital, Wilmington. Capacity, 224; admissions, 4,267. Mr. T. A. Weth, Superintendent (1 intern).

## ILLINOIS

Jackson Park Hospital, Chicago. Capacity, 226; admissions, 4,958. Mr. L. W. Hilton, Superintendent (interns).

## INDIANA

St. Joseph's Hospital, South Bend. Capacity, 218; admissions, 5,393. Sister Mary Ellen, Superintendent (2 interns, July 1).

## MARYLAND

Johns Hopkins Hospital, Baltimore. Capacity, 1,034; admissions, 18,214. Dr. Winford H. Smith, Director (residents—otolaryngology and radiology, July 1).

## MICHIGAN

City of Detroit Receiving Hospital, Detroit. Capacity, 640; admissions, 17,540. Dr. R. R. Piper, Medical Superintendent (2 interns).

## MISSOURI

St. Louis City Hospital, St. Louis. Capacity, 1,104; admissions, 14,098. Dr. Leo J. Wade, Medical Director (resident—psychiatry, July 1, disqualified for military service).

## NEW YORK

Kingston Hospital, Kingston. Capacity, 123; admissions, 2,510. Miss Jessie P. Allan, Superintendent (resident—mixed service, October 1). Bronx Hospital, New York City. Capacity, 389; admissions, 7,766. Mr. William B. Seltzer, Superintendent (resident—surgery, July 1, disqualified for military service). St. Francis Hospital, New York City. Capacity, 441; admissions, 6,788. Sister Camilla, R.N., Superintendent (interns, July 1).

## OHIO

St. Thomas Hospital, Akron. Capacity, 235; admissions, 6,147. Sister M. Eleanor, R.N., Superintendent (2 interns; 2 residents, disqualified for military service).

## PENNSYLVANIA

Chester Hospital, Chester. Capacity, 270; admissions, 6,858. Mr. L. P. Wray, Superintendent (interns). Chestnut Hill Hospital, Philadelphia. Capacity, 140; admissions, 2,595. Mr. H. P. Glendinning, Administrator (3 interns, July 1).

## WISCONSIN

Madison General Hospital, Madison. Capacity, 203; admissions, 6,567. Miss Grace Croft, Administrator (resident—mixed service).

# ORGANIZATION SECTION

## Washington Letter

(From a Special Correspondent)

April 2, 1945.

### World Health Department to Be Discussed at San Francisco

Second in importance to world peace will be plans for an international health organization to be discussed at the United Nations conference in San Francisco, Washington authorities believe. Foreign Policy Association experts express the view that such a health agency would rank next to military precautions as a means of maintaining peace. Health authorities recall the influenza epidemics that followed the first world war and point out that such developments as DDT and penicillin have helped to keep down disease in this war. Recent world health surveys point to the need of coordination of health control measures. Tuberculosis has become prevalent in devastated areas. Malnutrition is widespread. Breakdown of sanitation in bombed areas is a great potential peril to world health. Even before this war malaria, tuberculosis, nutritional diseases, syphilis and other diseases took heavy tolls in such countries as China and India.

### Price of Penicillin Reduced as Production Increases

Since the release on March 15 of penicillin for civilian use the price of the drug has dropped as a result of sales competition and increased production, a check with official sources here reveals. Where \$2.40 was charged for 100,000 Oxford units, the price for this quantity is now as low as \$1.54, wholesale. Price to a physician ranges from \$1.80 to \$2 for 100,000 units. The OPA ceiling price of \$10 per hundred thousand units has not been changed. It is estimated that the OPA in two months will have sufficient price data on hand to analyze costs in order to set a new ceiling. Should production continue to rise, another reduction in price is expected. The ultimate price of penicillin will be determined by success in finding improved methods of production and will depend on trade conditions generally. The prices of the sulfonamides are lower than those of penicillin. The District of Columbia Medical Society and the Army Medical Corps have issued a warning that penicillin is not a cure-all and have explained that it is issued in capsules for purchase on a doctor's prescription. People were advised to consult their physicians about its use.

### Bill Proposing Aid for Neuropsychiatric Outclinics

Federal provision for outclinic treatment of neuropsychiatric patients, as advocated by the National Committee for Mental Hygiene, is proposed in bill H. R. 2550, known as the National Neuropsychiatric Bill, introduced in Congress by Representative J. Percy Priest, Democrat of Tennessee. The bill is to provide for, foster and aid in coordinating research relating to neuropsychiatric disorders, to provide for more effective prevention, diagnosis and treatment and to establish the National Neuropsychiatric Institute as a function of the U. S. Public Health Service. A central research hospital near Washington is proposed, as well as support to universities and hospitals in psychiatric research. States would be enabled to initiate service to patients, now emphasized by needs of medically discharged veterans.

### Warning on Dangers of Nurse Draft is Given

Drafting nurses only for the armed forces will merely place an additional hardship on all civilian hospitals, Dr. Arthur J. Will, director of hospitals for Los Angeles County, said in a statement given to the Senate Military Affairs Committee during hearings on the House approved nurse draft bill. He said that voluntary recruiting of nurses not only had failed to meet the Army's urgent combat needs but has had the effect of curtailing the number of nurses available to civilian hospitals. Most of the nurses, he said, who had gone into the armed forces have come from the comparatively small number in hospitals. The alternative might be the registration of all graduate nurses,

regardless of age, to the end that many who are now engaged in the practice of nursing could be drawn into civilian hospital work. The American Nurses Association announced that nurses now are applying for army service at the rate of seven hundred a week.

### Veterans Administrator Hines Comments on Statement in The Journal

Commenting on an editorial in THE JOURNAL which reviewed reports made by the Senate Subcommittee on Health and Education and by newspapers and magazines on conditions in veterans' hospitals, Brig. Gen. Frank T. Hines, Veterans Administrator, said that he found the A. M. A. attitude "difficult to understand." He said "When THE JOURNAL criticizes the medicine being practiced in Veterans Administration hospitals, it is reflecting on its own membership, which directly contributed . . . to the clinical practices followed in caring for veterans." He stated that Veterans Administration medical officers and its entire special medical advisory group are members of the American Medical Association. The House, meantime, has passed a resolution authorizing its Committee on Veterans Affairs to investigate charges of "intolerable conditions" in Veterans Administration hospitals. It was passed on a roll call vote of 256 to 4 after Representative Philip J. Philbin, Democrat of Massachusetts, had urged the chamber to vote it down. Representative Philbin asked that the inquiry be extended to army and navy hospitals, which he said had also been accused of mistreating disabled and wounded veterans.

### Rockefeller Grant Aids War Research Workers

A Rockefeller Foundation grant of \$335,000 to the National Research Council will enable civilian and service war research workers to continue graduate school studies. A national but temporary program of postwar predoctoral fellowships is proposed to encourage resumption of graduate study in natural sciences for those who have had their education interrupted by war work. Cash value of the fellowships will permit those receiving them to devote substantially full time to working for Ph.D. degrees. The Washington announcement stated that "the almost complete cessation of consecutive professional training which has occurred in scientific fields will make impossible for some time the normal accession of additional highly trained personnel. These losses, in the face of sharply increasing demands for personnel, will inevitably retard to the danger point the resumption of scientific progress after the war. The resulting handicap to postwar industrial recovery, public health and military security is of national concern."

### Twenty-One States Represented at Public Health Series

Women health chairmen from twenty-one states attended a Public Health Service course arranged by the General Federation of Women's Clubs and the U. S. Public Health Service at the Public Health Center, Bethesda, Md. Among speakers were Surg. Gen. Thomas Parran, Dr. Mayhew Derryberry, chief, Field Activities in Health Education; Dr. C. L. Williams Sr., associate chief, Bureau of State Services, with G. S. J. Perrott and Mrs. Marjorie B. Illig of Massachusetts, national chairman of the health committee, General Federation of Women's Clubs, presiding. Also heard were Dr. R. R. Spencer, chief, National Cancer Institute, and Dr. L. L. Williams Jr., medical director, Tropical Disease Section, U. S. Public Health Service.

### Capital Notes

The Montgomery County Welfare Board has decided to collect fees from operators of nursing homes according to the number of patients.

District of Columbia commissions will ask funds from Congress to continue the psychiatric clinic at Juvenile Court, naming Dr. John F. Owen, superintendent of the State Hospital at Raleigh, N. C., as mental hygiene chief.

The Senate has passed a House bill permitting Georgetown University to erect its new hospital to a maximum height of 110 feet, which is over the usual zoning limitations.

In the cause of community health, the District has ordered Clean-Up Week from March 30 through April 7 at the request of civic groups led by Georgetown associations.

Leo G. Schmeltzer, administrator of the Wisconsin General Hospital, Madison, Wis., will report here soon as superintendent of the New George Washington University Hospital.

Adequate supplies of poultry for convalescent patients in District hospitals has been pledged by poultry wholesalers here at a conference to discuss the current shortage.

An epidemic of dog bites prompts District Health Commissioner George Ruhland to brand the outbreak as "damnable." In the past two years rabid dogs have bitten more than 300 Washingtonians, 4 of whom died.

The first health education institute for ministers of all denominations has been held in Washington with panel discussions on tuberculosis, cancer, heart disease and community health.

Health requirements of the underprivileged of Washington have been surveyed by Community Chest directors in an effort to collect all possible data for postwar community needs.

Twenty-two veterans from various parts of the country have been hospitalized at the new Fort Washington, Md., facility of the Veterans Administration, which will have some 1,300 domiciliary beds and 65 hospital beds.

Four psychiatric and medical leaders who have given important assistance to the armed forces were elected to membership in the National Committee for Mental Hygiene, reports Dr. George S. Stevenson, medical director. They are Lieut. Col. Paul L. Schroeder, psychiatric consultant to Army Service Forces, Atlanta, Ga.; Capt. Francis J. Braceland of the Navy Bureau of Medicine and Surgery, Washington, D. C.; Dr. Raymond W. Waggoner, chairman, Department of Psychiatry, University of Michigan, Ann Arbor, who formulated the medical survey program used in Selective Service, and Lieut. Col. Louis H. Renfrow, executive officer, Medical Division, National Headquarters of Selective Service, Washington, D. C.

Representative O'Toole, Democrat of New York, has asked for a Congressional investigation into Sister Kenny's decision to leave the country, following her dispute with members of the pediatric staff of Minneapolis City Hospital and the University of Minnesota over her right to treat spastic cases.

District Commissioner Mason has charged that the old Municipal Tuberculosis Hospital on Upshur Street Northwest is being conducted as "a flophouse for people who go out for a day's work and then come back at night for a free meal and bed." He asked that it be closed.

## Official Notes

### A NEW SERIES OF ELECTRICAL TRANSCRIPTIONS

The Bureau of Health Education announces a new series of electrical transcriptions available April 1. The title of this series is "More Life for You," and its theme is health problems in adult life.

This series of transcriptions consists of thirteen programs of fifteen minutes each designed for broadcasting at weekly intervals. Each program is complete in itself. Introductory and closing announcements are furnished on script for the use of the announcer in the local radio station. The remainder of the program is on transcription. The form of these broadcasts is program interview or round table followed by a summary. The broadcasters are twenty-three leading medical authorities interviewed by Harriet Hester. The programs are summarized by Dr. W. W. Bauer.

Following is the list of titles and participating experts:

1. Why We Grow Old. Dr. A. C. Ivy, Northwestern University; Dr. Arno B. Luckhardt, University of Chicago.
2. Diet and Food. C. A. Elvehjem, Ph.D., University of Wisconsin; Dr. J. S. McLester, Chairman, and Dr. George K. Anderson, Secretary

of the Council on Foods and Nutrition of the American Medical Association.

3. Glands. Dr. E. L. Sevringhaus, University of Wisconsin; Dr. Austin E. Smith, Secretary of the Council on Pharmacy and Chemistry of the American Medical Association.

4. The Skin and Its Care. Dr. Clark W. Finnerud, University of Illinois.

5. Mental Health. Dr. Jules Masserman, University of Chicago.

6. Heart Disease. Dr. Edwin P. Jordan, Assistant Editor of THE JOURNAL; Dr. W. W. Bauer, Director of the Bureau of Health Education of the American Medical Association.

7. Cancer. Maude Slye, Ph.D., University of Chicago; Dr. Max Cutler, Chicago Tumor Institute; Dr. Frank L. Rector, Michigan Department of Health.

8. Kidney Disease. Dr. Herman L. Kretschmer, University of Illinois; Dr. George E. Coleman, Northwestern University.

9. Blood Pressure. Dr. Nathan S. Davis III, Northwestern University.

10. Jobs and Health. Dr. Stanley J. Seeger, Chairman, and Dr. Carl M. Peterson, Secretary of the Council on Industrial Health of the American Medical Association; Dr. J. G. Townsend, U. S. Public Health Service.

11. Arthritis. Dr. Ernest E. Irons, University of Illinois.

12. Safety and Accident Prevention. Ned H. Dearborn, National Safety Council; Dr. Carl M. Peterson; Dr. W. W. Bauer.

13. Living Successfully. Dr. Morris Fishbein, Editor of THE JOURNAL.

This series is available on loan to local medical societies or to other local public health agencies subject to the approval of the local medical society. Make requests to the Bureau of Health Education, American Medical Association, 535 North Dearborn Street, Chicago 10.

### SCRIPTS FOR DOCTORS LOOK AHEAD

The basis of radio programs, whether they are talks, interviews or dramatizations, is the script. Scripts for Doctors Look Ahead are written by an experienced script writer, William J. Murphy, continuity editor of the National Broadcasting Company, Central Division, since 1940. Mr. Murphy is a cum laude graduate of Notre Dame University and is experienced as an advertising copy writer and radio continuity editor, having served as a continuity editor for the Columbia Broadcasting System prior to his National Broadcasting Company affiliation.

Mr. Murphy has written such well known features as Young Hickory, The Kiltner Family, Cameos of New Orleans, This Amazing America and all but two of the American Medical Association network broadcasts with NBC including such successful series as Medical Emergencies, Medicine in the News, Doctors at War, Doctors at Work and the electrically transcribed series Live and Like It.

The preparation of a script for Doctors Look Ahead begins with the selection and assembling of material by the Bureau of Health Education. A conference is then held in which the writer is given scientific material, an outline of the purposes of the broadcast and the special points to stress. Approximately a week later he returns with his dramatic script, for the plotting of which he is solely responsible. This script is then checked for script accuracy, ethics and similar considerations by the Bureau of Health Education and submitted to another medical consultant in the headquarters building for an unbiased opinion from one not concerned with preparing the script. When finally approved the designated physician either of the headquarters staff or an invited guest writes the closing summary and then the script is sent to the National Broadcasting Company for production.

In the next three weeks Doctors Look Ahead will include the following programs:

April 7. The Tuberculosis Situation in Wartime and Postwar, with particular reference to drug therapy.

April 14. Cancer, with special reference to education for youth. Summary will be by Dr. Frank L. Rector, cancer consultant, Michigan Department of Health.

April 21. Battle Fatigue, a program devoted to the effects of battle dangers and stress other than physical wounds. A special speaker to be announced.

Doctors Look Ahead will be heard on one hundred and twenty-three stations of the National Broadcasting Company network each Saturday at 4 p. m. Eastern War Time (3 p. m. Central War Time, 2 p. m. Mountain War Time and 1 p. m. Pacific War Time). Some stations may record the program and broadcast it at a time which suits their schedule better. Local newspaper radio announcements should be consulted.

## Postwar Medical Service

### COMMITTEE ON POSTWAR PLANNING

#### Report of the Subcommittee on Revision of Program for Enrolment of Medical Students

After a careful analysis of present and probable postwar needs for medical service and the supply of physicians available to meet these needs, your subcommittee is convinced a serious shortage of physicians will develop in this country unless there is a continuance of the full complement of medical students. Under existing conditions, this will not be possible. There is no provision for the deferment of suitable qualified applicants in premedicine and medicine subsequent to 1945.

It is estimated that during 1945 about 75 per cent of the normal enrolment of first year medical students can be provided as follows: Army (A. S. T. P.) 28 per cent, Navy (V-12) 25 per cent and physically disqualified for military service (including 4F, returned veterans, aliens and others) and women 22 per cent. At present the only prospects for students during 1946 can come from the following sources: Army none, Navy 10 per cent and physically disqualified and women possibly 30 to 35 per cent. Hence there will be unfilled about two thirds of the places in the freshmen classes of approved medical schools or 1,500 vacancies.

Recently there has been introduced into the Senate by Hon. Mr. Ellender a bill known as S. 637, dated Feb. 25, 1945, that would authorize "the release of persons from active military service and the deferment of persons from military service, in order to aid in making possible the education and training of physicians and dentists to meet essential needs."

Your subcommittee after a careful study of the bill believes it embodies the essential provisions to meet the current defect. It recommends the committee express approval of the general features of the bill and support the bill by means of appropriate action through its constituent organizations and other organizations and individuals interested in the health and medical care of the nation.

ERNEST E. IRONS, M.D.      MORRIS FISHBAIN, M.D.  
VICTOR JOHNSON, M.D.      HAROLD DIEHL, M.D.  
HAROLD C. LUETH, M.D.

## Medical Legislation

### MEDICAL BILLS IN CONGRESS

*Changes in Status.*—H. Res. 192 has passed the House, authorizing the Committee on World War Veterans' Legislation, acting as a whole or by subcommittee, to conduct an investigation of the Veterans Administration with a particular view to determining the efficiency of the administration and operation of Veterans Administration facilities. H. Res. 204 has passed the House authorizing an appropriation not to exceed \$50,000 for the purpose of enabling the Committee on Ways and Means to obtain information with respect to the need for amendment and expansion of the Social Security Act, with particular reference to old age and survivors' insurance, and the problems of coverage, benefits and taxes related thereto. H. Res. 206 has passed the House providing an additional appropriation not to exceed \$15,500 to enable the Committee on Labor to continue its investigation of the extent and character of aid now given by the federal, state and local governments and private agencies to the physically handicapped.

*Bills Introduced.*—S. 759, introduced, by request, by Senator McCarran, Nevada, and H. R. 2710, introduced by Representative Sumners, Texas, would authorize any United States commissioner specially designated for that purpose by the District Court of the United States for the Eastern District of Virginia or by the District Court of Maryland to have jurisdiction and authority to commit to St. Elizabeths Hospital in the District of Columbia, for observation and diagnosis, any person found in any place over which the United States has exclusive or

concurrent jurisdiction in Arlington County, Fairfax County or the city of Alexandria, in the state of Virginia, or in Montgomery County or in Prince Georges County, Md., who is alleged and is believed by the commissioner to be of unsound mind. S. 800, introduced by Senator Langer, North Dakota, proposes an appropriation of \$20,000,000 for the establishment and operation of a National Infantile Paralysis Clinic at Minneapolis, to include facilities for the hospitalization and treatment of persons suffering from infantile paralysis, and investigation and research with respect to the origin, causes and means of control of that disease. The bill proposes to create a board of five, appointed by the President from among persons who have had infantile paralysis and who have been treated therefor in accordance with the methods "discovered and practiced by Sister Elizabeth Kenny," with authority to take such action as may be necessary to carry out the purposes of the bill. H. R. 2716, introduced by Representative Randolph, West Virginia, provides for health programs for government employees, such programs to be limited to (1) treatment of minor illnesses and dental conditions except in case of an emergency or injury or illness sustained while in the performance of the employee's duty in accordance with the United States Employees' Compensation Act, (2) preemployment and other examinations, (3) referral of employees to private physicians and dentists and (4) education and preventive programs relating to health, including the alleviation of health hazards in the working environment. H. R. 2820, introduced by Representative Maloney, Louisiana, provides that any period of active duty in the United States Revenue Cutter Service during the Spanish-American War, on board the *Galveston* or any other ship of the United States and while such ship was cooperating with the War Department, shall be considered active military or naval service for the purposes of laws administered by the Veterans Administration.

### STATE LEGISLATION

#### Connecticut

*Bill Introduced.*—H. 1144 proposes to create a board of administrative research and planning to consist of five members appointed by the governor. The board is to collect and compile information, data and statistics, among other things, on health and other factors which may affect the governmental structure and social and economic life of the state.

#### Georgia

*Bills Introduced.*—H. Res. 113 and S. Res. 39 propose to commit the state administration to making possible a more intensive health program in the state and to authorize the state board of health to accept on behalf of the state such health funds as may be made available by the federal government.

#### Illinois

*Bill Introduced.*—H. 325 proposes to appropriate \$4,000,000 to pay \$1.50 per day for each patient suffering from tuberculosis to any sanatorium board which provides hospital or sanatorium care under medical supervision at public expense for each such patient hospitalized.

#### Maryland

*Bill Introduced.*—Joint Resolution 13 proposes to request the governor to appoint a special commission of nine to study the whole field of medical care and to submit its report and recommendations to the Legislative Council by Sept. 1, 1946 and to the General Assembly in January 1947.

#### Massachusetts

*Bill Introduced.*—H. 1738 proposes to enact a separate chiropractic practice act to create an independent board of chiropractic examiners to examine and license applicants for licenses to practice chiropractic. The bill proposes to define chiropractic as "the science of locating, and removing, by hand only, interference with the transmission or expression of nerve force in the human body, and the correction of misalignment or subluxations of the vertebral column. It excludes operative surgery, prescription or use of drugs or medicine or the practice of obstetrics, except that the x-ray may be used solely for the purpose of examinations."

California Medical Association, Los Angeles, May 6-7. Dr. George H. Kress, 450 Sutter Street, San Francisco 4, Secretary.  
Rhode Island Medical Society, Providence, May 16-17. Dr. William P. Buffum, 122 Waterman Street, Providence 3, Secretary.

## Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST; SUCH AS RELATE TO SOCIETY ACTIVITIES, NEW HOSPITALS, EDUCATION AND PUBLIC HEALTH.)

### CALIFORNIA

**Hitchcock Lectures.**—Dr. Franz Weidenreich, honorary director of the Cenozoic Research Laboratory and former professor of anatomy at Peiping Union Medical College, Peking, China, will deliver the second group of Hitchcock Lectures for 1945 at the University of California, Berkeley, during April. The Hitchcock Foundation lectures, of which Dr. Weidenreich will give five on "The Physical Evolution of Man," are public ones on scientific and practical subjects.

**Indian Health Official Visits University.**—Col. Sohan L. Bhatia, deputy director general of the Indian Medical Service and dean of the Medical School of the University of Bombay, was a recent visitor to the University of California Medical School, San Francisco. According to the *Clip Sheet* of the university Colonel Bhatia was sent by the Indian government to study methods of administration and organization in various medical schools in the United States. He will aid in the initiation of a public health program in India and will help to found a number of medical schools throughout the country.

**Memorial to Dr. George Rhodes.**—A memorial to the late Lieut. Col. George K. Rhodes, M. R. C., and associate clinical professor of surgery, University of California Medical School, San Francisco, will be established by his friends, patients, former students and associates, according to the *University of California Clip Sheet*. At the time of his death in southern England Colonel Rhodes was the consulting surgeon of the Southern Base Section, U. S. Army. Previously he had organized General Hospital No. 30 as the University of California Medical School Unit, headed its surgical service and remained with it until his appointment as consulting surgeon. Members of this unit, now on active duty overseas, have collected more than \$2,000 for the memorial fund (*THE JOURNAL*, Sept. 30, 1944, p. 317). A committee of ten is in charge of arrangements, with Dr. Francis S. Smyth, dean of the medical school, as honorary chairman and Dr. H. Glenn Bell, associate professor of surgery, chairman. It has not yet been decided what form the memorial will take, but a surgical fellowship for postgraduate study has been recommended.

### CONNECTICUT

**Vocational Counseling Service.**—Dr. Creighton Barker, New Haven, executive secretary of the Connecticut State Medical Society, is the only medical member of the board of eleven directors of the recently incorporated Vocational Counseling Service. The service is a nonprofit community organization to provide professional vocational and educational counseling, particularly designed to aid discharged veterans in finding the proper occupation. According to the state medical journal, if, after a trial period of three years, the service appears practical and important to the community, it is planned to establish a permanent organization. The headquarters for the service are located at 30 Davenport Avenue. At first the new service will function on a part time basis, and currently five experienced counselors of the Yale University faculty have been secured. Individuals will be expected to pay for services rendered at a reasonable cost, but arrangements have been made so that persons with limited means may be able to secure the service if required.

### ILLINOIS

**Gift to Improve Teaching of Science.**—The Francis Shimer College, Mount Carroll, has received a bequest from the late Dr. Blanche M. Haines, Three Rivers, Mich., of \$20,000 to set up the George R. Moore Memorial Fund to be used to improve and promote the teaching of sciences. Dr. Haines graduated at the Woman's Medical College, Chicago, in 1886 and the fund honors her father, who died in 1910.

### Chicago

**Dr. Kretschmer Lectures.**—Dr. Herman L. Kretschmer, President of the American Medical Association, addressed the Winnebago County Medical Society, Rockford, March 13, on "Problems in Kidney Surgery" and the Aux Plaines Branch of the Chicago Medical Society, March 23, on "Differential Diagnosis in Renal Disease."

**The William Hamlin Wilder Lecture.**—Karl Paul Link, Ph.D., professor of biochemistry, Wisconsin Agricultural Experiment Station, Madison, will deliver the second William Hamlin Wilder Memorial Lecture of the Institute of Medicine of Chicago at the Palmer House, May 25. His subject will be "The Anticoagulant Dicumarol."

**Hospital News.**—Mount Sinai Hospital has established a blood bank under the direction of its pathologist and director of laboratories, Dr. Israel Davidsohn. The bank was established primarily to facilitate the blood transfusion service to patients at Mount Sinai Hospital. As the bank makes progress, it is hoped that blood may be made available in modest amounts to patients outside the hospital.

**Dr. Wakerlin Given New Appointment.**—Dr. George W. Wakerlin, professor and head of the department of physiology, University of Illinois College of Medicine, has been appointed to serve also as assistant dean in charge of teaching and research at the Rush-Presbyterian Hospital, division of the University of Illinois College of Medicine. Dr. Wakerlin will work with the administration of the hospital, the Rush faculty, and the college of medicine in developing a comprehensive program of undergraduate and graduate medical education and research at Presbyterian Hospital and the Central Free Dispensary. A number of appointments to research positions in the medical sciences are to be made as part of this program.

**Gift of \$175,000 for Pediatric Research.**—A grant of \$175,000 to the University of Chicago for research in pediatrics from the estate of the late Dr. Walter H. O. Hoffmann was announced on March 28. The gift brings to \$832,722 the amount for support of teaching and research into the care and nurture of children since Dec. 15, 1944, newspapers report. Other gifts to the university include \$25,940 from the general education board for verbal tests in I. Q., \$20,000 from the Sonia Shankman Foundation for scholarships and research in the university's orthogenic school, two of \$15,000 for cancer research from the Albert and Mary Lasker Foundation and the Frances and Sidney Brody charitable fund, \$15,000 from Mrs. R. S. Maguire for university support, \$10,000 from T. Philip Swift for the department of medicine and \$10,000 from the E. J. Brach fund for general research.

**The Veteran and His Community.**—The University of Chicago opened a public lecture series on the veteran and his community, April 4, with a talk by William T. Hutchinson, Ph.D., chairman of the department of history, University of Chicago, on "The Veterans of Previous Wars." Subsequent lectures will be:

- R. W. Marshall, in charge of vocational rehabilitation and education, Chicago Branch Office of Veterans Administration, Legislation Concerning the Veteran, April 11.
- C. Edward Thorne, executive director, Veterans Information Center of Metropolitan Chicago, Who is to Deal with the Veteran—and How? April 18.
- Dr. David Slight, professor of psychiatry, University of Chicago School of Medicine, Some Psychologic Problems of the Veteran, April 25.
- Col. John R. Hall, M. C., commanding officer, Gardiner General Hospital, Health of the Veteran, May 2.
- Miss Adeline Johnesse, psychiatric case consultant of Chicago chapter, American Red Cross, Family Adjustment of the Veteran, May 9.
- Col. H. H. Weimer, veterans employment representative for Illinois, Veterans Employment Service, Employment of the Veteran, May 16.
- Robert K. Burns, chairman of the Daily Newspaper Printing and Publishing Commission, National War Labor Board, What Kind of Jobs Can the Veteran Find? May 23.
- Floyd W. Reeves, Ph.D., professor of administration, University of Chicago, Education of the Veteran, June 6.
- Lester Benston, director of rehabilitation, American Legion, Community Adjustment of the Veteran, June 13.

### INDIANA

**Rabies Order in Indiana.**—A quarantine for rabies was placed March 23 on Fort Wayne and all Allen County, newspapers reported. The action was taken after at least one mad dog bit at least 6 persons. Three of them on March 22 proved to have received rabies from the bites.

**School of Medicine Commended for "Record of Service."**—In a report made to the Indiana General Assembly recently by a special legislative investigating committee representing the two houses of the general assembly, the Indiana University School of Medicine, Indianapolis, was given commendation for its "splendid record of service." The inquiry was based on a resolution stating that the Indiana University School of Medicine "has been for some years limiting the number of students" so that "for some years past, even before the war, there was a scarcity of medical doctors in the state." The committee after its inquiry found that "it has been the policy of the Indiana Medical Center not to limit the number

of students entering the school and to graduate as many medical doctors as is possible without lowering the standards of the school and with regard to the facilities available." The committee's report further declared:

That the state of Indiana has not increased the number of medical students graduated in proportion to the increase in population, probably because Indiana has only one medical school compared with some neighboring states which have more than one, and further because the facilities at the Indiana Medical Center have not been expanded within the last ten years or more.

That it would not be expedient at this time to consider enlarging the facilities of the Indiana Medical Center because of the present national emergency and because further the committee has found that the medical school has given to the war 83 members of its staff and further that in all probability there will be a shortage of students within the next few years seeking admission because a large majority of that group is now serving in the armed forces of the United States.

## KANSAS

**Clendening Gift for Medical History.**—The University of Kansas Endowment Association has received a \$50,000 bequest under the will of the late Dr. Logan Clendening, Kansas City, Mo., to be used for the department of medical history. It is the understanding of Dr. Harry R. Wahl, Kansas City, dean of the medical school, that Dr. Clendening wished the money used to maintain the library of medical history, according to the state medical journal.

**Personal.**—Dr. Chester D. Updegraff, Greensburg, was recently elected coroner of Kiowa County.—Dr. Albert N. Gray, Burlington, was reelected coroner of Coffey County.—Dr. George Seitz, Salina, has been appointed Saline County health officer, succeeding Dr. Edwin G. Ganoung, Salina.

**Postgraduate Medical Clinic on Poliomyelitis.**—Dr. Edward A. Piszczek, director of the Cook County Public Health Unit, Chicago, and Gustav Valdemar, director of physical therapy, Children's Hospital, Denver, conducted a postgraduate medical clinic on poliomyelitis March 17-25 under the auspices of the Kansas Medical Society, the state board of health and the University of Kansas School of Medicine, Lawrence-Kansas City. The course was conducted two days each in Kansas City, Parsons, Salina, Wichita and Topeka. The general topics of basic knowledge of infantile paralysis, diagnosis of poliomyelitis and treatment were discussed from medical and physical therapeutic aspects. The speakers were furnished at the request of the state board of health by the National Foundation for Infantile Paralysis.

## MAINE

**Medical Examiners Appointed.**—Governor Hildreth has appointed the following medical examiners for four year terms each:

Androsoggin County: Drs. Romeo A. Beliveau, Lewiston, and Harold S. Pratt, Livermore Falls.  
Aroostook County: Drs. Francis J. Faucher, Grand Isle; Frank H. Jackson, Houlton, and Herrick C. Kimball, Fort Fairfield.  
Cumberland County: Drs. John M. Bischoffberger, Naples; Ervin A. Center, Standish, and William Holt, Portland.  
Franklin County: Dr. George L. Pratt, George A.  
Hancock County: Drs. Charles C. Gregory, Boothbay Harbor, and Joseph I. Herring, Herring.  
Kennebec County: Drs. Roland L. McLaughlin, McLaughlin.  
Winthrop; John G. Towne, Waterville, Gardiner.  
Oxford County: Drs. Kenneth E. Dore, Fryeburg; John A. Greene, Runford, and Delbert M. Stewart, South Paris.  
Penobscot County: Drs. Herbert C. Scribner, Bangor; Cornelius J. Taylor, Bangor; Herbert Lewis Taylor, Dexter; G. Frank Woodbury, Patten, and Ernest T. Young, Millinocket.  
Piscataquis County: Dr. Albert M. Carde, Milo.  
Sagadahoc County: Dr. Edwin F. Pratt, Richmond.  
Somerset County: Dr. Walter S. Stinchfield, Skowhegan.  
Waldo County: Drs. Edward P. Goodrich, Winterport, and Orris S. Vickery, Belfast.  
Washington County: Drs. James C. Bates, Calais, and Oscar F. Larson, Machias.  
York County: Drs. George R. Love, Saco; James H. Macdonald, Kennebunk, and Paul Taylor, Kittery.

## MARYLAND

**Changes in Health Officers.**—Dr. Theodore R. Shrop, Oakland, recently resigned as deputy state and county health officer of Garrett County. Dr. Louis G. Llewellyn, Pokomoke City, resigned a similar position in Worcester County.

**Hospital Ward for Premature Babies.**—Plans are under way to establish a new ward at the Harriet Lane Home for Invalid Children, Johns Hopkins Hospital, Baltimore, to provide special care for premature babies. The proposed unit will accommodate 24 babies and the project is being financed in part by the federal government.

**Rapid Treatment Center in Baltimore.**—A rapid treatment center of 60 beds for patients with venereal diseases was opened at the Baltimore City Hospitals recently with the aid of medical and nursing personnel furnished by the U. S.

Public Health Service. The treatment center was opened primarily for the purpose of assisting the city health department venereal disease clinics and other related medical agencies in the prompt and isolated treatment of cases of disease in the infectious stage. The health department bureau of venereal diseases is acting for the city welfare department as the admission service for these specialized hospital beds.

## MISSOURI

**Community Award Goes to Blue Cross Plan.**—On April 5 the annual Community Service Award for 1945 of the Hospital Council of Saint Louis will be presented to the St. Louis Blue Cross Plan. The award is given each year to the organization or individual making the greatest contribution to the community's health.

**Lectureship in Honor of Hanau W. Loeb.**—The Alpha Pi chapter of Phi Delta Epsilon has created a lectureship in honor of the late Dr. Hanau W. Loeb, formerly dean of the St. Louis University School of Medicine. The presentation of the lectureship to the school of medicine will take place at a dinner meeting at the Coronado Hotel, April 9, by Dr. Arthur E. Strauss, St. Louis, past grand consul of the national organization of Phi Delta Epsilon, on behalf of the fraternity. All interested persons are cordially invited to attend the dinner, reservations for which may be made by communicating with the dean, Rev. Alphonse S. Schwitalla, S.J., of St. Louis University School of Medicine, 1402 South Grand Boulevard, St. Louis 4.

## NEW YORK

**Nelson Russell Honored.**—The Chancellor's Medal of the University of Buffalo was presented to Dr. Nelson Gorham Russell, Buffalo, February 22, inscribed "in recognition of a lifetime of eminent service to your profession, your community and your country which has dignified Buffalo in the eyes of the world." Dr. Russell, who has been associated with the University of Buffalo School of Medicine for fifty-three years, was also cited as a "scientist, soldier, civic leader, teacher and mentor of two generations of physicians and dean of the practitioners of the healing art in this region." Dr. Russell graduated at Buffalo in 1895, joined the faculty as instructor in general pathology about 1897 and is now emeritus professor of medicine.

**Cancer Symposium.**—On April 13 the Nassau County Cancer Committee, in cooperation with the Nassau County Medical Society, will present an all day cancer symposium for physicians at the Garden City Hotel, Garden City. Among the speakers will be:

Dr. Earle G. Brown, Mineola, Five Years of Cancer Reporting in Nassau.  
Dr. Lloyd F. Craver, New York, Diagnostic Problems of Early Cancer.  
Dr. Clyde L. Deming, New Haven, Conn., Cancer of the Genitourinary Tract.  
Dr. James A. Corseaden, New York, Gynecologic Cancer.  
Edith H. Quimby, Sc.D., New York, Physical Basis for the Use of X-Rays and Radium in the Treatment of Cancer.  
Lieut. Comdr. Charles F. Geschickter (MC), Cancer of the Breast.  
Dr. George T. Pack, New York, Gastrointestinal Cancer.

**Bill Passed to Open All Medical Graduates for Licenses to Practice Medicine.**—A bill has been passed in both houses of the assembly in New York directing the state medical examiners to admit up to July 1, 1946 to examination any candidate "who shall have satisfactorily completed a four year course, consisting of at least eight months a year, in any medical school in this country." The bill has been sent to the governor for signature. The New York Times reported that final approval was given in the senate, where the measure, sponsored by Assemblyman Wheeler Milroe, Canastota, was passed by a vote of 34 to 15 over objections that it would open the door for practice to "pseudo-quacks" who had not attended schools approved by the state board of regents. Elmer F. Quinn, New York, senate minority leader, spoke for the bill, declaring that the only group opposing the measure was the state medical society. He asserted that many hospitals in New York City were forced to depend largely on interns to attend the sick and that these interns could not be licensed because the schools they attended were not approved by the state.

**Irvington House and New York University College of Medicine Now Affiliated.**—The New York University College of Medicine, New York, and Irvington House, sanatorium for cardiac children, Irvington, have established a medical affiliation to further the care and rehabilitation of underprivileged children with heart disease. Under the terms of the affiliation the college of medicine of the university will be responsible for the direction, supervision and administration of the medical and research program at Irvington House, the

announcement stated. The sanatorium will be used as a teaching center to train young doctors in the early recognition and treatment of rheumatic heart disease. While the New York University College of Medicine, under the terms of the affiliation, will have full medical responsibility for the direction of the institution, Irvington House will continue to depend on an annual appeal for voluntary contributions for its financial support. One of the major results expected from the new affiliation, according to Dr. Donal Sheehan, acting dean of the college of medicine, is an expansion of the sanatorium's research activities in the cause, prevention and treatment of rheumatic fever. In the past three years, promising studies in the prophylactic use of sulfonamide drugs have been conducted at Irvington House, and that type of work will be continued. Since its establishment twenty-five years ago, Irvington House has provided free care for more than 3,000 underprivileged children referred to it by about forty hospitals of greater New York and Westchester, and the present building, erected under the supervision of the New York Heart Association, contains an entire floor devoted to laboratories. Dormitories, school rooms, a dental clinic and recreation and craft workshops accommodate more than 100 children for periods ranging from six months to several years. It conducts a demonstration in rehabilitation and medical research of benefit to children throughout the country.

#### New York City

**Eighteenth Graduate Fortnight.**—"Contributions of the War Effort to Medicine" will be the theme of the eighteenth graduate fortnight of the New York Academy of Medicine, October 8-19.

**The Harvey Lecture.**—William F. Windle, Ph.D., professor of neurology, Northwestern University Medical School, Chicago, will deliver the seventh Harvey Society Lecture of the current series at the New York Academy of Medicine, April 19. His subject will be "Respiratory Conditions in the Fetus and Effects of Their Impairment."

**The Miller Memorial Lecture.**—The Adam M. Miller Memorial Lecture of the Long Island College of Medicine, Brooklyn, will be delivered by Edmund V. Cowdry, Ph.D., professor of anatomy, Washington University School of Medicine, St. Louis, April 23. Dr. Cowdry will speak on "Microscopic and Chemical Properties of Precancerous Lesions."

**Commercial Stores Cooperate with Health Department in Tuberculosis Drive.**—By means of window displays, newspaper advertisements, posters and other devices, retail stores will cooperate with the New York City Department of Health in a campaign against tuberculosis during April. The objective will be to urge the public to have chest x-rays. The campaign is being supported by the Fifth Avenue Association, the Retail Dry Goods Association and the Uptown Retail Guild. A release states that persons dialing the telephone number for a weather report will also hear a reminder at the end of the forecast to have a chest x-ray.

**Howard Blakeslee Honored.**—Howard W. Blakeslee, science editor for the Associated Press since 1928 and member and former president of the National Association of Science Writers, was guest of honor at a dinner at the Waldorf-Astoria Hotel, March 21, in recognition of his sixty-fifth birthday and the completion of forty years of service with the Associated Press, which he has served in various capacities since 1905. Representatives from colleges and universities, industrial research laboratories, the medical profession and the press were among those at the dinner. Speakers included Charles E. Honce, assistant general manager of the Associated Press; Robert C. Hockett, Ph.D., Cambridge, Mass., scientific director of the Sugar Research Foundation, and Mr. Blakeslee. The University of Michigan, Ann Arbor, which Mr. Blakeslee attended, awarded him the honorary degree of master of science in 1935. He shared the Pulitzer Prize in 1937 and received the award of the National Headliners Club in 1940.

**Proposed Medical Center.**—The construction of a giant medical center, part of the plans for which had been previously announced, to be undertaken cooperatively by New York City and New York University in the Bellevue Hospital area, will begin as soon as materials are available, according to Mayor Fiorello H. La Guardia in the New York Times, March 19. The mayor is said to have estimated the cost of creating the new medical center at \$27,500,000, of which \$12,500,000 would be the city's share. Harry Woodburn Chase, LL.D., chancellor of New York University, announced at the same time that the university would make a public appeal to raise its \$15,000,000. It was stated that most of the Bellevue Hospital buildings would be razed to make room for the new hospital. In a

statement the mayor said "We're going to rebuild Bellevue Hospital entirely. It is cheaper to build a new hospital than to remodel. We will reconstruct all the facilities at Bellevue except the diagnostic and will retain the new administration building and psychopathic department." The new building for Bellevue Hospital will have accommodations for at least 2,300 beds. New York University College of Medicine is now said to be preparing a prospectus for a new school and hospital for 450 beds on a site from East Thirtieth Street, north of Bellevue, at East Thirty-Third Street between First Avenue and East River Drive. The new hospital and center would provide flexibility in the clinical distribution of patients and for adjustments under the Health Insurance Plan of Greater New York, Inc., it was stated. An institute for forensic medicine will be a part of the center under an agreement by which the university will give the land to the city and the city will construct the building (THE JOURNAL, June 26, 1943, p. 630). Plans call for a new and enlarged department of preventive medicine in the medical college building to aid clinics now established on the lower east side. One half of the \$15,000,000 proposed as the university's share in the new construction will be spent for new buildings and the other half will be used as endowment. Two other units under consideration would be a small semiprivate hospital and an institute of medical sciences, which would offer research laboratories to younger men for study in specially important fields. The hospital would offer all methods of modern diagnosis, together with inpatient facilities, to families of the middle-low income group, based on the needs of persons subscribing to the Health Insurance Plan.

#### PENNSYLVANIA

**Society News.**—Dr. Charles C. Wolferth, Philadelphia, will address the Delaware County Medical Society at the Chester Hospital, Chester, April 12, on "Recent Advances in the Treatment of Cardiovascular Diseases."

**Accidents to Physicians.**—Dr. William D. Schrack Jr., Harrisburg, bureau of health conservation of the state health department, suffered severe injuries when his automobile collided with a Greyhound bus near Sunbury while negotiating a narrow pass through snow drifts, according to the *Pennsylvania Medical Journal*. Dr. J. Fletcher Lutz, York, was badly injured while taking a patient to the hospital; he alighted to clean ice from his windshield, when a truck crashed into his automobile.

**Meeting on the Eye and Ear Canceled.**—The proposed spring meeting of the newly formed Pennsylvania Academy of Ophthalmology and Otolaryngology, scheduled for April 25-26 at the Merion Golf Club, Ardmore, has been canceled. The academy was formed in 1944 from a reorganization of the Eastern Pennsylvania Association of Eye, Ear, Nose and Throat Physicians, the latter group having been created at a meeting in Pottsville in 1942. Dr. Sterling F. Mengel, Pottsville, the first secretary of the Eastern Pennsylvania group, on active duty with the Navy, was named secretary of the academy. Dr. Paul C. Craig, Reading, is now serving as acting secretary.

#### Philadelphia

**Rheumatic Fever Made a Reportable Disease.**—Effective immediately, rheumatic fever and rheumatic heart disease are reportable to the division of communicable disease of the department of public health. According to *Philadelphia Medicine*, all physicians are requested to cooperate in this matter.

**Postgraduate Institute Postponed.**—The tenth annual postgraduate institute of the Philadelphia County Medical Society, scheduled to be held at the Bellevue-Stratford Hotel, April 10-13, has been postponed as the result of the request of the government for the curtailment of all nonessential meetings, according to the *Pittsburgh Medical Bulletin*.

#### RHODE ISLAND

**Medical Aspects of Air Pollution.**—On April 2 Dr. Clarence A. Mills, professor of experimental medicine, University of Cincinnati College of Medicine, discussed the medical aspects of air pollution at a meeting of the Providence Medical Association. The talk was a part of the program of the committee on air pollution of the association, which is preparing a schedule of study and action in the hope of improving the air in Providence.

**Voluntary Hospitalization Insurance Accepted for Another Year.**—On February 19 the Rhode Island Voluntary Advisory Council on Health approved a recommendation of its technical committee that the principle of voluntary hospitalization insurance be accepted for another year. The voluntary advisory council was appointed by Governor J. Howard McGrath in 1944. At its first meeting, Feb. 5, 1944, it created its technical committee for the study of hospital insurance and

related problems, which subsequently divided itself into two divisions, one studying a proposal for medical and surgical benefits and the other concentrating on the proposal for compulsory hospital insurance. The technical committee, cognizant that the house of delegates of the state medical society has appointed a committee to study the possibility of providing surgical care on a prepaid basis, recommends that this group continue its study and make its report public. The committee endorses the principle of prepaid hospital cost through insurance and recommends employers, employees and the general public to participate voluntarily in order that there may be as widespread protection as possible. The *Rhode Island Medical Journal* states that by deferring action on a plan of compulsory insurance until the next annual session of the general assembly a period of time would be available during which employers and employees would become better acquainted with the advantages of hospital insurance and make such arrangements as they might desire to secure such coverage. As hospital facilities are not now available to care for their number of patients that might be expected if compulsory insurance were made effective immediately and cannot be provided until postwar conditions make building on a large scale possible, relatively little would be lost and much gained by using the intervening time to enroll as many persons as possible under a voluntary method.

### TENNESSEE

**Edwin Reinke Dies.**—Edwin Eustace Reinke, Ph.D., associated with the department of biology of Vanderbilt University, Nashville, since 1915 and chairman of the division of natural sciences and mathematics since 1941, died at Vanderbilt University Hospital, January 25.

### ALASKA

**Personal.**—Dr. William M. Whitehead, Juneau, has been appointed to the Territorial Board of Education for a term of six years.

**Dr. Carter Named Commissioner of Health.**—Dr. Cassius C. Carter, Juneau, who has been serving as commissioner of health since the death of Dr. Walter W. Council, Nov. 13, 1943, has now been appointed by the governor for the remainder of the term.

### GENERAL

**Charles Stephenson Named Secretary of Research for Cancer Society.**—Rear Admiral Charles S. Stephenson (MC), U. S. Navy, has been appointed secretary of the research division of the American Cancer Society. Through his department will be cleared all inquiries and requests for aid received as a result of the announcement that a large portion of this year's campaign funds will be definitely earmarked for research.

**Actions on 1945 Conventions.**—Reports received by the American Medical Association indicate the following action for the 1945 sessions of the respective organizations:

American College of Chest Physicians June meeting in Philadelphia canceled; the business meeting of the board of regents will be held in Chicago, June 17.

Medical Society of New Jersey, canceled.

American Student Health Association, canceled.

**Brochure on Borden Awards.**—The Borden Company has published a directory of recipients of Borden Awards distributed through the American Chemical Society, the American Dairy Science Association, American Home Economics Association, American Institute of Nutrition, American Academy of Pediatrics, Poultry Science Association and American Veterinary Medical Association. In addition to indicating the year and the winner for each of the awards, the biography of the 1944 recipients has been included.

**State and Territorial Health Officers to Hold Meeting.**—The forty-third annual conference of the U. S. Public Health Service with the state and territorial health officers will be held April 9-11 in the National Academy of Sciences, 2101 Constitution Avenue, Washington, D. C., according to *Public Health Reports*. All state health officials are urged to attend. The meeting is required by law and therefore has to attend. The meeting is required by law and therefore has to attend. The meeting is required by law and therefore has to attend. General sessions of the conference are open to all interested persons but attendance by out-of-town visitors is not encouraged in view of travel restrictions.

**Postage Meters Used in Cancer Campaign Appeal.**—The American Cancer Society this year has enlisted the cooperation of the Pitney-Bowes Postage Meter Company, Stamford, Conn., in preparing a design which they are offering in a mailing addressed to all of their customers. This mailing has already gone forward. The circular also includes a similar item which Pitney-Bowes is offering in behalf of the Ameri-

can Red Cross drive. Reports from many parts of the country indicate that favorable responses are beginning to come in from local firms. Cooperation is carried out by business houses using these postage meters instead of postage stamps. These meters allow for an advertising message, commonly called a postmark ad.

**Father Schwitalla Named Moderator of Physicians' Guilds.**—Rev. Alphonse M. Schwitalla, S.J., president of the Catholic Hospital Association and dean of the St. Louis University School of Medicine, St. Louis, has been named moderator of the Federation of Catholic Physicians' Guilds and editor of the federation's journal, the *Linacre Quarterly*. Mr. M. R. Kneiff, St. Louis, executive secretary of the Catholic Hospital Association, has been named acting executive secretary of the federation. The announcement of the change in offices was made March 24 following a meeting of the executive board of the federation at the Hotel Pennsylvania, New York. It was also announced that the federation is now an affiliate association of the National Catholic Welfare Conference. By agreement with the Catholic Hospital Association, the offices of the federation are moved for the present from Brooklyn to the association's offices at 1402 South Grand Boulevard, St. Louis 4. In the business management and administration of the federation, the Catholic Hospital Association will act as agent on behalf of the Catholic Physicians' Guild.

**Sigma Xi Lectures on Cancer.**—Dr. Peyton Rous, member, Rockefeller Institute for Medical Research, New York, opened a series of lectures on cancer that he will deliver throughout the country March 30 at the University of Virginia, Charlottesville. He spoke April 2 at the North Carolina State College of Agriculture and Engineering, Raleigh. April 5 at Louisiana State University, New Orleans, and April 9 at the University of California, Los Angeles. He will also speak at the following schools:

University of Oregon Medical School, Portland, April 13.

University of Idaho, Moscow, April 17.

Montana State College, Bozeman, April 20.

Mayo Clinic, Rochester, Minn., April 23.

University of Minnesota, Minneapolis, April 24.

University of Wisconsin, Madison, April 25.

University of Chicago, Chicago, April 26.

Washington University, St. Louis, April 27.

Ohio State University, Columbus, April 30.

Virginia Polytechnic Institute, Blacksburg, May 1.

West Virginia University, Morgantown, May 3.

Pennsylvania State College, State College, May 4.

Bucknell University, Lewisburg, Pa., May 7.

Swarthmore College, Swarthmore, Pa., May 8.

Temple University, Philadelphia, May 9.

**Nutrition Grants.**—Grants totaling \$914,190 have been allocated by the Nutrition Foundation since its organization March 12, 1942, according to an announcement March 28. These grants for 100 correlated research projects to increase basic knowledge in the field of nutrition were made to 44 universities and medical centers in the United States and Canada. At the third anniversary meeting of the Nutrition Foundation at the Waldorf-Astoria, New York, March 28, grants totaling \$258,100 were approved covering six new research projects and 24 renewals of grants for studies now under way. Among the new grants were the following:

Harvard University received \$47,500 for a five year study of nutrition in relation to maternal health, which will include the problems of pregnancy, childbirth, the condition of the newborn infant, and its subsequent health and development.

The Public Health Research Institute of the City of New York received \$10,500 for a three year study of the development of microchemical methods for evaluating nutritional status. There is a critical need for practical methods of measuring the influence of nutrition on public health in the marginal zones of malnutrition.

The University of Rochester School of Medicine and Dentistry, Rochester, N. Y., received \$10,000, for a two year study of the nature and significance of a pigment associated with vitamin deficiency.

Other grants were made to the University of Pittsburgh for studies on self selection of diets, to Washington University for studies on the mechanism of carbohydrate reactions in animal tissues, and to the University of Wisconsin to study the characterization of compounds containing bound biotin and other vitamins.

### CORRECTION

**Injuries of the Cervical Spine.**—In the article by Dr. Arthur G. Davis in *THE JOURNAL*, January 20, page 149, incorrect figure numbers appear in two or three places; i. e., on page 150, fourth line of second column, "fig. 5" should read "fig. 3"; page 152, last line of text in first column, "Figure 4" should read "Figure 7," and in the first line of the second column, "Figure 7" should read "Figure 6."

## Foreign Letters

### LONDON

(From Our Regular Correspondent)

March 7, 1945.

#### The Uses and Limitations of Penicillin

Sir Alexander Fleming, the discoverer of penicillin, opened a discussion on its uses and limitations before the Medical Society of London. He stated that an important fact about penicillin was that it was not toxic to leukocytes. Ordinary antiseptics, such as carbolic acid, killed the leukocytes more readily than they killed the bacteria. Penicillin was reputed to be bacteriostatic, but it was being established that it was bactericidal as well. It must be brought into contact with the bacteria to be effective. He said that intravenous administration must be repeated because the kidney excretes penicillin very rapidly. With the standard intravenous dose of 15,000 units, most of the penicillin had disappeared from the blood within an hour. With intramuscular injection it remained for about two hours; if 50,000 units was given, for rather more than four hours; if 100,000, rather more than six hours. The intravenous drip was the most economical method but involved certain difficulties; with the intramuscular drip there was a limit to the amount of fluid which could be administered with comfort to the patient. But the subcutaneous drip served the purpose quite well. The latest apparatus for introducing the requisite amount of fluid had a small clock or motor which every hour turns a screw connected with the piston of a syringe, so that up to a million units (about ten times the ordinary dose) could be given subcutaneously in twenty-four hours without discomfort. He stated that the standard dose of penicillin was 124,000 units in twenty-four hours, given either by single injection or by drip. Fleming's clinic had been successfully using half that dose for ordinary organisms, such as the staphylococcus and the streptococcus. For less sensitive organisms the dose has been larger.

Cases of staphylococcic septicemia, Sir Alexander continued, formerly regarded as almost hopeless, invariably recovered. Gonococcic infection seemed the easiest of all to treat. The routine treatment was 100,000 units split into eight or ten doses given at two or three hour intervals. This seemed to cure about 97 per cent of the cases. Such frequent doses were not as suitable for civilians as for men in the services. The plan was often 100,000 units in the morning and 50,000 at night. Syphilis was now being placed on the list of diseases to be treated by penicillin. A start was made with 120,000 units for a week in the usual split doses. This had been doubled, but even with the smaller dosage the spirochetes disappeared in twelve to fifteen hours. The Wassermann reaction became negative, and the patient appeared well, though in some cases there was a relapse. Penicillin was likely to be extremely successful in the mouth and respiratory tract. Nearly all the bacteria common in these regions were sensitive to penicillin; the only difficulty was to get the penicillin into contact with them. Two serious limitations of penicillin were its instability and rapid excretion. Made up in the form of solutions, ointments, creams or lozenges it was unstable. Some would say that it was a disadvantage that it could not be given by the mouth, the acid of the stomach destroying it, but that might be an advantage in preventing its abuse. Great care had to be exercised in making it up, to assure that it is bacteriologically sterile.

In reply to questions Fleming stated that skin irritation did not often follow penicillin therapy and was never serious. The Americans had made claims for penicillin in endocarditis, but he had not much faith in short term treatment. The penicillin

had to diffuse into the vegetations and it was necessary to maintain a certain concentration in the blood for a considerable period of time. As to the treatment of tertiary syphilis, he must refer the questioner to American journals, for we had no experience of it in this country.

#### Government Inquiry on Remuneration of Physicians

Evidently in view of the proposed National Health Service, the minister of health and the secretary of state for Scotland have appointed a committee, of which about half of the members are general practitioners, to consider what ought to be the range of total professional income of a registered medical practitioner in any publicly organized service of general medical practice. This income is to be established with regard to what has been the normal financial expectations of general medical practice in the past, with regard to the desirability of maintaining in the future the proper social and economic status of general medical practice and with regard to its power to attract a suitable type of recruit to the profession. The practitioners on the committee have all been nominated by the British Medical Association, and one of the joint secretaries of the committee is Dr. Violet Kelynack, assistant secretary of the British Medical Association.

#### Exhibition of War Injuries

After the destruction by German bombs in 1941 of the Army Medical War Collection housed in the Museum of the Royal College of Surgeons, the Medical Research Council was asked by the War Office and the college to assist in forming a comprehensive national collection of specimens, photographs and drawings of war injuries, which would serve both for teaching purposes and as a permanent record of the types of injuries in the present war. A special subcommittee of the war wounds committee of the council was appointed to direct the scheme. This subcommittee includes nominees of the three services, the Ministry of Health, the Department of Health for Scotland, the Royal Colleges of Physicians and Surgeons and the Ministry of Pensions. The arrangements for the collection were entrusted to Dr. Joan M. Ross, who is acting as temporary curator.

#### The Operative Treatment of Chronic Cerebral Hematoma

In the *British Medical Journal* (February 3, p. 146) Mr. G. F. Rowbotham and Dr. A. G. Ogilvie have described an important advance in cerebral surgery—the operative treatment of chronic cerebral hematomas. The cerebral blood vessels when weakened by disease or congenital malformation may give way under normal strain, producing spontaneous subarachnoid hemorrhage. The clinical picture is usually characteristic. A previously healthy young or middle aged person is struck with sudden severe pain in the head, which radiates into the neck and may reach the fingers and toes. Consciousness may be impaired. Cranial nerve and limb palsies may develop. Blood is always present in the cerebrospinal fluid, so that the diagnosis can readily be made by lumbar puncture. Such hemorrhage may result from rupture of congenital aneurysms of the circle of Willis. Since the aneurysms lie in the subarachnoid space, it is thought that the hemorrhage is always subarachnoid. But occasionally a congenital aneurysm becomes attached to brain tissue and ruptures intracerebrally, to produce a chronic hematoma. Two cases are reported—in a woman aged 28 and a man aged 23—who presented the symptoms of subarachnoid hemorrhage and in whom left hemiplegia and papilledema developed. Under local analgesia a temporal exposure was made. The brain was found to be bulging and obviously under pressure. By means of a brain cannula a cyst 4 cm. in diameter containing altered black blood was found at a depth of 2 cm. The cyst was opened by an incision into the brain tissue and its contents were removed by gentle suction. Recovery followed and both patients regained

health. Rowbotham and Ogilvie describe the operation as a new and successful venture in the therapy of cerebral hemorrhage. They chose to operate at the stage of chronic subdural hematoma and not at the stage of acute cerebral hemorrhage. Possibly in those cases of hemiplegia following a subarachnoid hemorrhage it is also wise to operate even when there is no secondary rise in intracranial pressure. It is noteworthy that the writers doubt whether surgery has much to offer in ordinary apoplexy or, in fact, in the early stages of cerebral hemorrhage due to any cause.

## BRAZIL

(From Our Regular Correspondent)

RIO DE JANEIRO, Jan. 30, 1945.

### Vital Statistics of Rio de Janeiro for 1944

Provisional data of vital statistics for the city of Rio de Janeiro for the year 1944 are now available. The population of the city computed as of July 1, 1944 was 1,940,000. The total number of deaths from all causes was 35,907, giving an annual crude death rate of 18.50 per thousand of population. Practically there had been no change in the death rate during the twelve year period 1932-1943, as this rate varied slightly from the average of 17.50 per thousand after a constant and regular decline since the beginning of the century. The number of live births registered in 1944 was 42,583, corresponding to the annual birth rate of 21.95 per thousand of population. With 3,159 stillbirths, the fetal mortality was 69.06 per thousand total births, a figure showing almost no change during the last few years. This is interpreted by Brazilian public health workers as a result of the high prevalence of syphilis in the population. The number of deaths from causes related to pregnancy, childbirth and the puerperium was 283, corresponding to a maternal death rate of 6.65 deaths per thousand live births, or 1 death in 150 live births.

One of the most important causes of death was tuberculosis, with a total of 6,318 deaths (5,996 from tuberculosis of the respiratory system). This is 17.59 per cent of the total number of deaths from all causes.

### Brazilian Menthol to the United States

Brazil is now the largest source of crystallized menthol imported by the United States. Since the beginning of the war the culture of *Mentha piperita* and the extraction of peppermint oil began to develop in São Paulo, Paraná, and the other southern states of Brazil. Yielding 75 to 80 per cent of menthol, the Brazilian variety of *Mentha* is not as good as that cultivated in Japan, which yielded an average of 85 per cent. It is better than the American variety, which produces an average of only 55 per cent of menthol. During the year 1943 Brazil produced about 50 tons of peppermint oil, from which 20 tons of crystallized menthol has been extracted and sent to the United States. The 1944 production was expected to reach the figure of 300 tons of crystallized menthol, which is about a third of the United States consumption.

### Accidents from Venomous Snakes

After India, Brazil is the country most afflicted by the scourge of bites from venomous snakes. There are two great laboratories for the preparation of antivenin serums—the Instituto Butantan and the Instituto Vital Brazil, both founded by Dr. Vital Brazil, in 1901 and in 1920 respectively. Dr. Ruy D. Barroso, from the latter institute, has recently published a study of 2,238 cases of snake bites treated with serum, including men, women, children and pet animals, mostly dogs. The serum most frequently used is prepared with a mixture of venoms from several species of snakes. The cases are distributed as follows: men 62.2 per cent, children 15.0 per cent, women 12.8 per cent and animals 10.0 per cent. The high percentage of men is obviously explained by greater exposure, principally in

agricultural work. In 91 of the cases treated, or 4.1 per cent, the victims died, because of too long delay between the bite and the injection of serum, or because an insufficient amount of serum had been used. The fatality rates were 2.6 per cent for men, 3.3 per cent for women, 4.6 per cent for children and 12.9 per cent for animals. From these figures Dr. Barroso concludes that the fatality rate decreases as the weight of the victim increases. The amount of serum must be increased with the lower weight of the victim. Of the total 2,238 cases, 1,271 victims have been hit during the warmer season against 43.1 per cent during the cooler season. The fatality rate (4.1 per cent) varied according to the kind of snake which caused the accident: 2.2 per cent of the cases of Bothrops biting were fatal against 13.2 of the cases of *Crotalus* biting and 5.4 of the cases of undetermined species. Dr. Barroso believes that anti-crotalus serum was less effective and that the amount of antigenic material in the preparation of such a serum should be increased in order to make it much more active.

### The Pathologic Picture of Dysentery Caused by *Shigella Alcalescens* Andrewes

Little has yet been written about the pathologic picture of the dysentery caused by *Shigella alcalescens* Andrewes, mainly because of the low fatality rate of the disease as compared to the classic dysentery caused by the Shiga and Flexner strains. Thus it is interesting to point out the main features of a fatal case carefully studied and reported by Dr. Arlindo de Assis. The patient was a 16 month old infant who died five days after his admission to the Arthur Bernardes Children's Hospital of Rio de Janeiro. A normal strain of *S. alcalescens* (serologic type I Assis), without any relationship to the Flexner, the Sonne and the Newcastle-Boyd 88 strains, was recovered from the feces during life and from the colon mucosa after death. Blood from the heart also yielded a prompt growth of the same micro-organism, while the gallbladder content proved to be sterile. Diffuse inflammatory changes were found in a moderate degree in the mucosa of the pelvic colon, occurring along with a rather slight reaction of the local lymphoid tissue. Peyer's patches remained unchanged. The abdominal lymph nodes were apparently normal. A diffuse exudate and inflammatory changes were again observed at the surface of the parietal endocardium (left ventricle) in association with infiltration of mononucleated cells. According to Dr. de Assis the features of the case bring a practical and definitive confirmation of the pathogenicity of *Shigella alcalescens* Andrewes for man.

### Deaths of Dr. Salles Guerra and Dr. Astrogildo Machado

Dr. Egydio Salles Guerra, a retired physician who was a leading surgeon in Rio de Janeiro during the first quarter of the present century, has died at the age of 75. He published several scientific papers and medical books as well as some literary works, including a biographic study of Dr. Oswaldo Cruz. At the inauguration of President Rodrigues Alves in 1902 Dr. Salles Guerra was invited to be director general of the National Department of Health, but he suggested for the post a young and unknown physician, Dr. Oswaldo Cruz, just arrived from Paris, where he had had special training in bacteriology and in parasitology at the Pasteur Institute. Dr. Oswaldo Cruz was appointed and began his successful campaign against yellow fever, freeing Rio de Janeiro of that dreadful scourge and becoming himself a Brazilian medical hero.

Dr. Astrogildo Machado, head of the Division of Bacteriology of the Instituto Oswaldo Cruz, has died at the age of 61. As an assistant of Dr. Carlos Chagas, Dr. Machado contributed to the experimental study of the American trypanosomiasis and developed, in cooperation with Dr. Guerreiro, the serologic diagnostic test for the disease known as the Machado-Guerreiro test.

## PARIS

(From Our Regular Correspondent)

Feb. 18, 1945.

## A Regimen of Famine and Its Consequences

France has been subjected for the past five years, and is still being subjected, to a dietary regimen of which history has few examples. The Académie de médecine and other scientific societies, as represented by the opinions of Charles Richet (who has been deported to Germany because of his courageous declarations), Lesné, Georges Duhamel, Robert Debré and Mme. Randouin, have constantly protested that the rationing was barbaric. The regimen is not only deficient but poorly balanced. Moreover, the rations are not always properly distributed. Even when the tickets are honored, the average caloric value of the ration never reaches 1,400 calories per day, in the place of 2,400 calories, which are considered as a minimum, and in the place of 3,000 to 4,000 calories, which were customary for the French before the invasion. The ration is made up of 63 per cent carbohydrates, 17 per cent fats and 15 per cent proteins, of which one third is of animal origin. The bread is deficient in nitrogen and is reinforced by an excess of indigestible cellulose. The amount of animal proteins is insufficient in relation to the vegetable proteins; the ration also lacks the proper amount of metallic salts and vitamins.

The ration for nurslings perhaps could be considered satisfactory, but it is also poorly balanced. Infants above the first year and adolescents are the most frequent victims. As of January 1944 children from 3 to 6 years of age instead of receiving a ration equaling that of adults because of the demands of growth did not receive more than 1,321 calories; there were 39 Gm. of fats in place of 80, 29 Gm. of nitrogenous foodstuffs in place of 40. Women in the last month of pregnancy received a ration containing between 1,700 and 1,900 calories. For all ages certain vitamins were insufficient.

Fourneau pointed out chemical deficiencies of this regimen. It was characterized particularly by poverty in calcium, phosphorus and vitamin D. These three elements constitute an inseparable ensemble. Their presence and proper relationship are indispensable not only for life but also for growth.

It has been frequently remarked that country dwellers have suffered less than city dwellers. That is correct as far as it concerns those who could make use of the provisions existing in their community. The black market was of help to those who could make use of it. A certain number of workers in heavy industries received supplementary rations. However, these allocations also were insufficient. One should not omit the mention of elderly persons, the poor of the cities and public charges.

## DISEASE AND DEATH INCREASE

The situation in the prisons, in the prison camps, in the concentration camps and among the deported who returned from Germany was terrible. In one colony of liberated refugees containing about 800 persons Sivadon observed 40 cases of generalized edema resembling beriberi associated with parietic symptoms. In the prisons, which were never so crowded as they are now, because of the Gestapo, the resistance of the inmates was reduced to the point that they died not so much from hunger as from infectious diseases. The mortality was three times the normal rate. Naturally these privations were multiplied during the cold season. Intellectual workers also were victims of insufficient nourishment, as pointed out by Binet and Georges Duhamel.

This state of chronic subnutrition was bound to reflect on the general state of health of the French, their morbidity and their mortality. The mortality in 1939 amounted to 15.5; it reached 18.6 in 1940. The mortality for the period of 1939 to 1943 for ages up to 1 year progressed from 62 to 75, an increase of

19 per cent. It is said that this rate was surpassed in 1944. The consequences of the war and subnutrition are catastrophic for children. The mortality rates, however, should be considered with regard to the particular territory. When one considers, for example, the eight departments of the Mediterranean zone, which contain rural and urban populations totaling 3,410,000 inhabitants, it will be found that the mortality rate in 1938 amounted to 145 for 10,000 and a mortality rate for tuberculosis of 109 for 100,000. These figures increased for 1943 from 149 to 183 (26 per cent), and 36.8 per cent for the mortality from tuberculosis. The variations for mortality rates from contagious diseases are not significant and the figures do not include war prisoners or those dying in captivity. A more thorough investigation into the subject is necessary, because the figures thus far obtained under difficult conditions are not entirely reliable.

## CHILDREN AND AGED SUFFER

For morbidity the consequences are varied. The lack of vitamins A and D have grave consequences: 54 per cent of the nurslings and infants below the age of 2 in Paris present signs of rickets. Mortality from gastroenteritis increased by 50 per cent.

Hunger edema is rather common among the aged. Loss of weight has been universally observed. It amounted for adults to as much as 25 Kg., or an average of 15 to 20 per cent. In infants it caused arrest of increase in weight. Aubertin observed that in children of Parisian schools the number of the emaciated and those whose weight did not increase amounted in 1941 and 1942 to 20 per cent. Emaciation was accompanied by fatigue. There were observed diseases of bone due to hunger; hernias and visceroptosis frequently developed; the red blood cells were often reduced to 3 or 4 million; a glycemia of 0.80, azotemia down to 0.30, indolent skin infections and disturbances of sulfur and calcium metabolism leading to spontaneous fractures were common. Fiessinger and his collaborators call attention to the frequent occurrence of miliary tuberculosis. The mortality from tuberculosis has reached alarming figures. Besides the miliary type, there occur cardiac complications and pleurisy. Pneumothorax therapy has proved to be ineffective.

---

**Marriages**

---

ALBERT S. WINER, Washington, D. C., to Miss Monalee Ellis of Fort Worth, Texas, November 5.

JOHN SIMPSON GORDON JR., Milwaukee, to Miss Lilfred Wright of Nashville, Tenn., February 16.

HARRIE BURTON LOCHHEAD, Philadelphia, to Miss Helen Stevenson of Oak Park, Ill., January 2.

JOSEPH HENRY MORRIS, Maysville, Ga., to Miss Rose Marie Cameron of New Orleans in December.

DAVID HUGH VARN JR. to Miss Thelma Ruth McEntee, both of Birmingham, Ala., January 27.

LAWRENCE WESTCOTT ROESSING to Miss Mabel Emily Wilson, both of Pittsburgh, February 14.

JOSEPH S. BEREZ, Redondo Beach, Calif., to Miss Ray Leslie Mann of Los Angeles, January 19.

BERNARD M. ZUSSMAN, New York, to Miss Jane Erdman of Memphis, Tenn., February 10.

GEORGE PETER HUMMEL to Miss Joan Louise Evans, both of Columbus, Ohio, February 17.

WOOD LYDA, Washington, D. C., to Mrs. Nancy Mullen Steere of Seattle, January 20.

HARRY CRAWFORD KING to Miss Lois Amy Campbell, both of Atlanta, Ga., January 6.

LEO WICKERT JR. to Miss Marie Elizabeth Slevin, both of Detroit, February 10.

W. E. FULMER, Columbia, S. C., to Miss Oney Fowler of Laurens recently.

## Deaths

**Terigi Richard Paganelli** ☉ New York; College of Physicians and Surgeons, Baltimore, 1903; specialist certified by the American Board of Ophthalmology; fellow of the American College of Surgeons; a founder of the New Jersey Academy of Medicine; member of the New York Academy of Medicine; at one time on the faculty of the New York Ophthalmic Hospital; consultant eye surgeon at St. Clare's and Downtown hospitals and the Northern Dispensary; honorary assistant surgeon, New York Eye and Ear Infirmary; consultant eye surgeon at the Columbus Hospital in Newark, N. J.; on the staff of the North Hudson Hospital, Weehawken, N. J.; at one time eye surgeon for the Delaware, Lackawanna and Western Railroad; served as eye examiner for the New York State Civil Service Commission in Albany and consultant eye surgeon for the New Jersey Department of Labor; during World War I president of the Italian Red Cross, member of the medical advisory board number 46 and member of draft board number 2 in Hoboken, N. J.; formerly eye surgeon for the board of education in Hoboken; composed the "University of Maryland March" and many light ballads; died in Orange, N. J., February 18, aged 63, of coronary thrombosis.

**James Sprigg Wilson** ☉ Colonel, U. S. Army, retired, Columbus, Ohio; University of Virginia Department of Medicine, Charlottesville, 1892; Army Medical School, 1896; entered the medical corps of the U. S. Army in 1896; rose through the various grades to the grade of colonel on May 15, 1917; retired Dec. 31, 1922 for disability in line of duty; veteran of the Spanish-American War and World War I; from 1910 to 1914 professor of tropical diseases at the University of Vermont College of Medicine, Burlington; in 1918 and 1919 chief surgeon for the American Expeditionary Forces in Siberia and also chief surgeon of the Inter-Allied Sanitary Commission; at one time surgeon for the Fifth Corps Area, with headquarters at Fort Hayes; in 1922 awarded the Distinguished Service Medal for outstanding work in the medical department of the Army; in 1921 received the master of science degree in public health at the Ohio State University, where in 1923 he became assistant professor of public health, serving in that capacity until 1933, and during 1932 and 1933 as director of the student health service; died in the Station Hospital, Fort Hayes, January 15, aged 73, of arterial hypertension.

**Ralph Emerson Myers** ☉ Oklahoma City; Cornell University Medical College, New York, 1918; specialist certified by the American Board of Radiology, Inc.; at one time professor of pharmacology at the University of Maryland, Baltimore, and professor of pharmacology and physiologic chemistry at the George Washington University School of Medicine, Washington, D. C.; later director of laboratories, St. Anthony's Hospital; served in the medical corps of the U. S. Army during World War I; at one time chairman of the section on radiology of the Southern Medical Association; fellow of the American College of Radiology; member of the American Radium Society, Radiological Society of North America and American Society of Clinical Pathologists; died at the Polyclinic Hospital March 14, aged 57, of meningitis caused by the type III pneumococcus.

**Edith Belle Lowry** ☉ St. Charles, Ill.; Bennett Medical College, Chicago, 1907; for six years a public school teacher in Minnesota and Utah; served as acting chief of the bureau of hospitals for the Chicago Health Department during World War I; from 1920 to 1923 director of field investigations in child hygiene in many Southern states under the U. S. Public Health Service division of child hygiene; in 1924 appointed chief of the division of child hygiene of the state department of public health; member of the American Public Health Association, Mississippi Valley Medical Society and American School of Health Association; author of numerous books on hygiene; on the staff of the Delnor Hospital, where she died March 8, aged 66, of peritonitis.

**Frank Farnum Abbott** ☉ Ontario, Calif.; Jefferson Medical College of Philadelphia, 1907; served as associate professor of medicine at the College of Medical Evangelists, Loma Linda and Los Angeles; past president of the San Bernardino County Medical Society; in 1938 president of the Southern California Society for the Control of Syphilis and Gonorrhea; medical superintendent of the Paradise Valley Sanitarium and hospital, National City, from 1910 to 1913; for many years chief of the syphilis clinic at the staffs of San Antonio Hospital, San Bernardino; member of the Pomona Valley Hospital, Community Hospital, Upland, and the Pomona Valley Hospital, Pomona; died March 9, aged 61, of coronary thrombosis.

**Walter Fulton Whittimore Hay**, Portland, Maine; Harvard Medical School, Boston, 1924; diplomate of the National Board of Medical Examiners; member of the American Medical Association, New England Obstetrical and Gynecological Society and the New England Surgical Society; fellow of the American College of Surgeons; interned at the Boston City Hospital, where he was on the surgical staff; interned at the Boston Lying-In Hospital; served overseas with the Red Cross Ambulance Service during World War I; on the staffs of the Maine General and Children's hospitals; visiting surgeon at the Mercy Hospital and the Maine Eye and Ear Infirmary; died December 27, aged 47, of coronary occlusion.

**Albert Pope Fitzsimmons**, Tecumseh, Neb.; Omaha Medical College, 1895; member of the American Medical Association; past president of the Johnson County Medical Society; veteran of the Spanish-American War; later acting assistant surgeon in the U. S. Army; served for two years as surgeon general of the Nebraska National Guard and for five years in the medical reserve corps of the U. S. Army; at one time associated with the government of the Philippine Islands; a member of the board of directors of the Johnson County Bank and of the board of the Tecumseh Building and Loan Association; died February 22, aged 75, of cerebral hemorrhage, hypertension and arteriosclerosis.

**Carl Foster Snapp** ☉ Grand Rapids, Mich.; Rush Medical College, Chicago, 1915; interned at the Presbyterian Hospital, Chicago; member of the American Academy of Ophthalmology and Otolaryngology; fellow of the American College of Surgeons; past president of the Kent County Medical Society, Southwest Michigan Triological Society and the Grand Rapids Eye, Ear, Nose and Throat Society; specialist certified by the American Board of Otolaryngology; served in France during World War I; for many years on the staffs of St. Mary's Hospital and the Blodgett Memorial Hospital, where he died January 20, aged 57, of cardiovascular renal syndrome with hypertension and uremia.

**Charles Davison Knowlton** ☉ Rockport, Mass.; College of Physicians and Surgeons, Boston, 1889; Tufts College Medical School, Boston; at one time assistant professor of theory and practice of medicine at Tufts College Medical School and instructor in laryngology at Harvard Medical School, Boston; an Affiliate Fellow of the American Medical Association; specialist certified by the American Board of Otolaryngology; served on the staffs of the Massachusetts Eye and Ear Infirmary and the Massachusetts General Hospital in Boston; died January 5, aged 77, of cerebral hemorrhage.

**Edward Milton Foote**, New York; Harvard Medical School, Boston, 1890; formerly instructor in surgery at the Columbia University College of Physicians and Surgeons and clinical professor of surgery at the New York Polyclinic Medical School and Hospital; commander, medical corps, U. S. Naval Reserve, during World War I; at one time visiting surgeon to the New York City Hospital, New York Skin and Cancer Hospital and St. Joseph's Hospital; served as chief of surgery at the Vanderbilt Clinic; joint author of "Principles and Practice of Minor Surgery"; died in the Roosevelt Hospital February 14, aged 79, of spontaneous pneumothorax.

**Edward Lovelle Stewart** ☉ Kansas City, Mo.; Kansas City Medical College, 1903; for many years professor of bacteriology and histology at the Kansas City Western Dental College, which in 1941 dedicated its current year book, the *Bushwacker*, to him; at one time professor of bacteriology at the University Medical College of Kansas City; served during World War I; colonel, medical reserve corps, U. S. Army, not on active duty; founder and first editor of the *Bulletin of the Jackson County Medical Society*; on the staffs of the Willows Maternity Sanitarium and the Fairmount Maternity Hospital; died January 24, aged 68, of bronchial carcinoma.

**Joseph MacDonald Bobb**, Cheektowaga, N. Y.; Meharry Medical College, Nashville, Tenn., 1934; interned at the Flint Goodridge Hospital of Dillard University, New Orleans; member of the American Medical Association; state physician for syphilis control at the William Street Clinic sponsored by the Meyer Memorial Hospital and a physician in the state compensation department; served as medical examiner for the Selective Service Board number 596; on the courtesy staffs of the Mercy Hospital and the General Hospital in Buffalo; died in the Freedmen's Hospital, Washington, D. C., January 30, aged 41, of intestinal obstruction and gangrene.

**Bernard Smith** ☉ Los Angeles; Rush Medical College, Chicago, 1903; clinical professor of medicine at the University of Southern California School of Medicine; member of the American Society for Clinical Investigation, the American

Heart Association and the Pacific Interurban Clinical Club; fellow of the American College of Physicians; served in the medical corps of the U. S. Army during World War I; director of the Los Angeles Metabolic Clinic; on the staffs of the Children's Hospital, Cedars of Lebanon Hospital and the Hospital of the Good Samaritan; died January 23, aged 66.

**Craig Wilson Munter** • Fort Worth, Texas; University of Nebraska College of Medicine, Omaha, 1924; member of the American Urological Association; served as vice president of the State Medical Association of Texas; vice president and formerly secretary of the Tarrant County Medical Society; editor-manager, *Bulletin of the Tarrant County Medical Society*; consulting urologist, City and County Hospital; member of the staffs of the All Saints Episcopal Hospital and the Harris Memorial Methodist Hospital, where he died January 14, aged 44, of coronary occlusion.

**Robert Oliver Tucker**, Nashville, Tenn.; Vanderbilt University School of Medicine, Nashville, 1885; member of the American Medical Association; past president of the Nashville Academy of Medicine; formerly professor of obstetrics at his alma mater and dean of the faculty and professor of obstetrics and clinical midwifery at the Medical Department of the University of Nashville and the University of Tennessee; served on the staffs of the Nashville General and St. Thomas hospitals; one of the founders of the Protestant Hospital; died January 13, aged 81, of angina pectoris.

**Frank Edward Duehring** • Washington, D. C.; Georgetown University School of Medicine, Washington, 1912; associate professor of anesthesia at his alma mater; member of the American Society of Anesthetists, Inc.; past president of the Georgetown Clinical Society; fellow of the International Anesthesia Research Society; served as a contract surgeon at Fort Myer, Va., during World War I; chief anesthetist at the Georgetown, Episcopal Eye, Ear and Throat and Providence hospitals; died February 2, aged 55, of coronary occlusion.

**Charles Eli Adams**, San Jose, Calif.; Dartmouth Medical School, Hanover, N. H., 1894; died January 26, aged 81, of coronary thrombosis.

**Horace Russel Frank Allen**, Indianapolis; College of Physicians and Surgeons, New York, 1895; member of the American Medical Association; for many years chief surgeon of the Indianapolis Motor Speedway; died February 12, aged 76, of coronary occlusion.

**David Herman Anderson**, Carmel, Calif.; University of Pennsylvania School of Medicine, Philadelphia, 1925; interned at the Rochester General Hospital, Rochester, N. Y.; served during World War I; with the Rockefeller Foundation for many years; died February 9, aged 49, of cerebral hemorrhage.

**Robert Louis Banister**, Ralston, N. J.; Columbia University College of Physicians and Surgeons, New York, 1904; died in the Morristown Hospital, Morristown, February 2, aged 68, of heart disease.

**John Frederick Bausch**, Ross, Ohio; Miami Medical College, Cincinnati, 1907; member of the American Medical Association; on the staffs of the Fort Hamilton Hospital and the Mercy Hospital, Hamilton, where he died February 18, aged 62, of heart disease.

**William Franklin Beck**, Altoona, Pa.; Jefferson Medical College of Philadelphia, 1891; first police surgeon of Altoona; one of the founders, member of the staff and for many years member of the board of trustees of the Mercy Hospital, where he died February 8, aged 79, of injuries received when struck by an automobile.

**Robert James Beels**, Shaker Heights, Ohio; Bennett Medical College, Chicago, 1910; member of the American Medical Association and the Cleveland Academy of Medicine; member of the staff of the Glenville Hospital, Cleveland; served during World War I; died February 2, aged 66, of rheumatic and arteriosclerotic heart disease.

**Erwin Felix Benner**, Salfordville, Pa.; Medico-Chirurgical College of Philadelphia, 1899; died in the Grand View Hospital, Sellersville, January 29, aged 68, of mesenteric thrombosis.

**Lon C. Bice**, Edinburg, Ind.; Bellevue Hospital Medical College, New York, 1897; member of the American Medical Association; served during World War I; died March 15, aged 74, of coronary thrombosis.

**Windsor Aldrich Brown**, Seattle; University of Vermont College of Medicine, Burlington, 1889; member of the American Medical Association; at one time city physician and member of the school board in Worcester, Mass.; died February 3, aged 76, of heart disease.

**Thomas Parker Bullard**, Palmetto, Ga.; Atlanta Medical College, 1897; member of the American Medical Association; died in a hospital at Newnan January 19, aged 73, of coronary heart disease.

**Charles Emery Burleson**, La Porte, Ind.; Northwestern University Medical School, Chicago, 1904; member of the American Medical Association; formerly county health officer; county jail and county farm physician; on the staff of the Fairview Hospital; died February 10, aged 72, of coronary occlusion.

**Sydney Howard Carney Jr.**, New Rochelle, N. Y.; Dartmouth Medical School, Hanover, N. H., 1889; served during World War I; died January 13, aged 81, of myocardial failure.

**James Bell Carothers**, Atlanta, Ga.; Atlanta Medical College, 1915; member of the American Medical Association; on the staff of the Crawford W. Long Memorial Hospital, where he died January 17, aged 55, of coronary occlusion.

**Francesco Ciuccarelli**, Trenton, N. J.; Regia Università degli Studi di Roma. Facoltà di Medicina e Chirurgia, Italy, 1916; served with the Italian army during World War I; died in St. Michael's Hospital, Newark, February 7, aged 55, of hypertensive encephalopathy and chronic nephritis.

**Roy Ellis Cruzen**, Centralia, Ill.; University of Minnesota College of Medicine, Minneapolis, 1915; died December 28, aged 55.

**Thomas Maltby Cunningham** • La Mesa, Calif.; College of Physicians and Surgeons, New York, 1895; at one time on the staff of St. Luke's Hospital in Marquette, Mich.; served on the staffs of the Mercy Hospital in San Diego and the Community Hospital; died February 6, aged 76, of cerebral hemorrhage.

**Louis E. Daugherty** • St. Paul; University of Minnesota College of Medicine and Surgery, Minneapolis, 1904; clinical assistant professor of general surgery at his alma mater; fellow of the American College of Surgeons; chief surgeon for the Omaha Railway for many years; on the staffs of the Miller Hospital, St. Joseph's Hospital and St. Luke's Hospital, where he died January 10, aged 64, of cardiorenal disease.

**Henry Louis Dietz** • Oakland, Calif.; California Medical College, San Francisco, 1896; died December 12, aged 71, of cardiovascular renal disease.

**William L. England**, Middletown, Ohio; Columbus Medical College, 1881; died January 6, aged 91, of myocardial failure.

**Joseph Creighton Feindel**, Athol, Mass.; College of Physicians and Surgeons, Baltimore, 1897; Harvard Medical School, Boston, 1899; died in Northampton December 20, aged 79, of coronary heart disease.

**John J. Flanagan**, New York; L.R.C.P. and L.R.C.S., Edinburgh, and L.R.F.P. & S., Glasgow, 1900; since 1924 head of the medical department of the New York Postoffice; at one time associated with the Bronx County Board of Health; died January 29, aged 67, of cerebral hemorrhage.

**Robert Lee Gallaher** • Caryville, Tenn.; Vanderbilt University School of Medicine, Nashville, 1900; past president of the Campbell County Medical Society; served during World War I; for many years surgeon for the Southern Railway; president of the First National Bank of Lake City and First State Bank of Caryville; died February 8, aged 66, of cerebral hemorrhage.

**Benjamin Roscoe Gary**, Newport News, Va.; University of Maryland School of Medicine, Baltimore, 1891; member of the American Medical Association; served as city coroner for many years; in 1938, on the forty-seventh anniversary of his practice in the community, was presented with a silver service from his patients; instrumental in founding the Riverside Hospital, where he served in various capacities and where he died February 13, aged 76, of chronic nephritis.

**Erasmus Manford Gebhart**, Los Angeles; Miami Medical College, Cincinnati, 1878; died January 19, aged 89, of cerebral hemorrhage.

**Frank Grauer** • New York; Bellevue Hospital Medical College, New York, 1884; fellow of the American College of Physicians; at one time instructor in the Carnegie Laboratories at his alma mater; at various periods pathologist and laboratory director at the Harlem Hospital, New York City Hospital, Park Hospital and the Lutheran Hospital; died in the Presbyterian Hospital February 16, aged 80, of coronary occlusion.

**John Perry Griffith** • Pittsburgh; Medico-Chirurgical College of Philadelphia, 1906; specialist certified by the American Board of Surgery; professor of surgery at the University of Pittsburgh School of Medicine; fellow of the American College of Surgeons; president of the staff and chief surgeon, Mercy

Hospital; chairman of the medical section of the Allegheny County Civilian Defense; died February 18, aged 61, of carcinoma of the prostate.

**Eugene Joseph Hanratta**, Watervliet, N. Y.; Albany Medical College, Albany, 1897; member of the American Medical Association; formerly mayor and postmaster of Watervliet; died February 5.

**Randolph Samuel Harter**, Schoolcraft, Mich.; Rush Medical College, Chicago, 1903; served on the courtesy staff of the Borgess Hospital and on the staff of the Bronson Methodist Hospital, Kalamazoo, where he died February 10, aged 66, of chronic valvular heart disease and chronic nephritis.

**Frank Alden Haslam**, Boston; Harvard Medical School, Boston, 1885; member of the American Medical Association; died December 31, aged 82, of arteriosclerotic heart disease.

**William McGregor Haynes**, Sherman, N. Y.; University of Buffalo School of Medicine, 1888; died in the Jamestown General Hospital, Jamestown, January 21, aged 80, of cerebral hemorrhage.

**Peter Andrew Helgesen**, Lake Mills, Iowa; College of Physicians and Surgeons, Keokuk, 1891; member of the American Medical Association; died in Phoenix, Ariz., January 19, aged 76, of coronary occlusion, bronchial asthma and burns of the left hand.

**Sylvester Bernard Helwig**, St. Louis; St. Louis University School of Medicine, 1923; died in Webster Groves, Mo., February 10, aged 48, of chronic hypertensive nephritis.

**Hugh William Henry** @ New Smyrna Beach, Fla.; University of Maryland School of Medicine, Baltimore, 1891; served as councilman in Ocala and as a director of the Marion County Chamber of Commerce; a member of the Rotary Club; died January 15, aged 77, of grip and chronic bronchitis.

**Herbert Inglis Hewish**, Wilkes-Barre, Pa.; University of Toronto Faculty of Medicine, Toronto, Ont., Canada, 1898; died in the Mercy Hospital December 25, aged 70, of diabetes mellitus and arteriosclerosis.

**Henry Philip Hirsch**, New York; University of the City of New York Medical Department, 1891; member of the American Medical Association; formerly medical supervisor of the department of child hygiene of the board of health; for many years in charge of the medical department of the New York Postoffice; medical examiner for the Veterans Administration at the Veterans Administration Facility; died February 19, aged 74, of coronary thrombosis.

**David Ivison Hoage**, New York; Long Island College Hospital, Brooklyn, 1903; died January 23, aged 67, of heart block and acute dilatation of the heart.

**William Walter Hobson**, Pittsburgh; College of Physicians and Surgeons, Baltimore, 1910; medical director of the Reliance Life Insurance Company; died January 4, aged 60, of coronary occlusion.

**Herbert J. Hopkins**, Pittsburgh; McGill University Faculty of Medicine, Montreal, Que., Canada, 1888; member of the American Medical Association; died December 14, aged 77, of coronary occlusion.

**Waldo Willard Hull**, South Williamsport, Pa.; University of Pennsylvania Department of Medicine, Philadelphia, 1889; veteran of the Spanish-American War; died December 15, aged 79, of carcinoma of the face with metastasis to the brain.

**Samuel Adams Jackson**, Muskegon, Mich.; Detroit College of Medicine and Surgery, 1916; member of the American Medical Association; past president of the Muskegon County Medical Society; for many years a member of the board of health; fellow of the American College of Surgeons; served as acting assistant in the U. S. Public Health Service; on the staffs of the Hackley and Mercy hospitals; died January 2, aged 54, of coronary disease.

**John Knox Jamieson**, Paw Paw, Mich.; Bennett Medical College, Chicago, 1900; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1907; on the staff of the Lake View Municipal Hospital; died January 5, aged 71, of heart disease.

**Hugh David Jamison**, Summit, N. J.; University of Pennsylvania Department of Medicine, Philadelphia, 1895; at one time on the staff of the Manhattan Eye, Ear, Nose and Throat Hospital, New York; died February 12, aged 71, of heart disease.

**James Colton Johnson**, Cedar Rapids, Iowa; Western University Faculty of Medicine, London, Ont., Canada, 1892; died December 25, aged 76, of cardiorenal disease and chronic nephritis.

**Harry Julius Kalet**, Pittsburgh; University of Pittsburgh School of Medicine, 1914; member of the American Medical Association; died in the Mercy Hospital February 18, aged 52, of rheumatic and hypertensive heart disease.

**Meger Zackary Kara** @ New York; University of Istanbul Medical Faculty, Turkey, 1914; attending ophthalmologist on the staff of the New York Eye and Ear Infirmary and chief of the department of ophthalmology at the Stuyvesant Poly-clinic; died at the Jersey City Medical Center, Jersey City, February 10, aged 56, of malignant nephrosclerosis.

**James C. Kelton**, Lascassas, Tenn.; University of Tennessee Medical Department, Nashville, 1901; member of the American Medical Association; formerly vice president and president of the Middle Tennessee Medical Association; died January 9, aged 74, of cerebral thrombosis.

**William Pitt Kennedy**, Dickson, Pa.; Starling Medical College, Columbus, 1882; died December 17, aged 87, of cardiovascular disease.

**William Francis Latzko**, New York; Medizinische Fakultät der Universität Wien, Vienna, Austria, 1886; at one time professor at the University of Vienna and university in Buenos Aires; consultant at the Beth Israel Hospital, where he died February 11, aged 81, of cirrhosis and carcinoma of the liver.

**Joseph Charles Lill** @ Fort Wayne, Ind.; St. Louis University School of Medicine, 1918; served as a member of the city board of health and as a deputy county coroner; on the staff of St. Joseph Hospital; died in Fort Lauderdale, Fla., January 4, aged 51, of pancreatic carcinoma.

**John Lewis Mahoney**, St. Petersburg, Fla.; Boston University School of Medicine, 1898; member of the American Medical Association; died January 2, aged 72, of carcinoma of the sigmoid with metastasis.

**John T. Manierre** @ Chicago; Northwestern University Medical School, Chicago, 1894; died January 12, aged 75, of carcinoma of the stomach.

**Guy Carlton Matthewson**, Flint, Mich.; Detroit College of Medicine and Surgery, 1916; member of the American Medical Association; died in the Hurley Hospital January 20, aged 62, of carcinoma of the face.

**Robert O. McAlexander** @ Indianapolis; Medical College of Indiana, Indianapolis, 1896; served on the staff of the City Hospital; died in the Methodist Hospital January 12, aged 77, of carcinoma of the stomach.

**Benjamin J. Nauman**, Peru, Ill.; Rush Medical College, Chicago, 1899; died in Wichita, Kan., January 5, aged 72, of senility.

**Gail Simpson Newsom**, Philomath, Ore.; University of Oregon Medical School, Portland, 1904; formerly health officer of Klamath County; on the staffs of the Ball Clinic and the Corvallis General Hospital, Corvallis; died in Corvallis December 22, aged 63, of cerebral hemorrhage.

**Alvin Frank Renneker** @ Cincinnati; Ohio-Miami Medical College of the University of Cincinnati, 1911; on the staff of the Good Samaritan Hospital, where he died January 5, aged 57, of hemorrhage from gastric ulcer.

**David J. Sibener** @ Brooklyn; Long Island College Hospital, Brooklyn, 1926; interned at the Mary Immaculate Hospital and the Queensboro Hospital in Jamaica, N. Y.; appointed diagnostician for the health department of New York City in 1929; clinical assistant of ophthalmology at Kings County Hospital and assistant in ophthalmology at the Israel Zion Hospital; died January 6, aged 42, of coronary thrombosis.

**George H. Steuart**, Ottoman, Va.; University of Maryland School of Medicine, Baltimore, 1899; member of the American Medical Association; served as assistant superintendent and superintendent at the University Hospital and as assistant surgeon to the U. S. Marine Hospital, both in Baltimore; chairman of the Lancaster County Board of Supervisors; died in a hospital at Richmond January 6, aged 79, of angina pectoris.

**Herman W. Weinberg**, Youngstown, Ohio; University of Pennsylvania Department of Medicine, Philadelphia, 1900; died in the North Side unit of the Youngstown Hospital December 31, aged 69, of arteriosclerotic heart disease.

**James Corthen Woodburn** @ Greenville, Ky.; Louisville Medical College, 1903; died January 16, aged 77, of Parkinson's disease and arteriosclerosis.

**John Barnaby Woodruff**, Johnstown, Pa.; Jefferson Medical College of Philadelphia, 1896; member of the American Medical Association; in 1906 president of the Cambria County Medical Society; member of the consulting staff and for many years chief of medicine at the Conemaugh Valley Memorial Hospital, where he was a member of the board of managers and where he died January 27, aged 85, of acute pyelonephritis.

## DIED WHILE IN MILITARY SERVICE

**Robert Ward Baker**, Davenport, Iowa; State University of Iowa College of Medicine, Iowa City, 1940; member of the American Medical Association; interned at the Mercy Hospital; commissioned a first lieutenant in the medical corps, Army of the United States, on Aug. 20, 1942; later promoted to captain; died in England Nov. 23, 1944, aged 28, of pneumonia.

**Wallace Rideout Briggs** @ Sacramento, Calif.; Harvard Medical School, Boston, 1919; specialist certified by the American Board of Ophthalmology; interned at the Massachusetts Eye and Ear Infirmary; served on the staff of the Sutter General Hospital; commissioned a lieutenant commander in the medical corps of the U. S. Naval Reserve on Sept. 10, 1942; died in the U. S. Naval Hospital, Long Beach, Dec. 18, 1944, aged 50, of bronchiogenic carcinoma of the lung.

**Arthur Stevenson Clay Jr.**, Monessen, Pa.; University of Pennsylvania School of Medicine, Philadelphia, 1938; member of the American Medical Association; interned at the George F. Geisinger Memorial Hospital, Danville, and served a residency in ophthalmology at the Wills Hospital in Philadelphia; on the staff of the Gemmill Hospital; commissioned a first lieutenant in the medical corps, Army of the United States; later promoted to captain; died in Guadalcanal Dec. 11, 1944, aged 31, of acute yellow atrophy of the liver.

**William Johnston Collie**, Portland, Ore.; Northwestern University Medical School, Chicago, 1936; member of the American Medical Association; interned at the Multnomah Hospital and served a residency at St. Vincent's Hospital; commissioned a first lieutenant in the medical reserve corps of the U. S. Army on May 31, 1938; began active duty as a captain in the Army of the United States on Dec. 30, 1940; later promoted to major and lieutenant colonel; died in Schirmeck, France, January 5, aged 35, as the result of injuries incurred in an accidental collision between a tank and a jeep.

**George Foster Eubanks**, Atlanta, Ga.; Emory University School of Medicine, Atlanta, 1925; interned at the Wesley Memorial Hospital; formerly fellow in surgery of the Mayo Foundation in Rochester, Minn.; at one time chief resident physician at the Knoxville General Hospital, Knoxville, Tenn.; attending proctologist at the Grady Municipal and the Georgia Baptist hospitals and associate surgeon at the Albert Steiner Clinic for Cancer and Allied Diseases; member of the American Medical Association, Association of Resident and Ex-Resident Physicians of the Mayo Clinic, Southern Medical Association and South-eastern Surgical Congress; fellow of the American Proctologic Society; in 1936 vice president of the Fulton County Medical Society; specialist certified by the American Board of Surgery; commissioned a major in the medical corps, Army of the United States, on Dec. 28, 1942; began active duty on Jan. 14, 1943; later promoted to lieutenant colonel; died in Marlborough, England, Sept. 25, 1944, aged 44, of coronary occlusion.

**Sydney Charles Feinberg** @ New York; Columbia University College of Physicians and Surgeons, New York, 1919; interned at the Mount Sinai Hospital and the Montefiore Home and Hospital; commissioned a captain in the medical corps, Army of the United States, on July 10, 1942; died in the Tilton General Hospital, Fort Dix, N. J., Dec. 24, 1944, aged 50, of histoplasmosis.

**Herbert Julius Kaufman** @ Owosso, Mich.; Wayne University College of Medicine, Detroit, 1939; interned at the Eloise Hospital, Eloise; commissioned a first lieutenant in the medical corps, Army of the United States, on June 23, 1942; later promoted to captain; died in the Hammond General Hospital, Modesto, Calif., Nov. 20, 1944, aged 32, of meningitis.

**James Floyd Klock**, Billings, Mont.; University of Michigan Medical School, Ann Arbor, 1931; interned at the Harborview Hospital in Seattle; served as senior physician, U. S. Indian Service; commissioned a first lieu-

tenant in the medical reserve corps of the U. S. Army on Feb. 13, 1933; began active duty as a captain in the medical corps, Army of the United States, on June 12, 1942; later promoted to major; died in Newbury, England, Dec. 12, 1944, aged 40, in a glider crash accident.

**John Ross Marshall** @ West Somerville, Mass.; Harvard Medical School, Boston, 1918; diplomate of the National Board of Medical Examiners; member of the New England Obstetrical and Gynecological Society; fellow of the American College of Surgeons; interned at the Boston City Hospital; served as chief surgeon at the Somerville Hospital, and on the staffs of the Cambridge Hospital, Cambridge, Lawrence Memorial Hospital, Medford, and the Symmes Arlington Hospital, Arlington; college physician for Tufts College for seventeen years; served during World War I, entering the U. S. Naval Reserve in 1918, subsequently serving a temporary assignment in the U. S. Navy as a lieutenant; later became a lieutenant and lieutenant commander in the medical corps of the U. S. Naval Reserve; reentered active service in May 1941, serving since Jan. 23, 1943 as medical inspector with the rank of commander; served at the U. S. Naval Hospital, Chelsea, and at U. S. Naval Hospital, Shoemaker, Calif., where he died Oct. 14, 1944, aged 56, of *Staphylococcus aureus* septicemia.

**Fabian Lee Pratt** @ Colonel, M. C., U. S. Army, San Francisco; Vanderbilt University School of Medicine, Nashville, 1911; School for Flight Surgeons in 1921, Air Service Balloon and Airship School, 1923, and Air Corps Primary Flying School, 1927; interned at the Bellevue Hospital in New York; entered World War I early in 1914 with the British, serving in France and Italy until 1917, when America entered into the war, and was transferred to the United States Army; commissioned a captain in the medical corps of the regular Army in 1917; advanced through the subsequent ranks to colonel; served as a flight surgeon at various stations in the continental United States, such as Mitchel Field, N. Y., Scott Field, Ill., Fort Riley, Kan., and Bolling Field, Washington, D. C.; also served a tour of duty in Hawaii; his early association with aviation gave him insight into the problems of medicine in relation to the flier; after study of the mechanics of aviation he became the only medical officer in the Army to hold pilot ratings in air craft both lighter than air and heavier than air; the Research Laboratories of the School of Aviation Medicine are a tribute to his efforts, as he was among the first to think in terms of research as applied to aviation medicine; served as commandant of the School of Aviation Medicine, 1939-1941; as a pilot he had over three thousand flying hours to his credit and was active in aviation almost to the day of his death; authorized to wear the Purple Heart, the Victory Medal, the King George Medal, the Belgian and Italian war crosses and many other decorations; since February 1943 surgeon of the Fourth Air Force; died December 18, aged 55, of heart disease.

**Henry Matthew Usiak**, Buffalo; University of Buffalo School of Medicine, 1941; diplomate of the National Board of Medical Examiners; interned at the Edward J. Meyer Memorial Hospital; commissioned a first lieutenant in the medical corps of the Army of the United States on June 11, 1941; later promoted to captain; died in Italy Nov. 30, 1944, aged 27, of infectious hepatitis.

**Jesse H. West** @ San Francisco; University of Oregon Medical School, Portland, 1926; interned at St. Luke's Hospital, where he was later chief resident; commissioned a captain in the medical corps, Army of the United States; died in the Lawson General Hospital, Atlanta, Ga., February 4, aged 46, of brain tumor.

**Frederick Ray Woodward**, Los Angeles; Medical College of Virginia, Richmond, 1942; served an internship and residency at the Los Angeles County Hospital; commissioned a first lieutenant in the medical corps, Army of the United States, June 2, 1942; died in Abilene, Texas, Nov. 22, 1944, aged 30, in an aircraft accident.

## Correspondence

# SPONTANEOUS PNEUMOTHORAX AND ASCENT IN AIRPLANE

Fraud orders issued by the United States Post Office are really effective—so far as the trade styles and names used at the time of the order are concerned. Circumvention therefore requires the use of new trade styles and names—but this fortunately results in the issuance of supplemental orders by the Post Office Department as indicated in the following paragraphs:

A. L. Dean, Robert Probasco, "Arthritis" and C E Charts —The Probasco in question was known as the general manager of a Los Angeles concern operating under the names "American Mutual Health Association" and "ABC Preparations Company," selling "A B C Preparations" through the mails with the representation that these would 'cure' all forms of rheumatism, sciatica and arthritis when used according to directions in conjunction with "diet charts" and 'instruction sheets' furnished by the promoters. As shown in this department of The Journal July 8, 1944, page 737, the Post Office Department debarred the scheme from the mails as a fraud. It was also shown that according to a government chemist, one part of the treatment was chiefly water, with less than 1 per cent each of hydrochloric and nitric acids, another contained 36 per cent of alcohol and small amounts of Jamaica dogwood and cimicifuga and the third a powder, was a mixture of phenolphthalein, senna, sulfur and cream of tartar. The Post Office Department, however later learned that Probasco had continued the business under his own name and that of an A L Dean, and on May 20, 1944, the Post Office issued a fraud order against these two names. Even this did not put an end to the fraud, for it was next discovered that Probasco was still doing business at the old address, 326 West Third Street, Los Angeles, but under a new trade style, "Arthritis." Against this name, accordingly, the Post Office Department issued a fraud order on Dec 5 1944. Nor was this all Probasco, as might have been expected, adopted a new trade style, "C E Charts," and on stickers attached to advertising matter that he sent out to prospects and old customers, he urged them to use only that title in addressing him. The Post Office Department, however, soon caught up with this trick, and on Jan 30, 1945, issued an additional fraud order covering the name C E Charts. A further one was issued on Feb 24, 1945 against "Diet Charts," the new name that Probasco had adopted. Again he changed his trade style, this time to 'Correct Diet,' and on March 21, 1945 a fraud order was issued against this name. Very likely, however the end is not yet, and one can only speculate on how many more fraud orders the government will have to issue against Probasco before he decides to give up his swindles.

E J McCann—This department of THE JOURNAL, July 9 1938 p 188, gave details of the case in which E J McCann of Elmira, N Y, was debarred from the use of the mails under his name and that of "Tonsol." The bone of contention was an alleged cure for diphtheria and tonsil infections, which treatment McCann sold through the mails and which the Post Office Department declared fraudulent. Government chemists reported that their analysis of Tonsol showed it to be essentially a 15 per cent solution of mild silver protein (argyrol type). At the hearing of the case it had also been shown that McCann was without medical education or training, and that no one with such qualifications was connected with his business. The article stressed the danger not only to the individual but to the community, of attempting to treat diphtheria with a spray sold on the mail-order plan. Since the order debarring McCann's business from the mails covered even his personal mail, on March 14, 1940, he filed with the Post Office Department an affidavit to the effect that his Tonsol activities had been discontinued and would not be resumed, either under the names formerly used or any others. Accordingly, the Post Office Department revoked the original fraud order to the extent of permitting McCann to receive personal mail in no way relating to his former business. Some time later, however, the Post Office Department, after obtaining evidence that McCann had resumed his old scheme and was selling a nostrum similar to Tonsol through the mails under the name "McCann's Remedy," ordered him to show cause why a new fraud order should not be issued against him. This he was unable to do to the satisfaction of that Department, and on Sept 7, 1944, the order was issued against the names McCann, E J McCann, "McCann's Remedy," and their officers and agents. It is worth noting that another government agency, the Food and Drug Administration, had occasion to prosecute McCann, also trading as the Tonsol Company, for fraudulently representing on the label of his nostrum that it was an effective cure for the diseased tonsils, diphtheria adenoids, quinsy and some other things. The government's report of this case stated that on Jan 10, 1939, McCann entered a plea of *nolo contendere*, and the district federal court in which the case was tried imposed a fine of \$50 but suspended payment thereof and placed McCann on probation for three months.

**Juan Avina**—From Madero, Mexico, one Juan Avina, using the names The Invisible Hospital and The Invisible Doctors perpetrated a fraud through the United States mails in representing that for certain sums he would prescribe curative treatment for any diseases and that through his 'invisible mystic power' he would "cure" the patient everywhere and protect him against all harm. The scheme was particularly directed to residents of Puerto Rico. On Oct 4 1940, the Post Office Department at Washington issued a fraud order against Avina's scheme depriving it from the United States mails. Later investigation revealed that Avina was evading the fraud order in continuing his business and operating under the names Avina, Abima, Abima and Avina and still operating from Madero. Accordingly, on Oct 23, 1941, the Post Office Department extended the original fraud order to cover these names.

*To the Editor*—In THE JOURNAL, March 3, Holter and Horwitz reported an instance of spontaneous pneumothorax produced by ascent in an airplane. In considering the mechanism of this accident the authors make the following statements "Under normal conditions the pleural cavity is merely a potential space between the parietal and pulmonary pleura in which an average pressure of about 756 mm of mercury is maintained. Again under normal conditions the intrapulmonary pressure is kept at approximately the same level. In this case the pressure was rather abruptly dropped to about 560 mm of mercury or by about 26 per cent, thereby creating a tendency for the lung to collapse partially. As long as the pleural cavity remained potential, this would not have been possible. But with the development of increased tendency to separate the pulmonary from the parietal pleura a weakness in the pleura was exploited and pneumothorax occurred." This reasoning contains a fundamental error which should be corrected, since the authors have expressed an opinion that extreme caution is warranted in advising patients who have had known diseases of the pleura about airplane travel.

With decrease in atmospheric pressure, the absolute pressure in the tissues of the body decreases correspondingly, so that the tissue pressure relative to atmospheric pressure remains the same (Ferris, E B , Molle, W , Engel, G L , Webb, J P, and Blankenhorn, M A Unpublished data) Liquids show no volume change under these conditions The only way in which liquid tissues can change in volume is through the formation of tissue bubbles as the result of a relatively rapid exposure of the body to low atmospheric pressure This phenomenon, which is responsible for the syndrome of decompression sickness, does not occur at altitudes much below 20,000 feet and could not be a factor in this subject who reached only 8,000 feet High altitude likewise has no effect on the volume or pressure of air or gas containing structures as long as they are in free communication with the ambient atmosphere (i e the lungs) Changes in pressure and volume will occur only in gas containing structures that have inadequate or no communication with the external atmosphere (i e middle ear, paranasal sinuses, gastrointestinal tract) As long as there is no air in the pleural space there will be no relative change in intrapulmonary pressure and hence no "tendency for the lung to collapse partially" Similarly, an emphysematous bleb would not be any more likely to rupture at altitude unless it had little or no communication with intrapulmonary air

Hence it seems reasonable to conclude that ascent to altitude cannot act as a precipitating factor for spontaneous pneumothorax by the mechanism the authors suggest. Indeed, if such a mechanism was possible one might expect a much higher incidence of spontaneous pneumothorax during the millions of airplane ascents that have been made in the past five years. Actually, it seems doubtful that the incidence is any higher than among the nonsflying population. The tendency toward pneumothorax would be increased only if there already was air in the pleural space or in the pulmonary interstitial tissue or mediastinum, a mechanism for pneumothorax pointed out by M. T. Macklin and C. C. Macklin (*Medicine* 23:281, 1944).

It seems likely either that the occurrence of pneumothorax in this subject was coincidental to flight or that the subject already had a pneumothorax before ascent.

GEORGE L. FUGLI, MD  
EUGENE B. FEPPIE, MD  
University of Cincinnati College of Medicine,  
Cincinnati

*To the Editor:*—I wish to comment on the article of Holter and Horwitz on "Spontaneous Pneumothorax Produced by Ascent in an Airplane" (*THE JOURNAL*, March 3, p. 519). They state that the intrapleural pressure in the potential space falls from 756 mm. of mercury to 560 mm. of mercury by ascent from the ground to an altitude of 8,000 feet, "thereby creating a tendency for the lung to collapse partially." I believe that the latter statement is untrue, for actually the only factor tending to separate the visceral and parietal pleurae is the elastic pull of the lung tissue. At any altitude and all altitudes, with the visceral and parietal pleurae in apposition and the pleural space merely a potential one, atmospheric pressure exerts an equal push on the inside of the visceral pleura and the outside of the parietal pleura. At any elevation it is only the elastic pull of the lung tissue which tends to separate the pleurae or to tear a weak place in the pleura.

Their second possibility "is that a peripheral emphysematous bleb may have ruptured as the result of relative increase of pressure within the bleb itself." I would go further and maintain that the only physical possibility of producing pneumothorax by ascent in an airplane would be by the expansion of gas in a closed bleb with consequent rupture of the part of the visceral pleura forming the portion of the wall of the bleb which is in apposition to the potential pleural space. If the bleb were open (i. e., in communication with an open bronchus) rupture could not occur. Only in a closed bleb would decreasing atmospheric pressure cause expansion of retained gas, stretching and subsequent rupture of the bleb.

It may be interesting to postulate, from the laws of physics, that coughing or straining with a closed glottis would be of great hazard to the person with an open bleb, whereas flying in an airplane would be innocuous. However, if the bleb remained closed through plugging of its bronchus the patient could cough or strain with impunity and ascent in an airplane would be likely to produce spontaneous pneumothorax.

The fact remains that, as the authors intimate, no one suspected of having emphysematous blebs or pulmonary cavities should travel by plane.

MAXWELL BERRY, M.D., Atlanta, Ga.

*To the Editor:*—In a recent report of a case of spontaneous pneumothorax (*THE JOURNAL*, March 3), Holter and Horwitz present certain statements which deserve comment.

In considering the mechanism of the accident they propose that the precipitating factor was the drop in barometric pressure entailed in an ascent to 8,000 feet, "thereby creating a tendency for the lung to collapse partially" and, again, ". . . with the development of increased tendency to separate the pulmonary from the parietal pleura, a weakness in the pleura was exploited and pneumothorax occurred." Such an increased tendency toward pulmonary collapse on ascent to altitude would indeed be an important factor to consider, if it really existed. As a matter of fact, no such tendency exists.

Under normal conditions the pressure in the potential pleural space is less than the intrapulmonary pressure by an amount which depends on the elastic recoil of the lung. The actual absolute pressure in this space is of no significance if considered alone, the intrapleural pressure being physiologically important only in relation to the intrapulmonary pressure. On ascent to altitude the intrapulmonary pressure falls, to be sure, but, since the reduction in barometric pressure is transmitted equally and immediately to all the body tissues, the intrapleural pressure remains precisely the same in relation to the intrapulmonary pressure as it was at ground level. There is no increased tendency for pulmonary collapse.

Since, as the authors point out, it seems likely that air travel will become more prevalent after the war, it is important that physicians realize the fundamental principles involved in exposure to reduced barometric pressure. Fallacious reasoning with

regard to pressure relations in the body can be largely avoided if it is remembered that the tissues of the body transmit the existing atmospheric pressure immediately and equally in all directions and that such pressures as arterial and venous blood pressures, cerebrospinal fluid pressure and intrapleural pressure are measured in relation to the pressure of the ambient atmosphere. Reference to the writings of Paul Bert in the latter portion of the last century is indicated in this respect.

WILLIAM V. WHITEHORN, M.D., Columbus, Ohio.

## POSTPARTUM MASSAGE OF DEEP PELVIC MUSCLES

*To the Editor:*—Dr. E. H. Terrell, whom I remember with pleasant memories from internship days, in *THE JOURNAL*, Oct. 28, 1944 calls attention to the work of Dr. George Thiele, whose "contribution . . . is the most valuable given in our field (proctology) during the past decade." Also in the field of obstetrics it has been a most valuable contribution. I have found it to be of great benefit in the late postpartum care of the obstetric patient.

So often, after delivery, there are vague sacroiliac and sacrococcygeal pains. Palpation of the deep pelvic muscles will reveal them to be spastic and painful. The trauma incident to delivery is the most likely explanation. Massage of these muscles by rectum with the patient in the lithotomy position usually gives gratifying relief. Particularly so is this if there has been undue displacement of the coccyx.

As Thiele emphasizes, massage at first should be light and of short duration, progressively increasing the pressure and length of time of treatment as the spasticity of the muscles relaxes.

Similar pain in the nonpuerperal woman has also sometimes yielded to this therapy.

WALTER S. L. McMANN, Captain, M. C., A. U. S.

## Bureau of Legal Medicine and Legislation

### MEDICOLEGAL ABSTRACTS

**Basic Science Acts: Validity of New Mexico Act.**—Polhemus, who was licensed to practice naturopathy in Arizona, without complying with the licensing laws of New Mexico attempted to practice naturopathy in that state and was arrested for practicing without a certificate from the New Mexico Board of Examiners in the Basic Sciences. Thereafter he instituted an action for damages in the district court of the United States for the district of New Mexico against the American Medical Association, the New Mexico Medical Society and the individual members of the New Mexico Board of Examiners in the Basic Sciences, which consisted of one physician, one osteopath, one chiropractor and two "laymen learned in the basic sciences." He alleged (1) that the defendants by illegal means induced the New Mexico legislature in 1941 to enact the New Mexico basic science act for the purpose of creating a monopoly in the practice of the healing arts in the state; (2) that the basic science act was discriminatory against him in that it did not entitle him, as a naturopath, to a basic science certificate on the same basis as physicians, osteopaths and chiropractors because the act, while it provided that persons licensed to practice at the time of its enactment in 1941 could receive such a certificate without examination, it made no such provision for naturopaths, who could not have been lawfully licensed as such in New Mexico at the time of the enactment of the law; (3) that the members of the basic science board adopted discriminatory and unreasonable rules and regulations in placing the basic science act into operation; and (4) that these acts together with his

rences of erythema multiforme, especially that preceded by herpes simplex. He believes that this procedure should be used in cases of recurrent erythema multiforme unassociated with herpes simplex.

**Sulfadiazine in Dacryocystitis of Newborn.**—Simpson states that the treatment of simple epiphora or epiphora complicated by dacryocystitis occurring soon after birth is based on the premise that an obstruction is present along the nasolacrimal duct. There may be either an anatomic or an accidental obstruction. A review of the causes has shown that there is a factor of infection in all cases. This factor may be primary, in which case the entire process is dependent on bacterial invasion of the mucous membrane of the nose and the nasolacrimal duct. The infection may be secondary, in which case the underlying anatomic obstructive agent favors infection by insufficient drainage of the tears. Simpson states that when a case of congenital epiphora with dacryocystitis is seen for the first time it is impossible to know whether or not an anatomic obstruction exists. For this reason chemotherapy in conjunction with conservative treatment is to be recommended in all cases. Simpson presents the observations on 2 infants successfully treated with sulfadiazine. An initial dose of 0.5 Gm. of sulfadiazine was given, followed by 0.25 Gm. every four hours, with one dose at night. In 1 case an ointment containing 5 per cent of sulfathiazole was applied to the sinus openings. The additional conservative treatment consisted in cleansing the inferior meatus by suction, irrigation of the nasolacrimal duct with isotonic solution of sodium chloride and digital pressure on the distended lacrimal sac in an attempt to rupture a congenital membrane or stricture. From a survey of the literature on the use of sulfonamide drugs in ophthalmology it is evident that the use of sulfonamide compounds for congenital dacryocystitis has not received the attention it deserves. Too much emphasis has been placed on a physical obstruction as the underlying factor. Early employment of sulfonamide treatment in dacryocystitis may reduce the number of cases in which surgical treatment becomes necessary.

 Flexirigid Gastroscope. L. L. Hardt.—p. 508.

**Prevention of Recurrence of Gastric Ulcer.**—Ivy applies the term *enterogastrone* to the chalone or hormonal agents which are responsible in part at least for the inhibition of gastric secretion and motility when an adequate concentration of fat or sugar is ingested. It is produced primarily in the upper intestine. Summarizing the evidence from animal experimentation, Ivy says that the parenteral administration of a mucosal extract of the upper intestine of swine prevents the occurrence of gastrojejunal ulcer in a high percentage of Mann-Williamson dogs. The protection afforded against ulcer is not limited to the period during which the extracts are being administered but has been observed to extend for periods as long as three years after cessation of treatment. Forty-three patients have to date received injections of enterogastrone. In 5 the injections were stopped because the patients complained of pain. Those selected for study had a long history of recurrences. Of the preparation the author is using 25 mg. as a canine inhibitory secretory unit. That is, 25 mg. given intravenously will reduce by 50 per cent the secretory response to 1 mg. of histamine dihydrochloride in a 20 pound (9 Kg.) dog with a pouch of the entire stomach. When given subcutaneously, 60 mg. constitutes a unit. Thus, when a human patient is injected subcutaneously with 200 mg., only approximately 3 units is given. This means that little depression of gastric secretion occurs. The direct control of acid secretion in man awaits the production of an enterogastrone preparation which contains less impurity than the present preparation. However, results obtained so far are encouraging. The 4 patients who received only enterogastrone therapy six times weekly for four months are now free from symptoms and of a duodenal niche, and the duodenal deformity has lessened in 2. Among 21 patients who had received injections three times weekly for seven to twelve months 4 have had one period of distress. The average expected recurrence of ulcer distress, on the basis of the past history, was reduced from 21 to 4 for a six months period. Several years of observation of more patients will be required to obtain reliable information on the late effects of the treatment.

**Section of Vagus Nerves in Duodenal and Gastric Ulcers.**—The presence of gastric secretory and motor fibers in the vagi and the large volume of experimental and clinical evidence indicating the crucial importance of gastric juice in the genesis of ulcer led Dragstedt and his associates to undertake complete division of the vagus nerves to the stomach in 11 cases of peptic ulcer. This was found to be most readily accomplished by opening the left pleural cavity, exposing the lower esophagus and isolating and dividing the vagus fibers before they pass through the diaphragm. The operation was well tolerated; there were no deaths, and the most serious complication was a postoperative pneumonia in 1 case. Gastrointestinal motility was not greatly altered, neither constipation nor diarrhea was produced, and it seems likely that food traversed the intestinal tract without great delay. Fluoroscopy after the operation revealed the persistence of peristalsis in the esophagus and the absence of cardiospasm, but in 1 case considerable atony in the wall of the fundus of the stomach was seen. No abnormalities in the motility or tonus of the small intestine could be determined. The continuous night secretion in most of the cases before operation was abundant. In 7 it exceeded a liter in twelve hours. This secretion was reduced

by the vagus section over 50 per cent in all cases and in many to a still greater degree. This provides final proof that the hypersecretion of gastric juice in cases of ulcer is neurogenic in origin and is probably due to a continuous hypertonus of the gastric secretory fibers in the vagus nerves. The striking relief of the ulcer pain and distress secured by the operation, the absence of untoward sequelae and the decrease in gastric secretion all indicate that this procedure will find a place in the treatment of many cases of intractable peptic ulcer. The first operation was performed only eighteen months ago and accordingly the time is still too short to pass judgment on the final result.

**Effect of Methyl Testosterone on Performance of Older Men.**—Simonson, Kearns and Enzer investigated whether exaggerated fatigue in older men might be partially due to reduction in sex hormone production. If this should be so, testosterone treatment might be expected to restore partially the working capacity. The 6 subjects on which the authors performed their tests varied in age between 48 and 67. All complained of excessive fatigability or loss of working capacity. The following tests were used: (a) endurance in a heavy type of dynamic work, leading to fatigue usually in not more than three minutes; (b) endurance in a type of static work; (c) absolute muscle force in several different muscle groups; (d) recovery of pulse rate after thirty knee bendings and during performance tests a and b; (e) maximum tapping rate; (f) fusion frequency of flicker. The fusion frequency may be looked on as an expression of the excitability of the retino-cortical system and probably the whole central nervous system. Oral treatment with 30 to 40 mg. of methyl testosterone increased significantly, compared to a placebo period, the fusion frequency of flicker and back-muscle strength. The performance was increased in dynamic and static work in 4 of 5 subjects. No effect was noted on the strength of arm extensors and only a slight increase in handgrip strength in 2 of 6 subjects. The positive effect on the fusion frequency, back-muscle strength or dynamic work and static work performance was maintained up to eight months. A dosage of 20 mg. was sufficient to maintain the effect previously attained with 40 mg. in 1 subject and was insufficient in another. No effect was observed in maximum tapping rate and heart rate in exercise and recovery. The results appear to be compatible with the hypothesis that maintenance of a higher level of male sex hormone has an influence on the depression of working capacity with age.

**Industrial Exposure to Butanol.**—Tabershaw and his associates have studied effects of butanol, used as a solvent and reactivator for synthetic resin such as polyvinyl butyral, a material used extensively in the manufacture of ponchos, rain coats and sleeping pads for military use. The manufacturing operations are performed for the most part by women. The garments are cemented together in sections. The butanol is

used in two ways: 1. As a constituent of the cement it is usually mixed with other solvents, such as naphtha and ethyl alcohol. 2. As a reactivating agent, that is, when swabbed on the resin, it softens the material, permitting folding and sealing. The authors describe observations in six different plants using butanol. The chief complaint of the workers was irritation of the eyes. Air samples were taken in the areas where ocular irritation was most prevalent and it was determined that butanol concentrations above 50 parts per million produce eye irritation. As used in the manufacture of waterproofed products, the concentration of butanol rarely rises much above 100 parts per million, but in this range, while no serious systemic effects develop, ocular inflammation is common and serious enough to cause lost time and to disrupt operations. There was no evidence of toxemia, but the odor is disagreeable and produces in some workers a slight headache and vertigo. The vapors are also somewhat irritating to the nose and throat. Dermatitis is frequent. Gloves or mechanical devices were not used. An ointment seemed to offer some protection. The dermatitis consisted of a fissured eczema, especially around the finger nails and along the sides of the fingers. These lesions yielded rapidly to treatment and were prevented almost entirely by the use of a protective ointment before work and a lanolin emollient after work.

**Penicillin in Treatment-Resistant Syphilis.**—In the case reported by Noojin and his collaborators a penile syphilitic lesion developed in 1941 in a man aged 28. A serologic test for syphilis was said to be positive at this time, and treatment with nearsphenamine was started. The patient received intravenous injections fairly regularly for the first ten injections, and treatment after this was intermittent. The penile lesion did not heal until three months after therapy was begun. During the next two and one-half years the patient received irregularly approximately sixty injections of nearsphenamine and ten injections of bismuth subsalicylate. He was first seen at Duke Hospital on April 24, 1944 because of multiple ulcers over his hands and feet. During the six months preceding examination he had received an average of two intravenous injections of nearsphenamine each month. Repeated Wassermann, Kahn, Kline and Mazzini tests on several blood specimens were strongly positive. Dark field examinations of several of the cutaneous lesions repeatedly revealed *Treponema pallidum*. The patient was given immediately bismuth subsalicylate 0.2 Gm. intramuscularly and mapharsen 0.06 Gm. intravenously. He was given a note to his physician with a request that the mapharsen be repeated within four days and that bismuth and mapharsen in the same dosage be given concomitantly each week for the succeeding six weeks. The patient returned ten weeks later. During this interval he had received concurrent intramuscular and intravenous therapy each week without improvement. The cutaneous lesions were again found by dark field examination to be positive for *Treponema pallidum*. The patient was now given 1,200,000 units of penicillin over a period of four days. Forty thousand units was administered intramuscularly every three hours, day and night, until a total of thirty injections had been given. Nineteen days after the final injection of penicillin, healing was complete and there were no new lesions.

**Brucella Melitensis in Cheese from Goat's Milk.**

According to Stiles the cheese manufactured from goat's milk in the vicinity of Trinidad, Colo., has an estimated annual value of a quarter of a million dollars. A sanitary survey of conditions on the goat ranches and the cheese making plants revealed insanitary practices and a polluted water supply. *Brucella melitensis* organisms were isolated from guinea pigs injected with goat cheese prepared from unpasteurized goat's milk. Of 19 cheese samples examined 8 proved to be positive milk. The testing of 14,339 blood samples, representing 131 herds, in the Bang's Disease Laboratory in Denver gave 8.5 per cent reactors. A man who appraised about 1,000 diseased goats contracted acute infection with clinical symptoms of brucellosis. Through the cooperation of the Colorado State Board of Livestock Commission the U. S. Public Health Service, the Food and Drug Administration and the Bureau of Animal Industry sanitary conditions have improved on goat ranches and in cheese plants. Reacting goats have been destroyed and newly acquired animals have been tested before being added to clean herds.

**Superiority of Penicillin Over Other Antibacterial Substances.**—Jern and Meleny found that the inoculation of the chorioallantoic fluid of 10 day old chick embryos with 0.1 cc. of a savita broth culture of *Staphylococcus aureus* consistently brought about the death of the embryos within twenty-four hours. The administration of staphylococcus bacteriophage immediately following the inoculation of bacteria prolonged the life of all chick embryos. The cultures of the egg material of the phage-treated embryonated eggs resulted in a decrease and a degeneration of bacterial growth. A complete sterilization was seldom achieved. The presence of bacteriophage in the chorioallantoic fluid usually did not prevent the bacterial invasion of the blood stream of the embryos, although the appearance of phage in the blood usually could be demonstrated. Active multiplication of bacteriophage occurred in the majority of the cases when the undiluted or lower dilutions of phage were used. The in vitro experiments carried out with chorioallantoic fluid and with a mixture of the egg material showed that staphylococcus phage not only multiplied in these fluids but also produced a lysis of susceptible bacteria suspended in them. The presence of embryonic blood did not prevent bacterial lysis, although there was some inhibition. The administration of 100 units of the calcium salt of penicillin within six hours following the bacterial inoculation resulted in survival of the majority of the embryonated eggs. The therapeutic results were essentially the same when 10 units of penicillin was administered, but survivals fell off when 1 unit was used. The sterilization of the infected eggs, however, depended on the number of units of penicillin used. With 100 units of penicillin 76 per cent of eggs were completely sterilized. The administration of sulfathiazole simultaneously with the bacteria failed to prolong the life of the embryonated eggs. Antistaphylococcus rabbit serum and staphylococcus antitoxin horse serum produced some prolongation of the life of the eggs, but the antibacterial effect of these substances was also insignificant. Carboxymethoxylamine produced a sterilizing effect in vivo and in vitro in a majority of the cases but was toxic for the embryos. Vioform was not toxic but possessed only a slight bacteriostatic effect. The new antibiotic agent from *Bacillus T*, a gram positive sporulating bacillus, exerted a significant protective effect, but it was not as efficient as penicillin.

**Effect of Caudal Analgesia on Uterine Motility.**—To determine more accurately the effect of caudal analgesia on the uterine contractions, Frankel studied the labors of 50 patients under caudal analgesia by means of the Lorand tocograph, an instrument devised for recording graphically the contractions of the uterus through the anterior abdominal wall. He found that the most important factor affecting uterine motility was the level to which the analgesia ascended. When the recommended level (between the sixth and tenth thoracic segments) was maintained, only 20 per cent showed a decrease in uterine motility, and these were minor changes. The remainder were unaffected. When the level of analgesia was permitted to ascend above the

fourth thoracic segment, labor was interrupted in 69 per cent of the patients. When a low level of analgesia involving only the sacral nerves was achieved in 2 patients there was a great improvement in the strength and frequency of the uterine contractions. This improvement continued after relief from pain was attained. Forty-four per cent of patients studied showed a progressive decrease in uterine tone. This did not appear related to the level of analgesia.

**Early Filariasis.**—After reviewing the clinical course in a large series of filariasis patients in Samoa it became apparent to Zuckerman and Hibbard that although the majority of patients usually showed classic signs and symptoms of retrograde lymphangitis there remained a small number of patients with a minimal degree of disability. It was determined that an absolute diagnosis of filariasis could not be made without a careful clinical correlation unless the parasite was present in the tissue. Lymph node sections were restudied with the object of establishing, if possible, the relationship between the signs and symptoms observed in the early cases and the microscopic changes manifested in the nodes. Lymph node biopsies were done on 62 patients, representing various stages of the disease. Although a few nodes measured as much as 2.5 cm. in length the majority varied from 0.7 to 1.5 cm. They were elongated and discrete, and the overlying skin was freely movable. Generally they were set in a fine, fibrous periglandular network which allowed a clean line of cleavage on sharp dissection. On cross section the nodes were firm and homogeneous, the capsule thickened and often edematous and fibrosed. A coiled male or female adult worm cut in cross or sagittal section was the characteristic picture in the lymphatic channels. The parasite lay in a granulating lymph channel which was surrounded by epithelioid cells, Langhans giant cells, plasma cells and a dense infiltration of eosinophils. The endothelium of the lymph channels exhibited a granulomatous hyperplasia, with swelling of the cells. Some lymphatic channels showed endothelial changes and obliteration, other channels obliterative endolymphangitis with adventitial fibrosis. In the lymph node biopsies the authors differentiate four different variations. In the first group adult filariae were found in or outside the lymph node, in the second group dense eosinophilic infiltration was present but adult filariae were absent, in the third group both adult worms and eosinophilic infiltration were absent from the biopsy tissue and in the fourth group there were neither adult worms nor eosinophils. The authors believe that infection by *Wuchereria bancrofti* is accompanied by a generalized disturbance of the reticuloendothelial system which manifests itself as a hyperplasia of these cells. The endothelium of the lymph channels is similarly affected and the end result is an obliterative endolymphangitis. Eosinophilia is due to the presence of a parasite, usually the result of a dying parasite. The plugging of the lymphatic channel by the parasite causes backing up of toxic products, which would account for the so-called retro-

grade lymphangitis. Biopsy is unnecessary for diagnosis in the majority of cases but is useful as confirmatory evidence in the clinically atypical cases.

**Plasma Treatment of Mumps Orchitis.**—Smith says that an outbreak of 40 cases of mumps occurred aboard ship. Five of the patients developed orchitis. All patients were given 500 cc. of reactivated dried pooled plasma. Results obtained were excellent to dramatic. Four patients volunteered the information that the plasma gave them quick relief. Not enough time has elapsed to determine if any patients will develop atrophy of the testes. One patient received a second 500 cc. of plasma when meningitic signs and symptoms appeared.

Rehabilitation of War Casualties. J. B. Dynes.—p. 32.

**Effect of Morphine Sulfate at High Altitudes.**—Peterson and his associates point out that the sick or wounded persons who are candidates for transport by air should receive morphine for the control of pain or shock. In such persons it becomes a matter of concern whether the effects of morphine on the body, other than those of analgesia and sedation, may seriously impair their ability to undergo air transport. The authors exposed 9 subjects to simulated altitude in decompression studies to determine the effect of morphine sulfate on their ability to withstand the physiologic effects of anoxia. They found that when the reflex excitability of the nervous system is at a reasonably high level morphine sulfate in a  $\frac{1}{4}$  grain dose (15 mg.) does not alter the average blood oxygen saturation under conditions of simulated altitude. The ability to respond to oxygen administration was unhampered. When the reflex excitability of the nervous system was not maintained following morphine sulfate, as occurred in 2 subjects, there was a deterioration in the blood oxygen saturating ability under conditions of simulated altitude. However, the ability to respond to oxygen administration was unhampered. No significant deviation of the electrocardiogram or pulse rate occurred when anoxia was combined with morphine.

**Effect of Sulfathiazole at High Altitudes.**—Peterson and his co-workers made studies on the effects of sulfonamides on altitude tolerance in 3 men. Normal adult males, receiving sulfathiazole in full therapeutic doses, failed to show significant deviations in blood oxygen saturation levels, electrocardiograms or electroencephalograms when subjected to simulated altitudes of 20,000 feet. Anoxia produced in the decompression chamber at simulated altitudes of 20,000 feet failed to change in a significant manner the subjective reactions of human subjects to full therapeutic doses of sulfathiazole. It is concluded that the evidence does not contraindicate the use of this drug for wounded personnel who are to be transported below or above 10,000 feet with supplementary oxygen.

Progressive Bacterial Synergistic Gangrene, with Report of Case. N. J. Bonnin.—p. 119.

**Treatment of an Arteriovenous Fistula.**—Simple ligation of the artery proximal to an arteriovenous fistula, such as might be done proximal to a simple aneurysm, is contraindicated, Holman says. It is obvious that the blood flowing through the collateral vessels would flow back to the heart through the site of the lessened resistance at the fistula, thus bypassing the peripheral vascular bed. Gangrene would be inevitable under these conditions. The operation of choice for an arteriovenous fistula is quadruple ligation of artery and vein proximal and distal to the fistula, with excision of the abnormal communication. A fistula which has been allowed to remain four months or longer has usually so stimulated collateral circulation that ligation of the main artery to a limb can be performed with impunity. If excision of the fistula is impossible owing to difficulty in mobilization because of excessive scarring or because of the inclusion of main nerve trunk in dense scarring surrounding the fistula, quadruple ligation without excision may be preferable. The proximal artery, however, must be sufficiently mobilized to permit ligation at two points and division between them. Ligation in continuity may lead to reestablishment of the arterial lumen and reactivation of the fistula. The success of operations on the large vessels depends in great measure on the avoidance of sepsis. The strictest precautions against infection must be followed throughout, and the liberal use of the sulfonamides locally and systemically is indicated in any contaminated or potentially infected wounds. In surgery of the large vessels to pack or to drain wounds is to invite almost certain disaster. If there is any question of infection, penicillin should be promptly administered in maximum dosage.

**Gunshot Wounds of Chest.**—Horsley reviews 40 gunshot wounds of the chest treated at an Australian general hospital. The patients were admitted over a period of three months and their stay in the hospital exceeded seven days. The treatment was almost entirely conservative. A small intrapulmonary metallic foreign body causes little morbidity, and there appeared to be no definite indication for its removal. An intrapleural foreign body, on the other hand, appears to be a potent source of empyema, particularly when the foreign body is thick and jagged. Rapid cure of the pleural infection followed removal of such foreign bodies. Foreign bodies in the chest wall are frequently removed. Perforating wounds resulting from a small caliber bullet seem to cause severe morbidity only when they produce bronchopleural fistulas. Of the perforating chest wounds 25 per cent developed a bronchopleural fistula, which was the most difficult of all complications. Pleural effusion was present in the majority of the cases, and the presence of a hemothorax played a prominent part. Infection was not a serious complication. Hemoptysis was of not much value as an indication either of the nature of the wound or of the degree

of morbidity to be expected. The object of the treatment was to close the thorax, remove effusion, establish a negative pressure in the pleural cavity and, if necessary, remove any foreign body from the pleural cavity. Once a "dry" pleural cavity and an expanding lung were obtained, full expansion of the thorax was encouraged by lung exercises and physical training. Blood transfusion was given to debilitated patients. The chief indication for intercostal drainage was the presence of recurring exudate requiring frequent aspiration. An attempt was made in every case to combine the use of an intercostal tube with negative pressure drainage. Thoracotomy was performed in two types of conditions: (a) retained intrapleural foreign body and (b) gross pleural infection which failed to respond to intercostal drainage.

**Penicillin in Infective Dermatoses.**—At a large military hospital Taylor and Hughes used penicillin in the treatment of sycosis barbae, impetigo contagiosa, furunculosis and other varieties of the large group of eruptions known as the infective dermatoses. Penicillin was applied locally in various ways in an endeavor to find the most efficient and most economical mode of application. The preparations tried included crude penicillin filtrate in a base of equal parts of lanette wax, liquid petrolatum and water; calcium penicillin in a base of 30 per cent lanette wax in water; sodium penicillin in a base of 30 per cent of lanette wax; sodium penicillin in aqueous solution; penicillium mold of about fourteen days' growth, and penicillium mold crushed up in a base of 30 per cent lanette wax in water. Before treatment the lesions were examined bacteriologically. Cultures on blood agar were made with a wool swab. The plates were incubated for twenty-four hours or longer, the organisms growing were identified and a rough colony count was made. All organisms grown were tested for sensitivity to penicillin, and all staphylococci had their coagulase production assessed. During treatment, daily cultures were made in a similar way. The authors found that penicillin is effective in the local treatment of certain skin diseases caused by cocci. The most satisfactory method of treatment of sycosis barbae and impetigo is to spray the lesions with an aqueous solution containing 200 units of penicillin in each cubic centimeter. An adequate dose of penicillin from the start is essential to prevent the development of penicillin-fast organisms. A strength of 200 units of penicillin in each cubic centimeter or 400 units per gram of lanette base seems to be sufficient. The pain in deep-seated lesions (furuncles) is much relieved after application of penicillin. An underlying seborrheic state in cases of sycosis and impetigo is liable to cause relapse soon after cessation of treatment and necessitates further courses of treatment. The appearance of penicillin-insensitive organisms indicates that further treatment with penicillin is of little value.

**Traumatic Uremia.**—Darmady and his associates report 6 cases of uremia occurring in young soldiers a few days after they were wounded by high explosive missiles. The injuries were severe but did not seem sufficient to cause death. All the men developed oliguria, vomiting and an elevated blood urea. In searching for a causative factor the following features were noted: 1. The injuries in all cases were caused by high explosives. 2. There were considerable injuries to the extremities in all cases; in none was there a crushing injury, nor was the local condition in itself sufficient to account for death. 3. Low blood pressure was recorded at some stage in 5 cases. 4. There was a lesion of a major vessel in 6 cases. 5. Sulfanilamide was given by mouth in 5 cases. 6. All the men were given transfusions of group O blood. No clinical evidence of mismatched transfusion was apparent. Cases have been reported during the present war under the title of "crush syndrome" in which the clinical picture and postmortem findings in the kidneys are comparable to those found in these 6 cases. More

recently it has been pointed out that similar changes are sometimes found in injuries without crushing, including head injuries and also in association with blackwater fever, pyloric stenosis with vomiting, and septic abortion. While not all the biochemical and renal changes associated with all these conditions are identical, there is sufficient similarity to justify a search for a common etiologic basis. The mechanism which leads to the sequence of events is unknown. There seem to be two possible explanations: (1) a metabolic product carried to the kidney by the blood stream and (2) anoxia of the kidney resulting either from a period of hypotension or from a neurogenic vascular disturbance.

**Deficiency Bowel Pattern.**—Brown and Trowell describe experiences in diagnosing and treating a malnutritional state which in its advanced stage is often seen in African adults and children (kwashiorkor). Apathy of the facies is exaggerated by the mild edema, which obscures the expression. The patient is mentally dull, is sluggish in his movements and appears depressed. The hair is scanty. The characteristic dermatosis consists of scaly shiny dark brown areas appearing over the pressure sites of the back and buttocks or anywhere. The keratin layers of the skin of the legs become thin and shining, and fissure and crack. The dermatosis becomes moist, resembling intertrigo and peels to reveal pale areas. Cheilosis may develop. The patient complains of a variety of gastrointestinal symptoms. A few have sore mouth with loss of lingual papillae, and fissures appear in a raw red tongue. Stomatitis is common. Anorexia may be severe and twisting; burning abdominal pains are often reported. Loose stools are common; they are bulky, frothy and acid. They contain much undigested starch and muscle fibers. Flagellates, mainly *Giardia intestinalis*, are common. Much flatus is passed by rectum. Advanced cases show distended coils of intestine, and peristalsis is usually painful. Sigmoidoscopy may show a congested or granular mucosa. Paresthesias are common in the hands and feet, and slight peripheral neuritis is present in many cases. Anemia does not respond readily to iron or liver administered orally. Most patients had a history of inadequate diet over a long period; their meals had consisted mainly of cooked carbohydrate and were deficient in calories, animal protein, fat, green vegetables and vitamins. Patients did not improve when given an adequate diet; it was necessary to add vitamin concentrates. Early cases responded well to supplements of cooked liver or brewers' yeast given daily. More advanced cases did not respond to oral therapy but showed improvement after large doses of crude liver extracts, given parenterally. Advanced cases, especially if complicated by infections, did not respond to treatment. These patients either died or became chronic invalids. In untreated cases the prognosis is uniformly bad. Almost all progress rapidly to death in a few weeks or months.

\*Familial Spasmodic Paraplegia. E. Cienfuegos and J. Daneri N.—p. 189.

**Familial Spasmodic Paraplegia.**—Cienfuegos and Daneri report 3 cases of familial spasmodic paraplegia of the Strümpell-Lorrain type in brothers aged 8, 13 and 15 years. The father and 3 sisters aged 2, 4 and 7 years are normal. The mother is nervous but otherwise normal. The patients presented a normal physical and mental development up to the age of 8 months or 1 year, when they showed symptoms of the disease. Papillary atrophy, oligophrenia, speech disorders and abnormal reflexes were encountered in all. The authors discuss the differential diagnosis between familial spasmodic paraplegia of the Strümpell-Lorrain type, the group of familial or individual spasmodic forms of paraplegia, the familial amaurotic idiocy type (the Tay-Sachs disease) and other forms of diffuse

periaxial encephalitis. They conclude that all of these manifestations are different forms of spinocerebellar degeneration. The type of the disease depends on the acuteness and extent of nervous degeneration.

\*Progressive Lenticular Neurohepatic Degeneration (Wilson's Disease) and Pseudosclerosis. T. Fracassi.—p. 185.

**Progressive Lenticular Neurohepatic Degeneration.**—Fracassi reports 1 case of chronic and 1 case of acute hepatolenticular degeneration of unknown etiology. The clinical symptoms of the acute form were those of choreic extrapyramidal hyperkinesia and those of the chronic case of parkinsonian rigidity and tremors. The cerebral lesions were similar in severity but not in extent. In both cases the lesions were distributed mostly over the medial part of the striated body and especially over the putamen, but there were also large spongy lesions in the deeper layers of the cerebral cortex, the red nucleus, the white matter and the dentate nucleus in the cerebellum, with small necrotic perivascular foci. There were also glial changes. The clear glial nuclei were enlarged and had assumed several shapes: oval, lobulated and elongated. The chromatin network had disappeared from the glia, giving it a colorless appearance. The protoplasm of the glial cells contained some granules of metachromatic pigments. The changes in the liver were those of atrophic cirrhosis of the Laënnec type in the chronic case and of insular cirrhosis in the acute case. Pathologic findings suggest that the disease is a form of a diffuse degeneration and demyelization of the cerebrum, the cerebellum, the red nuclei, the dentate nuclei and the white matter of the cerebellum, rather than a lesion of the putamen and the striated body.

**Homologous Serum Therapy in Diphtheria.**—Bormann and his associates report observations in 16 cases of diphtheria treated with human antitoxin serum. Continuous examination of the antitoxin content of the blood of these patients revealed a pronounced increase in the antitoxin level of 10 of the patients during the second week in addition to the increase in the antitoxin level immediately after the administration of the serum. The new antitoxin titer did not change during an investigation period of from six to eight weeks. In 6 of the cases treated with human antitoxin serum and in 2 cases treated with horse serum the antitoxin level of the blood decreased slowly after the initial increase, but active antitoxin formation by the human organism was likewise suggested at least in 1 of the cases treated with horse serum, since for six weeks the antitoxin level remained considerably above the protection threshold. These observations suggest that serum administration to diphtheria patients does not interfere with the active formation of antibodies. That applies to the very early administration as well as to repeated administration. It seems likely that during the first days the antigen stimulus may appear, which represents the eliciting cause of the later active antitoxin formation. The antigen stimulus thus arises at the time when it cannot as yet be prevented by the passive administration of antitoxins. Toxic diphtheria occurred in children in spite of previous active immunization, but the mortality of the immunized children was lower, amounting to 29.2 per cent as compared to that of 85.5 per cent of the nonimmunized children. In cases of toxic diphtheria the fatal intoxication of the organism occurs during the first hours of the disease in spite of the serum therapy.

**Pathogenesis of Polycythemia Vera.**—Stöger's concept of Vasquez's disease is that it is due to an abnormal increase in the intrinsic factor in the presence of a diathesis characterized by a deficiency in the central regulation of hemopoiesis. Castle's experiment was repeated as follows: An untreated fasting patient with pernicious anemia was given a broth consisting of 200 Gm. of lean beef meat and 75 cc. of incubated gastric juice secreted by a fasting normal man after histamine administration. In a second experiment the untreated patient with pernicious anemia was given a broth consisting of 200 Gm. of lean beef meat and 75 cc. of incubated gastric juice secreted by a fasting patient with Vasquez's disease after histamine administration. The continuous control for eight days of the reticulocytes, the erythrocytes and the hemoglobin revealed a stronger reaction in the second experiment than in the first. The increase in the number of reticulocytes in the second experiment was more than double when compared with the increase in the number of reticulocytes in the first experiment. The number of erythrocytes was increased from 1,080,000 to 1,740,000 in the second experiment, whereas almost no increase occurred in the first experiment. There was also an increase in the hemoglobin content in the second experiment. After an interval of ten days a third experiment was carried out by repeating the first on the same patient except for the administration of the gastric juice secreted by a different normal person. The results were the same as in the first experiment. It is suggested that a more than normal increase in the intrinsic factor has been demonstrated since an extraordinary increase in the number of reticulocytes resulted under the same experimental conditions from the administration of the same amount of gastric juice and of the same amount of extrinsic factor.

**Thrombosis and Pulmonary Embolism in Pneumonia.**—Ask-Upmark analyzed 1,454 cases of lobar pneumonia treated at the Medical Clinic in Lund from 1916 to 1941. Thromboembolism was observed in 27 instances, i. e. in about every 50th case. There were 11 instances in men and 16 in women. Persons over 40 years of age were affected somewhat more often than those below this age. Thus 10 of the 27 patients with thromboembolism were less than 40 and 17 persons were over 40. During the last four years (1938 to 1941) more instances of thromboembolism have been recorded than during the preceding twenty-two years owing to the introduction of specific therapies such as serum therapy, chemotherapy or both, which allow patients to survive and to develop thromboembolism who previously would have succumbed to the disease at an early stage. The average time elapsed between the onset of pneumonia and the onset of thromboembolism was thirteen days, the average time elapsed between the crisis and the onset of thromboembolism eight days. The evolution of thromboembolism should be anticipated when the temperature does not reach the normal level after the crisis or lysis, although it may occur even if this level is reached. Hemodynamic factors favoring the development of thromboembolism are the reduction of muscular tonus, the impairment of the blood pressure and the involvement of the heart. Hematologic factors are venous stasis, increase in the thrombocytes and in particular the behavior of the thrombin. The concept is suggested that an important feature in the pathogenesis of thromboembolism is the impairment caused by the pneumonic process of the basophil parenchyma, the heparin-producing mast cells.

## Book Notices

**Physical Medicine in General Practice.** By William Bierman, M.D., Attending Physical Therapist, Mount Sinai Hospital, New York. Cloth. Price, \$7.50. Pp. 654, with 310 illustrations. New York & London: Paul B. Hoeber, Inc., 1944.

This book has been prepared primarily for the general practitioner. It contains descriptions of many procedures. The section on hydrotherapy includes descriptions of the steps in the application of the various types of wet compresses and packs to the body. The simple types of whirlpool baths that can be used in the office and in the hospital are described. The section on infra-red irradiation contains a brief description of the physics of radiant energy and the use of luminous bakers, heat lamps and cabinet baths. The limitations and lack of practicability of the cabinet baths are not emphasized. Only the long wave or conventional diathermy is discussed in the chapter on diathermy. The author uses the term "short wave currents" instead of the commonly used term "short wave diathermy" in discussing the high frequency currents produced by vacuum tube oscillators. The effective and practical technics of applications of condenser pads and induction coils to the various regions of the body are pictured and described. In the chapter on fever therapy the author discusses many of the early methods that were used for induction of artificial fever as well as the technics commonly used today. The indications for and dangers of fever therapy are presented. However, this section does not emphasize adequately the dangers of fever therapy when carried out by inexperienced persons and without adequate equipment. The section on the galvanic current includes a discussion of the use of low voltage currents for iontophoresis, muscle stimulation, electrolysis and testing for reaction of degeneration. The use of the faradic and the sinusoidal currents is considered briefly. A brief chapter on massage gives a description of the physiologic effects of massage and the principles involved in the various strokes commonly used. There are several valuable and interesting chapters on closely allied topics, such as occupational therapy, climatotherapy and spa therapy. The latter part of the book includes practical suggestions on applied physical therapy for diseases of all the systems of the body. The appendix contains a valuable discussion of the requirements for physical therapeutic apparatus as outlined by the Department of Hospitals of New York City, which can serve as a guide for physicians in general practice who wish to buy such equipment.

**A Textbook of Histology: Functional Significance of Cells and Inter-cellular Substances.** By E. V. Cowdry, Professor of Anatomy, The School of Medicine, Washington University, St. Louis. Third edition. Cloth. Price, \$7. Pp. 426, with 317 illustrations. Philadelphia: Lea & Febiger, 1944.

In the new edition the author has adhered to the method of presentation outlined in the preface of the first edition. He rejects the usual manner of approach in which the material is treated in more or less isolated units of the order of cells, tissues and organs. Since the properties of cells and tissues are greatly dependent on the environment in which they exist, the author attempts "to build up, as the discussion advances, a conception of cells and elementary tissues in the many environments in which they normally exist." The author has abandoned the usual order of teaching histology and has arranged the material around the blood vascular system as the principal integrator. The result is an interesting book which deserves the close attention of those who have experienced difficulties in teaching histology as though it were built up of isolated units. It is debatable, however, whether the arrangement of the material in this book actually contributes to the removal of these difficulties. For example, the deferment of the discussion of the elementary tissues to practically the end of the book complicates unnecessarily any teaching program of histology. The author could probably have achieved his purpose of synthesis and integration by following a more logical, analytic order.

This edition is considerably simplified. Fortunately, this has not been accomplished at the expense of the newer experimental work, which is well represented. The original illustrations are good and those taken from the literature are chosen with care. This book will undoubtedly stimulate the student and arouse his interest in modern experimental histology.

**Large Scale Rorschach Techniques: A Manual for the Group Rorschach and Multiple Choice Test.** By M. R. Harrower-Erickson, Acad. Dip., Ph.D., Research Associate, Department of Neuropsychiatry, University of Wisconsin, Madison, and M. E. Steiner, B.A., M.A., Personnel Section, General Electric Company, Bridgeport, Conn. Cloth. Price, \$8.50. Pp. 419, with illustrations. Springfield, Illinois: Charles C Thomas, 1945.

The present volume represents a well written, comprehensive manual of large scale Rorschach technics by writers who are well known and respected for their work in this field. Methods used for group testing and multiple choice tests, according to the Rorschach (ink blot) method are clearly delineated. The Rorschach test is rapidly coming to be regarded and better utilized as a method of estimating emotional stability and ego strength and as a prognostic indicator in various types of psychologic disturbances. The authors of this manual have shown how the technic can be administered to groups and in this way greatly extend the scope of the original method. They have also devised a new test which can be utilized for screening, or eliminating poorly adjusted persons from the armed forces even though the persons giving the test have not had extensive training in the Rorschach technic. The manual contains also a section devoted to military psychiatry which demonstrates the utilization of the Rorschach test for differential diagnosis of psychiatric casualties. The book is well indexed for handy reference and contains a separate index for the authors referred to in the text. The work represents an extremely valuable contribution to both military and civilian psychologic investigation.

**Textbook of Medical Treatment.** By Various Authors. Edited by D. M. Dunlop, B.A., M.D., F.R.C.P., Professor of Therapeutics and Clinical Medicine, University of Edinburgh, L. S. P. Davidson, B.A., M.D., F.R.C.P., Professor of Medicine and Clinical Medicine, University of Edinburgh, and J. W. McNee, D.S.O., D.Sc., M.D., Physician, H. M. the King in Scotland. With a foreword by the late Professor A. J. Clark, B.A., M.D., D.P.H. Third edition. Cloth. Price, \$8. Pp. 1,218, with 28 illustrations. Baltimore: William Wood & Company, 1944.

This book, although the third edition since 1939, has several deficiencies. For example, the index contains no reference to penicillin and none to staphylococci, although there are several references to streptococci. Under the heading mercurial diuretics the index has a cross reference to mersalyl, a single member of the group. The discussion of active immunization against tetanus with toxoid is exceedingly brief and mentions only that "active immunization against tetanus has recently been introduced in the British army. The course consists of two doses of 1 cc. of tetanus toxoid with an interval of six weeks between the injections." Thiouracil (incidentally with a misprint) is mentioned in two sentences. After the war it should be possible to revise this book more extensively, eliminating most of the defects which now exist.

**Bacteriology for Medical Students and Practitioners.** By A. D. Gardner, D.M., F.R.C.S., Professor in Bacteriology, University of Oxford, Oxford. Third edition. Cloth. Price, \$2.50. Pp. 264, with 31 illustrations. New York & London: Oxford University Press, 1944.

This pocket size book presents shortly, readably and relevantly, without details of technic, information in bacteriology which the medical student or practitioner should know. The success of the book is evident from the fact that it is now in its third edition. The present volume has been brought up to date and the last chapter has been enlarged by the inclusion of new and partly unpublished matter on disinfection and chemotherapy. The volume may be recommended to medical students and practitioners, though it must be supplemented when detailed knowledge of a subject is desired.

**Bibliographie der Luftfahrtmedizin. Zweite Folge: Eine Zusammenstellung von Arbeiten über Luftfahrtmedizin und Grenzgebiete 1937 bis Ende 1940.** Von Dr. med. Ingeborg Schmidt. In: Luftfahrtmedizin, Band 8, Heft 1. Paper. Pp. 128. Berlin: Springer-Verlag, 1943.

This is a bibliography of aviation medicine divided according to subject and author. There is first a list of books and monographs followed by subjects alphabetically from acrobolism to teeth. The subject headings are in German, but the titles or articles in English and other non-German languages have not been translated. The list of classified references occupies ninety-three pages, with approximately twenty-five references to the page.

ANSWER.—Administration of amino acids has not been demonstrated to have a specific effect on hypertrophic pyloric stenosis or on pylorospasm in the infant, so far as can be determined. However, amino acid-saline infusions have proved to be useful as a supplement to glucose solution in cases of pyloric obstruction in which parenteral feeding and fluid administration are required. In neglected cases showing pronounced dehydration and inanition from continuous vomiting, such replacement therapy is indicated as an essential feature of preoperative and post-operative management.

## THE CLINICAL MANAGEMENT OF WEAKNESS AND FATIGUE

FRANK N. ALLAN, M.D.  
BOSTON

The patient who seeks advice because he feels weak and tired seldom realizes the complexity of the problem he presents to his physician. Unless he fears carcinoma or tuberculosis or is the type of person who enjoys receiving medical attention, he may think that he need not take up much of the physician's time for examination. All that he desires is a recommendation of a good tonic or vitamin preparation. Actual experience with the problem shows that there may be need for investigation utilizing all the resources of medical science.

### DIAGNOSIS

In a study recently reported elsewhere<sup>1</sup> an analysis was made of the findings in 300 cases in which examination was requested because of a complaint of weakness, fatigue or weak spells. Physical disorders were found to explain the complaint in 20 per cent; nervous conditions were held responsible in 80 per cent.

The diagnosis of the physical disorders concerned with these complaints could be made by history and examination in approximately half the cases; in the remainder laboratory tests and roentgenograms were needed to reveal hidden disease or confirm a diagnosis which might otherwise be uncertain. The selective use of laboratory tests and roentgenograms also aided in the exclusion of physical disease.

Physical disorders of twenty-four types were encountered (chart 1). The most common conditions were chronic infections, diabetes, heart disease, severe anemia, nephritis and various neurologic disorders including narcolepsy and myasthenia gravis. Tuberculosis was, of course, represented among the infections, but nontuberculous pulmonary infections and their sequelae were more frequent. Weakness sometimes persists for a prolonged period after the activity of any serious infection has subsided. Certain conditions such as vitamin deficiencies and endocrine disorders, considered common causes of weakness by both the public and the medical profession, actually were rare (0.3 and 1.3 per cent respectively) and not a single case of weakness due to liver trouble, "poor elimination" or low blood pressure was encountered.

Of the 239 patients whose weakness and fatigue were attributed to a nervous condition, the patient was con-

sidered neurotic in less than 1 out of 5 (chart 2). A small number (6 in all) had simple mental depression. The majority were suffering from what may be termed "benign nervousness." This was classified as chronic nervous exhaustion when severe and prolonged and as nervous fatigue when mild. Although no sharp line divides the three groups, it is important, as will be pointed out later, to make a distinction in order to plan the most effective treatment and evaluate the prognosis.

### DIAGNOSTIC PROCEDURES

To deal with weakness and fatigue successfully, the diagnosis must first be made accurately and completely. Except in the case of myasthenia gravis, the complaints are almost entirely subjective. History taking must therefore be thorough and systematic. The history must often be reviewed more than once in order to secure all the essential facts. A good history followed by the general physical examination may alone lead to a correct diagnosis or at least point to pathways which additional investigation may profitably follow.

Urinalysis and determination of hemoglobin, red and white blood cell count, examination of the blood smear and a test for syphilis are always required. The blood sedimentation rate and the agglutination test for undulant fever should be determined when there is suspicion of a hidden infection. A roentgenogram of the chest should always be secured of young people who feel tired and should also be advised for older people who have had a past history of pleurisy, contact with tuberculosis and any respiratory symptoms such as cough. A record of the daily temperature for at least three days may also be of considerable value in cases in which infection is suspected.

Special laboratory tests which may be indicated in certain cases include the metabolism test and blood cholesterol determination for thyroid disease, blood sugar tests for hyperinsulinism or hypoglycosis, roentgenologic examination of the head for pituitary tumor, the water test for adrenal deficiency,<sup>2</sup> the neostigmine and quinine tests for myasthenia gravis and the electroencephalogram for psychomotor epilepsy.

### RECOGNITION OF NERVOUS STATES

The diagnosis of nervous states need not be deferred until all possibilities of organic disease have been eliminated. A patient with heart disease, diabetes or asthma, for example, may complain of weakness which has no relation to these conditions. Nervous conditions should be recognized by their positive characteristics, and if both a nervous state and organic disease are present they should both be identified and given appropriate attention.

From the Department of Internal Medicine, the Lahey Clinic.  
Read before the Section on Practice of Medicine at the Ninety-Fourth Annual Session of the American Medical Association, Chicago, June 14, 1944.

1. Allan, F. N.: The Differential Diagnosis of Weakness and Fatigue, *New England J. Med.* 231: 414-418 (Sept. 21) 1944.

2. Robinson, F. J.; Power, M. H., and Kepler, E. J.: Two New Procedures to Assist in the Recognition and Exclusion of Addison's Disease: Preliminary Report, *Proc. Staff Meet., Mayo Clin.* 16: 577-583 (Sept. 10) 1941.

There are four pathognomonic features of weakness and fatigue arising from a nervous state:

- 1. Weakness greater in the morning, wearing off during the day.
- 2. Variability from day to day without change in activity to account for the difference.
- 3. Immediate benefit from the use of slowly acting medication such as thyroid, vitamins, liver extract, iron and digitalis.
- 4. Immediate relapse on omission of customary treatment with these drugs.

Four other features are of probable importance:

- 1. Lifelong ill health.
- 2. Complaints of more than three years' duration without any physical disorder to account for them.
- 3. Symptoms obviously nervous in origin such as a lump in the throat and difficulty in getting a satisfying breath.
- 4. Nervous behavior such as flushing and weeping.

Two additional features are of possible importance:

- 1. A family history of "nervous breakdown."
- 2. A personal history of unusual nervous strain.

There are at least eight points of difference between the neuroses and the benign nervous condition. The neuroses are predominantly due to intrinsic causes. There is a background of constitutional inadequacy. A family history of nervous or mental breakdown is common. The complaints are usually multiple. The history is changeable; emphasis is placed on different points at different interviews. The onset is vague. The duration is commonly since childhood. On the other hand, "benign nervousness" is largely due to extrinsic factors. An average person acquires a nervous state because of unusual stress and strain. He can usually give a straightforward consistent history. His complaint is of limited duration and he can date the onset. The reaction to reassurance is likely to be decidedly different. The person with "benign nervousness" feels pleased if told that the examination shows no physical disorder; the neurotic person is disappointed.

Chart 1.—Physical disorders in 61 of 300 cases, 20 per cent.

TREATMENT

The treatment of patients suffering from weakness and fatigue must, of course, be determined by the results of the diagnostic study. In some cases it is possible to prescribe therapy which is more or less specific, such as liver extract in pernicious anemia, diet and insulin in diabetes, and thyroid tablets in myxedema. For the nervous patient, removal of a cause of needless anxiety is equally specific.

In certain cases expert psychologic and psychiatric assistance should be sought. The cases referred for psychiatric consultation should be selected with discrimination. One does not refer all patients with a cold to a nose and throat specialist nor all persons with tachycardia to a cardiologist. To refer all patients with nervous problems to a psychiatrist is not feasible, necessary or desirable.

Chart 2.—Nervous disorders in 239 of 300 cases, 80 per cent.

Ordinary superficial wounds free from infection heal naturally without daily dressings and frequent probing. In like manner the ordinary nervous and emotional strains of everyday life subside and their effects disappear without psychiatric treatment.

The contributions of psychiatry are welcome, but it may be pointed out that the psychiatrist often does not possess the best qualifications to deal with minor nervous and mental problems. In fact, the psychiatrist whose background is largely concerned with institutional care of patients with major mental disorders may be unsuited for this type of practice. He has limited personal contact with these minor problems approaching the borderline of his specialty.

Patients frequently resent the suggestion that they see a psychiatrist, sometimes rightly so. However well intentioned his efforts may be, the attempt to secure a psychiatric history is not always helpful and is sometimes objectionable. The fact that a patient has a nervous complaint does not justify intrusion into all the recesses of his private life. The objections of patients are supported by good psychologic reasons. Contrary to the idea, currently popular, that past emotional and psychologic trauma should be brought to light, it should be asserted that it is often better to avoid such remembrance. It is important to recognize the nervous state, but it is not always essential to treatment to analyze its origin. A surgeon can deal with a fracture without making inquiry into the details of the automobile accident during which it occurred.

No one type of psychotherapy is suitable for all cases, and the circumstances must guide the psychologic approach. Nervous problems often solve themselves while treatment is directed at some other condition, present in fact or in fancy. This psychologic fact, which represents the chief resources of chiropractic, osteopathy and other cults, deserves consideration in the comprehensive program of the practice of medicine.

Nervous problems are often solved best of all by religion, which gives the afflicted person a new interest in his present life and faith in the future. The church may contribute threefold assistance—the pastor giving his personal counsel, the institution providing fellowship and, finally, the challenge to a better way of living, subordinating interest in self and personal difficulties. The special help which clergymen may give in the care of the sick has been recognized in certain semi-

naries which now give "clinical" training as a part of the theological education.

Every nervous patient must be given a chance to tell his complete story. This can be accomplished not merely by avoiding haste but by establishing a friendly relationship which enables the patient to express his feelings without embarrassment.

Early reassurance and encouragement help tremendously except in dealing with a neurotic patient. This type of person resents a superficial optimistic attitude in regard to complaints which to him seem so serious and disabling. The physician must use all his tact, patience and resourcefulness. He first must convince him that he has a good understanding of the profound effect of the symptoms before he can explain that they are harmless.

The patient with a mental depression is also not receptive to reassurance. It is seldom helpful to spend much time in discussion beyond a statement of the facts concerning the present and expression of the rule that the cycle of mental depression will run its course in time.

Confidence in the physician and his methods is vitally important in all cases. Often the determination of the precise diagnosis marks the first step in recovery. It is not necessary for the patient himself to understand it, but he must have confidence that the physician understands what is wrong.

Some patients need a friendly shoulder on which to weep, a sympathetic ear to receive a recital of worries and fears; some people are like a clock which requires winding every so often. Any physician who is sincerely interested may provide this help. Nervous people deserve interest and not scorn. As patients they may be tiring, but they often possess charm and talent and form a valuable element in society.

Patients who are actually disabled by nervous problems, whose complaints are of long duration and patients who reveal loss of confidence in the prospects of recovery and lack of confidence in the medical adviser should be selected for psychiatric consideration. Psychotherapy is relatively ineffective in cases of mental depression, but when of profound degree causing complete disability, psychiatric consultation should be advised and the possibility of benefit from electric shock therapy should be considered.

The prognosis with regard to functional nervous disorders can perhaps best be illustrated by the following analogies:

A person with "benign nervousness" is like a ship which has run aground because of stormy weather or has struck a sand bar because it is overladen. A shift in the wind, a change in the tide or the unloading of part of the cargo enables it to proceed on its voyage.

A person with mental depression is like a ship frozen in the ice. It will remain there until the spring thaw unless freed by dynamiting (as with electric shock therapy or some unusual psychologic experience).

A psychoneurotic person is like a ship adrift because the engine, rudder or other mechanism has broken down on account of defective construction. Expert engineering skill (psychiatric assistance) may be needed to get it functioning again, but the prospects of lasting success depend most of all on the seriousness of the intrinsic defect.

#### NONSPECIFIC TREATMENT

In all cases nonspecific measures must be given attention. Patients seek and actually need detailed advice with regard to a suitable regimen, providing a

balance between work and recreation and sleep. A vacation or a change of work should not be recommended unless readjustments to the present circumstances prove ineffectual. Decreased activity does not always mean actual rest. Some patients may need advice regarding the technic of relaxation. A few may find help in reading books, pamphlets and outlines of instructions. Reading has definite but limited value for the majority of patients. It appeals to some, but all may be helped much more by direct counsel from the physician.

Many patients need advice about the diet and may receive benefit even when there is no evidence of dietary deficiency. Treatment with vitamins may be definitely advantageous. They should be prescribed when the circumstances in regard to work and other matters make it difficult to secure nutritious meals. Whenever possible, it is much better to point out how the diet can be improved with perhaps the expenditure of less money than would be needed to purchase vitamin preparations.

Other medication may be of distinct value. It has become the fashion to deplore the use of drugs in dealing with nervous disorders. The objections come chiefly from those who have least contact with patients in their home environment and consequently have little understanding of their personal difficulties. Practicing physicians who realize their value are likely to be apologetic. There is, however, no reason to scorn the use of sedatives and other drugs. In this field, as in cardiology, drugs, although not curative, can be used with great benefit, provided they are used with judgment.

A prescription of a sedative should never take the place of a conscientious effort to determine the cause of the condition which demands treatment. The proper choice of a sedative is highly important. Phenobarbital in small dosage is best used for relief of constant nervous tension. It is much to be preferred to the use of bromides, formerly so popular. To aid sleep at night, one of the quick reacting barbiturates with shorter duration of action is preferable. Finally, one important part of the directions should never be omitted. The patient should be told when to stop the medication.

Stimulating drugs have more limited usefulness. Amphetamine or desoxyephedrine is sometimes of value in giving temporary relief from exhaustion or drowsiness. In the case of narcolepsy, such treatment can be used indefinitely with success. In other cases there is not often a desire to use the drugs constantly. In the occasional case thyroid tablets may have a nonspecific tonic effect, but even when there is a low metabolic rate there is usually no benefit unless the low metabolism is really due to thyroid deficiency.

#### SUMMARY

The management of weakness, fatigue and weak spells demands careful diagnosis. In a series of 300 cases presenting these complaints, a physical disorder was found responsible in 20 per cent and a nervous condition in 80 per cent.

For many of the physical disorders, treatment which is more or less specific is available. For a nervous patient, removal of a cause of worry is also a specific remedy. As with the physical disorders, the nervous conditions require proper classification to guide treatment and indicate prognosis. A psychoneurosis was present in less than 1 in 5. A small number had a simple mental depression. The majority had a benign

nervous condition classified as chronic nervous exhaustion when extreme and prolonged, and as nervous fatigue when of lesser degree. With each type a different therapeutic approach must be employed.

Psychotherapy and nonspecific measures must be adapted to suit the needs of the individual case. Special psychiatric care is desirable in dealing with many of the cases of psychoneurosis, some of the cases of mental depression and a few of the cases of chronic nervous exhaustion. Most of the benign nervous conditions do not properly fall within the field of psychiatry. They represent a challenge to all of us engaged in the practice of medicine.

### ABSTRACT OF DISCUSSION

DR. WALTER C. ALVAREZ, Rochester, Minn.: Perhaps 1 of every 4 of my patients complains of fatigue and wants a focal cause found: one that can be eradicated. In the cases of the young or the old something like that may be demonstrable, but in most cases, especially of those many women who have felt tired for years, I can't find any focal cause and I don't expect to. Many women are supposed to have fever, but this is 99.6 F. in the afternoons, and every nervous woman should have that when she is upset or worried. Many have a basal metabolic rate of  $-15$  per cent but that, again, is normal for a thin frail nervous woman, and the taking of desiccated thyroid only makes her more jittery. Many are supposed to have some endocrine disturbance, but they show no sign of it that I can recognize. Some persons have earned fatigue through overwork or living under great strain. Their fatigue comes at the end of a hard day. Most of the persons who complain most bitterly of fatigue haven't earned it by overwork. They wake fatigued and feel better toward evening. What is the matter with all these tired people? Many are constitutionally frail or inadequate to stand up to the strains of life. At the worst the patient is a "relative of the insane" and his feelings of painful fatigue represent his share of a bad nervous inheritance. Some persons tire themselves out by fretting and fussing and worrying or having needless debauches of emotion over little happenings or needless conflicts with people about them. They wear themselves out. In older people who suddenly break down one must always think of the possibility of a mild "stroke" which did not involve any center for face or hand or arm. Since most people die slowly from the cumulative effects of episodes of cerebral arteriosclerosis, such little strokes must be common. Unfortunately, as yet they are not recognized often enough. A large percentage of the patients referred to me with supposed gastrointestinal troubles are really suffering from an unrecognized nervous breakdown. The patient failed to tell his physicians that for months or years he was too nervous and tired to work, too jittery to meet people and too restless to sleep or to read or to go to a movie or perhaps even to listen to the radio. Such nervous breaks should promptly be recognized and the causes determined. Then treatment should be directed more at relieving the nervousness than the vague indigestion.

DR. BENJAMIN F. SIEVE, Boston: I must disagree with Dr. Allan as to the diagnosis of neurosis or benign neurosis in 80 per cent of the group. If a detailed history was taken covering the five to ten years preceding the acute illness, the diagnosis of neurosis would be changed. The necessity of extremely detailed history in diagnosing abdominal conditions is true for any group of cases. I refer particularly to a group like Dr. Allan's with complaints of weakness, fatigue irritability, some constipation, occasional insomnia and increased nocturia over a period ranging from six months to five years before consultation. Detailed study, including physical and laboratory findings, frequently reveals minute changes which constitute a definite physiologic deficiency. The basal metabolic rate may range from minus 8 per cent to plus 15 per cent, with low blood pressure, low pulse rate, 48 to 60, and temperature as low as 94.8 F. The heart is usually slightly enlarged, the

vital capacity decreased and urinary output sometimes diminished. These patients usually have dry skin, dry hair and somewhat atonic muscular development. Foci of infection may be frequently revealed, especially in the prostate. Although laboratory studies reveal little change from the normal, these slight variations present a definite clinical picture. There may be just a slight decrease in the red cell count, say to 4,000,000, hemoglobin 68 to 76 per cent, white blood cell count 4,000 to 5,000 suggesting a leukopenia, and smear showing relative lymphocytosis. These factors indicate a subclinical type of hypothyroidism, not true myxedema or hyperthyroidism. Usually there is concurrent subclinical vitamin B complex deficiency, suggested in part by atrophic papillae of the tongue and perhaps leukoplakia of the buccal mucous membranes. When foci of infection are cleared and substitution therapy is administered to produce physiologic balance, these patients lose all complaints in two to three months. If the indicated hormones and vitamins are used, sedation is never necessary. Eradication of foci of infection should be emphasized, since infection interferes with the absorption of vitamins and hormones. I believe that many of Dr. Allan's so-called neurotic group, if studied in detail from the point of view of physiologic deficiency, could be helped by substitution therapy. In my own experience with similar cases at least 60 per cent were entirely relieved of symptoms.

DR. WALTER FREEMAN, Washington, D. C.: The presentation of Dr. Allan and the discussion of Dr. Alvarez bring to a focus the hard working individual who is feeling the strain. It is common for a man or a woman of this type to have a breakdown. How much better it is for him to have a nervous breakdown at the age of 40 than a cardiovascular breakdown at the age of 60. A nervous breakdown teaches an individual—and it is fine education—how much he can get out of his own machinery, what the signs of overstrain are and what to do about it. These people are weak. Their knees are weak. They feel dizziness in the head. You can produce these symptoms in two minutes. If you want to demonstrate to the patient and to yourself how these symptoms develop just have him stand up by your desk, open his mouth and breathe, one minute, two minutes, three minutes, and he will be ready for collapse. Have him sit down, hold his nose and let him pile up a little carbon dioxide in his system and the symptoms disappear in a few minutes. William J. Kerr of San Francisco called attention to this test. It is a useful one in sorting out these people, who have emotional hyperventilation with various functional symptoms. Now what are you going to do for them? Rest? The worst thing in the world. When their muscles are resting their brains are working and they are working overtime. You watch these people opposite your desk and they are sitting in their chairs and they can't get their breath. "Doctor, I feel so tight here." What are they doing? They are hyperventilating all the time and they don't realize it and their relatives don't realize it. Emotion makes them overventilated. The way to handle a good many of these cases is a matter of exercise—cold bathing, horseback riding, long walks. These patients start off on a walk; they are tired, they are exhausted, they cannot walk more than half a block without having to sit down to rest. This is where the persuasive powers of the physician come in. He will tell them this is not a true fatigue. It is a false fatigue, a nervous fatigue. "You must push yourself beyond that," he says. "Get your second wind. Walk your 5 miles the first day and keep on as long as your feet don't get sore, and after a week you will be sleeping better and be more relaxed." What the patient is doing during this physical activity is building up a certain amount of carbon dioxide and overcoming the subclinical tetany which is such a devastating factor in this weakness. When their muscles are working their brains are resting.

DR. FRANK N. ALLAN, Boston: I agree with Dr. Sieve that the problem of fatigue does, indeed, deserve detailed study and investigation from the standpoint of endocrine and vitamin deficiencies, but I regret that we find it impossible to help so many patients simply by treatment with thyroid and vitamins. The cooperation of physicians in all fields of medicine is essential to secure the best solution to this problem. There is no one remedy, and certainly the answer has not been furnished by the vitamin capsule.

## PHYSICAL IMPAIRMENT AND JOB PERFORMANCE

A COMPARATIVE STUDY OF ACCIDENT EXPERIENCE, PRODUCTION AND EFFICIENCY, SICK ABSENTEEISM AND TURNOVER AMONG 2,858 PHYSICALLY IMPAIRED AND 5,523 ABLE BODIED WORKERS IN GOVERNMENT INDUSTRY

VERNE K. HARVEY, M.D.

Medical Director, U. S. Civil Service Commission  
AND

E. PARKER LUONGO, M.D.

Assistant Medical Director, U. S. Civil Service Commission  
WASHINGTON, D. C.

(Concluded from page 907)

### ACCIDENT RECORDS

Restrictive and so-called protective employment policies with regard to impaired workers in the past have been based mainly on two premises: (1) accident proneness and (2) liability for second injuries. The questions of productivity, efficiency and absenteeism have been secondary considerations.

In early studies on accident proneness in this country, physical defects have not assumed as important a role as the question of human failure—that is, faulty attitudes, failure to recognize potential hazards, faulty judgment of speed or distance, impulsiveness, irresponsibility or failure to keep attention constant.<sup>17</sup> Even in a more recent study, made in a large government department of the unsafe personal factors in lost time accidents, it was disclosed that improper attitude was responsible for 55 per cent of lost time accidents; lack of knowledge or skill was responsible for 21 per cent of lost time accidents, and bodily defects were responsible for only 2 per cent of accidents.<sup>18</sup> The apparent low percentage of accident proneness attributable to physical defects may be due to present inadequate methods of evaluating or investigating preexisting physical defects in the injured employee, to failure in recognizing psychologic as well as organic aspects of disease or to lack of consideration of physical defects as causative factors in fatigue.

Recently Biram and Barton<sup>19</sup> have demonstrated some correlation between suppression of simultaneous binocular vision, impaired stereopsis, exophoria on distant vision and esophoria on near vision and an increase in accident proneness of workers. Kuhn's<sup>20</sup> investigation of accident rate as it relates to visual skill has raised the important question of whether or not visual skill has been taken into proper consideration in the investigation of prevention of accidents. As indicated by a study of a group of workers who had lost time accidents during 1939 in contrast to the plant average, it was found that the percentage of visual defects was higher among those with accidents. Kuhn points out that the problem of accidents as it relates to visual factors in the past mainly concerned itself with accidents to the eyes and protection to the eyes; the emphasis is changing to defective visual function as

it relates to accident prevention. Bennett<sup>21</sup> showed that among 42 lost time accidents 39.1 were reported in individuals with some element of subnormal vision. Poole and Bent<sup>8</sup> obtained information on accident proneness as it relates to heart disease. They demonstrated a higher frequency rate among cardiac cases (14.28) as compared with the plant average (7.64), with a lower severity rate among cardiac cases as compared with the rate for the plant. Further investigation of the types mentioned may show a higher percentage of bodily defects as being responsible for accident proneness or that a combination of physical defects with certain psychologic makeups in individuals may be the cause of accident proneness.

The psychologic or human failure element remains the outstanding problem in the diagnosis and treatment of accident proneness. Improvement in safety devices alone will not be adequate to meet this problem. This is borne out by reports made during the last ten years by insurance companies, the National Research Council and the Industrial Board of Great Britain, which show that from 80 to 90 per cent of all accidents are not due to defective machinery, physical or mental defects or to lack of skill but to an  $x$  factor in the person injured.<sup>22</sup> Carozzi and Stocker,<sup>23</sup> without denying the utility of a safety service in industrial establishments, have placed stress on the necessity of accepting the suggestions of those who understand the "human factor" if prejudice on the subject is to be eliminated.

Farmer<sup>14</sup> has pointed out that accident prone persons can to some extent be detected before employment by means of tests which partially measure certain psychologic functions involved in industrial proficiency and accident proneness. He states further that, if these tests were used in selecting candidates for certain skilled trades in which their value has been proved, those selected would have a lower accident rate and would at the same time be more proficient at their trades than those rejected. The tests are of two types: (1) the esthetokinetic (measurement of sensorimotor coordination) and (2) tempermental (measurement of neurologic and psychologic stability). In connection with these tests, research performed by Farmer and Chambers<sup>24</sup> indicated that there exists no correlation between higher intellectual processes and proneness to accident. Dawson<sup>25</sup> places emphasis on the factor of the employee's personality and general reaction time in accident prevention and considers personality as a tangible factor that can be analyzed and treated. He places responsibility on the industrial physicians and industrial psychologists for analysis of accident proneness of employees, for diagnosis of its component parts and for scientific treatment of causative factors. Dunbar<sup>22</sup> approaches the  $x$  factor on a psychosomatic basis and indicates that personality profiles will be diagnostically useful in investigating accident habits and proneness. Selling<sup>26</sup> stresses the importance of psychophysical tests of persons in industry and indicates that

there are certain jobs in any plant which are dangerous to the person or others in the department if an attempt is made by one with slow reaction time to do the job. This field of testing has been in the hands of psychologists and has received a place of importance in industries where there are a large number of employees in motor vehicle operation. Many such industries have outstanding records for safety.

The commission, in studying the relative accident proneness among physically impaired and able bodied workers, has attempted to determine the effectiveness of judicious placement procedures based on job analysis with regard to minimizing accident proneness and the hazard of second injury among the physically impaired workers. The majority of impaired workers coming under this study have been placed in jobs by matching their defects with the physical demands of the job and

† Includes administrative, professional, semiprofessional, technical and scientific workers.

environmental conditions, so that they may render satisfactory service without being a hazard to themselves or to others.

Table 8 presents lost time accident experience of physically impaired and able bodied workers by industry. The average frequency rate <sup>27</sup> for the physically impaired was found to be 16.15 as compared to 12.26 for the able bodied. There is little significant difference in the average severity <sup>28</sup> rates of the physically impaired (0.21) and the able bodied (0.20). This would indicate that, although the impaired experienced more accidents than the able bodied, they had proportionately less severe accidents.

Findings on the accident experience of physically impaired workers, by occupation, are given in table 9.

In shipbuilding and ship repair activities, which can be classified as more hazardous types of industry, the physically impaired had a slightly lower frequency rate

(18.08) as compared with the able bodied (18.84) and showed a lower severity rate (0.24 as compared with 0.39 for the able bodied).

The frequency rates for the impaired were higher than those of the able bodied in the following industries: (1) aircraft, (2) ordnance, (3) manufacturing (other than aircraft and ordnance), (4) inspection, storage and supply and (5) activities of camps, forts and naval training stations.

In procurement, inspection, storage and supply, the highest frequency rates of any industry occur in both groups of workers (table 12). The severity rate for the physically impaired (0.06), however, was lower than that of the able bodied (0.14).

In administrative offices where occupations were mainly of the clerical, professional, scientific and technical types impaired workers had no accidents, while the able bodied had a frequency rate of 2.27 and a severity rate of 0.01. Tables 10 and 11 present the figures on total plant population and certain sections of plants surveyed. It is to be noted that the average frequency rate (13.56) for sectional employees is lower than the average frequency rate of the physically impaired (16.15) but is higher than the average frequency rate for the able bodied (12.26). This would indicate, in view of the lower percentage of handicapped population (approximately 3 per cent) in comparison with the able bodied population in all plants, that the able bodied workers sampled possessed on an average approximately the same accident proneness as all sectional workers.

With regard to severity rates, we find that the average rate for sectional employees (0.68) is higher than the average rate of both the able bodied (0.20) and the physically impaired (0.21) in the sample study. This indicates on a sectional basis that the physically impaired, while showing a higher frequency rate than the sectional workers, had accidents which were less severe.

It is believed that the comparative statistics on the sampled group and those for total population of plants surveyed have some significance from the standpoint of employment policy and accident prevention. From the standpoint of accident prevention it is important to consider sectional experience of workers and the experience of the sample to determine how such experience compares with the average for the plant and for the industry. It was possible to obtain lost time accident experience in selected establishments from which samples were drawn in five industries: aircraft, ordnance, shipbuilding and ship repair, other manufacturing, and camps, forts and naval training stations.

Aircraft installations had a frequency rate of 5.34 and a severity rate of 0.323. This indicates a lower frequency rate by industry than by certain sections in that industry (8.35) but a higher severity rate (0.323) than in the sections (0.25). Both the section and industry experience showed lower frequency rates than those found among the sampled workers in the industry. However, the severity rates both for sections and for the industry were higher than those for the sample.

In ordnance activities, industry rates (14.28F and 0.569S) were higher than sectional rates and rates of the samples, both in frequency and in severity.

In shipbuilding and ship repair the industry rates (14.99F and 0.451S) were lower than the sectional rates and the sampled rates from the standpoint of

27. The number of lost time accidents per million man-hours' exposure.  
28. The average time loss measured in days per thousand hours worked.

frequency, and higher than those of the sample from the standpoint of severity.

In industries involving "other manufacturing" a frequency rate was obtained for the total industry which was higher than the sectional rate and lower than the sample of physically impaired workers. No severity rate was obtained by industry for this activity.

\* Sample of 56.9 per cent of sections surveyed.

† Include fatal accident charges in man-days lost.

The total industry frequency rate for camps, forts and naval training stations was higher than the sample of both able bodied and impaired workers in that industry.

It is evident that sectional experience in some industries studied appears more favorable than for the industry as a whole, and in some the sectional experience was less favorable than for the industry as a whole. In either case the increased frequency rates of certain physically impaired workers as compared with able bodied workers of the samples indicate the possibility that there is a theoretical threshold of absorption of impaired workers with certain physical defects under present employment practices, which, when exceeded, may increase accident liability for the industry as a whole and increase production costs. There is evidence that some industries coming under this study may have exceeded this threshold because of employment in some sections of large numbers of accident prone able bodied and accident prone impaired workers.

Table 12 presents findings on lost time accident frequency rates and severity rates by types of physical impairments. Workers with hearing defects were found to have the highest frequency rate (36.36) and the

highest severity rate (0.47) of all impaired workers. The lowest class frequency rate was among those with arrested tuberculosis (11.60). The frequency rate (17.23) among the sample miscellaneous group of defects (diabetes, epilepsy, pulmonary disease other than tuberculosis, and dwarfism) represents a rate among a very small number of employees (table 7). The rate among the visual defect group (15.96) represents the accident experience mainly of persons blind in one eye. The visual defect group was a large one, con-

taining 507 employees blind in one eye and 58 who were either totally blind or industrially blind. Of the 58 totally or industrially blind, 2 employees experienced one accident each.

Although safety reports on impaired workers attributed a small percentage of these accidents (6.7 in the males and 16.7 in the females) to preexisting disabilities, it is felt that variation in rates for various types of defects is significant from the standpoint of accident proneness. Since these impaired workers were in most cases interviewed, physically examined and then placed in environments which apparently presented no unusual hazards from the standpoint of their physical defects, and since they were given duties on the basis of their physical capacities as related to physical demands of the job, there is evidence that a psychologic element relating to certain physical impairments played a role in causing significant variations of frequency rates among the several classes of physical defects found in impaired workers studied. It is not believed that the larger number of accidents were distributed among particular classes of physical defects

purely by chance. In this connection it is of interest to note that the frequency rate for persons with heart disease (13.07) closely approximates the rate (14.28) found by Poole and Bent.<sup>6</sup> Accidents in numbers among the groups with hearing defects (7.5 per hundred), with deformities of shoulder and hip (6 per hundred), with amputation of fingers (4.2 per hundred) and with visual defects (3.2 per hundred) accounted for an excessive number of all accidents among the impaired workers. The average number of injuries among the able bodied and the remainder of impaired workers sampled was approximately 2 per hundred workers. The average frequency rate (16.16) for the impaired workers in this study, therefore, is not of itself a good measure of the average liability of impaired workers as a group. It is believed that the average has been too much affected by the experience of workers in particular physical defect classes whose rates were in excess. These classes increased the overall average rate. According to Farmer<sup>11</sup> it is the few who sustain a large number of accidents who increase the average accident rate of any group, and they are in no way typical of the group as a whole. It can be concluded, however, that accident proneness apparently is much greater among impaired workers with certain types of physical defects than among most able bodied workers.

## SECOND INJURIES

A very important aspect of accident experience of impaired workers relating to protective hiring practices involves the question of second injuries. These injuries constitute an aggravation of earlier disabilities for which compensation may or may not have been paid. They frequently transform partial disability into total disability, as in the case of loss of one hand, foot or eye followed by an injury which destroys the other member.<sup>29</sup>

When an employee has sustained an injury involving the loss of a member of the body and afterward loses another in a second injury in the same or another occupation, he may become permanently and totally disabled, thus increasing the amount to be paid in the form of workmen's compensation. In private industry the essence of the problem of hiring the impaired worker lies in whether the employer or his insurance carrier may possibly have to bear the burden of cost of second injuries.<sup>30</sup> Comparatively recent measures have been adopted in some states to protect employers and their insurance carriers from second injuries among employees. This protection usually is in the form of second injury funds out of which is paid the difference between compensation received by the worker for the second injury and compensation payable for the disability resulting from the combined effects of the first and second injuries.<sup>31</sup> Some states, however, have persisted in the past in attempting to protect employers by permitting workers with physical defects to waive their rights to compensation for injuries resulting from an aggravation of an existing disability. This procedure has been criticized on the ground that it defeats the social purposes of compensation legislation.

Compensation for initial and second injuries of federal civil service employees is governed by the Compensation Act of 1916, as amended. Under this act the United States, as the employer and the insurer, assumes fully the consequences of injury to an employee whatever the injury may be, including liability for permanent total disability when caused by an injury which, in combination with previous disability, results in permanent total disability. There are no separate funds under the Federal Compensation Act for civil service employees comparable to those for employees in private employment. It can be seen that no purpose would be served by maintaining two funds, since there would be no relief to the immediate employer, namely the United States, because the United States would supply both funds. The spread liability feature in private employment insurance, therefore, does not apply.

In discussing the question of second injuries it is well to consider their significance from the standpoint of expectancy. The significance of second injuries, when considered in terms of the actual number occurring, has been questioned in the belief that they are negligible as compared with the number of persons being injured for the first time.

An analysis of the experience of the New York Special Disability Fund by the Finance Bureau of the New York State Department of Labor, and also by the Division of Statistics and Information, disclosed that

the number of cases charged against the fund on Dec. 16, 1943 was 99. Charges are made against this fund only when the second injury results in permanent total disability; the liability of the fund is for the additional compensation above that allowed for the second injury considered by itself as a permanent partial disability. Payments in the permanent total cases continue through the lifetime of the worker. The fund began operating in 1919, and the number of cases terminated in 1943 was 5 and the number acquired was 5. For the years 1931 through 1942 there were 971,776 cases with class awards and during the same period the special disability fund acquired 87 cases, indicating 1 second injury fund case to 11,170 compensated injuries.<sup>32</sup>

In 1941 Kessler stated that in Connecticut the workmen's compensation law contained a waiver clause by virtue of which the employee is permitted to waive any rights to compensation for additional injury on account of physical disability. Ohio, Wisconsin and Massachusetts also permit certain physically impaired workmen to waive compensation. These waivers were signed at a rate of from 1,000 to 1,500 a month; yet, despite this large number of workers with physical defects, the incidence of accidental injuries among the waiver group was no higher than that of the normal working population.<sup>33</sup> There is evidence, therefore, in private industry that the expectancy of second injuries as compared with first injuries is very low and therefore the problem of second injuries may have received undue emphasis.

An additional problem relating to second injuries has arisen on the assumption that insurance carriers for private industry are interested in the physical defects of persons hired in any particular plant. The basis for this conception has not been substantiated, since in general insurance carriers leave the function of hiring and firing entirely in the hands of the employer, and rating plans and rules are not devised according to physical characteristics of workers, such plans and rules being affected only by bad accident experience in the plant, leading eventually to a higher insurance rate.<sup>34</sup> The federal government as the insurance carrier takes a similar attitude and is mainly interested in accident experience of government agencies from the standpoint of promoting safety.

It can be seen that the question of second injuries to federal workers cannot be viewed in the same light as second injuries among workers in private industry from the standpoint of employer insurance liability. The federal government, however, outside of all consideration of financial liability, must protect impaired workers from further injury and promote safety.

An important objective in the commission's study was to determine where and how impaired workers could safely be employed. The problem, therefore, is not one of second injuries from the standpoint of financial liability but one of obtaining the facts on accident proneness which would aid in preventing impaired workers from getting hurt. Actually, among the 2,858 cases of impaired workers studied there was only 1 worker who received an injury of the type that would place him in the second injury class if he was in private industry, according to the accepted concept of such

#### PRODUCTION AND EFFICIENCY

Although overshadowed by questions of accident proneness and liability for second injury, the comparative productivity and efficiency of the impaired and the able bodied have in the past been an issue in employment practices.

Previous studies of job performance in private industry, some of which have already been cited, demonstrated the impaired to be as good as, or better than, the able bodied from the standpoint of production and efficiency. In some of these studies it was no doubt possible to obtain objective findings on production and efficiency based on output per man-hour statistics; in many, however, the findings appear to be on a general opinion basis.

Since output per man-hour statistics on individual workers were generally not available, it was necessary in the commission's study to obtain measurements of productivity both in quality and in quantity, based on opinions of supervisors and foremen. These were not general opinions, however, relating to groups of workers but were opinions on individual workers known to the

foremen or supervisors. Supervisors and foremen were given no specific information to the effect that the purpose of the study was to evaluate the job performance of physically impaired workers. Further, for the purpose of control, efficiency ratings were obtained which are based on elements which include those relating to quantity and quality productivity.

In government industry, as in private industry, the most important element to be considered in studying

production and efficiency is that of the "doing" function. This function may be looked on as having three components: "how much," "how well" and "general manner of doing."

The "how much" is related to the kinds of work and the evidences of productiveness therein. The quality of work—that is, the "how well"—is also related to the kinds of work and the evidences of quality in them. In the case of the workers coming under this study, quality of work, however, changes according to the level of positions occupied. In industrial positions, generally, accuracy is to be considered with respect to the operation when the activity is procedural or operational in character.

"The manner of doing work" is evidenced by the performance of the task in an orderly fashion, the ability to organize work and demonstration of willingness to assist others wherever needed. The "manner" component also involves cooperativeness, initiative, reliability and trustworthiness.

In most of the positions coming under the study, the element of "doing" is related particularly to maintenance of equipment, tools and instruments and keeping such tools, instruments and equipment in working order. There is a relationship also to activities such as cleaning, making minor mechanical adjustments and knowing

TABLE 15.—Percentage Distribution of Physically Impaired and Able Bodied Workers by Sex and Efficiency Ratings

when repairs are necessary. Mechanical skill is directly related to the "doing" function, and such skill is demonstrated in making, or in repairing, an article with which the craft is concerned and in which the employee applies a required amount of theory and knowledge in the performance of the tasks in the trade or craft.

Different degrees of mechanical skill are, of course, required in particular trades; for example, in the plumbing trade the mechanical skill required of a plumber's helper, a plumber and a master plumber is progressively greater. All of these elements were taken into consideration with regard to the matching process and in evaluating productivity and efficiency in general.

In connection with adjective efficiency ratings, the rating "excellent" means that performance in every important phase of the work was outstanding and there was no weakness in performance in any respect; the rating "very good" means that performance in at least half of the important phases of the work was outstanding and there was no weakness in performance in any respect; a rating of "good" means that performance met requirements from an overall point of view; a rating of "fair" means that performance did not quite measure up to requirements from an overall point of view, and a rating of "unsatisfactory" means that performance in a majority of important phases of the work did not meet job requirements.

Table 13 furnishes a percentage distribution of physically impaired and able bodied workers by quantity

productivity. The heaviest distribution of workers in both groups was in the class that produced the same as all other sectional workers. Of the able bodied in the sample 31.5 per cent produced more than other sectional workers, and in the case of the impaired 27.4 per cent produced more than other sectional workers. This indicates that the productivity in terms of quantity was slightly higher for the able bodied than for the impaired workers. A more significant difference in quantity productivity, however, is found on the analysis of percentage distribution of both groups of workers in the class producing less than other workers. These figures demonstrate that 16.3 per cent of the

The control figures on efficiency ratings (table 15) show a fairly close proportion in the distribution among the two groups of workers in comparison with distributions relating to quantity and quality productivity. A further analysis was made of the productivity of impaired workers according to occupation (tables 16 and 17). In all occupations, the largest percentage of impaired workers were found to be in the class performing the same as other sectional workers, from the standpoint both of quality (63.2 per cent) and of quantity (56.3 per cent). The best performance with regard to quality and quantity was found among those impaired workers who were craftsmen. Those impaired

impaired workers in the sample produced less than other sectional workers, while only 10.2 per cent of the able bodied produced less. From the standpoint of quality productivity (table 14), the differences in quality of work performed by the two groups is not very great. With regard to the impaired workers, 30.3 per cent did a better job than other sectional workers, while 32.1 per cent of the able bodied did a better job. As in the analysis of quantity productivity, the percentage distribution of workers in both groups on quality was heaviest in the class consisting of those who produced as well as other sectional workers. With regard to workers producing inferior quality of work, the percentage difference between both groups is not as significant as similar figures on quantity percentages just mentioned.

workers who were employed as laborers accounted for the largest percentage of the class in which the quality of work was worse and the quantity less than that of other sectional workers. A further analysis of the efficiency ratings of physically impaired workers by occupation (table 18) disclosed that the heaviest percentage of workers in all occupations were given ratings of "good." The highest percentage of workers receiving ratings of "very good" and "excellent" were among those in clerical occupations. The largest percentage of workers receiving "fair" and "unsatisfactory" ratings were craftsmen. Correlating efficiency ratings of craftsmen and the findings with regard to productivity among impaired workers in this occupational group, one notes that there is a discrepancy between the craftsmen's productivity

and their efficiency ratings. A possible explanation of this discrepancy may lie in the fact that the physically impaired craftsmen, although outstanding in productivity, were weak in other elements taken into consideration in the assigning of efficiency ratings.

An analysis was made of opinions of foremen and supervisors (tables 19 and 20) with regard to the relationship of physical defects among workers to occupation. It was found that the highest percentage of workers who perform better because of their physical defects were craftsmen and that the highest percentage of workers who did not work as well because of their physical defects were laborers. For 75.8 per cent of all impaired workers the physical defects, according to the supervisor or foreman, made no difference in job performance.

Statistics obtained on the percentage distribution of physically impaired workers by type of disability and relation of the disability to performance were not sig-

(a) foreman and supervisor opinions on relationship of physical defect to job performance and (b) actual findings in job performance among the impaired.

There is a suggestion that the group of impaired workers producing less in quality and quantity may also have been responsible for increased accident proneness in the impaired group. No absolute correlation on this point, however, has been made.

#### SICK ABSENTEEISM

Statistical data on absenteeism in wartime often have a tendency to be misleading and unreliable. According to Lanza<sup>34</sup> it is difficult and more or less meaningless to compare wartime absenteeism figures with the accurate and carefully estimated figures of peace years.

During the abnormal years prevailing, especially during the first two years of the war, illness often has been an excuse of convenience and it is difficult to obtain objective statements from employees that will

nificant from the standpoint of class of physical defect and are not reported.

In summary, from the standpoint of productivity and efficiency, the average job performance of the physically impaired compared favorably with matching able bodied

throw light on reasons for voluntary absences or simply on the question of whether or not the absence was voluntary.

Statistics previously compiled have not demonstrated that physical condition is an important factor but rather that the socioeconomic problems of workers are the cardinal underlying causes of absenteeism, especially of the short term type.<sup>35</sup> These absences have been demonstrated to run highest in weeks including certain holidays and social events and to be based mainly on general fatigue and personal factors, such as seeking new place of residence and purchasing food and clothing. These short term absences in many instances are reported under sick leave and, as a general rule, the real cause for absences cannot be obtained objectively on questioning the employee himself.

The question of general absenteeism in wartime, therefore, may be primarily one of reliability and deportment, and, depending on job independence of population in any given establishment, may be considered a normal factor to a certain degree in industrial

operation. Job independence very often is the governing factor, and it is only in periods when manpower is at a premium and maximum production is a national necessity that absenteeism becomes a matter of grave concern.

The statistics (tables 21, 22 and 23) on sick absenteeism are on an annual cumulative basis, and 80 per cent of the cases on which the figures are based represent short term absences of from one to three days. The average yearly rate for the impaired males (7.7) was higher than for the able bodied males (7.0), and the average rate for impaired females (9.6) was higher

among workers performing administrative, professional and related tasks may be significant in relationship, in that fatigue from predominantly mental stress may be a larger factor in short term absenteeism than fatigue from predominantly manual or physical stress.

The highest average number of days lost per worker in the impaired group because of sickness was among those workers with arrested tuberculosis (14.4). Workers with arrested tuberculosis show a high sick absenteeism experience (20.1) in administrative, professional, technical and scientific occupations and in manual occupations (16.2 for craftsmen, 13.5 for

than for able bodied females (8.7). The overall sick absenteeism average for male and female employees in the entire federal service is 7 days per worker annually. These findings may not be significant, per se, but they furnish a means of establishing a correlation with the findings on accident experience; such correlation would tend to support Farmer's<sup>11</sup> suggestion that those who most often report minor sickness may be less resistant to fatigue and more likely to incur accidents.

The highest rates of sick absenteeism among all workers were found in the administrative, professional, technical and scientific workers. From the standpoint of fatigue, these figures tend to demonstrate that speed of production among craftsmen and other workers performing manual tasks, and speed of production

operatives and 16.5 for laborers). From the standpoint of fatigue there is no correlation between the findings on sick absenteeism among the arrested tuberculosis cases as a group and the findings on accident proneness in this group, since, although they had the highest sick absenteeism rate, they had as a class the lowest accident frequency rate of all classes of defects studied. It is possible that a large number in this group took sick leave as a precautionary measure, having been conditioned to the idea of avoiding fatigue during the course of treatment for the disease.

Impaired workers in administrative offices and in camps, forts and naval training stations experienced a higher average sick absenteeism rate (11.1) than impaired workers in other industries. The lowest rate

was for impaired workers in ordnance activities. In shipbuilding and repair there was only a difference of one tenth of a day in the average of the impaired and that of the able bodied. This is of interest in view of the fact that the accident frequency rates of the able bodied and the physically impaired in shipbuilding and ship repair are approximately the same.

#### TURNOVER

Turnover, like absenteeism, is to a certain extent a normal factor in industrial operation and is governed by job independence and many other conditions not having a direct relationship to physical condition. Past experience of rehabilitation agencies and statistics compiled by these agencies indicate that the impaired are determined to make good on the job and to stay on the job, and that they apparently are the last group to be affected by job independence.<sup>4</sup>

In the commission's study an attempt was made to determine the comparative turnover rates of the physically impaired and the able bodied in all the industrial establishments surveyed. Lack of complete information with regard to the physically impaired population in most establishments made it impossible to do this. Pressure of war work precluded the taking of a census. It was possible, however, to obtain well controlled statistics on an annual basis in three large establishments which employed a total of 16,463 workers. The following factors were considered in studying turnover in these three establishments:

A. Quits or terminations initiated by employees (for example, dissatisfaction with hours, wages, working conditions, labor policies, local housing transportation, obtaining another job, marriage, maternity or ill health).

B. Separation for the purpose of entering the armed forces.

C. Quits resulting from unauthorized absences.

D. Discharges. In this group were considered removals for such reasons as incompetence, physical inability to perform the work, violation of rules, dishonesty, insubordination or laziness.

E. Miscellaneous separations. This included termination of employment due to transfer, permanent disability, death or retirement.

The percentage of turnover for all employees, excluding military separations, was obtained by subtracting the number of separations due to the draft from the total number of separations and dividing this figure by the average number of employees working on a yearly basis. The percentage of turnover among the impaired was secured by dividing the number of separations of the impaired by the yearly average working force of impaired employees.

Among the impaired workers in these establishments the turnover was found to be negligible (5.4) in comparison with the turnover rate of the able bodied (52.9). It is felt that the size of the sample of employees mentioned is sufficient to indicate the employment stability of physically impaired workers. The low rate for the impaired has significance beyond the fact that it indicates that they remain on the job; it also indicates that no large number of impaired workers during the twelve months period were separated and makes almost negligible the possibility of percentage error due to lack of information on impaired workers separated during the calendar year, regardless of whether these separations were due to unsatisfactory placement, skill failure, physical demands failure or other causes.

#### SPECIAL CONSIDERATIONS GIVEN TO PHYSICALLY IMPAIRED WORKERS

Of the 2,858 impaired workers studied, 19.7 per cent required changes in the job or job tailoring in placement. This figure for percentage of job changes is too low to be consistent with effecting optimum job performance of the group. It no doubt expresses the pressure of war work and the necessity of getting persons on the job with minimum delay in order to meet work deadlines. The highest number of job changes were necessary for service workers; the lowest number were made for administrative, professional, clerical, technical and scientific workers.

With regard to special considerations shown impaired workers, it was found that 9.7 per cent were given such considerations, including permission to enter and leave by transportation at entrance of the establishment, change in lunch and rest periods, permission to report or leave at hours other than regular, permission not to report time on clock or by card, permission to receive pay by check or mail, and use of special equipment. The greatest consideration shown to impaired workers was with regard to permission to report or leave the establishment at hours other than regular and for special lunch and rest periods.

Chart 3.—Median annual base rate of earnings for able bodied (white columns) and physically impaired (shaded columns) workers by occupation.

It is significant that 90.3 per cent of all impaired workers received no special considerations at all with regard to transportation, lunch and rest periods, hours of work, methods of remuneration, special equipment or reporting time on clock or by card.

#### EARNINGS

Chart 3 demonstrates the median annual base rate of earnings of physically impaired and able bodied workers by occupation at the time of the survey. The median salary figures for each type of occupation demonstrate a striking similarity in earnings of the sample for both groups. The largest percentage of workers in both groups earn between \$1,800 and \$2,000 a year. The median annual earnings for all able bodied was \$1,938 a year as compared with \$1,900 a year for the physically impaired. At the beginning of employment the highest percentage of workers in both groups had annual earnings of \$1,440. Correlation of this figure with that on earnings at the time of the survey shows that both the physically impaired and the able bodied were able to increase their earning power substantially through promotion and by assignment to duties involving greater responsibility or skill or through administrative promotion.

## CONCLUSIONS

1. A study has been made of the job performance of 2,858 physically impaired male and female workers as compared with that of 5,523 able bodied male and female workers of similar age, experience and occupational characteristics from the standpoints of accident experience, production and efficiency, sick absenteeism and employment stability.

2. The average accident frequency rate for the physically impaired was found to be higher than the average frequency rate for the able bodied. An excessive number of accidents in certain physical defect classes contributed heavily to the accident frequency rate of the impaired group. The physically impaired experienced less severe accidents than the able bodied. There is evidence that a psychologic element relating to some types of physical impairments plays an important role in causing significant variations of frequency rates among the several classes of physical defects found among impaired workers in this study. This psychologic element also exists among the able bodied but has greater significance among workers with certain types of physical defects from the standpoint of prevention of further impairment by second injuries and determining a safe threshold of absorption of physically impaired workers into certain types of industries without raising overall accident and severity rates or production costs of those industries. The psychologic element in accident proneness cannot be measured or altered either by ordinary interview or by matching physical capacities or other qualifications to physical and other demands of jobs. It can to some extent be detected before employment both in the able bodied and in the physically impaired by means of tests which partially measure certain psychologic functions involved in industrial proficiency and accident proneness.

3. The productivity, both in quantity and in quality, and the efficiency ratings of the physically impaired were found to compare favorably with those of the able bodied.

4. Findings on increased short term sick absenteeism among the physically impaired show some correlation with the accident experience of this group and suggest that those workers who most often report minor sickness may be less resistant to fatigue and more likely to incur accidents.

5. A much lower rate of turnover was found among the physically impaired than among the able bodied, indicating that the impaired are superior from the standpoint of employment stability and that no large number of impaired workers during a twelve month period were separated because of skill failure, physical demands failure or other causes.

6. The percentage of job changes, or tailoring, in the employment of impaired workers was relatively too low to be consistent with effecting optimum job performance of the impaired. This low percentage of job changes may be an expression of the pressure of war work and the urgency for getting persons on the job with a minimum of delay in order to meet production deadlines.

7. The percentage of the physically impaired receiving special considerations with regard to transportation, lunch and rest periods, hours of work and methods of remuneration, special equipment or in time reporting has been found to be low.

8. The impaired as well as the able bodied show a substantial increase in earnings at the time of survey over earnings at time of initial employment in their jobs.

The commission will continue to support the policy of selective and judicious placement of the physically impaired, including disabled veterans, with further emphasis on selective placement from the standpoint of special interviewing and testing of impaired workers, especially with regard to applicants for employment in government industry. The special tests may well be considered in connection with able bodied workers from the standpoint of overall safety promotion. Further emphasis will be placed on close working relationships with rehabilitation agencies to insure adequate employment preparation and reassignment procedures and on job analysis to determine physical demands of positions. Studies of job performance will be done on a continuing basis, either complete or spot check, to be used as guides in future placements.

The commission will continue to stress the need for, and within the limits of its authority aid in the development of adequate health and safety programs for federal employees, so that disabled veterans and other impaired workers will be judiciously placed in positions where they may function proficiently and safely.

SHEATHING OF THE RETINAL VEINS  
IN MULTIPLE SCLEROSIS

C. WILBUR RUCKER, M.D.

ROCHESTER, MINN.

A number of patients afflicted with multiple sclerosis present on ophthalmoscopic examination a peculiar white sheathing of some of their retinal veins. In certain instances it appears as a thickening of the walls of the veins, especially in their peripheral branches. In other instances it takes the form of small white plaques overlying the veins, and there occasionally may be a constriction in caliber of the lumen.<sup>1</sup>

In the normal retina the walls of the blood vessels are transparent and therefore invisible. Only the column of blood within them is seen by the examiner. On the head of the optic nerve an excess of supporting tissue may at times form white cuffs around the vessels. When

Total.....	50

these cuffs are limited to the optic disk they are merely developmental anomalies. When they extend beyond the margins of the disk they indicate the previous presence of an inflammatory reaction or papilledema, particularly if there is an accompanying disturbance of the pigment.

Thickening of the vascular walls away from the disk is almost always indicative of disease. It may be found, for example, in retinitis of diabetes or of hypertension, in retinal phlebitis or in the vessels overlying a healed patch of choroiditis. In all these conditions the sheathing can be explained by associated changes in the fundus.

From the Section on Ophthalmology, Mayo Clinic.  
Read before the Section on Nervous and Mental Diseases at the Ninety-Fourth Annual Session of the American Medical Association, Chicago, June 12, 1944.  
1. Rucker, C. W.: Sheathing of the Retinal Veins in Multiple Sclerosis, Proc. Staff Meet., Mayo Clin. 19: 176-178 (April 5) 1944.

Venous sheathing that occurs without any other visible disease in the retina seems to have special significance and is illustrated in the accompanying reproductions of photographs of the fundus.

The most common type of sheathing is that seen in figures 1 and 2, in which the wall of the vein seems to be thickened. In figure 2 and also in figure 3 there is a localized constriction in the caliber of the vein, suggesting that the thickening of the wall may have invaded the lumen. The dense white plaques illustrated in figure 4 are encountered less frequently than sheathing. Opacities in the posterior portion of the vitreous occasionally accompany the changes in the veins. They may be ring shaped, as shown in figure 5, or they may be linear or nodular.

In none of the cases in which this sheathing was encountered did there appear to be any involvement of the retinal arteries.

From May 1941, when I first noticed that this type of perivenous sheathing seemed to be encountered more frequently in multiple sclerosis than in other conditions, until March 1944 I observed it in 50 cases, shown in the accompanying table. I found that a diagnosis of

Fig. 1.—Thin sheathing toward the periphery of a nasal vein in the right eye

multiple sclerosis had been made by a competent neurologist in 31 of the 50 cases. The diagnosis had been made largely on clinical grounds; the cerebrospinal fluid had been examined in relatively few instances. In 11 other cases the presence of multiple sclerosis had been suspected. In these cases the diagnosis apparently was a neurologic problem; multiple sclerosis was one of two or more possibilities considered. In the remaining 8 cases a diagnosis of multiple sclerosis was not made. In the first group the patients had the signs and symptoms generally accepted as evidence of multiple sclerosis. There is no need of discussing these cases further.

The patients in the second group, in which the presence of multiple sclerosis was suspected, deserve some comment. The first patient was a woman aged 24 who had what was called "degenerative disease of the spinal cord." The second was a man aged 27 who had had diplopia for five days five years previously and poor vision in the left eye for eight months and in the right for two months. The third patient was a woman aged 46 who had progressive weakness and spasticity of her legs of undetermined origin. The fourth was a man aged 24 who had periodic ataxia which the neurologist stated was due either to hereditary degenerative cerebellar ataxia or to multiple sclerosis. The fifth

was a man aged 59 who, the neurologist recorded, had all the signs and symptoms of multiple sclerosis; however, the neurologist hesitated to make such a diagnosis because of the age of the patient. The sixth patient was a man aged 37 who had unilateral acute retrobulbar neuritis and recovered within a month after the onset

Fig. 2.—Branch of a left superior temporal vein showing thickening of its wall toward the upper periphery and a localized constriction in its caliber below, near its origin

of the disease. The seventh patient, a man aged 30, had acute optic neuritis of undetermined origin. Physicians who have studied disorders of the optic nerve know that patients 6 and 7 stand better than a two to one chance of having symptoms of multiple sclerosis within the next few years and that the visual loss is likely to be the first episode in the disease. The eighth patient was a man aged 52 who had been troubled by urinary incontinence for twelve years. The diagnosis was degenerative disease of the spinal cord allied to multiple sclerosis. The ninth was a man aged 49 for whose condition a tentative diagnosis of multiple sclerosis was made. Examination of the spinal fluid

Fig. 3.—Constriction similar to that in figure 2 in the left inferior temporal vein beyond its first arterial crossing

showed the colloidal gold curve to be of the zone 1 type. Pneumoencephalography disclosed somewhat enlarged ventricles, however, and this raised the question of the possibility of arachnoiditis. The tenth patient was a woman aged 36 who for two years had had recurrent episodes of numbness of her hands which had been partly relieved by wrapping them in hot towels. The eleventh patient was a man aged 21 who had been having

attacks of paresthesia for six months. That he drank excessive quantities of hard liquor and had a large liver complicated the picture and made an exact diagnosis difficult. If the patients in this group did not have multiple sclerosis, whatever they had at least resembled it.

Fig. 4—Dense localized sheathing.

The third group, those for whose condition a diagnosis of multiple sclerosis was not made, require less comment. The first of these patients was a woman aged 51 who had latent syphilis and had had several nervous breakdowns. A serologic test for syphilis was negative. The second patient, a woman aged 48, was seen after an unexplained attack of vertigo of several days' duration. The third was a housewife aged 23 who had no symptoms and who did not undergo a neurologic examination. Patients 4, 5, 6 and 7 of this group were thought to be psychoneurotic. The eighth patient was a man aged 36 who had severe diabetes of recent onset. Ophthalmoscopy did not reveal diabetic retinitis, but

Fig. 5.—Opacity in the posterior part of the vitreous of the right eye of a patient who had peripheral sheathing in both eyes

on the superior temporal vein in the right eye there was a thin sheath and a localized constriction in the caliber of the lumen. No evidence of multiple sclerosis was found on neurologic examination. This patient and number 3 of this group are the only ones of the whole series of 50 who could be said to have normal nervous systems.

The ages of the patients in the whole group ranged from 18 to 59 years; the average age was about 35 years. The time since the onset of the first symptom

of multiple sclerosis ranged from two weeks to twenty-one years. The sheathing does not appear to have been the result of previous retrobulbar neuritis or optic neuritis, for only 13 patients gave a history of having had visual disturbances. It is not related to optic atrophy, as only 16 patients had pallor of the optic disks. Apparently retinal perivenous sheathing occurs at any age and during any time in the course of the multiple sclerosis and is not related to visual difficulties. Its incidence may be close to 20 per cent, as one of my associates examined the eyegrounds under good mydriasis in a series of 52 cases of multiple sclerosis and found sheathing present in 10 of them.<sup>2</sup>

#### COMMENT

The nature of the sheathing is difficult to interpret from ophthalmoscopy alone. As yet, no eyes have become available to me for study under the microscope. The fundal picture bears a resemblance to a feature observed by a number of pathologists in their sections of the central nervous system of persons who died of multiple sclerosis, namely an accumulation of cells around venules, although it does not seem to shed new light on the problem of determining whether this represents a reaction to primary degeneration of nerves or whether the venous disease is primary. In the retina, no thrombosis of the veins has been observed. The sheathing is not the result of a so-called demyelinating process, for the nerve fibers of the retina do not have a myelin covering.

#### CONCLUSION

Sheathing of some of the retinal veins is occasionally encountered on ophthalmoscopy of otherwise normal ocular fundi. It is usually indicative of disease of the central nervous system, most often of multiple sclerosis.

#### ABSTRACT OF DISCUSSION

DR. FREDERICK P. MOERSCH, Rochester, Minn.: It is strange that the presence of perivenous sheathing in multiple sclerosis, which is readily recognized once it is looked for, should have escaped the attention of the neurologist and ophthalmologist up to this time. One would like to know the significance of the perivenous sheathing, but Dr. Rucker is cautious and avoids attempting an explanation. If one has in mind a possible vascular basis for the development of multiple sclerosis one might expect to observe perivenous sheathing relatively early in the disease process. I believe the author has not found this to be true. I should like to ask Dr. Rucker whether perivenous sheathing tends to progress, regress or remain constant. According to Dr. Rucker, sheathing of the retinal veins was present in approximately 20 per cent of a series of cases of multiple sclerosis. It is noteworthy that perivenous sheathing and pallor of the optic disks appear to be unrelated. I wonder if Dr. Rucker has any figures on the occurrence of perivenous sheathing in other types of retrobulbar neuritis. Perivenous sheathing is not to be considered as a pathognomonic sign of multiple sclerosis, but as yet no single clinical sign is pathognomonic of this mysterious disease. Until pathologic studies of the affected vessels are completed, one will have to be cautious in the interpretation of the presence of perivenous sheathing.

DR. R. P. MACKAY, Chicago: Several years ago Dr. Putnam sponsored the theory that multiple sclerosis is due to venous thromboses in the central nervous system. There is considerable debate about this matter at the present time. It certainly cannot be without significance that entirely independently of any of the researches of Dr. Putnam or those who preceded him in this field Dr. Rucker brings us today his significant findings. His facts can be used in support of the theory that multiple sclerosis is due to venous thromboses. It can also be used, as

2. Treusch, J. V., and Rucker, C. W.: The Incidence of Clumping in the Retinal Veins in Multiple Sclerosis, *Proc. Staff Meet., Mayo Clin.* 19: 253-254 (May 17) 1944.

Dr. Rucker indicated, as evidence that the plaques of multiple sclerosis are not primarily demyelinated, plaques but that the demyelination itself is secondary to some disease occurring in the wall of the blood vessel. When Dr. Rucker speaks of "perivenous sheathing," he perhaps will admit that the prefix "peri" may be inappropriate. The "sheathing," so called, which he describes and which we saw in his projections, is actually, I believe, to be interpreted as a thickening of the wall of the vessel itself.

DR. C. W. RUCKER, Rochester, Minn.: This perivenous sheathing visible in the retina has been found both early in the disease and late in the disease. I do not know how early it occurs. I have seen it occur in patients who had had evidence of multiple sclerosis for only two weeks. As yet I have not had the opportunity of following any of these patients over a long period of time or of making repeated observations. I have not encountered it in any other types of retrobulbar neuritis than the type due to multiple sclerosis. Dr. Mackay's criticism of my choice of the words "perivenous sheathing" is, I think, well taken. As yet, though, I do not know what word to use for it. That is only a tentative descriptive term. If he has a better one I should like to know what it is.

## ANEMIA THERAPY

### REVIEW OF VARIOUS LIVER AND STOMACH FRACTIONS AND IRON SALTS

E. J. TEETER, M.D.

INDIANAPOLIS

It has been eighteen years since the announcement of Minot and Murphy<sup>1</sup> of the spectacular beneficial effect of raw liver therapy on patients having Addisonian pernicious anemia. In that eighteen years there have been developed many extracts of liver and these extracts have contributed immeasurably to the ease and effectiveness of primary anemia therapy. However, therapy has been somewhat complicated by the multitude of products made available. It has been my experience that this multiplicity of liver extracts leads to confusion in the choice of an extract to prescribe. This confusion exists both in regard to high and low potency extracts and in regard to oral and intramuscular methods of administration.

A rapid review of the development of liver therapy from its inception following the work of Minot and Murphy through the development of stomach tissue extracts by Sturgis and Isaacs<sup>2</sup> in 1929 to the present time will serve to outline the differences in liver extracts and clarify confusion existing concerning the many types available.

The accompanying diagrams illustrate several fundamental steps in the processing of liver extracts. These several steps by no means include all of the processes necessary, but they do show complete processing in brief and represent the essential steps necessary in the production of both oral and intramuscular liver extracts containing the antipernicious anemia factor effective in the control of primary anemia.

In 1927 and again in 1928 Cohn and his co-workers<sup>3</sup> published the results of their investigation on the prepa-

ration of a liver extract low in volume but high in antianemia potency. In 1930 Whipple and his colleagues<sup>4</sup> published a report on a liver extract which they called the secondary anemia fraction.

First step: Raw ground liver  
+ Water  
+ Heat (approximately 85 C.)

The first step was the grinding of raw liver into water, the temperature of which had been adjusted to approximately 85 C. In the initial work the  $p_H$  of this suspension was made either alkaline or acid, but subsequent events proved that this adjustment of  $p_H$  was not essential.

Second step: Raw ground liver  
+ Water  
+ Heat (approximately 85 C.)  
↓  
Precipitate      Filtrate

In the second step it is seen that as a result of raising the temperature to 85 C. there was formed a precipitate and a filtrate. Both the precipitate and the filtrate were administered to known Addisonian pernicious anemia patients to determine which of the two contained the antianemia principle. It was found at this point that the filtrate produced a response in the peripheral blood stream.

Third step: Raw ground liver  
+ Water  
+ Heat (approximately 85 C.)  
↓  
Precipitate      Filtrate  
                         Concentrated under vacuum  
                         (Cohn fraction D)  
                         + Ethyl alcohol 70%  
                         (C<sub>2</sub>H<sub>5</sub>OH)

The third step consisted in concentrating the filtrate under vacuum to reduce its volume. This concentrate was found to be more effective than any previously found extract. It was given the name Cohn fraction D. It should be emphasized that the term Cohn fraction D is not the name of the antipernicious anemia factor; it merely designates one fraction of whole fresh liver which is effective in primary anemia. To this concentrate was added 70 per cent ethyl alcohol as a precipitant. This was a further step in reduction of volume but with preservation of activity.

As a result of the addition of the 70 per cent alcohol, the fourth step was the separation of the precipitate

Fourth step: Raw ground liver  
+ Water  
+ Heat (approximately 85 C.)  
↓  
Precipitate      Filtrate  
                         Concentrated under vacuum  
                         (Cohn fraction D)  
                         + Ethyl alcohol 70%  
                         (C<sub>2</sub>H<sub>5</sub>OH)  
↓  
Precipitate      Filtrate  
(Whipple)

from the filtrate and the testing of these components on patients having anemia. In spite of a reduction in volume of material, the antianemic potency was pre-

From the Lilly Research Laboratories.

served in the filtrate. The precipitate at this point is the secondary anemia fraction of Whipple.

Since the investigators knew from previous experience that concentration under vacuum of the filtrate did not harm the potency, the fifth step consisted in again concentrating under vacuum and adding 90 per cent ethyl alcohol.

In the sixth step the precipitate and filtrate formed as a result of adding the 90 per cent alcohol were separated

and once more the potency of each was tested on primary anemia patients. In this instance it was found that the filtrate did not contain antianemic potency, whereas the precipitate was highly potent and produced a very satisfactory increase in reticulocytes and subsequently red blood cells. This last precipitate was given the name Cohn fraction G and represents the first liver extract generally available, which was extremely small in bulk but high in antianemic potency.

A glance at the completed diagram shows that there are two filtrates and one precipitate, each of which contains the antianemic factor and each of which could be used in the treatment of primary anemia. Thus we have at this point three products from which to choose. Various precipitants other than ethyl alcohol can be used and will result in the formation of extracts containing the antianemia principle in varying quantities. The possibilities are actually limited only by the number of precipitants available.

It was Dr. Raphael Isaacs who in 1929, in collaboration with Sturgis<sup>2</sup> and Sharp,<sup>5</sup> carried on the experiments which demonstrated that an extract prepared from stomach tissue produced a satisfactory increase in reticulocyte percentage and subsequent increase in red blood cells. The first stomach extract was made by desiccating fresh whole hog stomach and resulted in

a product 30 Gm. of which represented approximately 190 Gm. of fresh tissue. They carried the processing further and succeeded in producing a stomach tissue extract 30 Gm. of which represented as much as 218 Gm. of fresh tissue. This, then, meant that there were available both liver and stomach tissue extracts for the oral treatment of primary anemia.

Up to this time there were available only oral products. The eminently satisfactory results obtained with these oral extracts encouraged investigators to attempt the preparation of intravenous liver extracts. Late in 1930 Gansslen<sup>6</sup> published a report on an injectable liver extract. Details of the processing were not included in the article.

Cohn<sup>7</sup> was able to prepare fractions of whole fresh liver which gave no specific protein reactions. Still later Cohn<sup>8</sup> and West<sup>9</sup> and their co-workers prepared various active fractions which were given intravenously.

The methods of preparation of these early intravenous extracts were such that only small amounts could be prepared for experimental use. Castle and Taylor<sup>10</sup> attempted the preparation of an intravenous extract and used the original Cohn fraction G. This particular fraction of liver was precipitated in 95 per cent alcohol, and the precipitate was found to be readily soluble in water. It was largely free of reaction-producing substances. The potency of the extract was so high that a single intravenous injection of extract derived from 100 Gm. of raw liver would produce a maximal reticulocyte response within five days and an increase of 1,000,000 red blood cells within ten days. The smallness of the volume dosage and the amount of raw liver represented are more spectacular when it is remembered that successful treatment of pernicious anemia requires as much as 500 Gm. of raw liver orally per day. Subsequent to this first work on intravenous extracts, Strauss, Taylor and Castle<sup>11</sup> discovered that they could produce very satisfactory remissions in patients following the single intravenous injection of an extract derived from as little as 20 Gm. of fresh raw liver.

At this time, then, there were available several oral products prepared from liver tissue and from stomach tissue, to which were added the intravenous liver preparations.

It was found that the intravenous extracts produced a goodly number of delayed reactions despite the fact that apparently all protein substances had been removed. These reactions produced no untoward results but were not pleasant, and it was believed that further improvement could be made in the extract by consideration of the possibility of intramuscular injection.

Strauss, Taylor and Castle<sup>11</sup> used as a starting point for intramuscular preparations the Cohn fraction G.

5. Sharp, E. A.: An Antianemic Factor in Desiccated Stomach, *J. A. M. A.* 93: 749 (Sept. 7) 1929.

This fraction of whole fresh liver was put into distilled water, subjected to heat, a preservative was added, the  $p_H$  was adjusted to approximately 7.4 and a buffer was added. The filtrate resulted in a product each 10 cc. of which represented approximately 50 Gm. of fresh liver. This extract, when administered intramuscularly to pernicious anemia patients, gave a highly satisfactory response and had none of the obvious disadvantages of an intravenous injection. Thus was added still one more form of liver extract therapy possible in the treatment of primary anemia.

In the last few years research work on liver extract has continued with two main objectives: (1) the isolation and identification of the substance effective in pernicious anemia and (2) increase of the potency per volume dose.

The identification of the active principle has not been accomplished.

The concentration of the antianemia principle in small volume dosage has been successful, and intramuscular extracts are available which need be given in only 1 cc. or a fraction of 1 cc. doses at intervals of ten to fifteen days. The oral products have not been concentrated nearly as much. The daily dosage of oral liver extracts is still rather large in weight. However, one step forward in reducing the bulk of the daily oral dose was accomplished by Walden and Clowes.<sup>12</sup> They found that the digestion of stomach tissue with liver tissue resulted in a preparation which had a potency of three to four times that of the raw liver from which it was derived. Similar experiments were conducted using the Coln fraction G treated with fresh ground stomach tissue, and this also yielded a product having a three to four fold gain in potency. However, the bulk or volume of the daily required dose of oral extracts still remains high compared to that of the intramuscular.

Research work of these many years has made available many oral and intramuscular products each of which will produce results if given in the proper daily dosage or as an accumulative dosage given at intervals of days to weeks.

The problem which confronts us as physicians is one of choice among these products. First we should consider the oral, the intravenous and the intramuscular routes of administration. The intravenous has no advantage and several disadvantages when compared to the intramuscular extracts and therefore can be eliminated at once. This then leaves us with a choice between the oral and the intramuscular extracts. Oral products contain the antianemia principle and have the advantage of method of administration. However, because addisonian pernicious anemia is primarily a disease of the gastrointestinal tract, the antianemia factor in oral products may not be absorbed effectively, especially in the acute stages of primary anemia. Intramuscular extracts are the products of choice because of their low volume dose and because absorption is assured, once the material is deposited in the muscle.

Having made a choice of either the oral or the intramuscular method of administration, there still remains the question of potency of the various products. Several years ago a U. S. Pharmacopeia committee was chosen for the purpose of establishing standards for both oral and intramuscular products. Because the antianemia

principle itself has never been identified and because there is no laboratory animal test satisfactory, it was necessary to establish standards on the human patient. This was done by the United States Pharmacopeia Anti-Anemia Preparations Advisory Board and we now have available products which conform to a U. S. P. standard unit. Hence our choice of various products from the standpoint of potency narrows itself to one of either the high or the low potency in terms of U. S. P. units.

For several years there has been a difference of opinion as to whether higher potency, or so-called "refined" liver extracts, are complete treatment for the patient having neurologic signs and symptoms of addisonian pernicious anemia. In our clinic we have found that the high potency intramuscular liver extracts will relieve the pernicious anemia patient of his anesthesia and paresthesia and diminution in vibratory sense. The only exceptions are those patients whose posterolateral sclerosis has progressed so far that the changes are irreversible. Fortunately, the number of these patients is small. In that small group whose neurologic signs and symptoms do not respond to the higher potency intramuscular liver extracts we have failed to produce any appreciable improvement in their condition when therapy has been changed to the more so-called "crude" liver extracts. The criticism could be made at this point that the therapy with the crude extracts should have been used as initial treatment and that the time spent in using the more refined liver extract was the margin of safety which the patient had in the reversibility of his neurologic signs and symptoms. However, our results when only the crude liver extracts were available were no better than they are at present with the use of the higher refined extracts. Therefore we are of the opinion that the higher potency extracts will do everything for an addisonian pernicious anemia patient that the crude liver extracts will do.

#### IRON SALT THERAPY

Iron salt therapy has run a somewhat parallel course to that of liver and stomach therapy in that there have been several different salts available and much difference of opinion on the relative efficacy of these iron salts. Much excellent clinical research work has been done on iron salt therapy and the recommendations today can be summarized very briefly. At present the consensus is that any iron salt suitable as a therapeutic agent will produce a rise in the hemoglobin if that iron salt is given in the proper dosage. In general, ferrous iron salts will produce a higher percentage hemoglobin rise than will ferric iron salts when given in equal dosage. It has been found that 15 grains (1 Gm.) of ferrous sulfate is a good average daily dose. If one prefers to use iron and ammonium citrates, which is a ferric iron salt, the dose should be two or three times that of the ferrous iron salt, and the result in hemoglobin response will be equally satisfactory with the lower dose of ferrous iron. There is little to be gained in attempting to differentiate between response to one ferrous salt and another ferrous salt. The same is true of the ferric salts. The choice lies between the ferrous and the ferric salt, with adjustment of the dosage according to the one chosen.

The dosage of liver extracts and iron salts cannot be arbitrary. Red blood cell counts and hemoglobin determinations, while they do require time, provide the only accurate measures of dosage of antianemia therapy.

12. Walden, G. B., and Clowes, G. H. A.: Pernicious Anemia: Method Whereby Therapeutic Efficacy of Liver and Liver Fractions May Be Substantially Increased, *Proc. Soc. Exper. Biol. & Med.* 29: 873, 1932.

## SUMMARY

The choice of anemia therapy from among many preparations developed in the past eighteen years can be facilitated by consideration of the following factors:

1. Oral versus intramuscular extracts.
2. Intramuscular liver extracts are more surely absorbed and, by the same token, more effective, particularly in the acute stage of primary anemia.
3. Oral extracts are more convenient both for the physician and for the patient and can be used effectively for maintenance.
4. Stomach and liver extracts standardized according to the requirements of the United States Pharmacopeia should be prescribed.
5. Any iron salt suitable as a therapeutic agent can be prescribed. Ferric salts require two to three times as much daily as is required of ferrous salts.
6. Size of the daily dose of antianemic therapy cannot be judged in terms of units or grains. Red blood cell count and hemoglobin determination are safe guides, and enough therapy should be prescribed to produce the desired results.

## ABSTRACT OF DISCUSSION

DR. FRANCIS D. MURPHY, Milwaukee: From observations of 339 cases of pernicious anemia, studied at Milwaukee County Hospital during the period from 1930 to 1943, it was found that accuracy in diagnosis improved steadily. In a review of 80 cases observed over a period of ten years 43, or 53.75 per cent, were not diagnosed accurately by the first physician consulted, and in 11.25 per cent the first three physicians consulted failed to make the correct diagnosis. Eighty-six per cent of the cases were not adequately studied until hospitalization. Since the standardization in this country of various liver extracts according to unit potency, treatment has been more effective and uniform, but there still is lack of unanimity of opinion concerning methods of administration. The method which has yielded the best results in general consists in giving regular doses of 30 to 45 units, that is almost 2 to 3 cc. intramuscularly every day for the first five or six days, then reduce and spread the doses to 15 units, or 1 cc., two or three times a week, and then 15 units weekly until the red blood cell count has risen to normal. The maintenance dose in our clinic consists of 15 units about once a month. Sometimes a so-called resistant case is found, but these cases are rare. When there is a lack of proper response the diagnostic work should be checked closely, for another disease may be present which interferes with the proper responses. In the presence of infection or when any serious complication such as heart disease, nephritis or tuberculosis is present there may be modification in the responses we looked for. In 64.7 per cent of our 339 cases there was some disease other than pernicious anemia. Allergic reactions are more common than we thought, as 27.5 per cent of our patients had reactions. Nineteen of our 80 patients discontinued treatment and the period of lapse ranged from three months to five years. As there is no satisfactory method of gaging the exact amount of liver or stomach substance required by individuals, it is best to use these extracts according to the general plan found most effective in the majority of the larger clinics throughout the country. The extracts have been standardized, and the plan of management is becoming quite uniform.

DR. RAPHAEL ISAACS, Chicago: Further progress is hampered by the lack of untreated patients with pernicious anemia in relapse on whom newer products could be evaluated. Such patients should be reported to laboratories testing liver extract, and the treatment can be carried out in cooperation with the physician. Liver extract is of value when the red blood cells are larger than normal and the color index is high. As the percentage of hemoglobin varies with the instrument used, the

value should be reported in grams. If three times the number of grams is greater than the first three figures of the red blood cell count, the "color index" is high. If the number is lower there is an iron deficiency and iron is needed. As Dr. Teeter has pointed out, any type of iron is effective but many patients suffer from iron poisoning (pain, nausea, vomiting, constipation, abdominal discomfort). Reduced iron is very effective, but ferrous sulfate appears to be the most economical form because of the smallness of the dose, and it is the most generally used. It appears to be equally effective before or after meals, but after meals is the logical time for administration. In some patients the formation of blood is facilitated by thyroid, bile, high protein intake and whole liver. Occasionally patients with iron deficiency are encountered and no type of iron therapy appears to influence their blood picture. When medicines containing calcium or phosphorus are given for long periods, the absorption of iron is defective.

DR. E. J. TEETER, Indianapolis: The importance of doing a blood count and hemoglobin for the successful treatment of anemia and for the diagnosis of anemias cannot be overemphasized. Frequently we receive letters or appeals for help, or patients are sent in, even when the attending physician has done an excellent job but has missed accurate diagnosis and treatment by not doing three or four blood counts and hemoglobins, preferably by one of the best methods, not the Tallqvist. I urge you to do these blood counts. Many times they will save your time, your patient's time and perhaps unnecessary treatment. There are a great many patients who do not tolerate sufficient iron. Several years ago Dr. Reznikoff asked his chemist to prepare a ferrous gluconate. Dr. Reznikoff did not know definitely that ferrous gluconate was the answer, but he had observed many patients who could not tolerate iron and he wanted an iron salt which could be tolerated. The ferrous gluconate was given to patients unable to tolerate other forms of iron salts, and 1 patient's response will serve to illustrate his experience and subsequently my own. One patient received as little as 2 grains (0.13 Gm.) of ferrous sulfate daily and experienced gastrointestinal upsets, and there was every reason to believe they were due to the iron. She was given as much as 30 grains (2 Gm.) of ferrous gluconate and tolerated it well. Each time I encounter a patient who cannot tolerate iron I give ferrous gluconate. The dosage is the same as for other ferrous salts, although the actual iron content is a little lower. Ferrous sulfate has about 20 per cent iron and ferrous gluconate 12 per cent, but the end results are the same. It was first thought that the reactions were true protein reactions. Last year Dr. Feinberg of Chicago published an article in the *Annals of Internal Medicine* on experiments in which he had separated liver extract into protein and nonprotein fractions. Curiously, it was the nonprotein fractions which resulted in reactions. I believe these are true anaphylactic reactions easily treated with a small dose of epinephrine.

**Classic Descriptions of Drug Actions.**—Now elsewhere Helen turned her thoughts, the child of Zeus. Straightway she cast into the wine of which they drank a drug which quenches pain and strife and brings forgetfulness of every ill. He who should taste it, mingled in the bowl, would not that day let tears fall down his cheeks although his mother and his father died, although before his door a brother or dear son fell by the sword and his own eyes beheld. Such cunning drugs had the daughter of Zeus, drugs of healing virtue, which Polydamna gave, the wife of Thon, in Egypt, where the fruitful soil yields drugs of every kind, some that when mixed are healing, others deadly. There every one is a physician, skillful beyond all humankind; for they are of the race of Pacon. So after she had cast the drug into the bowl and bidden pour, then once more taking up the word, she said: ". . . They talk a little about the greatness of Odysseus—about long enough for the drug to take effect." Then "discreet Telemachus" remarks "Nay, bring us to our beds, that so at least, lulled in sweet sleep, we be at ease."—Homer's *Odyssey*, fourth book, George Herbert Palmer's translation.

## Special Article

### AMERICAN HEALTH RESORTS

#### THE PROBLEM OF THE AMERICAN SPAS

RICHARD KOVACS, M.D.

NEW YORK

*These special articles on spa therapy and American Health resorts were prepared under the direction of the Committee on American Health Resorts. The opinions expressed are those of the authors and do not necessarily reflect the opinion of the committee. These articles may be published later as a Handbook on Health Resorts.*

A spa is an institution, developed around a mineral spring or springs, which makes curative use of the water in conjunction with other natural resources and physical treatment agencies, such as rest, exercise and diet. A well organized spa must provide suitable physical facilities and trained technical help to administer these therapeutic agents, as well as competent medical supervision. No other country is so richly endowed with natural resources and such a variety of climate as our own United States; yet in contrast to the world renowned spas of the continent of Europe, which up to the time of the present world war have attracted yearly many thousands of American health seekers, in the past few decades the status of many American spas has medically and economically deteriorated rather than progressed. In a textbook on American spas written in 1927, Fitch<sup>1</sup> reported 431 active spring areas with 871 springs and listed 17 spas as the "Great American Spas"; he stated that some 240 former spas had been abandoned. Stearns and his associates,<sup>2</sup> reporting for the U. S. Geological Survey in 1936, found 184 thermal springs developed for economic use. The 1943 edition of Clendening and Hashinger's popular book<sup>3</sup> on treatment enumerates only 34 active springs, among these only 6 of Fitch's Great American Spas. The recent report of the Baruch Committee on Physical Medicine<sup>4</sup> states that American spa resorts have been disappearing at a rapid rate and that only two or three spas in the United States attempt a serious medical regimen.

A striking illustration of the difference in appreciation of the official status of the spas abroad and those in the United States was in evidence at the 1939-1940 New York World's Fair. There were seen impressive exhibits of the health resorts of France, Great Britain, Italy and Switzerland; literature was distributed about the health advantages of these resorts and treatments they offer; in addition, a list of qualified physicians at each resort and a full price scale of every item of treatment and accommodation were available. In contrast, there was no exhibit of the American spa system, either as a whole or as a part of the public health and medical exhibit. Only in some of the state exhibits were views of the recreational facilities or the buildings of the state's favorite resort shown, but no attempt was made anywhere for a concerted demonstration of the curative features of any spa.<sup>5</sup>

#### EUROPEAN VS. AMERICAN SPAS

The success of the health resorts of Europe has been due to a number of factors. Practically all foreign resorts are either owned by a municipality or by the state, are situated in beautiful natural surroundings and are attractively developed. Every one connected with them has the one aim of ministering to the needs of those who arrive in quest of health. They are made available to the rich and poor alike and are not regarded merely as a luxury for the society crowd. Many of them specialize in handling one condition or one group of diseases, such as those of the heart, kidneys, lungs or rheumatic ailments, and offer all known resources for the treatment of that particular disease condition. Patients are, as a rule, sent by their physicians who know what means for treatment are available; they are routinely referred to a competent spa physician who checks on their condition and prescribes treatment appropriate for the individual patient. A spa physician sees the patients regularly, while a trained and supervised technical staff administers the treatments. At their close the patient is referred back with a complete report to his home physician. Extensive cooperation is maintained with the outside medical profession by the frequent holding of medical conventions at spas, by the teaching of "balneology," the science of mineral water treatment, at the medical school and the offering of special facilities to physicians and their families.<sup>6</sup>

Conditions in the average American resort are often quite different from the well organized routine of continental resorts. Only a few resorts have any sort of history or tradition. Many of the smaller resorts are located at the site of an accidentally discovered mineral or hot water spring, where a lay owner has erected a few primitive shacks which can be called bath houses only by courtesy. These primitive bath places often only contain a dozen or more tubs in charge of several husky male or female attendants; a waiting space and a few so-called rest rooms with a cot in each complete the equipment. A physician may not even be nominally in charge and often cannot be found for miles. All the bath house owner is interested in is to sell his baths to any one who happens to come along or come on advice of friends or following some crude advertisement. There are no recreational facilities available, and no effort is made to improve the landscaping around the shacks of which the resort consists. Dozens of such wouldbe resorts are strewn all over the American continent from the Empire State to the deserts of New Mexico, Wyoming and California and are visited year in and year out by simple folk suffering from a variety of ailments, chiefly rheumatic. In the large majority of these small bathing institutions no physician ever comes near the place, and patients do not receive any competent medical advice. They would have difficulty in obtaining it because most of the local physicians either are not interested in the bath house or have had no training in prescribing effective bath treatments.

On the other hand, there are quite a few excellent institutions which are in every way comparable to the best health places abroad. They employ a competent medical staff, offer very fine hotel facilities and have not only developed their own natural resources to the fullest extent but in addition use many other treatment facilities. The rates of attendance include, as a rule, all hotel accommodation and treatments. Glen Springs

5. Kovacs, Richard: American Spas, M. Rec. 53: 254 (April 2) 1941.

(now closed) and Clifton Springs, New York, are examples of such high type institutions. Battle Creek Sanitarium, Michigan, now taken over by the Army, also belonged in this class. In a few additional resorts, well regulated and supervised treatments are administered through cooperative efforts of medical men; among these are Sharon Springs, N. Y., Martinsville, Ind., and Marlin, Texas.

A special class of American spas is represented by the "social resorts" such as Hot Springs, Va., White Sulphur Springs (now the Ashford General Hospital), W. Va., and French Lick Springs, Ind., which appear to subordinate the use of their waters to the social enjoyment of life. Their patrons who are reported in the society columns as taking the "cure" do this chiefly in the forms of horseback riding, golf and swimming in indoor pools and drinking five o'clock tea to the strains of a concert orchestra. However, there is usually an excellent medical department with many treatment facilities available. These resorts date back many years and have some real traditions.

There are less than ten health resorts in the United States under direct control or supervision of the federal or state government or municipal administration. Among those is Berkeley Springs, W. Va., perhaps the first summer resort in the United States; Big Horn Springs in Wyoming, Hot Springs in Arkansas, Excelsior Springs in Missouri, and Saratoga Springs, N. Y. In these places much is done to control the proper use of bath facilities and to insure high class medical service. The government owned resorts also provide free baths to the indigent.

Neither the average American nor most of his physicians have been educated by years of tradition in making the best use of treatment in a resort. The average American citizen often goes off to a resort on his own decision, and when he gets there he does not seek a physician's advice as to what water to drink and what baths to take but is perfectly satisfied to consult the hotel clerk, the boarding house keeper or the bath house attendant. He resents being asked to undergo a medical examination before taking the cure. All he wants to do is to take his baths and to continue eating and drinking as he pleases. In some of the more luxurious places, living on the "American plan" of prewar times, he usually overfeeds himself, adding insult to injury. He wishes to be entertained and relaxed in his own way.

Outdoor concerts given under shade trees on a large beautifully landscaped central plaza are the most popular daily entertainment in a European spa. Nothing like this takes place in the modern American resort, although here and there still appear a few deserted band stands as a reminder of a mid-Victorian past. The resort hotels do provide Sunday night concerts, through which many of the older guests sleep peacefully or more or less audibly. The American temperament seeks more active and exciting forms of relaxation. Gambling is one which continues to flourish in some places despite all efforts to suppress or dampen it. Of course, some of the European spas likewise have been notorious for gambling in the past.

The manager of the picturesque old mountain resort of Bedford Springs, Pa., ruefully remarked that in years past whole families used to come to spend the summer "taking the waters" and resting in the peaceful atmosphere; now the children of these families come for week ends only, want dancing and sports and drive along the countryside visiting road houses. They have not learned how to relax and probably never will.

In addition to the changed habits of the modern generation, the economic depression after World War I has made itself felt in changing the frequency and the length of stay of old patrons' visits to the resorts. In order to make up for the lack of volume most of the larger resort hotels began to cater to large conventions. The arrival of carloads of pleasure bent executives or salesmen of insurance or automobiles certainly filled up the hotel but also raised havoc with its peaceful atmosphere when there was a staggering of revelers through the corridors in the wee small hours. The hotels endeavored to reserve whole wings for such visitors, but some of the old standbys disliked to give up their accustomed locations and preferred to go elsewhere to escape the turmoil. The result was a loss in the more steady clientele of the resort.

The report of the Baruch Committee summarizes as the causes for the decline of the spa resorts: (a) The undefined status of spas in relation to health and medical care. (b) Failure of spa resorts to fulfil their mission. They have not served, adequately, sufficiently large groups or enough different types of people. (c) The attempt to combine pleasure with health procedures, the former receiving more emphasis than the latter. (d) Inability of private owners to finance resorts without public assistance. (e) Short seasons. (f) Lack of correlated clinical facilities and well rounded diagnostic services.

#### THE MEDICAL PROFESSION AND THE SPAS

It is a well admitted fact that for a variety of reasons the medical profession of the United States has not taken much interest in American spas. Perhaps the principal among these reasons is that in medical schools the proper scope of spa and climate treatment is not being taught. Another important reason is that reliable information has not been available from sources which carry authority. In some of the places the spas have published claims regarding their value which are unfounded; this and the lack of good medical supervision and the growth of outright quackish practices in some places have served to antagonize directly the medical profession.<sup>7</sup> There were not enough constructive efforts on the part of the management and the physicians of the few high class spas to counteract these adverse influences. No wonder that in spite of the generally accepted value of the continental spas and the large host of patients streaming there yearly, with or without medical advice, the sentiment of most American physicians toward our own spas has been that of more or less indifference. Except holding occasional medical conventions in one or two of the social resorts, little interest was taken on the part of organized medicine to become acquainted with the spas.

Efforts to change this undesirable situation came in 1936 and 1937 when a group of members of the American Congress of Physical Therapy made study trips through a number of Eastern and Midwestern spas, and at the 1937 annual session of the congress a Committee on Spas and Health Resorts was appointed to survey the spa situation. The committee sent a questionnaire to 152 places and received 70 replies, and its recommendations<sup>8</sup> to improve the status of the spas included discouragement of the use of unfounded claims and testimonials, encouragement of proper medical supervision with clinical and laboratory studies of their natural resources and their application in treating

8. Report of the Committee on Spas and Health Resorts, American Congress of Physical Therapy, *Arch. Phys. Therapy* 20: 42 (Jan.) 1939.

patients in order to establish sound indications, and encouragement of presentation of established facts to the medical profession by lectures on hydrotherapy, balneology and climatology in medical schools by presentation of papers covering such subjects at medical meetings and by invitations to physicians to visit and inspect the individual spas and climate resorts. It also recommended development of facilities for use of spas and climate resorts at a cost within the reach of persons with moderate means.

Following the publication of this report and chiefly owing to the efforts of the great therapist the late Dr. Bernard Fantus, who accompanied the congress committee on one of its trips, the American Medical Association appointed in 1939 a Committee on Health Resorts. After three years of labor this committee published in 1943 and 1944 fourteen articles on the various aspects of American health resorts but had as yet no specific recommendations. On the other hand, the Baruch report made a number of recommendations under the heading of Hydrology and Health Resorts, such as the formation of a hydrotherapeutic center for basic and clinical research, changes in medical curriculums and the establishment of graduate and "refresher" courses in physical medicine and particularly hydrology, as well as the establishment of fellowships and grants-in-aid of research in hydrology.

Action on these well based recommendations undoubtedly will promote the science of hydrology and the interest of the medical profession in spa therapy. There is much need for clearcut studies of the role of the mineral content of the waters as a potent factor in spa therapy as well as that of a well directed physical treatment and dietetic regimen as part of the spa routine. It takes a well grounded and well experienced general therapist and diagnostician to evaluate and to employ successfully for the individual patient all agencies of a spa regimen. However, because of the many factors involved much more has to be done besides advancing the science of hydrology and balneology. In order to give spa therapy a new lease on life. It would be of little use to produce scientifically trained balneologists when there is no public demand for their services and when the management of spas does not find it desirable to offer specialized medical service and to keep therapeutic facilities on a high standard.

#### PRESENT AND FUTURE POSSIBILITIES OF AMERICAN SPAS

The American hospital system, admired the world over, insures skilled and dependable care to rich and poor alike. Health resorts could form another important link in our health system when they are developed to the same high standards. There are great possibilities for well organized and well directed health resorts in every part of the American scene to help large numbers of sufferers from chronic illness and to recondition those who are simply worn out and tired.

The usefulness of a spa regimen is well established<sup>9</sup> in acute and chronic gastric disease, in catarrhal diseases of the gallbladder and milder forms of colonic irritation, in various forms of kidney and gallbladder disease, in catarrhal disorders of the respiratory tract, in many forms of heart disease, in most forms of chronic arthritis and in rheumatic disorders of muscle nerves and tendons, and in some metabolic and skin disorders. Spa therapy has also been proved of immeasurable value to people exhausted after acute illness or operation. Hence

the increasing employment of spa treatment in recent years for convalescent care.

Spa treatment is for the first time being employed on a large scale in the United States for service personnel affected by the present global war. In recent months the Army, Navy and Public Health Service have taken over a number of spas and climatic resorts to serve in the military rehabilitation program.<sup>10</sup> Among the new army establishments are the Ashford General Hospital at White Sulphur Springs (the former Greenbrier Hotel), the Station Hospital, Camp Carson, Colorado Springs, Colo., the Fitzsimons General Hospital, Denver, the Percy Jones General Hospital, Battle Creek, Mich. (the former Battle Creek Sanitarium), the well known Army and Navy General Hospital at Hot Springs, Ark., and establishments at Tucson, Ariz., Miami, Fla., and Asheville, N. C. The Bureau of Medicine and Surgery of the Navy has established a naval convalescent hospital at Glenwood Springs, Colo., and hospitals at Asheville, N. C., Yosemite, Calif., and Sun Valley, Ida. The Veterans Administration contemplates establishing hospitals at Saratoga Springs, N. Y., Hot Springs, Salt Lake, Utah, Hot Springs, S. D., Bay Pines, Fla., and Mineral Wells, Texas.

It is safe to assume that the utilization of the spas for purposes of military rehabilitation will serve as a potent stimulus for their future similar use in civilian life. Spa resorts should be used in the future as health centers to raise the level of fitness in those who are free from disease and will be benefited by quiet and leisure to enjoy and appreciate nature or by those who need recuperation from the hectic pace of metropolitan life. In the expected large scale extension of social and health insurance every member of the community should have an opportunity to take advantage of spa treatment instead of the privileged classes. This would add a large number of prospective users of spa and climatic resort treatment.

#### TASKS AND PROBLEMS AHEAD

In order that American spas may succeed in rendering a high standard of service in the years of national reconstruction to follow, a long range nationwide program under proper leadership is desirable, effecting a change in the present attitude of the medical profession and the public and enlisting the cooperation of the various communities and authorities. The economic status of the resorts must also be improved.

From the medical point of view the carrying out of the recommendations of the committees of the American Congress of Physical Therapy and those of the Baruch Committee is of primary importance in overcoming the lack of information of the large part of the medical profession and in generally raising the status of balneotherapy. After the war there will be many medical men available with a good basic knowledge in general medicine, physical therapy and rehabilitation who will make good material for further training as spa physicians. There will be likewise many good physical therapy technicians, women and men, looking for opportunities to continue their work in rehabilitation. It would be up to a centralized agency to look out for the additional training and placement of these physicians and technicians.

For the information of the medical profession and for the protection of the public, there needs to be a medical authority which could pronounce a spa as an "approved" one, after meeting certain requirements.

9. McClellan, Walter S.: New Trends in Treatment of Chronic Diseases: Experience in Spa Therapy, *Ann. Int. Med.* 18:525 (May) 1943.

10. The Utilization of Health Resorts for Military Reconstruction, editorial, *J. A. M. A.* 123:564 (Oct. 30) 1943.

Such an authority already exists in the Committee on Health Resorts of the American Medical Association. This committee provided in 1942 official listing of American health resorts. The pertinent rules relating to listing are:<sup>11</sup>

*Claims and Advertising.*—The claims made for a resort must be acceptable to the Committee, and all advertising material must be presented with applications. A resort will not be listed or retained if the management makes unwarranted, exaggerated or misleading statements in any of its advertising.

*Medical Supervision.*—Medical supervision must meet with the approval of the Committee and must be of such character as to place proper safeguards about the patient to protect him from mistreatment or dangerous treatment. Institutions which permit attendants or technicians to alter or supplement a physician's prescription or to prescribe treatment without restrictions or medical supervision will not be listed. An institution applying for listing will be scrutinized most carefully as to the character of the safeguards placed about the patient by way of medical supervision and the efficiency and good faith with which the rules governing these needs are enforced.

*Inspection.*—An institution which makes application cannot be given formal consideration until it has been inspected by an inspector designated for the purpose by the Committee.

*Removal from List.*—If in the opinion of the Committee a listed institution fails to live up to the letter and spirit of these rules or engages in practices contrary to established scientific procedure, the Committee may remove the institution from the list.

In spite of the opportunity offered to all resorts to be listed, so far only one institution has received approval and listing.<sup>12</sup>

In England the British Spa Federation<sup>13</sup> in 1939 laid down the following requirements for the spas which are admitted to membership in that body:

1. The possession of natural mineral waters which possess a definite therapeutic value.
2. The existence of sufficient bathing and "pump room" accommodation.
3. The residence in the particular town of medical men who specialize in spa treatment.
4. Suitable hotel and boarding house accommodation.
5. Treatment must be given under the direction of properly qualified medical men.
6. The amenities and sanitary conditions of the town must be duly approved by the Federation.
7. The spa must be under municipal or other approved control.
8. The chief activity of the spa must be the provision of facilities for spa treatment.

A Federation of American Spas should have been formed a long time ago for cooperation of spas to safeguard ethical standards in operation and publicity. The difficulty confronting the planning for a nationwide organization of spas is the previously described differences in setup and economic backgrounds of the various spas under federal, state or municipal control and those privately owned. But with the proper spirit for rendering public service on a high medical and ethical plan and to disseminate information relating thereto, such an organization can be effected. There would seem to be also a role for another national organization, an independent council or foundation which may advise and assist spas to become more useful regionally or nationally, help them in securing medical and technical staff of acceptable standards, and assist in research and

also in education of the public and the medical profession. A campaign of education regarding health resorts—once they are established in accordance with desirable standards—would enable the average American citizen to appreciate the possibilities of spa therapy and could be best carried on by such an independent organization, possibly under the auspices of the Baruch Committee.

It is self evident that the success of the spas in rendering health service is dependent on their stable economic foundation. Simons<sup>14</sup> states that the medical and professional phase of spa operation is closely involved at every point with the business side and points out that the overwhelming majority of chronic and convalescent patients are not in the income classes from which the majority of present spa patrons come. This would raise the fundamental question whether spas should be publicly owned and operated or privately operated. The report of the Baruch Committee extols the success of public ownership in conjunction with private medical practice at Hot Springs, Ark., and Saratoga Springs, N. Y. New York State has made a capital investment of nine million dollars in Saratoga Spa and, in spite of the considerable income from bath houses, spends over a quarter of a million dollars tax money for yearly maintenance. This is an example of munificence which not many states can follow. Yet there is no reason why in a number of states some sort of a subsidy could not be granted to spas endorsed by the medical profession and by welfare organizations on the basis of free services to some of the indigents of the state. However, unless the present American system of free enterprise is definitely abandoned in favor of a socialistic form of government, the idea of a health system resting on general taxation does not appear to be warranted. Under a state or federal system of fully tax supported spas the majority of people would pay for benefits offered to only a few.

In order to derive funds for spa maintenance and improvement from those directly benefited by the spa, a small tax collected from all spa visitors would seem worth considering. Such a system of taxation has been in operation for many years in most spas abroad, in the form of a "cure tax"; it is collected from every visitor to a spa, graded according to the type of accommodation and the length of stay. After the present era of taxation for everything, there may be less opposition in the United States to this form of taxation, especially when it is known that its proceeds provide civic improvements, landscaping, concerts and the like.

Provisions for those of moderate or very limited income could be made at many spas under the existing system in the large institutions by providing smaller units to furnish service at moderate costs. This is being done at present at Saratoga Springs. Smaller spas, because of the lessened overhead expenses, could easily develop facilities to persons with moderate means. It would seem desirable that, in future health and accident social insurance schemes, provisions should be made which will enable suitable patients to receive spa treatment in regionally designated centers, just as the present war injured are taken care of at spas.

The local community of every health resort should be made aware of the fact that, when properly conducted, a health resort constitutes an important asset to the community, the same as a hospital. It is also a desirable economic asset through the influx of visitors spending money. The cooperation of a local citizens' commit-

tee could be sought to carry on such civic improvements as will make the surroundings of such places attractive and conducive to rest and recreation. Leading physicians should be included in such committees, and the active help of local medical societies should be sought in all matters pertaining to examination and treatment of all seekers of health. With such cooperation, funds for proper development of some of the smaller resorts will be easier to obtain and there may develop a friendly rivalry between communities boosting their health resorts.

## COMMENT

The solution of the problem of the spas is a difficult one because of the many conflicting medical, social, economic and political issues. Improving the medical situation is perhaps the most clearcut issue but in meeting it the advancement of balneology and the creation of a simple supervising agency is not sufficient. If spas are not to be left drifting along with the ultimate survival of the fittest there must be a general advisory and driving force organized either by the spas themselves or by a friendly outside agency. Only by a well guided cooperation of the medical profession the public and the authorities concerned can a gradual, nationwide raising of the general status of American spas be achieved and their desirable role as part of a national health system be fully developed.

## Clinical Notes, Suggestions and New Instruments

### RECURRENT PNEUMOCOCCIC MENINGITIS FOLLOWING SULFONAMIDE THERAPY

DANIEL H. LABBY, M.D., NEW YORK

Pneumococcic meningitis in the past has been an extremely fatal condition, a review of cases recorded before 1937 revealing only 185 cures in the entire literature.<sup>1</sup> This discouraging situation has been greatly modified by the use of chemotherapeutic agents. The wise use of sulfonamides early in pneumococcic pneumonia and other pneumococcic infections has prevented an undetermined number of meningeal complications, and the intensive use of these drugs has resulted in many apparent cures of well established pneumococcic meningitis. In addition it appears that occasionally the use of sulfonamide drugs may result in arrest of meningeal manifestations without cure, and that temporary remissions may be followed by relapses displaying typical signs of meningitis of greater or less severity. This relapsing form of pneumococcic meningitis may be regarded as a new clinical phenomenon which has thus far been reported in only 3 cases<sup>2</sup> and in each instance after more or less extensive use of sulfonamide drugs. Attention was focused on it by observation of the following case:

R. M., a man aged 55, Italian, a waiter, seen at the New York Hospital in 1943, had sustained a skull fracture fourteen years before, while still in Italy. There was bleeding from the ears, nose and mouth and unconsciousness for twenty-four hours, but after two weeks' hospitalization he was discharged as well, except for complete deafness in the left ear. He remained healthy for the next thirteen years. In November 1942 while on a hunting trip he was seized suddenly and without prodromes by a severe generalized headache, with vomit-

ing and a temperature of 105 F. For four days he was irrational and was then taken to a local hospital, where some sulfonamide compound was administered. In ten days he felt entirely well and was able to go home. Ten days later, however, he developed another attack which he described as identical to the first. Again he was given a sulfonamide drug by his local physician and within three days the attack had subsided. For the next two months there were recurrent attacks at almost regular ten day intervals. Each relapse seemed to begin after sulfonamide therapy had been discontinued. At irregular intervals during this period he took daily doses of approximately 3 Gm. of a sulfonamide. In February 1943 a particularly severe attack which remained untreated for two days subsided promptly when a sulfonamide drug was given.

For the next four months he remained completely free of meningeal symptoms but on June 28 and again on July 25 there were minor attacks, which responded quickly to sulfonamide. He was first seen in our clinic in August 1943; at that time physical examination and an x-ray examination of the skull were entirely negative. An audiogram revealed complete loss of hearing in the left ear and an electroencephalogram revealed minor abnormalities.

On Sept. 1, 1943 he was suddenly seized with a severe headache accompanied by fever and vomiting, soon followed by

Fig. 1.—Hospital course, September 1943.

disorientation. This led to admission to the New York Hospital, where examination revealed a stiff neck with positive Kernig and Brudzinski signs, a temperature of 39 C. (102.2 F.), respirations of 40 per minute and a blood pressure of 150/75 (fig. 1). Blood count showed 10.5 Gm. of hemoglobin, 4.9 million red blood cells and 19,100 white cells with 18 per cent lymphocytes, 2 per cent monocytes, 62 per cent mature and 18 per cent immature polymorphonuclear leukocytes. The urine was clear, Mazzini test negative, blood urea nitrogen 13 mg. per hundred cubic centimeters. The spinal fluid was under pressure of 170 mm. and contained 5,020 white cells, of which 94 per cent were polymorphonuclear leukocytes and 6 per cent lymphocytes. No organisms were seen and none grew out on culture.

The patient was immediately placed on sulfadiazine 2.5 Gm. intravenously every four hours, with 1.8 Gm. of sodium bicarbonate by mouth. Blood levels of sulfadiazine were maintained between 7 and 10 mg. per hundred cubic centimeters and within two days the temperature had fallen to normal (fig. 1). A spinal tap done on the fourth hospital day revealed 252 white cells: 66 per cent polymorphonuclears and 34 per cent lymphocytes; again no organisms were recovered. Because the white blood cell count fell to 3,000 on the fifth hospital day, sulfadiazine was discontinued for one day but was resumed twenty-four hours later, when the count was 7,300. On the sixth hospital day the spinal fluid showed only 21 lymphocytes and the patient continued to feel well. Chemotherapy was continued until the ninth hospital day. At that time because an

2. Hopkins, Hatch, Schenck and Pepper.<sup>1</sup> Elvidge and Roseman.<sup>2</sup> Craddock and Bowers.<sup>3</sup>

x-ray examination of the paranasal sinuses was interpreted as revealing a right frontal sinusitis with possible surrounding osteomyelitis, a right external frontal sinusotomy was performed. No pus was encountered, and only a few shreds of loose granulation tissue extending up from the ethmoidal region were seen. The left sinus could be inspected and was found

Fig. 2.—Hospital course, November and December 1943.

to be in good condition. The posterior plate of the frontal sinus was not removed. The patient made an uneventful recovery without further therapy. On the seventeenth and again on the twenty-first hospital day purulent material was irrigated from both maxillary antrums. This later proved on culture to contain *Staphylococcus aureus* hemolyticus and *Hemophilus influenzae*.

The patient was discharged on the twenty-first hospital day and reported to the ear, nose and throat clinic for further sinus irrigations on two more occasions. Nine days after discharge on Oct. 1, 1943 signs of meningitis recurred but promptly responded to 1 Gm. of sulfadiazine, which he took every four hours while at home. Each of three subsequent

Fig. 3.—Hospital course, Jan. 29 to Feb. 16, 1944.

episodes of similar character were effectively controlled by self-administered sulfadiazine. A severe persistent headache following the last attack was the reason for readmission to the New York Hospital on Nov. 22, 1943 (fig. 2). Examination at that time revealed a temperature of 37.2 C. (98.9 F.). The patient exhibited a stiff neck and complained of a severe generalized headache but was completely oriented. The white

blood cell count was 9,700 and lumbar puncture revealed a pressure of 190 mm. with 132 white blood cells, of which 10 per cent were polymorphonuclears and 90 per cent lymphocytes. Gram positive diplococci were seen on smear and later proved to be type 29 pneumococci. Sulfadiazine therapy was resumed, but on the second hospital day despite a sulfadiazine blood level of 14.5 mg. per hundred cubic centimeters the temperature rose abruptly to 39.4 C. (102.9 F.) and signs of meningitis again appeared. The white blood cell count was 18,000, and a spinal tap revealed 1,200 white blood cells, of which 85 per cent were polymorphonuclears and 15 per cent lymphocytes. The type 29 pneumococcus was again recovered from the spinal fluid. Sulfadiazine was continued vigorously with blood levels varying from 13 to 18 mg. per hundred cubic centimeters and by the fifth hospital day his temperature had fallen to 36 C. (96.8 F.) and the white blood cell count to 11,600. At this time the patient felt well, but two days later the temperature rose abruptly to 39.4 C. (102.9 F.) despite a sulfadiazine blood level of 15 mg. per hundred cubic centimeters but fell to normal within twenty-four hours. This experience was repeated on the tenth hospital day, and at this time 2 cc. of 0.5 per cent methy-

Fig. 4.—Mild dilatation of third and lateral ventricles without shift or displacement.

lene blue was injected through a lumbar spinal needle. Careful observation of the upper respiratory passages failed to reveal the dye, which might have indicated a communication from the subarachnoid space. Tests of the nasal secretions revealed no sugar, which might have indicated a cerebrospinal fluid rhinorrhea. For the next three weeks the course was asymptomatic with normal temperature and white blood cell count. On the twentieth hospital day the spinal fluid showed normal pressure and 4 lymphocytes; it was sterile on culture. The Francis test with type 29 SSS was negative. Cultures of washings from the nose and throat and sinuses contained no pneumococci.

The patient was finally discharged on the thirty-second hospital day, with directions to take 1 Gm. of sulfadiazine four times each day. He remained entirely well until three weeks after discharge, when the removal of two abscessed teeth apparently precipitated another attack of acute meningitis. At the time of the recurrence he was taking 3 Gm. of sulfadiazine per day. Increase of the dose to 4 Gm. was followed by prompt subsidence of symptoms. One week later, however, the patient was again admitted with a temperature of 39.4 C. (102.9 F.), a white blood cell count of 15,900 and the signs of severe meningeal involvement (fig. 3). A spinal tap revealed 983 white cells, of which 46 per cent were polymorphonuclears and 54 per cent lymphocytes. Gram positive diplococci were seen on smear, and these later proved on culture to be the type 29 pneumococcus.

It was decided to use penicillin, which was given in four doses each of 10,000 units intrathecally over the next forty-eight hours. His temperature and white blood cell count promptly fell to normal, his symptoms subsided and spinal fluid cell count fell to 23 cells with 90 per cent lymphocytes and 10 per cent polymorphonuclears. A pneumoencephalogram was performed on the sixth hospital day. Because of the possibility of a brain abscess, a focus of pus that might be disturbed by the procedure, the patient was given 60,000 units of penicillin intramuscularly over the twenty-four hours immediately before and after the procedure. A rise in temperature to 39.4 C. (102.9 F.) followed, but there was neither stiff neck nor Kernig sign. There was mild headache, a reaction anticipated with this type of procedure. With no further therapy the temperature returned to normal within thirty-six hours and remained so for the next nine days. The pneumoencephalogram revealed only mild dilatation of the third and lateral ventricles without shift or displacement (fig. 4). This was interpreted as a mild internal hydrocephalus due to the chronic arachnoiditis from the long standing recurrent meningitis. The patient was discharged on the eighteenth hospital day entirely well. X-ray films of the sinuses revealed a pansinusitis with a right frontal sinusitis and surrounding osteitis. Repeated cultures of the sinuses and upper respiratory passages failed to reveal any pneumococci. The patient recently had several teeth removed, for which he was given a short course of sulfadiazine prophylactically. No complications developed and there was no headache or stiff neck. Cultures of the tooth roots have produced no pneumococci to this time. One year after the last attack and the penicillin therapy the patient has remained well and entirely without symptoms of meningitis.

## COMMENT

Although the clinical course of this illness could best be explained by the periodic discharge of infectious material into the subarachnoid space from some focus of a type 29 pneumococcus either as an abscess within the brain or meninges or in the sinuses and upper respiratory passages, such a focus was not demonstrable, and localizing neurologic signs never appeared. A review of the reported experiences with brain abscess in the literature failed to produce a case with a clinical course similar to ours. It seemed possible but unlikely that the skull fracture thirteen years before might have been significant, but no communication between the meninges and the respiratory tract through a definite fracture could be demonstrated.

In the case reported by Elvidge and Roseman<sup>3</sup> there was a compound fracture with its opening into the frontal and ethmoidal sinuses. This communication afforded opportunity for infection of the meninges by a type 23 pneumococcus soon after the fracture occurred. The subsequent course was marked by two recurrences with eventual cure after the use of specific antiserum and sulfapyridine. It is of interest that these observers were unable to recover the organism from the spinal fluid at the time of the first recurrence, though it was obtained at the time of all the other attacks. A case of recurrent meningitis due to a repeatedly recoverable type 34 pneumococcus was recently called to our attention from the Bellevue Service of Dr. William S. Tillett.<sup>4</sup> His patient had sustained a skull fracture two years before and, although no communication or defect was demonstrable, a lesion was detected in a lumbar vertebra by x-ray suggesting a bone abscess of osteomyelitis. After numerous recurrences, each following the cessation of sulfonamide therapy and each controlled by resuming sulfonamide, the patient was given penicillin intravenously. He experienced a remission, then relapsed and was given a combination of 120,000 units of penicillin and sulfadiazine and had no further attacks for several months. He finally disappeared and was not seen in the clinic again. Craddock and Bowers' case<sup>5</sup> was unassociated with any fracture or demonstrable focus and yielded

a type 17 pneumococcus from the spinal fluid on the first admission, but at the time of the second attack forty-one days later the spinal fluid was sterile. The third attack occurred 129 days later and at that time a type 28 pneumococcus was recovered. With the fourth and final attack 136 days later the spinal fluid was again found to be sterile. In our own case we were able to obtain the type 29 pneumococcus on all except the first hospital admission. In a report by Hopkins, Hatch, Schenck and Pepper<sup>1</sup> a type 18 pneumococcus was recovered from the spinal fluid during each of three attacks of meningitis developing in the course of an acute respiratory infection with sinusitis. Eventual cure was associated with vigorous combined sulfonamide and specific serum therapy.

It cannot be proved that our patient had simple exacerbations of meningitis from a possible dormant focus, since the spinal fluid was not cultured and the patient was not observed with each recurrence. Indeed, on the first admission the spinal fluid yielded no organisms in the midst of a severe attack. However, the number of attacks, their repeated character and their probable relation to withdrawal from chemotherapy discourages the concept that the patient was experiencing many separate infections. A comparison of our experience with that from the literature reviewed indicates that our case has had a unique course both in the fact of its sixteen months duration and the undeterminable number of recurrences. The problem of this patient's immunity is therefore of great interest. Since there was no demonstrable antibody to the type 29 pneumococcus despite the patient's long role as a host, his recurrences probably cannot be presumed to represent variations in antibody strength. In addition, after continued sulfonamide therapy over a sixteen month period the organism remains sulfonamide sensitive by clinical as well as in vitro laboratory tests. The three recurrent attacks of meningitis in a setting of good blood levels of sulfadiazine at first suggested the possibility that the organism had become sulfonamide resistant.

It has been proposed recently by Mirick,<sup>6</sup> MacLeod<sup>7</sup> and others<sup>8</sup> that within single pneumococcus types there exists both sulfonamide sensitive and resistant subvarieties or that in the course of sulfonamide therapy of an otherwise sensitive type a resistant variety develops. Despite the opportunity for the breeding out or development of a resistant strain, such has not occurred. Since sulfadiazine is less effective in pneumococcal meningitis than in other pneumococcal infections, presumably because of its general ineffectiveness in the presence of pus, penicillin was considered a more desirable therapeutic agent at the time of the patient's last admission to the hospital. Although at that time we were unaware of Tillett's experience with penicillin in a similar case<sup>4</sup> there is some degree of parallelism in the final outcome in both his case and ours. In light of the recent experience of Waring and Smith,<sup>9</sup> in which the possible value of combined penicillin and sulfonamide therapy was demonstrated in 11 out of 12 cases of pneumococcal meningitis, it is of interest that the successful outcome of our case finally depended on the use of penicillin alone.

Perhaps too little time has elapsed since the penicillin treatment of the last attack in our patient to be certain that the attacks have been completely eliminated, although it is now one year, the longest free period the patient has experienced since onset.

## SUMMARY

A man aged 55 who had sustained a skull fracture in 1929 had his first attack of meningitis thirteen years later. This responded to sulfonamide therapy but recurred when therapy was stopped. For the following sixteen months there were

# FAILURE OF MAPHARSEN AS AN ADJUVANT TO ATABRINE IN THE TREATMENT OF RELAPSING TERTIAN MALARIA

MAJOR CALVIN F. KAY  
MEDICAL CORPS, ARMY OF THE UNITED STATES

During the summer and fall of 1943 a very large number of American soldiers stationed in the Far East developed malaria. During the period from the following January until the end of May the incidence of primary attacks of malaria dropped to an almost negligible figure, but patients continued to be admitted in considerable numbers with relapsing tertian malaria. Some of these men had been hospitalized and treated with various standard antimalarial courses five or more times within the preceding few months. Relapsing malaria was a serious menace to the efficiency of the men and their organizations and a burden on the medical installations. An ideal opportunity was presented to observe relapsing tertian malaria during a period in which the confusing factor of reinfection was practically negligible and to test the efficacy of a different form of therapy in this disease.

Intravenous arsenical therapy has been used for years in India and elsewhere for relief of the clinical symptoms of tertian malaria. It is known that the benefit, though dramatic, is temporary. Recrudescence of the clinical symptoms and reappearance of the parasites in the blood occur quickly and with great regularity. These observations were confirmed in this hospital in a small group of patients treated with mapharsen or neoarsphenamine. Furthermore, we observed 3 instances in which tertian malaria developed repeatedly in patients being treated with mapharsen for syphilis. With this evidence it appeared unlikely that mapharsen or neoarsphenamine, either in a single dose or in repeated doses of the magnitude employed in the treatment of syphilis, would cure tertian malaria. There remained the possibility that it might cure relapsing tertian malaria when used in combination with atabrine.

## METHOD

From Jan. 10, 1944 to March 25, 1944 all patients admitted to a general hospital with clinical malaria in whom *Plasmodium vivax* was demonstrated were placed in one or the other of two groups. Those admitted to certain of the medical wards were treated with atabrine alone; those admitted to the remaining wards were treated with atabrine and mapharsen. Assigning wards to the respective wards was completely unselected. The rarely occurring primary cases and the personnel of transient organizations, in whom it was predicted that follow-up would be difficult or impossible, were not included in the groups. In a few instances it was later necessary to drop patients from the groups because of transfers to other areas. The 176 patients of the two groups were followed until a relapse occurred or until May 30, 1944, when all patients in whom no relapse had occurred were contacted and, where possible, smears were obtained.

There were 109 cases in the atabrine group. Each was treated with 0.2 Gm. of atabrine every six hours for five doses, then 0.1 Gm. three times daily for six more days, a total of 2.8 Gm. in eight days, as recommended by the Surgeon General (Circular Letter No. 153, Aug. 19, 1943).

The 67 cases in the atabrine-mapharsen group were treated with atabrine as described. In addition a total of 0.160 Gm. of mapharsen was given intravenously in three doses of 0.04, 0.06 and 0.06 Gm. on the third, fifth and eighth days of atabrine therapy.

In this investigation mapharsen was administered under the direction of Clarence S. Livingood, Major, M. C., Chief of Section, Dermatology and Syphilology.

## RESULTS

Clinical malaria relapses, with the diagnoses confirmed by positive smears, occurred in 81 patients, or 74.3 per cent, of the atabrine group, and in 48 patients, or 71.6 per cent, of the atabrine-mapharsen group. The figures would be somewhat higher in both groups with the addition of asymptomatic patients with positive smears at the end of the follow-up period.

From the time of admission for treatment of the malaria attack included in this series, all patients were followed for at least sixty-five days, some for as long as one hundred and forty days. Approximately two thirds of the cases were followed for more than ninety days unless a relapse had already been observed. A longer period of observation would have been desired but was not possible because at the time of conclusion of the study new malaria infections were beginning to rise to significant levels, and by prolonging the period of observation relapse would have become confused with reinfection.

The accompanying chart illustrates the time interval from admission to the hospital for treatment to subsequent readmission for each group. Very early relapses, before the fortieth day, developed only in the atabrine group. A sharp rise then occurred, peaking in the fifty to sixty-five day period, then falling off abruptly by the seventieth day.<sup>1</sup> Relapses, in general, occurred slightly earlier in the atabrine group (median fifty-one days) than in the atabrine-mapharsen group (median fifty-seven days).

Relapsing tertian malaria: time interval from clinical onset of relapse to onset of subsequent relapse in 81 patients treated with atabrine 2.8 Gm. and in 48 patients treated with atabrine 2.8 Gm. plus mapharsen 0.16 Gm.

No objective differences in the character of the acute attack were noted. Those patients who received the mapharsen during the early period of guarded optimism noted what might be described as "tonic" effects. Later, when neither the patient nor the physician had confidence in its curative value, these "tonic" effects were no longer observed.

## SUMMARY

1. Relapsing tertian malaria was observed in a group of 176 patients during a period in which new malarial infection did not occur in significant incidence.
2. Of these, 109 were treated with atabrine, 2.8 Gm. in eight days; 74.3 per cent of these again developed clinical malaria during the sixty-five to one hundred and forty day period of observation.
3. The other 67 were treated with atabrine as described, plus mapharsen 0.160 Gm. in three doses; 71.6 per cent of these relapsed.
4. Very early relapses occurred more frequently in the atabrine group, and the mean time of relapse interval was slightly shorter than in the atabrine-mapharsen group.
5. It is concluded that mapharsen in the dosage administered is of no practical value as an adjuvant to atabrine in the treatment of relapsing tertian malaria.

1. As 100 per cent of the cases were followed for sixty-five days or longer, and 93 per cent for seventy days, a longer follow-up should have greatly influenced the composition of the figure.

## Council on Foods and Nutrition

### SPECIAL ARTICLE

*This is the first of a series of articles discussing the significance of protein nutrition in health and disease. This material was prepared by the authors at the request of the Council and has been authorized for publication.*

## PROTEIN: ITS ROLE IN HUMAN NUTRITION

### INTRODUCTION

FREDRICK J. STARE, Ph.D., M.D.

AND

CHARLES S. DAVIDSON, M.D.

BOSTON

Good nutrition for an individual implies that he receive and utilize a suitable metabolic mixture of all substances necessary for health. This can be obtained only from food selected, processed, prepared, consumed, absorbed and utilized so that it furnishes in optimal amounts the individual's essential nutrients. Such a diet must contain protein, fat, carbohydrate, certain minerals and vitamins, and water in optimum amounts. The optimum allowance which is recommended for each nutrient should be much greater than the minimum requirement of that nutrient. That is, provision must be made not only for actual requirements but also for variations from the "normal" both in health and in disease, for the accumulation of some "reserves" and for differences in actual food intake due to food habits, individual tastes and variations in economic status.

Lewis<sup>1</sup> has recently reviewed much of our knowledge of proteins. They are the principal nitrogenous constituents of all plant and animal tissues. They are essential constituents of both the protoplasm and the nucleus of cells and are the main organic constituents of the muscle and glandular tissues of the body. They are important in the osmotic relations between intracellular and extracellular fluid. The individual structure and function of the body tissues depend to a large extent on the presence of specific proteins, such as the enzymes, hormones and antibodies.

### DIGESTION, ABSORPTION AND METABOLISM OF PROTEIN

Chemically, proteins are large complex organic molecules, consisting of amino acids linked together. In the process of digestion these large molecules are broken down into simpler chemical units (polypeptides) and ultimately into the component amino acids, which are still smaller molecules. The amino acids are then absorbed and enter the portal and general circulation. Indeed, after a meal rich in protein there is a temporary rise in the blood amino acid concentration. Depending on the state of the individual's nutrition, a part of the absorbed amino acids is used for replacing and building body and plasma protein, and the remainder is deaminated, chiefly by the liver, with the formation of carbohydrate and the production of nonprotein nitroge-

nous products, which are excreted in the urine. Therefore the urine nitrogen represents the sum of that derived from body protein breakdown (endogenous) and that derived from the food protein used for energy and not for building body tissues (exogenous). About half of the amino acid molecules after deamination are changed to carbohydrates.

Plasma proteins are of at least two distinct varieties, the albumins and the globulins, separated chiefly by the former's greater solubility in water. Recently the electrophoretic method of Tiselius<sup>2</sup> has served to characterize these two fractions more clearly and has further enabled the separation of several globulin fractions. The globulin fractions are fibrinogen and the alpha, beta and gamma globulins. Each of these fractions has certain characteristic physical properties and is associated usually with specific physiologic functions. For example, circulating antibodies are found chiefly in the gamma globulin fraction, whereas prothrombin, essential for the clotting of blood, is found chiefly in the beta globulin fraction.<sup>3</sup>

The globulin fractions exert less than one fifth of the osmotic effect of albumin, and it is not usual for the globulin fractions to be changed significantly with changes in protein nutrition. The albumin is the plasma protein which first becomes reduced in protein deficiency. Likewise in plasma protein loss, such as into exudates from burn surfaces, or into the urine as in nephrosis, it is the albumin which is most affected. Thus severe depletion of body proteins may eventually be reflected in the blood by a fall in the plasma albumin concentration. However, it should be emphasized that a measurable fall in plasma albumin concentration occurs only after a pronounced loss in body proteins. When a low blood albumin concentration develops, body protein depletion must be suspected. The critical level of plasma albumin below which edema usually occurs is given by Bruckman and Peters<sup>4</sup> as 3 per cent. Certain situations, as for example anemia, may modify this critical level for it is well known that edema may occur with plasma albumin levels greater than 3 per cent.

The plasma proteins are largely manufactured in the liver,<sup>5</sup> especially fibrinogen and albumin.<sup>6</sup> The globulins may be synthesized, at least in part, by the reticulo-endothelial system.<sup>7</sup>

### NITROGEN BALANCE

An individual is considered to be in nitrogen equilibrium when the nitrogen intake is equal to the nitrogen excretion over a period of several days. Nitrogen intake is derived from ingested food, though recently proteins and their hydrolysates have been given parenterally. Nitrogen loss is chiefly in the urine as non-protein nitrogen. The loss of nitrogen in the stool of a healthy adult is relatively constant, even with ordinary changes in diet. However, the amount of nitrogen in the stool may increase considerably following the ingestion of certain proteins which are not well utilized. In cases of poor intestinal absorption

and when diarrhea is present, an increase in stool nitrogen may also occur. Even the ingestion of large amounts of nonprotein roughage may increase the loss of nitrogen into the stools. Loss of nitrogenous products from wounds and from other suppurating lesions must be taken into consideration in balance studies. A sudden clearing of an increased nonprotein nitrogen of the blood into the urine may further disturb equilibrium conditions.

Negative nitrogen balance exists when excretion of nitrogen is greater than the amount consumed. In the absence of extensive loss of protein, or incomplete absorption, a negative nitrogen balance means that increased catabolism of protein exists or ingestion has been inadequate.

A positive nitrogen balance, that is, a greater intake than excretion of nitrogen, indicates that utilization of nitrogen for building body tissues is occurring. Such a condition is found during active growth and after the existence of body protein depletion, when adequate diets are furnished. Individuals consuming low protein diets may remain in nitrogen equilibrium particularly if the amount of carbohydrate and fat in the food is sufficient to meet energy requirements. Even though sufficient to keep an individual in nitrogen equilibrium, a low protein intake cannot be considered optimal, or even safe for any length of time, for it does not furnish any elasticity for increased demands in the case of intercurrent illness or for small inadvertent changes in the diet. Furthermore, other nutrients such as certain minerals and vitamins of the B complex which are found with protein foods may also be consumed in amounts below the optimum. Thus nitrogen equilibrium per se does not necessarily represent desirable protein intake.

The treatment of body protein depletion, with or without hypoalbuminuria, depends on increasing the protein intake until the patient is in positive nitrogen balance and continuing such diets until the protein deficit is made up. Generally the more positive the nitrogen balance the shorter the time required for making up the deficit completely. In severe depletion of protein a long time may be required to make up the deficit. Albumin is regenerated at a rate of approximately 25 Gm. per day or more.<sup>8</sup>

Elman and his co-workers<sup>9</sup> have calculated that a reduction of 1 Gm. in the total circulating plasma albumin indicates a loss of 30 Gm. of body protein. For example, a 70 kilogram man with a plasma volume of 3,500 cc. and with 4.0 Gm. of albumin per hundred cubic centimeters would have 140 Gm. of total plasma albumin. A reduction in the plasma albumin concentration from 4 to 3.5 Gm. per hundred cubic centimeters would mean a reduction in the total plasma albumin from 140 to 123 Gm., or a loss of 17 Gm. If each gram represents, as Elman suggests, a loss of 30 Gm. of body protein, such a reduction of albumin from 4.0 to 3.5 Gm. per hundred cubic centimeters of plasma would represent a loss from the body of at least 510 Gm. of albumin. Return of the plasma albumin concentration to normal may occur before and often long before the body deficit is made up but is probably only temporary, and a prompt fall would probably occur if the protein intake should again be insufficient. Thus the

return to a normal plasma albumin indicates that the treatment is effective but not necessarily complete and that the high protein food intake must be maintained until normal weight and strength are regained.

#### PROTEIN AND AMINO ACID REQUIREMENTS

Some twenty-two nutritionally important amino acids have been identified. Of these ten have been shown to be essential for growth in the rat. Recent research has shown that at least eight are necessary for the maintenance of nitrogen equilibrium in young human adults for limited periods.<sup>10</sup> The term "essential" as applied to an amino acid means that body tissues cannot make that amino acid in sufficient amount to meet physiologic requirements, and therefore it must be obtained ready made from food. It also means that the amino acid in question is necessary for some essential physiologic process. The rate of growth, the maintenance of nitrogen equilibrium and the rate of regeneration of the plasma protein of an animal are the criteria that have been generally used to measure the essentiality of an amino acid. However, other methods of measuring the essential value of a given amino acid, based on specific physiologic function, may show a greater need for such amino acids over and above these requirements. Practically nothing is known of the quantitative requirements of each of the essential amino acids in man.

The biologic or nutritional value of proteins is dependent on their content of amino acids, particularly those that are essential. Generally speaking, proteins of animal origin which include not only those in meat, both from muscle and glandular tissue, but also those from milk, eggs, fowl and fish, are of higher nutritional value than the commonly used vegetable proteins, since they are "complete." That is, they contain all the essential amino acids. However, vegetable proteins supply many of the essential amino acids and in properly selected diets may supplement one another and result in the ingestion of adequate protein. Rats and dogs have been maintained in good health on diets in which the only source of protein has been of vegetable origin (wheat germ and corn germ).<sup>11</sup> Several studies with adult human beings have shown that nitrogen equilibrium and apparent good health may be maintained for relatively limited periods on low protein diets (0.5 Gm. per kilogram of body weight) when only about one tenth of the total protein intake is of animal origin.<sup>12</sup> The old custom of recommending that approximately half of our protein intake be of animal origin is not necessarily a good one. Man generally receives his protein from both animal and vegetable sources, the former from the flesh of various animals, particularly the cow, pig and sheep, and from milk, cheese and eggs, and the latter from the cereal grains, wheat, corn, rye and the legumes, such as peas and beans.<sup>1</sup> Variety in the choice of foods is good nutritional practice, and this is particularly true of protein foods because the amino acids of one protein may supplement deficiencies of another protein source and thereby furnish a sufficient quantity of the essential amino acids.

12. Sherman, H. C.: *The Chemistry of Foods and Nutrition*, New York, Macmillan Company, 1941.

Before the rationing of food in the present war it was not uncommon for persons to consume 150 Gm. of protein chiefly of animal origin per day. Eskimos and explorers of the arctic and antarctic regions consume large amounts of animal protein. There are many persons who state that subjectively they feel better on diets furnishing a high proportion of animal proteins. Soldiers and those doing heavy physical labor generally prefer large quantities of meat, partly because of its satiety value and also because meat furnishes fat and hence contributes effectively to energy. Meat also supplies many other essential nutrients. However, it is well established that the body requirements for protein per se are not increased by activity, provided sufficient carbohydrate and fat are fed so that the protein is not required for energy production.

Protein used for energy yields approximately the same number of calories per gram as does carbohydrate. However, if enough calories from nonprotein sources are not provided in the diet, amino acids will be used for energy and will not be available for the important anabolic reactions which require them; that is, the building of body proteins.

The amount of protein in diets in this country, as well as relative proportions of animal and vegetable protein, varies considerably. For some time physicians following Sherman's careful work<sup>13</sup> have recommended approximately 1 Gm. of protein per kilogram of body weight for optimum nutrition in the normal adult, with increases of half to twice as much in pregnancy, lactation, growth and even more in certain pathologic states, such as extensive burns and various diseases in which there is loss of protein or poor synthesis of plasma protein. It is well known that minimum protein requirements for the normal adult are much less, in fact probably not more than half of the recommended intake of 1 Gm. per kilogram of body weight. Thus Youmans and his co-workers<sup>14</sup> in studying the nutrition of a rural population in Tennessee found that many of their subjects had a daily protein intake far below 1 Gm. per kilogram of body weight. Three per cent had plasma protein levels below 6 Gm. per hundred cubic centimeters, and 9 per cent had plasma albumin levels of less than 4 Gm. per hundred cubic centimeters. That there is not more evidence of prolonged protein deficit in these people, as revealed by reduced plasma protein levels, is surprising when one considers that the diet was low in calories as well as in protein. It seems reasonable to conclude from this and similar studies that a comparable population may exist on a very low protein and caloric intake for some time without the frequent development of hypoproteinemia. In spite of the lack of hypoproteinemia, many of these persons may have had a gradually increasing body protein deficit.

From the practical point of view it is well to recall that most foods rich in protein furnish nutrients other than protein. They are generally among the best sources of the vitamin B complex as well as good sources of minerals and, frequently, of fat. Hence diets deficient in protein are likely to be deficient in some of these other nutrients as well. The population studied by Youmans may, for example, have some

deficits in other nutrients, generally furnished by the protein rich foods, and although existing in apparent good health may be in a vulnerable position in the case of increased metabolic demands. In this connection the studies of Mann<sup>15</sup> on 200 school boys should be referred to. Two groups were studied, both on identical and apparently adequate diets. To the boys of one group a pint of milk per day was given. During the four year period of the study the groups receiving milk gained more weight, were more fit and had fewer illnesses than the control group. Therefore a diet may appear to be nutritionally adequate but still not be optimal. One should think, as Sherman<sup>16</sup> suggests, of the "nutritional improbability of what some consider normal."

It is evident that protein has many necessary functions in health and in the fields of preventive and curative medicine. Many of these will be discussed in some detail in future articles to appear in this series; only brief mention will be made here of the normal protein requirements during pregnancy, growth and old age and of the increased demands in certain diseases.

#### PREGNANCY

The old adage that the pregnant woman must "eat for two" may not be true quantitatively but does express the increased nutritional demands of the individual during pregnancy. There is evidence that the mother stores protein in excess of that required for the fetus. The actual protein requirement during pregnancy cannot be definitely stated, but 10 to 20 Gm. of additional protein per day have been suggested as the increased requirement,<sup>17</sup> and on the basis of this and other available data the Food and Nutrition Board of the National Research Council<sup>18</sup> has recommended that the mother's diet should contain 85 Gm. of protein daily during the latter half of pregnancy. The studies of Burke, Harding and Stuart<sup>19</sup> on 216 mothers and their infants have shown that only 10 per cent of the mothers followed during pregnancy had a diet containing 85 Gm. of protein or more during the last two trimesters of pregnancy. Fifty-two per cent consumed from 55 to 84 Gm. daily, 24 per cent between 45 and 54 Gm. while 14 per cent consumed as little as 45 Gm. or less of protein daily. Thus 90 per cent of the mothers consumed below the suggested optimal allowance of protein. The weight, length and general condition of the infants at birth bore a direct relationship to the grams of protein consumed daily by the mother. It would appear that there is a direct relation between the amount of protein in a mother's diet and the start in life she gives to her infant. This relationship is of such magnitude that it can be demonstrated with each 10 gram protein difference in the antepartum diet. It would appear from this study "that less than 75 Gm. of protein daily during the latter part of pregnancy results in an infant who will tend to be short, light in weight and most likely to receive a low pediatric rating in other respects." It is probable that the low protein diet taken by these mothers was also deficient in other

essential nutrients, especially certain minerals and vitamins of the B complex, so that in reality a multiple deficiency may have existed.

During lactation there is an even greater demand for protein. This is not surprising, for not only must the mother maintain her own metabolic processes and make up any deficit of protein that may have occurred in pregnancy, but she must also supply the infant with milk. If a mother during the fourth week post partum supplies an average of 750 cc. of milk daily, containing 1.5 Gm. of protein per hundred cubic centimeters, she would be losing 11 Gm. of protein by milk production. This would require more than 11 Gm. of additional protein in the diet, for it is known that the conversion is not complete.

#### GROWTH

In infancy and childhood the protein requirements are relatively much higher in relation to body weight than in the normal adult. This is clear when one considers that for normal growth protein is retained for tissue synthesis, and a strongly positive nitrogen balance must be maintained. The recommended allowances for infants and young children have been given at between 3 and 4 Gm. of protein per kilogram of body weight daily.<sup>20</sup> Here again the optimal allowance is probably in excess of the actual requirement but may be necessary to keep the child in the maximum positive nitrogen balance that some authors have recommended.<sup>21</sup> Moreover, as the child grows older and eats a more varied diet, the biologic value of the proteins may decrease somewhat, requiring a higher total protein intake. During adolescence there is again an increased demand for protein as well as other nutrients, and it is well for adolescents to consume goodly amounts of milk, meat, eggs and other protein rich foods.

#### OLD AGE

The protein requirements during old age are not known but may be somewhat less than the requirements of the normal adult.<sup>22</sup> However, in old age there are many factors which may act to diminish the protein intake. Physiologic changes, such as defective or absent teeth, achlorhydria and chronic constipation, may lead to anorexia and a low protein intake. In fact, old persons often develop a distaste for meat. Therefore, in spite of the lowered metabolic requirements, great care should be exercised to make sure that the actual protein intake does not fall below an amount commensurate with health.

#### DISEASE

During most illnesses there is a disturbance in protein metabolism. In acute infections an increased catabolism of protein is found and may be related more to "intoxication" than to the increased temperature itself.<sup>23</sup> Increased catabolism of protein also occurs in a variety of other illnesses not usually considered as representing an increased protein demand, for example diabetic acidosis, in which the loss of protein may be very great. The physician is often confronted with patients suffering from protein depletion, especially those with lesions of the gastrointestinal tract. Minot<sup>24</sup>

has said "Defective nutrition can arise when the diet seems adequate because of some disturbance in the state of the gastrointestinal tract and its contents which may act adversely so as to 'condition' or enhance a deficiency of nutritional factors within the body proper." Protein deficiency of itself may lead in time to actual edema of the intestinal mucosa, resulting in poor intestinal absorption, thus completing the vicious cycle.<sup>25</sup>

It has recently been shown<sup>26</sup> that patients with severe thermal burns excrete in the urine large amounts of nonprotein nitrogenous products soon after the injury and also lose from the burn surface excessive amounts of protein and its breakdown products for long periods thereafter. To prevent a protein deficit, as evidenced by progressive hypoproteinemia, poor granulation tissue and pronounced loss of weight, a very large protein intake is required by persons who are burned.<sup>27</sup>

In nephrosis the body protein deficit is often great because of the fact that such large amounts of protein are lost in the urine that plasma albumin concentrations of less than 1 Gm. per hundred cubic centimeters are not uncommon and account for the massive edema often seen in this disease. With a severe protein deficiency already present in patients with this disease, and with continued protein loss occurring, it may take weeks or months of maintaining a strongly positive nitrogen balance before the deficit is sufficiently made up to the point where a rise in plasma albumin occurs and edema disappears. If the proteinuria is greater in amount than the maximum daily plasma albumin regeneration, as does sometimes occur, it becomes almost impossible to make up the protein deficit.

The nutritional aspects of convalescent care have been discussed recently by Peters.<sup>28</sup> In acute febrile diseases and after serious injuries, protein catabolism is increased and urinary nitrogen excretion may be several times the normal.<sup>29</sup> It is important to administer as early as possible in convalescence sufficient protein to replace such loss, and also sufficient carbohydrate and fat to provide for the caloric requirements of such individuals so that the protein provided can be utilized for rebuilding of tissue and not for energy production. In this way a body protein deficit can be largely avoided and convalescence perhaps shortened and attended by fewer complications.

Severe restriction of protein and of calories in the diet may lead to use of body protein for fuel. If prolonged, a large body protein deficit may occur with hypoproteinemia and edema. Often this condition has been called "war edema" or "famine edema." During the first world war, food, particularly protein foodstuffs, was so restricted in some European countries that the population reached the starvation level and edema became common. Protein is known to be restricted in the occupied countries in the present war, and reports of such clinical protein deficiencies have

already appeared.<sup>30</sup> The problem of supplying food to these countries as they are liberated is very great. Not only must enough food be available to meet the usual optimal daily requirements, but a body protein deficit of large proportions, produced by several years of semi-starvation, must be made up.

#### METHOD OF SUPPLYING PROTEIN

Food by mouth is the most effective route for the administration of protein. However, for some patients with considerable body protein depletion or with increased nitrogen catabolism, especially if associated with anorexia or disturbance of the gastrointestinal tract, it may not be possible to supply sufficient protein by mouth, and other routes of administration must be used. Concentrated protein preparations may be given by stomach tube, but in certain instances this procedure may lead to distention and diarrhea.

Protein has been given intravenously in the form of human plasma, human albumin, gelatin, various hydrolysates of casein and whole blood. Intravenously administered protein, although often a useful supplement to that given orally, is usually difficult to give in amounts sufficient to meet the daily requirement. The use of plasma or a hydrolysate of protein is not practical unless given in sufficient quantity to contribute effectively to the protein requirements. Ordinarily the concentration of protein in plasma is so low (5 to 6 Gm. per hundred cubic centimeters) that large quantities of plasma are required to make up for more than a slight body protein deficit. Although available now only in limited amounts, plasma albumin is a useful substance for supplying protein intravenously. It has been prepared in concentrated salt free solutions (25 per cent) and may be given with benefit to patients with a protein deficit.<sup>31</sup> Under such a regimen it must be kept in mind that a single protein is being administered. Proteins prepared for intravenous use are deficient in the vitamin B complex, minerals and fat, which protein foods supply. There is some evidence that plasma proteins and especially plasma albumin may not adequately serve as nutritional protein if they are used as the only source of protein. Recently in rat growth experiments the proteins of human plasma have been found to be deficient in isoleucine,<sup>32</sup> and human albumin in isoleucine and tryptophan.<sup>33</sup> The amino acid requirements for man may differ both qualitatively and quantitatively from those of the rat, so that direct application of the results on animals to man cannot be made.

Gelatin has been prepared and used as a blood substitute in surgical shock.<sup>34</sup> However satisfactory it may be in this regard, gelatin is lacking in many of the essential amino acids, so that it is quite unsatisfactory as a source of protein for nutritional purposes.<sup>35</sup>

In the last few years hydrolysates of certain proteins have been used intravenously and orally to supply protein. Casein has been the protein most used, as it can be obtained easily in relatively pure form and has high biologic value. The protein is hydrolyzed either by acid or by proteolytic enzymes, and when augmented by such amino acids as may be lost in the preparation it is readily utilized. If sufficient amounts of such hydrolysates are administered, nitrogen balance may be maintained.<sup>36</sup> However, the continued intravenous use of such preparations may result in venous thrombosis at and near the site of injection, making the administration difficult.

Whole blood transfusion is probably not of significant value in supplying protein. While whole blood contains sufficient total protein to be of nutritional interest, it is believed that its principal protein, hemoglobin, cannot in any circumstances be used as a nutritional protein. Whipple, studying this problem on dogs rendered hypoproteinemic by repeated plasmapheresis, has recently stated that "hemoglobin in its production may draw on the plasma protein but hemoglobin stands apart in the protein economy and does not contribute freely to the protein pool."<sup>37</sup>

#### ACCEPTED FOODS

*The following additional foods have been accepted as conforming to the Rules of the Council on Foods and Nutrition of the American Medical Association for admission to Accepted Foods.*

GEORGE K. ANDERSON, M.D., Secretary.

#### PREPARATIONS USED IN THE FEEDING OF INFANTS (See Accepted Foods, 1939, p. 156)

Quaker Oats Company, Chicago.

BABY QUAKER INSTANT STRAINED OATMEAL consists of ground rolled oats, dicalcium phosphate, salt, dried brewers' yeast and sodium iron pyrophosphate.

*Analysis* (submitted by manufacturer).—Moisture 6.2%, ash 4.7%, fat (by acid hydrolysis) 6.8%, protein ( $N \times 6.25$ ) 15.3%, fiber 1.9%, carbohydrates 65.1%, calcium (Ca) 762 mg. per hundred grams, phosphorus (P) 980 mg. per hundred grams, iron (Fe) 23 mg. per hundred grams.

*Calories*.—108 per ounce; 3.8 per gram.

##### Vitamins.

	Per Hundred Grams
Thiamine .....	1.06 mg.
Riboflavin .....	0.14 mg.
Niacin .....	1.4 mg.

Libby, McNeill and Libby, Chicago.

LIBBY'S BRAND HOMOGENIZED PEARS.

*Analysis* (submitted by manufacturer).—Total solids 16.85%, moisture (by difference) 83.15%, total ash 0.29%, nitrogen 0.03%, fat 0.02%, protein ( $N \times 6.5$ ) 0.16%, crude fiber 1.20%, carbohydrates (by difference) 15.18%, salt (as NaCl) 0.09%, iron (Fe) 3.42 mg. per hundred grams, copper (Cu) 0.26 mg. per hundred grams, calcium (Ca) 19.7 mg. per hundred grams, phosphorus (P) 8.59 mg. per hundred grams.

*Calories*.—0.62 per gram, 17.49 per ounce.

LIBBY'S HOMOGENIZED LIVER SOUP consists of tomato juice, carrots, water, beef liver, celery, potatoes, whole barley flour, salt and onions.

*Analysis* (submitted by manufacturer).—Total solids 12.58%, moisture 87.42%, protein 3.12½%, fat 0.30%, carbohydrate 7.07%, crude fiber 0.92%, ash 1.17%, salt 0.85%, calcium (Ca) 26.83 mg. per hundred grams, phosphorus (P) 71.7 mg. per hundred grams, iron (Fe) 2.3 mg. per hundred grams, copper (Cu) 0.28 mg. per hundred grams.

*Calories*.—45.0 per hundred grams.

*Vitamins*.—Thiamine 0.1 mg. per hundred grams.

Ascorbic acid 4.8 mg. per hundred grams.

## AIR FRESHENERS

Since the introduction of air conditioning, people have recognized that artificial climates lack some intangible quality that characterizes outside air at its best. However purified, moved, protected or otherwise treated, the air of air conditioning systems designed for human consumption fails to measure up to the "zestfulness of country air." A variety of investigations has been directed to the determination and provision of this highly desirable quality. At various times consideration has been given to the use of ionization, ozone, chlorophyll and other devices and materials. Numerous products and procedures have reached the market with the claim that outside air with all its good qualities has been reproduced on the inside. Largely these claims are merely claims, without reality. The American Society of Heating and Ventilating Engineers through one of its official publications has stated that "extensive studies have failed to elucidate the cause of the stimulating qualities of country air, qualities which are lost when such air is brought indoors and particularly when it is handled by mechanical means."

The American Medical Association's Committee to Study Air Conditioning in a recent preliminary report to the Board of Trustees, not yet published, makes this statement: "Air provided by air conditioning systems may be deodorized, properly humidified or dehumidified, moved at rates suitable for human comfort and altogether may promote human comfort, but there still remains an artificial quality. Early future developments may bring the air of the country hilltop into the cocktail lounge, but, as labeled by the committee charged with the responsibility of watching such development, such air not yet has arrived."

This committee has been concerned with the hope that developments in the art of air conditioning will eventually provide inside atmospheres in all respects equal to outside ones. At this time, however, the committee does not know any product or practice which will impart to atmospheres distributed by mechanical means the much desired qualities of country air.

## CARBONIC ANHYDRASE

Early in this century, with the advent of physics and chemistry as tools in biologic research, the mechanisms of many vital equilibria became better understood. Thus, in connection with the chemistry of respiration it was learned that a large proportion of the carbon dioxide is carried by the blood in the form of bicarbonate. However, it was shown later that less than 2 per cent of the carbon dioxide evolved from the blood in the lungs could come from the uncatalyzed decomposition of bicarbonate; a search was then made for a factor promoting this remarkably efficient reaction. In 1932 Meldrum and Roughton<sup>1</sup> discovered an enzyme in the erythrocyte whose function is to expedite the decomposition of bicarbonate to carbon dioxide and water and also to reverse this reaction under favorable conditions. This catalyst, which was named carbonic anhydrase, is a protein, containing zinc in the molecule, showing optimal activity at  $p_{\text{H}}$  7.0 and capable of exerting measurable activity in a dilution of one to ten million.

Obviously, knowledge of the distribution in the body of an enzyme with such specificity might be expected to lead to an elucidation of certain types of metabolic processes. Carbonic anhydrase has been found in the gastric mucous membrane of the rat, cat and rabbit in concentrations higher than that in the red blood cells.<sup>2</sup> The distribution coincides with the areas where the acid gastric juice is secreted, and the concentration of the enzyme is parallel to the number of parietal cells present. Further studies by Davenport have led to the belief that the hydrogen ions of the gastric hydrochloric acid arise in the carbonic acid synthesized under the influence of the carbonic anhydrase of the parietal cells. That this enzyme plays a part in the elaboration of gastric hydrochloric acid is further indicated by the fact that thiocyanate inhibits its activity and in a parallel way decreases the formation of acid.<sup>3</sup>

Recently the distribution of carbonic anhydrase in the central nervous system has received detailed attention; the concentration of the enzyme at various levels of the spinal cord and of the brain of several species of animals and of man has been determined.<sup>4</sup> Within a given species the pattern of distribution is constant and, in general, the amount of carbonic anhydrase increases in a rostral direction. In the human brain the greatest concentration is in the white matter immediately below the cortex, whereas in the animals studied the maximum enzyme activity occurred in the gray matter of the cortex. It is of interest that the pattern of distribution of carbonic anhydrase is little if any

different in the brain of insane persons than it is in normal brains.

Although the function of carbonic anhydrase in the red blood cell and in the gastric mucosa seems well defined, the physiologic significance of this enzyme in the brain and in the spinal cord is less evident. The intensity of metabolism in the central nervous system is high; it is possible that the carbonic anhydrase is part of the mechanism for the speedy removal of the resulting carbon dioxide.

#### UNITED STATES CADET NURSE CORPS

Elsewhere in this issue (page 995) appears a condensation of the testimony of Surg. Gen. Thomas Parran of the United States Public Health Service before the House Committee on Military Affairs. This statement reviews the development, organization and accomplishments of the United States Cadet Nurse Corps.

This corps is probably the most successful recruitment effort of the war. During the first year the number of graduates was relatively small, totaling 1,206. During the current fiscal year this number will be increased to 9,165. In following years there will be sharp increases in graduates, totaling over 25,000 in 1945-1946 and over 35,000 in 1946-1947.

The Cadet Nurse Corps was organized for students who pledged to "engage in essential nursing, military or civilian, for the duration of the war." Despite the fact that military duty is not required of the graduates, 40 per cent of the graduates during the first eighteen months of the existence of the corps have applied for military service. This is a much greater proportion than exists in graduates who are not in the corps. During the last year approximately 29,000 nurses graduated from all schools. Had 40 per cent of these entered the armed services, the full army quota of 10,000 additional nurses required by the Army in 1944 would have been exceeded.

The Cadet Nurse Corps is accomplishing important results in civilian nursing, not merely by providing badly needed nursing care but also by replacing and releasing graduate nurses. It is estimated that students in nursing schools are now giving 80 per cent of nursing care in their affiliated hospitals. The recruitment program of the United States Cadet Nurse Corps has contributed immeasurably toward preventing a collapse of nursing care in civilian hospitals.

Discussing the cost of this program, the Surgeon General says "In my opinion the country has received and increasingly will receive substantial returns on this investment. We cannot measure what the loss to the country would have been if civilian nursing service had collapsed, any more than we could measure the cost of failure on the Normandy beachheads."

## Current Comment

### PENICILLIN BY MOUTH

Simplified methods of administering penicillin that will provide adequate and prolonged blood concentrations are being sought by many investigators. Chow and McKee<sup>1</sup> combined crystalline penicillin with human plasma proteins to make a large penicillin protein complex, which in mice is more slowly absorbed after intramuscular injection. György and his associates<sup>2</sup> have administered penicillin orally with trisodium citrate as a buffer salt to eliminate the destructive action on penicillin by the hydrochloric acid in the stomach. Little and Lumb<sup>3</sup> have used both the stabilizing effect of protein and the buffer action of sodium bicarbonate in administering penicillin by mouth. In doing routine penicillin sensitivity assays by the "gutter plate" method, Little and Lumb sometimes used the Seitz filtered urine of patients receiving penicillin parenterally. They noted that the urine solution seemed to retain its activity longer than the saline solution of the sodium salt of penicillin. They devised experiments to compare the stability of urine solutions from 25 patients receiving penicillin intramuscularly with a control penicillin in saline solution. Their results showed that the antibacterial substance in the urine was more resistant to changes in  $p_H$  and to heat than was the saline solution of penicillin. Sodium penicillin mixed with normal urine acted as the penicillin in saline solution. This apparent stabilization of penicillin by passage through the body suggested that it might be possible to stabilize penicillin outside the body so that it could be given orally. In choosing stabilizing agents the fact that penicillin is excreted in appreciable amounts in the bile suggested the use of cholesterol and sodium taurocholate. Other accounts had indicated sulfur to be the important element in stabilizing penicillin. As suitable pure chemical substances were not available the authors decided to use milk and eggs. Penicillin in these various diluents when incubated at  $p_H$  7.5 for six hours at 37 C. was still active in all the solutions. When the  $p_H$  was reduced to 2.5 penicillin was destroyed in the distilled water, saline and cholesterol solutions; it was seriously affected in plasma and milk and showed the least damage in the raw egg solution. Taurocholate also had some protective action. In a volunteer with gastric hyperacidity the most satisfactory excretion of penicillin in the urine occurred when he was given alkali, sodium bicarbonate, followed by penicillin mixed with raw egg. Three other volunteers received this mixture with successful results. The same dose of alkali and egg penicillin was given to a patient with achlorhydria to test the possibility of destroying the action of penicillin by overalkalization. In this patient also the urinary excretion of penicillin was normal. Early tests on volunteers and patients showed that when 20,000 units of penicillin was taken orally the proportion excreted in the

urine was 75 to 80 per cent, which is much the same as for the intramuscular administration of 15,000 units, but, on the average, excretion continued for five to six hours after a single oral dose, as against four to five hours after intramuscular injection. Tests were also carried out to compare the concentration of penicillin in the blood serum of persons receiving penicillin orally and intramuscularly. Early work indicated that oral administration caused a slow rise to a peak concentration in the serum prolonged for at least three hours. Using the intramuscular route there was an abrupt rise of penicillin concentration in the serum to a high level fifteen to thirty minutes after injection followed by a rapid fall, so that two or three hours after injection penicillin was not detected in the serum by plate methods. Subsequent serum estimates on a larger series of cases show the oral and intramuscular curves more nearly alike. Clinically the results of administering penicillin by mouth with sodium bicarbonate and egg appeared satisfactory in cases of tonsillitis. The method is now on trial in gonorrhea, pneumonia and surgical sepsis.

### COLLOID LAXATIVES

Among the various physical agents used in the treatment of constipation the hydrophilic gums (acacia, karaya, tragacanth, bassora, agar, Irish moss, psyllium seed) occupy a prominent place. They have considerable power to retain water and to give with water viscous colloidal solutions. They lubricate and protect the intestinal mucosa, favor soft consistency of the stool by their water binding power and increase its bulk, which through distention of the intestinal wall stimulates the peristalsis.<sup>1</sup> The frequency and ease of bowel movements are thereby increased. Significant increase in the bulk of feces results when these agents are given orally in dry form. This is especially pronounced in the case of Irish moss, psyllium seed and agar but absent when completely hydrated colloidal solutions of the gums are used. The laxative action extends throughout the entire length of the bowel because these substances are metabolized in minor degree only by the enzymes of the intestinal bacteria and mucosa. They contrast in this respect with the hemicellulose pectin, which is readily broken down in the colon to disappear from the stool and is used in the treatment of diarrhea. The recent development of several synthetic mucilages, such as polyvinyl alcohol and methylcellulose, provide hydrophilic colloids which are nontoxic when given orally, are not absorbed by the intestinal mucosa, are not degraded by intestinal enzymes and are nonantigenic. In addition to these obvious advantages over the natural gums they have a high degree of chemical uniformity. Numerous experiments<sup>2</sup> in feeding man and animals with methylcellulose have shown that it is excreted practically quantitatively with the stool without any untoward effects even after

prolonged administration. Tainter<sup>3</sup> used the highly viscous type of methylcellulose (4,000 centipoises) as a colloid laxative in animals and in man and found that only 5 Gm. twice daily produced stools with increased water content and bulk, semisoft consistency and easy passage. These hydrophilic colloids share with the other gums the advantage over liquid petrolatum that they do not interfere with the intestinal absorption of fat soluble vitamins and are not taken up to any degree by the intestinal mucosa.

### EXPERIMENTAL HUMAN TRANSMISSION OF INFECTIVE HEPATITIS (INFECTIOUS JAUNDICE)

The failure of efforts to transmit infective hepatitis to animals led to experiments on human volunteers. The reports of such experiments since 1942 are listed in an article by Havens, Paul, Van Rooyen and others<sup>1</sup> in which they review briefly the results of their own work on human transmission of infective hepatitis by the oral route. The disease can be transmitted to human beings in various ways. The causal agent, which there is reason to believe is a heat stable and filtrable virus, has been found in the blood, in feces and probably also in nasopharyngeal washings as well as in urine, in the early stages of the attack, in some instances even before the recognition of jaundice.

The experiments by MacCollum and Bradley,<sup>2</sup> by Havens and his co-workers,<sup>1</sup> and by Findlay and Willcox<sup>3</sup> all indicate that the causal agent of infective hepatitis is present in the feces of the patient. The disease has been caused in volunteers by feeding capsules of fecal material from cases of hepatitis or by spraying such material into the nasal and nasopharyngeal passages. Findlay and Willcox<sup>3</sup> report positive results from the oral introduction of urine from a patient with infective hepatitis. In all these positive results the incubation period was about thirty days.

As yet experiments have not been reported with the feces of patients with "serum jaundice" following the injection of human serum or plasma, particularly yellow fever vaccine containing human serum. But positive results have been reported from the parenteral injection with serum of patients suffering from "serum jaundice," the incubation period being, however, much longer than in positive experiments with materials from cases of spontaneous hepatitis.

The human experiments on infective hepatitis are giving results of great significance. They point to the intestinal-oral circuit as "part at least of the natural route of spreading infective hepatitis." Contamination of food and drink may be the cause of "the fulminating outbreaks occasionally encountered among both civil and military population." The results of the experiments will also serve as a basis for further investigations into the nature of the causative agent.

# MEDICINE AND THE WAR

## ARMY

### GROWTH OF ARMY MEDICAL CENTER

Major Gen. Shelley U. Marietta, commanding general of the Army Medical Center, recently stated that there was no truth in the rumor that the Forest Glen section of Walter Reed Hospital is to be transformed into an operative section of this hospital. Forest Glen is actually being further developed for the benefit of personnel sent there for recuperation after operations. Buildings now being erected there provide for the expansion of this feature of physical rehabilitation. However, General Marietta said that the branch at Beltsville, Md., used for patients most advanced toward rehabilitation, is to be abandoned, and patients who would normally be sent there will be sent to convalescent camps throughout the United States.

### NURSES GRADUATE AT A. A. F. SCHOOL OF AVIATION MEDICINE

Thirty-five officers of the Army Nurse Corps recently graduated from the Army Air Forces School of Aviation Medicine, Randolph Field, Texas, ten as "flight nurses" and twenty-five as "chief nurses."

The course for flight nurses extends over a period of nine weeks. This is divided into three phases of three weeks each. The first phase is a review of various military and medical subjects required of all military personnel. The second phase is concerned with material peculiar to air evacuation, and the third phase is occupied by actual evacuation flights with the zone of the interior.

The four weeks course given to the chief nurses is designed to familiarize the nurse with various phases of military nursing and nursing administration as well as to enable her to function in a supervisory capacity over Army Nurse Corps personnel.

The diplomas were presented by Col. John R. McGraw, acting commandant of the school.

### SALE OF ARMY BANDAGES

Howard Bonham, in charge of public relations for the American Red Cross, points out that the 28,000,000 army bandages that were sold as dusters were not American Red Cross dressings but were purchased from commercial concerns. None of the Red Cross dressings have been salvaged by the War Department. On the contrary, the American Red Cross was recently requested to supply an additional 43,000,000 dressings. The Congressional action controlling the disposal by government agencies of surplus property acquired in connection with the war effort states that no surgical dressings, garments or other items processed, produced or donated by the American Red Cross may be disposed of except after consultation with the American Red Cross.

### "LET'S WALK"

Under the title "Let's Walk," the Convalescent Training Division of the Office of the Air Surgeon has issued a manual (Air Forces Manual No. 49) which is designed to teach the man who has had a leg amputation to walk again. It is a well illustrated, carefully prepared handbook, telling the man how to exercise in order to prepare his muscles for the job. There follows a history of crutches, with a description of the various types available and full information leading up to the ultimate use of an artificial limb. The book is based on a large experience and should be most helpful in achieving its purpose.

### NAMED POST SURGEON

Col. Charles E. Sima, M. C., has been appointed post surgeon at Fort Des Moines, Iowa, succeeding Major Charles H. Coughlan, who has been transferred to Camp Carson, Colorado.

### MEDICAL AID MAN AWARDED MEDAL OF HONOR

The Medal of Honor was recently awarded to a medical aid man, Pvt. Harold A. Garman, formerly of Albion, Ill., who saved the lives of three seriously wounded infantrymen last August 25 when the assault boat in which they were being evacuated across the Seine was fired on by the Germans. At the time of the action Private Garman's medical battalion, the Fifth, was attached to the Fifth Infantry Division of the Third Army, then fighting near Montereau, France. The citation accompanying the award read:

"For conspicuous gallantry and intrepidity at the risk of his life above and beyond the call of duty. On Aug. 25, 1941, in the vicinity of Montereau, France, the enemy was sharply contesting any enlargement of the bridgehead which our forces had established on the northern bank of the Seine River in this sector. Casualties were being evacuated to the southern shore in assault boats paddled by litter bearers from a medical battalion.

"Private Garman, also a litter bearer in this battalion, was working on the friendly shore carrying the wounded from the boats to waiting ambulances. As one boatload of wounded reached midstream, a German machine gun suddenly opened fire on it from a commanding position on the northern bank 100 yards away. All of the men in the boat immediately took to the water except one man, who was so badly wounded that he could not rise from his litter. Two other patients who were unable to swim because of their wounds clung to the sides of the boat.

"Seeing the extreme danger of these patients, Private Garman without a moment's hesitation plunged into the Seine. Swimming directly into a hail of machine gun bullets he rapidly reached the assault boat and then, while still under accurately aimed fire, towed the boat with great effort to the southern shore.

"This soldier's moving heroism not only saved the lives of the 3 patients but so inspired his comrades that additional assault boats were immediately procured and the evacuation of the wounded resumed. Private Garman's great courage and his heroic devotion to the highest tenets of the Medical Corps may be written with great pride in the annals of the corps."

### RECENT LECTURES AT SAN FRANCISCO PORT OF EMBARKATION

A series of lectures in Industrial Nursing and Medicine was held at the Port Dispensary, San Francisco Port of Embarkation, Fort Mason, California, under the United States Army Industrial Medical Program from Nov. 29, 1944 to March 7, 1945. The conference was open to all industrial nurses, personnel managers and safety engineers in the San Francisco Bay area. The series was arranged by Col. H. S. Villars, M. C., port surgeon for the San Francisco Port of Embarkation. Among the subjects discussed were the medical aspects of industrial diseases, health education, women in industry and mental hygiene.

### ARMY AWARDS AND COMMENDATIONS

#### Colonel Elliott G. Colby

Col. Elliott G. Colby, formerly of San Diego, Calif., has been awarded the Bronze Star "for meritorious achievement in connection with military operations against the enemy on Saipan, Marianas Islands, as surgeon for Army Garrison Force APO 244, an Island Command, Saipan, Marianas Islands, from April 15, 1944 to Nov. 24, 1944. Colonel Colby landed on Saipan on D plus 2 and assisted at the evacuation stations and field hospitals. With inadequate personnel he established a hospital

for the care of a civilian population of approximately 17,000 and generally supervised the sanitation of the civilian camp during the period of the assault. He made early reconnaissance in areas infested with Japanese snipers, selected sites and prepared layouts for the hospitals. He prepared a plan for and participated in the establishment of the air evacuation of casualties which was successfully conducted from the island of Saipan. Colonel Colby was confronted with a task of establishing sanitary and livable conditions on an island utterly devastated and on which there were scarcely forty inhabitable and no undamaged buildings. The thousands of unburied enemy dead, the mounds of debris and the unhealthful habits of disease ridden civilians, added to the swarming flies, crawling insects, teeming mosquitoes and multitudinous vermin, virtually all disease bearing, posed one of the major problems of the occupation and resulted in an epidemic of dengue and dysentery which threatened the success of the mission. By his untiring efforts, ingenuity, practical approach and professional ability he devised and initiated a program of spraying the island from an airplane with DDT, using improvised equipment, and thereby eradicated the flies, mosquitoes and vermin, which immediately reflected a reduced rate of illness and restored the maximum number of soldiers to duty. This accomplishment was a major contribution to the success of the mission, which made possible the mass air raid on Tokyo on Nov. 24, 1944." Dr. Colby graduated from the College of Medical Evangelists, Los Angeles, in 1922 and entered the service Sept. 16, 1940.

#### Lieutenant Colonel James W. Branch

Lieut. Col. James W. Branch, formerly of Hope, Ark., was recently awarded the Bronze Star "for meritorious achievement in connection with military operations against an enemy of the United States in France during the period July 29, 1944 to Oct. 13, 1944. He controlled and directed the activities of the . . . Medical Battalion Armored which evacuated . . . wounded and sick. Frequently he operated in enemy territory, and on one occasion he with another officer and an enlisted man was captured. After being held captive for three days and being subjected to both friendly and enemy artillery fire, he succeeded in persuading fifty of the enemy to surrender. This action supplied our troops with much valuable information. Lieutenant Colonel Branch organized collecting platoons and treatment platoons so that fatal casualties were rare once the wounded reached the medical battalion. When unit detachments sustained casualties, trained aid men from the medical battalion were able to perform these functions efficiently. His professional knowledge, ability to organize the medical evacuation, and his tactical efficiency reflects great credit on himself, his battalion and the Medical Corps of the United States Army." Dr. Branch graduated from the University of Arkansas School of Medicine, Little Rock, in 1935 and entered the service Feb. 3, 1941.

#### Captain Nicholas W. Hatfield

The Silver Star was recently awarded to Capt. Nicholas W. Hatfield, formerly of Indianapolis, "for gallantry in action at Biak Island, June 7, 1944. Although himself painfully and seriously wounded during the barrage of enemy artillery and mortar fire, Captain Hatfield, a medical officer in command of a collecting platoon, refused to be evacuated until he had personally treated the casualties brought to him by personnel of his platoon. This required four hours, during which time he was continually exposed to intermittent enemy fire. When the last casualty had been treated and evacuated, Captain Hatfield was carried to the beach evacuation point. Owing to limited facilities for evacuating wounded to hospitals in the rear, Captain Hatfield again refused to be evacuated until the evacuation of the other wounded had been completed. This necessitated another delay of thirty-six hours. His outstanding devotion to duty probably saved the lives of many wounded." Dr. Hatfield graduated from Jefferson Medical College of Philadelphia in 1935 and entered the service July 5, 1942.

#### Brigadier General Edgar King

Brig. Gen. Edgar King, commanding officer of the Medical Section, Army Service Forces Training Center, Fort Lewis, Washington, was recently awarded the Legion of Merit for

"exceptionally meritorious conduct in the performance of outstanding services." The citation states that General King "directed and coordinated the organization, training and supply of medical units which participated with the forces engaged in the successful operations in the Filbert, Marshall and Marianas Islands." General King graduated from the University of Arkansas School of Medicine, Little Rock, in 1906 and from the Army Medical School in 1907. He was surgeon of the Hawaiian Department at the time of Pearl Harbor and was awarded the Distinguished Service Medal for outstanding work in caring for Pearl Harbor casualties. Subsequently he was surgeon of the Central Pacific Area and then became surgeon of the United States Armed Forces, Pacific Ocean Area.

#### Major Howard P. Serrell

The Silver Star was recently presented to Major Howard P. Serrell, formerly of Greenwich, Conn., for "meritorious service" in France. Dr. Serrell, who graduated from Cornell University Medical College, New York, in 1932, entered the service in November 1942. The War Department stated that he was decorated for "voluntarily flying into besieged Bastogne on Christmas Day to render medical aid to the U. S. forces there." Accompanied by a medical corpsman, Dr. Serrell flew into Bastogne in a small plane accompanied by four U. S. Army Air Corps pursuit ships as guards. Throughout Christmas day he performed twenty major operations, "saving many lives." Dr. Serrell also took part in the D day invasion of Normandy.

#### Captain Benedict Biondi

The Chinese Grand Star of Honor Medal, for outstanding and distinguished service rendered to the republic of China and to the Chinese army, was recently presented to Capt. Benedict Biondi, formerly of New Haven, Conn. With the medal Dr. Biondi also received a certificate with the official Chinese signatures. Dr. Biondi graduated from Tufts College Medical School, Boston, in 1938 and entered the service Aug. 13, 1943. He is now serving in China with the Fifty-Third Portable Surgical Hospital.

#### Captain William Henry

Capt. William Henry, formerly of New York City, was recently awarded the Bronze Star for heroism. Dr. Henry is regimental surgeon of the 112th Infantry medics (with the 28th Infantry Division in France). He has been active at the front in all of the 28th's campaigns—the Normandy hedgerow battles, the closing of the Falaise Gap, the sweep across Belgium and Luxembourg and the first allied punch at the Siegfried Line on Sept. 10, 1944. Dr. Henry graduated from Long Island College of Medicine, Brooklyn, in 1941 and entered the service July 1, 1942.

#### Colonel Marshall M. Best

For meritorious service last year the Bronze Star was awarded to Col. Marshall M. Best of Xenia, Ohio, now stationed in France. Accompanying the award was a citation from Brig. Gen. William L. Richardson, which complimented Dr. Best for his "ingenuity, enthusiasm and skill" as command surgeon of the Ninth Air Service Command. Dr. Best graduated from the University of Cincinnati College of Medicine in 1927 and entered the service Jan. 5, 1941.

#### Major G. Charles Morrone

The Bronze Star for "meritorious service" in connection with military operations against the enemy in France and Belgium was recently awarded to Major G. Charles Morrone of Yonkers, N. Y., while serving as general surgeon of the 44th Evacuation Hospital. Dr. Morrone graduated from Georgetown University School of Medicine, Washington, in 1930 and entered the service in August 1942.

#### Colonel Anthony J. Lanza

The Legion of Merit was recently awarded to Col. Anthony J. Lanza, formerly of Arlington, Va., "for exceptionally meritorious conduct in the performance of outstanding services from March 1942 to December 1944." Dr. Lanza graduated from George Washington University School of Medicine, Washington, in 1906 and entered the service March 12, 1942.

## MISCELLANEOUS

## THE CADET NURSE CORPS

Testimony of Thomas Parran, Surgeon General,  
U. S. Public Health Service, Before the  
House Committee on Military  
Affairs, February 6

The Public Health Service, working with the hospital and nursing associations, has been actively concerned with the total wartime nursing problem since 1941. In the fiscal years 1941-1943 Congress appropriated \$5,300,000 to be allotted to nurse training schools as incentive payments to increase student nurse enrolments. In the spring of 1943 it became apparent that the limited measures were insufficient to meet the demands of total war. After extensive hearings the Bolton Nurse Training Act was passed. The provisions of this act were designed by all national nursing and hospital groups, who were agreed that this was the only practical way to meet the total situation. Under the provisions of the Bolton act the U. S. Cadet Nurse Corps was organized. The purpose of the act is to furnish an adequate supply of nurses for the armed forces, governmental and civilian hospitals, health agencies and war industries. Consideration at that time was given to establishing a program exclusively for the armed forces. It was decided, and I think wisely decided, that one unified training program should be undertaken to meet both the military and civilian needs. The Bolton act became effective July 1, 1943. Under its provisions grants of federal funds are made to schools of nursing meeting provisions of the act. The more important provisions are (1) that the school will give an accelerated program of training (twenty-four to thirty months instead of thirty-six months), (2) that students admitted to the corps pledge to "engage in essential nursing, military or civilian, for the duration of the war" and (3) that in return for the moral obligation which the student nurse assumes, the government pays all reasonable tuition, fees and other training costs and provides a distinctive uniform.

The U. S. Cadet Nurse Corps has been highly successful; in fact, it has been recognized as the most successful recruitment effort of the war. More than 1,100 out of a total of 1,300 nurse training schools are participating. A quota of new admissions to all schools was set at 65,000 for the first fiscal year. The actual number of admissions was 65,521. The quota set for the current fiscal year is 60,000 and for next year the same. The total corps membership of first, second and third year students on Jan. 1, 1945 was 105,000. These quotas do not represent the full needs of the country for nursing service. They do represent, however, the maximum training capacity of the nurse training institutions, and the numbers being trained should meet our most urgent needs for nurses.

Since many schools could not accelerate their training programs for older students and since most of these students had already paid their tuitions, only a small proportion of students approaching graduation at that time joined the corps. As a result, during the first fiscal year there were only 1,205 graduates of the corps, and during the current fiscal year 9,165. The number will increase sharply: for the fiscal year 1945-46, 25,166; for the fiscal year 1946-47, 35,579.

All required clinical experience, laboratory and classroom instruction must have been completed under an accelerated program within a period of not more than thirty months. This makes the student available as a senior cadet for full time nursing service during her last six months before graduation. She performs hospital nursing service comparable to that of a graduate nurse. Many state regulations require thirty-six months' training before a student nurse may graduate and take the examination to become a registered nurse.

The Bolton act provides that senior cadets may apply for service in army, navy and other federal hospitals in this country. From April 1944, the first date at which senior cadets became available, until Jan. 1, 1945 the total number of senior cadet nurses was 8,556. The U. S. Civil Service Commission, clearing agency for the federal services, reported 10,168 applications during that same period. Some of these applicants will not be available for active duty until the first months of 1945. The number of available senior cadets will be doubled and trebled during the current and next fiscal years.

The single most important and immediate function of the Cadet Nurse Corps has been the replacement of graduate nurses in civilian hospitals, which makes it possible for greater numbers of graduates to go into the military. Even in 1943, before the great increase in student enrolment, student nurses were giving two thirds of all the nursing care in civilian hospitals operating training schools (Altenderfer, Marion E.: *Pub. Health Rep.* 60:90 [Jan. 26] 1945). Our best estimates are that students now are giving 80 per cent of nursing care in their associated hospitals.

By replacing graduate nurses who already have gone into the military, the U. S. Cadet Nurse Corps has prevented a collapse of nursing care in civilian hospitals. Moreover, the increasing number of graduates constitute a reservoir of nurse power which if effectively distributed would in my opinion meet both the military and minimum civilian needs.

This nurse training program represents a substantial investment of federal funds: \$63,000,000 during the current fiscal year. In my opinion the country has received and increasingly will receive substantial returns on this investment. We cannot measure what the loss to the country would have been if civilian nursing service had collapsed, any more than we could measure the cost of failure on the Normandy beachheads. We can, however, recognize the practical contribution already made by the thousands of loyal and tireless members of the U. S. Cadet Nurse Corps. They have made it possible to release many more graduates to the armed forces; as senior cadets they have given service comparable to graduates in the five federal services, the largest of which is the Army. Increased admissions to schools of nursing in 1944 (76 per cent as compared with 1940, the last year prior to federal aid) have prevented the collapse of civilian nursing, the reservoir from which the military must draw.

Cadet nurses have been criticized because not all of them have applied for military service. The law as passed by the Congress does not impose that obligation on them. Of the approximately 10,500 nurses who have graduated from the Cadet Nurse Corps during its first eighteen months existence ended Jan. 1, 1945, 40 per cent have applied or have actually been accepted by the military services, and this record was made during the time when the public believed the war about to end. It does not include the peak enlistment period since January 1. They have responded for military duty in much greater proportion than have their classmates who were not in the corps. To be specific, there were graduated from nurse training schools last year some 29,000 nurses. If 40 per cent of this total number had entered the armed services the Army's 1944 quota of 10,000 additional nurses would have been exceeded at the time the President made his recommendation.

Hospitals today are caring for the largest number of patients in their history in spite of the fact that we have no widespread epidemics. While some nurses can be withdrawn from hospital service, there is no large reservoir in this group. The Army should not accept nurses who are occupying positions which are really essential. There are two groups of nurses in particular where a great damage may be done. Public health departments and visiting nurse associations employ approximately 21,000 nurses. None of them are overstaffed. In fact, this figure represents 20 to 30 per cent vacancies. Public health nurses constitute the largest single group among all health department employees. Without nurses, health departments cannot operate. Because many hospitals are overloaded, many sick patients are being cared for in their homes by visiting nurses.

The nurse training schools are training an unprecedented number of nurses. Losses of teaching staffs to the military have been severe during the past three years.

We must continue, therefore, to supply a minimum number of graduates with minimum special preparation to fill key positions vacated in staffs of public health agencies and schools of nursing.

As the war progresses, the major civilian health problems are still ahead of us. We shall see the cumulative effects of fatigue, long hours of work, worry, anxiety and grief. In other words, there is bound to be a lower level of civilian health and greater susceptibility to disease. We have been fortunate up to now in not having had any serious epidemics.

## ROCHESTER LEAGUE FOR THE HARD OF HEARING TO AID VETERANS

The Rochester League for the Hard of Hearing, Rochester, Minn., recently completed a program whereby returning veterans who have suffered loss of hearing at the battle fronts will be given aid and instructions. The league has trained interviewers and teachers and a program of social activities. The organization can direct the hard of hearing person to the agency that will try to place him in a job or suggest his vocational training needs. The league conducts classes in lip reading, with instructors supplied by the board of education. It is equipped also with a club room and kitchen for social activities. Another service the organization offers is audiometer tests to guide the hard of hearing in the selection of mechanical hearing aids that are on the market.

## PSYCHIATRIC NURSING SCHOOLS

Neuropsychiatric nursing schools are now activated at the following general hospitals in the stated service commands: First, Pushing, at Framingham, Mass.; Second, Mason, at Brentwood, N. Y.; Fourth, Kennedy, at Memphis; Seventh, Fitzsimons, at Denver; Eighth, McCloskey, at Temple, Texas. The Army Medical Department stated that similar schools will be established in the other commands in a short time.

Leading specialists are now supervising a three month training course in these schools. The enrollees are volunteer army nurses, and a certificate of neuropsychiatric nursing is awarded on successful completion of the course. At least two of these nurses are assigned to each general hospital in this country and to the staff of general hospitals organized in this country for service abroad.

## BELGIAN AMERICAN EDUCATIONAL FOUNDATION, INC.

Three pamphlets, published in French, on the subject of blood transfusion, penicillin and the use of the sulfonamide drugs were recently issued by the Belgian American Educational Foundation, Inc. (420 Lexington Avenue, New York 17) and are being distributed free of charge to members of the medical profession in Belgium. Some of these pamphlets have already arrived in Belgium and additional pamphlets are now being prepared.

## HOSPITALS NEEDING INTERNS AND RESIDENTS

The following hospitals have indicated to the Council on Medical Education and Hospitals that they have not completed their house staff quota allotted by the Procurement and Assignment Service:

(Continuation of list in THE JOURNAL, April 7, page 928)

### DELAWARE

Wilmington General Hospital, Wilmington. Capacity, 224; admissions, 4,267. Mr. T. A. Weth, Superintendent (1 intern).

### ILLINOIS

Loretto Hospital, Chicago. Capacity, 159; admissions, 4,221. Sister M. Stephanie, R.N., Superintendent (interns, October and December). St. Mary's Hospital, East St. Louis. Capacity, 276; admissions, 5,366. Sister M. Prosperia, R.N., Superintendent (2 interns).

### MASSACHUSETTS

Brockton Hospital, Brockton. Capacity, 151; admissions, 2,608. Dr. F. M. Hollister, Superintendent (1 intern, July 1).

### NEW YORK

Israel Zion Hospital, Brooklyn. Capacity, 518; admissions, 9,867. Dr. J. Prager, Executive Director (interns, July and October). Mother Cabrini Memorial Hospital, New York City. Capacity, 205; admissions, 3,212. Mother Corinna, Superior (interns).

### NORTH CAROLINA

Watts Hospital, Durham. Capacity, 225; admissions, 7,527. Mr. Samuel B. Forbus, Superintendent (2 interns, 1 resident—medicine, July 1).

### OHIO

St. Thomas Hospital, Akron. Capacity, 235; admissions, 6,147. Sister M. Eleanor, R.N., Superintendent (2 interns, 1 resident, July 1).

## WARTIME GRADUATE MEDICAL MEETINGS

The following subjects and speakers for Wartime Graduate Medical Meetings have just been announced:

### California

A. A. F. Regional Hospital, March Field, Riverside: Blood Plasma and Substitutes, Lieut. Col. R. M. Jones; Water Balance, Major Edward Swartz, April 17.

Torney General Hospital, Palm Springs: Fractures About the Wrist, Lieut. Col. Richard B. McGovney; Fractures About the Ankle Joint, Dr. Samuel S. Mathews, April 17.

Station Hospital, Camp Cooke, Lompoc. Allergies, Dr. Robert W. Lamson, April 18.

Hoff General Hospital, Santa Barbara: Allergies, Dr. Robert W. Lamson, April 18.

A. A. F. Regional and Convalescent Hospital, Santa Ana: Surgery of the Traumatic Abdomen, Dr. Charles Phillips and Comdr. Gaylord Bates, April 17.

U. S. Naval Air Training Station, San Diego: Problems of Urology, Major P. S. Bennetts, April 20.

U. S. Naval Hospital, Long Beach: Thoracic Surgery, Dr. John Jones and Lieut. Comdr. J. E. Dailey, April 21.

Letterman General Hospital, Presidio of San Francisco: Psychosomatic Medicine, Dr. Karl Bowman, April 21.

Station Hospital, Fort McDowell, Angel Island: Changing Trends in Syphilotherapy, Drs. Norman N. Epstein and Rees B. Rees Jr., April 27.

### Illinois

Regional Hospital, Rantoul: Brain and Spinal Cord Injuries, Dr. Loren William Avery, April 18; Conditions Affecting Glucose Metabolism, Dr. Arthur R. Colwell, April 25.

### Indiana

Billings General Hospital, Fort Benjamin Harrison: Diseases of the Intestinal Tract: Medical and Surgical Diagnosis and Care, Drs. Walter Palmer and Warren Cole, April 25.

Wakeman General Hospital, Camp Atterbury: Dermatologic Disease, Drs. C. G. Culbertson and Stephen Rothman, April 25.

### Kentucky

Fort Knox General Hospital, Louisville: Low Back Pain, Dr. Fremont A. Chandler, April 18; Late Treatment of Burns, Dr. Wayne B. Slaughter, April 18.

Nichols General Hospital, Louisville: Low Back Pain, Dr. Fremont A. Chandler, April 19; Late Treatment of Burns, Dr. Wayne B. Slaughter, April 19.

### Nebraska

Station Hospital, McCook Army Air Field: Melena—Those Obscure Hemorrhages from the Bowel, Dr. Julius B. Christensen, April 17; Hematuria, Dr. Leroy W. LaTowsky, April 17; Blood and Its Derivatives, Dr. Raymond L. Borchers, April 17.

### Pennsylvania

Deshon General Hospital, Butler: "Blood Dyscrasias" and "The Rh Factor and Erythroblastosis Fetalis," Dr. Mortimer Cohen, April 17.

U. S. Naval Hospital, Philadelphia: Functional Nervous Disorders and Their Differentiation from the Organic, Dr. George Wilson, April 20.

### Virginia

Woodrow Wilson General Hospital, Staunton: Arteriovenous Fistula, Dr. William B. Porter, April 18; Penicillin, Capt. Monroe Romansky, April 25.

A. A. F. Regional Hospital, Langley Field: Psychosomatic Medicine, Dr. Salomon Katzenelbogen, April 27; Radiology, Dr. Clayton W. Eley, April 27.

### Wisconsin

Station Hospital, Camp McCoy: Heart Disease, Dr. Chester M. Kurtz, April 25.

## MATERNITY CARE

Dr. Martha M. Eliot, associate chief of the Children's Bureau, United States Department of Labor, reported recently that three fourths of a million servicemen's wives and infants received care under the emergency maternity and infant care program in the first two years of its operation.

# ORGANIZATION SECTION

## Washington Letter

(From a Special Correspondent)

April 9, 1945.

### Defeat of Manpower Bill Discourages Nurse Draft

Passage of legislation to draft nurses for service with the armed forces has become doubtful since the Senate's overwhelming vote against the compulsory manpower bill. Senator Elbert D. Thomas of Utah, chairman of the Senate Military Affairs Committee, which reported the nurse draft bills, said "I have no heart to push the nurses' bill affecting only a relatively small proportion of women, now that the Senate has turned down the manpower bill and the freezing of workers in war jobs. At least there should be final action on the manpower bill to see if there is any disposition to do anything at all about it before we try to draft nurses." Senator Thomas said that an amendment would be offered to the nurse bill to prevent the draft from being used if enough nurses were recruited voluntarily. Senator Lister Hill of Alabama was named to follow the nurses' bill when it reaches the floor, but action is not expected by the Senate for weeks.

### Commander of Veterans of Foreign Wars Comments on Veterans Administration Hospitals

Many veterans leave Veterans Administration hospitals against medical advice because compensation or pensions are reduced during hospitalization, according to Omar B. Ketchum, national legislative representative of the Veterans of Foreign Wars, commenting on charges of inefficiency and neglect in veterans' hospitals. He explained that veterans with no dependents, who are receiving compensation or pension, are limited in the amounts payable during hospitalization. This results in veterans leaving the hospital "before recovery is complete," he said. Illustrating, he said, a service connected disabled veteran, without dependents, who may receive \$100 a month is limited to \$20 a month in cash benefits while hospitalized. A non-service connected pension is limited to \$8 a month for the man without dependents. Mr. Ketchum said that Brig. Gen. Frank T. Hines, veterans' administrator, was to be commended for his forthright and open invitation to veterans' groups to make independent or joint surveys of every veterans' hospital in the country.

### Congressmen Receive Psychologists' Peace Plan

All United States Senators and Representatives have received copies of the ten points of human nature which 2,038 American psychologists state must be considered in drawing up plans for an enduring peace. They are included in a statement of "Human Nature and Peace," formed by an informal committee of thirteen psychologists headed jointly by Dr. Gordon W. Allport, chairman, department of psychology, Harvard University, and Dr. Gardner Murphy, chairman, department of psychology, College of the City of New York, both past presidents of the American Psychological Association. Their statement was endorsed by 2,038 members. The ten points which they say must be considered if new wars are to be avoided are: 1. War can be avoided. War is not born in men, it is built into men. 2. In planning for permanent peace the coming generation should be the primary focus of attention. 3. Racial, national and group hatreds can be controlled to a considerable degree. 4. Condescension toward "inferior" groups destroys our chances for a lasting peace. 5. Liberated and enemy peoples must participate in planning their own destiny. 6. The confusion of defeated peoples will call for clarity and consistency in the application of rewards and punishments. 7. If properly administered, relief and rehabilitation can lead to self reliance and cooperation; if improperly administered, to resentment and hatred. 8. The root desires of the common people of all lands are the safest guide to framing a peace. 9. The trend of human relationships is toward ever wider units of collective security. 10. Commitments now may prevent postwar apathy and reaction.

### Rabies Control Legislation Proposed for the District of Columbia

So serious has the prevalence of rabid dogs become in the District of Columbia that legislation granting the District commissioners power to carry out a rabies control program through the annual vaccination of dogs has been approved in principle by the Budget Bureau and submitted to the U. S. Public Health Service. Congressional approval is being sought. The bill is designed to eradicate the rabies menace, practically unknown in the Capital before 1942. Penalties for infractions under the bill would range as high as \$300 or ninety days in jail. The present legislation was substituted for an earlier bill which would have made annual vaccination a specific law, it being felt that the regulations should be "more flexible." The District Health Department reports that, since January 1, 54 rabid dogs were reported to the department, double the number for the same period last year.

### Health Programs Affected by Ban on Labor Royalty

Sidelight to the effort to make it illegal for labor unions to collect "royalties" like those collected by James Petrillo, president of the American Federation of Musicians, and sought by John L. Lewis for his United Mine Workers Union is their effect on health programs supported by such royalties. A bill was presented by Senator Bailey of North Carolina to prevent employer payments to a union for other than union dues. If the bill is made law it would not only upset the Petrillo royalties but it would do away with many negotiated agreements whereby employers agree to pay a small portion of the payroll into health funds administered jointly by the union and the employer. These help to pay sickness and accident benefits, medical costs and death benefits. An increasing number of employers have provision for these contributions in their union contracts.

### Extension of Maternity and Infant Care Advocated

Extension of the Emergency Maternity and Infant Care program, now available to wives of enlisted men, to include wives of veterans, widows of service men and infants born after the father has left the service is advocated by the C. I. O. President Philip Murray has made this request to Representative Butler Hare, chairman of the subcommittee of the House Appropriations Committee, before which renewal of the emergency maternity and infant care program is pending. Dr. Martha M. Eliot, associate chief of the Children's Bureau, reports that three quarters of a million service men's wives and infants received care under the program in its first two years.

### Surgeon General Parran Warns of Danger to United States from Wartime Epidemic

Danger of a widespread epidemic is emphasized by Surgeon General Thomas Parran, who explained that fatigue, anxiety and grief are bound to lower resistance. Dr. Parran said that the health record of the nation has been surprisingly good despite depleted medical and nursing staffs. Part of the credit, he said, was due to an educated populace which acts wisely and takes scientific steps to care for its children and generally guards against disease.

### Capital Notes

Pedro J. Noizeux of the Argentina Automobile Clubs reports that new service stations being set up by his organizations in Argentina include airplane landing fields and in some instances have been used as maternity hospitals.

Dr. Charles-Edward Amory Winslow, director of Yale University School of Public Health, has been asked by the Washington Metropolitan Health Council to survey health and hospital facilities in the Washington metropolitan area.

The National Capital Park and Planning Commission has approved a block size Army Medical Museum and Library on East Capitol Street adjacent to the Library of Congress. The structure has been authorized by Congress.

Five urgent requests that Upshur Street Tuberculosis Hospital remain in operation were received by the District of Columbia commissioners from Daniel L. Seckinger, Gallinger Hospital; Supt. Daniel L. Finucane, Glenn Dale Tuberculosis Sanatorium; Dr. John M. Stanley, Upshur Street; Dr. A. Barklie Coulter, Bureau for Tuberculosis, and District Health Officer George C. Ruhland. Commissioner Guy Mason has called the institution a "flophouse" and urged that it be closed.

## Medical Legislation

### STATE LEGISLATION

#### California

*Bills Introduced.*—S. Constitutional Amendment 15, A. Constitutional Amendment 29 and A. Constitutional Amendment 30 propose, in effect, to submit to the electorate of the state a proposition whether or not the state constitution may be so amended as to direct the legislature specifically by appropriate legislation to create and enforce a system of health or sickness insurance. A. 2157 proposes to enact what is referred to as the California Optional Health Insurance Act, which proposes to provide stated health services to employees, as defined in the act, to be financed out of a health service fund to which both employer and employee contribute.

#### Delaware

*Bill Introduced.*—S. Substitute for S. 195 proposes to require the state board of health to make a survey of existing hospitals and health centers in the state and to evaluate the sufficiency of such facilities to supply the health requirements of the state. The board of health is authorized also to accept on behalf of the state and to expend grants or advances made by federal agencies for such purposes.

#### Illinois

*Bills Introduced.*—H. 389 proposes to enact a separate chiropractic practice act respecting the examination and licensing of applicants for licenses to practice chiropractic. H. 397 proposes to revise the law relating to the commitment, detention and care of mentally ill persons and to provide for the licensing and regulating of private institutions for the care of such persons.

#### Maine

*Bill Introduced.*—S. 405 proposes to prohibit the operation of a hospital, sanatorium, convalescent home, rest home, nursing home or related institution without a license from the department of health.

#### Michigan

*Bill Introduced.*—S. 335 proposes to prohibit the operation of a hospital, sanatorium, rest home, nursing home, maternity home, infirmary or related institution without a license from the department of health.

#### Minnesota

*Bill Introduced.*—H. 382 proposes to authorize the formation of nonprofit medical service plan corporations to operate medical service plans whereby the services of duly licensed physicians are provided at the expense of the corporations to persons who become subscribers to plans operated by such corporations.

#### Missouri

*Bills Introduced.*—H. 283 proposes that whenever an employee is required to subject himself to a physical examination as a condition precedent or subsequent to employment he shall be entitled to have that examination conducted in the state and if rejected for employment or continuance in employment to receive a complete copy of the report of such physical examination without cost to him. H. 280 proposes to permit a county or a group of counties to operate a health center.

#### New Jersey

*Bill Introduced.*—A. 380 proposes to enact a separate naturopathic practice act and to create an independent board of naturopathic examiners to examine and license applicants for licenses to practice naturopathy.

#### Pennsylvania

*Bills Introduced.*—S. 558 and S. 559 propose, in effect, so to amend the laws permitting the operation of hospital service plans as to permit hospital service plan corporations also to operate medical service plans.

#### South Carolina

*Bill Introduced.*—H. 555 proposes to create the South Carolina Hospital Commission, which is to survey existing hospitals and health centers and to evaluate their sufficiency to render adequate health services to the state. The commission is to be authorized to accept on behalf of the state and to expend for such purposes such sums as are made available by the federal government or any agency thereof.

#### Rhode Island

*Bill Introduced.*—S. 193 proposes that there shall be no discrimination made by any state department for or against any school of practice of the healing art in any medical plan which involves the expenditure of state funds.

#### Texas

*Bills Introduced.*—H. 754 proposes to create in the state department of education a physical restoration service for crippled children under 21 years of age. The service is to make provisions for locating, examining and physically restoring crippled children. H. 797 proposes to prohibit any person from experimenting or operating in any manner on a living dog for any purpose other than healing or curing the dog. Any person who violates this prohibition, the bill proposes, is to be punished by a fine of from one hundred to five hundred dollars and/or by imprisonment in the county jail for from three months to one year.

#### Virginia

*Bills Introduced.*—S. 27XX and H. 49XX propose to direct the department of health to survey all hospitals, health centers and related facilities in the state to ascertain the need for additional facilities and to develop plans and programs for the construction of those additional facilities, if any are needed. The department is to be authorized to accept and expend advances or grants of federal funds for such purposes.

#### Wisconsin

*Bills Introduced.*—S. 412 proposes to authorize the establishment and administration of a system of compulsory health insurance. A. 498 proposes to appropriate \$40,000 for the acquisition of suitable quarters for the maintenance and operation of a state home for children convalescing from rheumatic fever. The bill proposes to appropriate in addition annually \$22,500 for the maintenance and operation of this home. A. 510 proposes to limit, except on the prescription of licensed physicians, dentists or veterinarians, the retail sale of ergot, thymus, pituitary, histamine, hydrastis, pilocarpine, physostigmine, pennyroyal, muscatine and slippery elm. A. 524 proposes that the house of delegates of the state medical society shall have the power to establish in the state or in any county or counties of the state a nonprofit plan or plans for the prepayment of sickness care of indigents and low income groups and others through contracts with public officials and with physicians and others. Such plan established as provided is to be subject to all the pertinent state insurance laws except as stated in the bill. Under the present law the state society, or a county society in a manner approved by the state society, may undertake and coordinate all sickness care of indigents and low income groups through contracts of this character. A. 532 proposes to enact a separate naturopathic practice act and to create an independent board of naturopathic examiners to examine and license applicants for licenses to practice naturopathy, defined as "the prevention, diagnosis and treatment of human injuries, ailments and diseases by means of any one or more of the material, physical, mechanical or psychological forces or agencies; it includes all forms of physiotherapy and it excludes the practice of major surgery, obstetrics and the use of narcotics, vaccines and serums."

## Bureau of Information

Connecticut is the first state to complete and submit its county summary sheets to the Bureau of Information. Dr. Creighton Barker, Executive Secretary of the Connecticut State Medical Society, returned this information, which was exceptionally comprehensive. In Connecticut there is a close liaison between the state society and the counties, so that a complete system of records is maintained in the state medical society headquarters.

The following table presents some of the data on each county in Connecticut. The number of persons per telephone is used as one index of the economic status of the area. Many physicians over 65 years of age are carrying on large practices and are doing much to maintain the health of communities. They are not included in computing the physician-population ratio, however, as the future needs of the communities will be largely dependent on younger physicians.

### Connecticut

County <sup>1</sup>	Principal Cities <sup>2</sup>	Population	Physicians Under 65	Persons per Physician	Persons per Telephone <sup>3</sup>
Fairfield		434,285	328	1,324	6.7
	Bridgeport	147,121			
	Stamford	47,938			
	Norwalk	39,849			
Hartford		474,286	373	1,272	7.3
	Hartford	166,267			
	New Britain	65,685			
	Bristol	30,167			
Litchfield		87,662	48	1,826	5.6
	Torrington	26,988			
	Winsted	7,074			
Middlesex		58,635	38	1,543	7.2
	Middletown	26,495			
New Haven		477,763	347	1,377	7.4
	New Haven	160,605			
	Waterbury	99,314			
	Meriden	39,494			
New London		129,384	74	1,748	8.4
	New London	30,456			
	Norwich	23,652			
Tolland		32,327	12	2,604	13.2
	Rockville	7,572			
Windham		54,080	19	2,846	6.7
	Willimantic	12,101			
	Putnam	7,775			

1. Bureau of Census, estimated population 1943.

2. Bureau of Census, population 1940.

3. Based on 1940 figures, Am. Tel. & Tel. Co.

Since veteran medical officers are concerned primarily with the problem of becoming reestablished in practice, the greatest number of letters coming to the Bureau of Information ask what areas need physicians. Other inquiries deal with matters of education and licensure. In order to reply satisfactorily, accurate knowledge of needs and economic factors that obtain in each locality must be available.

The economic data are supplied by the summary sheets when completely filled out. This includes the ratio of doctors in active practice to population, the number of telephones in relation to the population, general information about the location, climate and industrial activities, and specific needs of the county as shown by pertinent facts given under the section "Remarks" on the summary sheet. With this information available, it is readily possible for the medical officer to make an initial selection of areas in which he might like to practice. The further investigation through the state and county societies is thus greatly facilitated and much unnecessary correspondence and perhaps travel may be avoided. In many communities vacancies are being held open for physicians now in military service. The number of physicians listed may therefore be misleading, and, consequently, direct correspondence with the county medical society will always be necessary.

## Official Notes

### DOCTORS LOOK AHEAD: CORRECTED SCHEDULE

During April and the first week in May, Doctors Look Ahead will include the following programs:

April 14. Cancer, with special reference to education for youth. Dr. Frank L. Rector, cancer consultant, Michigan Department of Health, will be the speaker.

April 21. American Spas (instead of the title previously announced). The speaker will be Dr. Walter S. McClellan, chairman of the Committee on Health Resorts, American Medical Association. Dr. McClellan will speak from New York.

April 28. Battle Fatigue (previously announced for April 21). The speaker will be Major General George F. Lull, Deputy Surgeon General, U. S. Army, who will speak from Washington, D. C.

May 5. Child Health. Speaker, Dr. George K. Anderson, Secretary of the Council on Foods and Nutrition, American Medical Association.

Doctors Look Ahead will be heard on one hundred and twenty-three stations of the National Broadcasting Company network each Saturday at 4 p. m. Eastern War Time (3 p. m. Central War Time, 2 p. m. Mountain War Time and 1 p. m. Pacific War Time). Some stations may record the program and broadcast it at a time which suits their schedule better. Local newspaper radio announcements should be consulted.

Owing to radio network conflicts the program for April 28 will be at 2 p. m. Eastern War Time (1 p. m. Central War Time, 12 noon Mountain War Time and 11 a. m. Pacific War Time).

## Woman's Auxiliary

### New Jersey

Dr. Royal A. Schaaf, president of the Academy of Medicine of Newark, Dr. Louis Schneider, president of the Essex County Medical Society, Mr. Philip Cummings, world traveler and lecturer, and Dr. Robert A. Lampert, author of "Yankee Doctor in Paradise," were guest speakers at the Essex County auxiliary meeting recently. Mr. Cummings and Dr. Lampert told of living conditions in the South Pacific, stating that deaths from tropical diseases far exceeded those inflicted by the Japanese.

At the November meeting of the Mercer County auxiliary, more than a thousand surgical dressings were folded.

### Pennsylvania

The Woman's Auxiliary to the Philadelphia County Medical Society took part in the meeting of the county medical society, January 9. Certificates were presented to seventeen doctors who have been in practice for fifty years. Dr. William H. Perkins, dean of Jefferson Medical College, Dr. William Pepper, dean of the University of Pennsylvania, Dr. William Parkinson, dean of Temple University, and Dr. Francis Borzell were the guest speakers.

The auxiliary reported a donation of \$500 to the Aid Association and \$50 to the wounded soldiers at Valley Forge Hospital.

### Texas

The Woman's Auxiliary to the State Medical Association of Texas has established a Woman's Auxiliary library endowment fund for the development of a library for the state medical association as a tribute to the doctors of Texas. The first donation (\$1,000) to this fund was made by Mr. and Mrs. G. A. Ray of Pettus, Texas, in memory of their daughter. Through donations contributed by all the presidents who have served the Woman's Auxiliary, plus donations made by those husbands of Auxiliary presidents who have served as president of the state medical association, a second fund of \$1,000 has been added and is to be known as "The Presidents' Library Endowment Fund."

At the first fall meeting of the Hunt-Rockwell-Rains counties Woman's Auxiliary the war activities report showed that approximately 78,000 hours have been given to war work during the past year. Mrs. S. E. Thompson, state president, addressed the meeting and asked for continued support of the student loan fund maintained for the purpose of assisting worthy students who have completed at least their second year in a standard medical school.

## Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST: SUCH AS RELATE TO SOCIETY ACTIVITIES, NEW HOSPITALS, EDUCATION AND PUBLIC HEALTH.)

### CALIFORNIA

**Survey Shows Need for Educational Program for Spastic Children.**—Need for a state educational program for spastic children in California was shown by a survey made at the request of the legislature by Lois Shulz, graduate student, under the supervision of Frank N. Freeman, Ph.D., dean of the School of Education on the Berkeley campus of the University of California, according to the *University of California Clip Sheet*, April 3. More than 1,200 children with cerebral palsy, usually called spastics, were known to school authorities. These had disabilities ranging from minor muscle involvement to silent speech, partial sight or hearing and inability to walk, help or feed themselves. Low mental capacity does not necessarily accompany these, it was stated. Less than 500 of these children were reported to be in school. Of these, the report indicated, it is evident from the many reports from teachers that the spastic child experiences much difficulty in learning and requires a large amount of individual attention from specially trained teachers.

**Permanente Foundation Research Fellowships.**—The Permanente Foundation will offer a limited number of fellowships for clinical research in the fields of medicine, surgery and related specialties. Appointments will be awarded to graduates of recognized medical schools who have completed an approved internship. Fellowships will be offered for the study of specifically announced problems in clinical medicine or surgery. Opportunities will be present for study in associated subjects and related fields and for resident bedside training when desired. A limited number of fellowships will also be available to qualified physicians who present a suitable research problem of their own choosing. A detailed outline of the investigational study which the applicant desires to undertake should be presented to the Permanente Fellowship Committee for approval. Constant supervision, guidance and teaching will be furnished by an assigned advisory committee. A thesis covering the year's work will be required at the completion of the fellowship. At the conclusion of the research fellowship, opportunities will be available to men for extension of the fellowship or for positions on the resident or attending staff of the Permanente hospitals. Research fellows will receive \$225 monthly, plus maintenance. Fellowships for the year 1945 in the field of internal medicine will cover cardiac status in pneumonia and the evaluation of recent advances in peptic ulcer therapy. Applications should be addressed to the Chairman, Fellowship Committee, Permanente Foundation Hospital, Broadway and MacArthur Boulevard, Oakland 11, Calif.

### DISTRICT OF COLUMBIA

**Course in Physical Medicine.**—The committee on post-graduate education of the Medical Society of the District of Columbia opened a three lecture course in physical medicine, April 9, with a talk by Francis O. Schmitt, Ph.D., head of the department of biology and the department of biologic engineering of the Massachusetts Institute of Technology, Cambridge, on "The Physical Basis of Physical Medicine." Dr. Frank H. Krusen, head of the section on physical medicine, Mayo Clinic, Rochester, Minn., will give the second lecture, April 16, on "The Future of Physical Medicine," and Dr. George M. Piersol, director, division of physical medicine, and professor of medicine, Medico-Chirurgical College, Graduate School of Medicine, University of Pennsylvania, Philadelphia, the third lecture, April 23, on "Clinical Aspects of Physical Medicine."

### ILLINOIS

**Changes in Health Officers.**—Dr. James T. Googe, health officer of district number 6 with headquarters at Gilman, has been appointed to a similar position with the McDonough and Fulton County unit, succeeding the late Dr. Cyrus P. McRaven, Macomb. —Dr. Sidney I. Franklin on March 21 was appointed health officer of the recently formed DuPage County Health Department (*THE JOURNAL*, Dec. 9, 1944, p. 970). —Dr. Bernard E. Bolotoff has been named health officer of Rockford, succeeding Dr. Hobart W. Edson, who held the position for fifteen years.

### Chicago

**Brigadier Cairns to Give Mayo Lecture.**—Brigadier Hugh W. B. Cairns, Nuffield professor of surgery, Oxford University, and consultant in neurologic surgery to the Royal Army Medical Corps, will deliver the Charles H. Mayo Lecture in Surgery of Northwestern University in the Archibald Church Library of the medical school at 4 p. m., April 20. His subject will be "The Treatment of War Wounds of the Head."

**Course in Electrocardiography.**—The annual intensive two weeks course in electrocardiography for graduate physicians will be given at Michael Reese Hospital under the personal direction of Dr. Louis N. Katz, director of cardiovascular research, August 20-September 1. Group and individual instruction will be given, and the course is open to beginning and advanced students in electrocardiography. Further information and a copy of the program may be obtained on application to the cardiovascular department, Michael Reese Hospital, Chicago 16.

**The Capps Prize.**—The Institute of Medicine of Chicago offers its annual Joseph A. Capps Prize of \$400 for the most meritorious investigation in medicine or in the specialties of medicine. The investigation may be also in the fundamental sciences, provided the work has a definite bearing on some medical problem. Competition is open to graduates of Chicago medical schools who completed their internship or one year of laboratory work in 1943 or thereafter. Manuscripts must be submitted to the secretary of the Institute of Medicine of Chicago, 86 East Randolph Street, Chicago 1, not later than December 31.

**Arthur Compton Honored.**—Arthur H. Compton, Sc.D., dean of the division of physical sciences and chairman of the department of physics, University of Chicago, has "received the Washington Award for devoted, unselfish and preeminent service in advancing human progress, in recognition of 'his research and teaching in the physical sciences, increasing man's knowledge of the action of x-rays and cosmic rays,'" according to *Science*. Members of the commission of award represent the American Society of Civil Engineers, the American Institute of Mining and Metallurgical Engineers, the American Society of Mechanical Engineers, the American Institute of Electrical Engineers and the Western Society of Engineers.

**Physicians Exonerated in Malpractice Accusation.**—The medical committee of the Illinois Department of Registration and Education on April 2 exonerated Drs. Edward L. Cornell and Ralph A. Reis on charges of alleged gross malpractice in connection with the death of a woman in Southtown Hospital, Nov. 11, 1943. Newspapers reported that evidence taken at a department hearing showed that the two physicians had been brought into the case as obstetric specialists after complications had set in and the woman had been seized with convulsions in the expected birth of her baby, which also died. In voting unanimous vindication for Dr. Cornell and Dr. Reis, the committee overruled the contention of Attorney John Tyrell, representing the department, that the two physicians, as members of the joint maternal welfare committee of Cook County, were members of a "supergovernment" appointed by the board of health. Since the committee was organized in February 1938 to furnish expert consultation in abnormal births in Chicago hospitals, the maternity death rate for the city has dropped approximately 60 per cent in such cases, records disclose.

### KENTUCKY

**Accident to Physician.**—Dr. Harry R. Mendelsohn, Covington, and his wife were injured recently when a streetcar struck their automobile. Newspaper reports implied that the streetcar operator had ignored a red traffic light.

**Malaria Control Program.**—DDT will be used in a malaria control program for rural areas of McCracken, Graves, Hickman and Fulton counties in accordance with plans adopted by a meeting in Paducah recently. The control program is sponsored by the U. S. Public Health Service, the state department of health and the local county health organizations.

**Proposed Health Center in Owensboro.**—The Owensboro board of city commissioners and the Daviess County Fiscal Court agreed at a joint meeting to appropriate approximately \$50,000 each toward the construction of a proposed health center in Owensboro. The federal government will supply the remaining \$50,000 if the city-county application is approved.

## MICHIGAN

**Memorial Hospital Dedicated.**—Formal ceremonies March 4 marked the dedication of the Ontonagon Memorial Hospital, Ontonagon. The new institute was dedicated to the memory of young men and young women of Ontonagon Township who have served, are now serving or will serve in the armed forces during World War II.

**New Professor of Anatomy.**—Gordon H. Scott, Ph.D., professor and head of the department of anatomy, University of Southern California School of Medicine, Los Angeles, has been appointed professor and head of the department at Wayne University College of Medicine, Detroit. Dr. Scott received his Ph.D. at the University of Minnesota, Minneapolis.

**Gifts to Wayne University.**—A grant of \$1,500 has been given to Wayne University by Frederick Stearns and Company to be used in the study of amino acids under the direction of William M. Cahill, Ph.D., Detroit, assistant professor of physiologic chemistry at the college of medicine. Dr. James Milton Robb, Detroit, has contributed \$1,000 for the use of the Alpha Omega Alpha scholarship and lectureship foundation at the college of medicine (THE JOURNAL, May 20, 1944, p. 220).

## NEBRASKA

**Voluntary Health Service in School System.**—Credit is ascribed to Dr. William H. Betz, Omaha, in building an unusual health unit in the Bellevue School system. According to the Omaha *World-Herald*, in 1937, after appearance before the school board and overcoming objections from numerous sources, Dr. Betz was given a tiny office and a cot in the combination high and grade school at Bellevue. Currently, with the cooperation of the school board and community, the office has expanded to include an especially equipped clinic with 2 beds, a pickup cot, examination chairs, medicine chests and file cases containing the complete health record of every pupil enrolled in the Bellevue schools. The operations of the clinic now include immunization and inoculation with parental consent of every child in the school. A full time nurse is employed whose duties include educational work, both with teachers and with pupils. Each teacher is given instruction in the common symptoms of childhood ailments. After room inspection each morning children with suggestions of colds, suggestive rashes or unusual paleness are sent to the school nurse for a check-up. If the illness is serious the child is put to bed, the parents are called and the child is referred to his family physician. In a statement to the press Dr. Betz emphasizes that beyond first aid the child is not treated or prescribed for. He is always referred to his own doctor. It is often necessary to keep a sick child at the clinic all day, particularly now with so many mothers working. A child is never sent home until the parents are consulted. If the parents cannot call for the child, he is taken to his home or physician by the school nurse. The school expends from \$1,100 to \$1,200 annually for maintenance of the clinic, with a \$400 emergency fund. A percentage of the cost is borne by the state health department. Dr. Betz's services are purely voluntary.

## NEW YORK

**Local Society on Psychosomatic Medicine.**—Announcement has just been received of the recent organization of the Albany Society for the Advancement of Psychosomatic Medicine with Drs. Robert R. Faust, Albany, president and Alva Gwin, Albany, secretary.

**Christopher Parnall Resigns at Rochester General Hospital.**—Dr. Christopher G. Parnall has resigned as medical director of the Rochester General Hospital, Rochester, effective October 1, and plans to devote his time to consultation "as a free lance" in hospital planning and construction. Dr. Parnall has held the position for twenty-one years.

**New Health Officer Named Professor of Child Hygiene.**—Dr. Albert D. Kaiser, who was sworn in as health officer of Rochester March 29, has also been given an appointment as professor of child hygiene at the University of Rochester School of Medicine and Dentistry. Dr. Kaiser, who has been associate professor of pediatrics, was given the full professorship in recognition of his long service to the school and his new position of health officer, in which he succeeded Dr. Arthur M. Johnson (THE JOURNAL, March 3, p. 534).

**Cancer Teaching Day.**—April 26 has been designated cancer teaching day in a cooperative program at the Hotel Statler, Buffalo, by the Medical Society of the County of Erie, Buffalo Academy of Medicine, eighth district branch of the Medical Society of the State of New York, University of Buffalo School of Medicine, state medical society and the

division of cancer control of the state department of health. Among the speakers will be Drs. Donald Guthrie, Sayre, Pa., on "Diagnosis and Surgical Treatment of Carcinoma of the Breast" and Dr. Lloyd F. Craver, New York, "What Can the General Practitioner Do About Lowering Cancer Mortality?" Speakers at the evening meeting will be Drs. Hayes Martin, New York, on "Diagnosis and Curability of Intraoral Cancer" and John H. Garlock, New York, "Carcinoma of the Colon."

**National Affiliation Dissolved with Local Cancer Group.**—On March 23 the American Cancer Society issued a "public notice" that the affiliation with the New York State Committee for the Control of Cancer had been officially severed. According to the Rochester *Democrat and Chronicle*, Clarence C. Little, Sc.D., managing director of the American Cancer Society, stated that the break with the state committee occurred when the latter failed to meet a proviso that its chairman shall be appointed by the national society. Action severing the relationship was taken by unanimous action of the executive committee of the national group, Oct. 6, 1944, it was stated. No official appointment of chairman had been made since this date and no one authorized by the national society had held office and, therefore, continuation of the state society's activities had been unauthorized since the action of the national group.

**Governor Signs Blood Bank Bill.**—A state mobile unit will be established by the department of health as the result of Governor Dewey signing a bill appropriating \$100,000 to finance the collection and distribution of human blood and its derivatives for the treatment of the sick and injured in the state (THE JOURNAL, March 10, p. 606). The program will appeal to citizens in communities not reached by the present Red Cross program, according to the Rochester *Times-Union*, and will permit the creation of blood collection and distribution programs in areas of the state where no such program now exists. In announcing that the program had been developed with the assistance of the Red Cross, Governor Dewey also made public the following statement concerning the measure by the state medical society: "It is considered that the establishment by the health department of a program for the collection, storage and distribution of human blood and blood derivatives, including therapeutic and diagnostic serums, is most important in the treatment of sick and injured persons and the prevention of disease."

**Urge Creation of Division of Mental Hygiene.**—The Westchester County Board of Health on March 22 voted unanimously to request the board of supervisors to provide \$66,000 a year to operate a division of mental hygiene within the health department. According to the New York *Times* the division would maintain at least six clinics to serve the general public, with special attention to the psychiatric needs of children, war veterans and veterans' families. The proposal was drafted by the recently organized Westchester Mental Hygiene Association, which announced to the press that as far as known the plan was the first in the nation that would afford under public auspices complete county coverage in terms of accessibility of service. Each clinic would have resident social workers, collaborating with itinerant psychiatrists, psychologists and case supervisors. Dr. Edwin G. Ramsdell, White Plains, chairman of the board of health, appointed a committee to draft the administrative details. The mental hygiene association said the cost from May 1 to the end of the year would be \$46,200 and that nonveterans receiving treatment would be charged fees in accordance with ability to pay.

## New York City

**The Rothschild Lecture.**—Dr. Frank H. Lahey, Boston, will deliver the Rothschild Lecture at Beth Israel Hospital, April 24, on "The Management of Thyroid Disease: Some of the New Developments, Including a Review of Our Experiences with Thiouracil."

**Plan for Library Expansion.**—A committee of representatives of several large chemical and pharmaceutical concerns has been organized to raise \$500,000 for "badly needed expansion" of the library of the New York Academy of Medicine, the New York *Times* reported March 21. The fund would permit construction of a nine floor addition to the stack room, which will increase capacity to 374,000 volumes. It would also provide for a new catalogue of 2,800,000 cards and improved handling, delivery, photostating and bibliographic service.

**Outbreak of Trichinosis.**—An outbreak of trichinosis was recently announced in New York, involving 32 residents of Manhattan, Brooklyn and the Bronx who ate mettwurst and similar products made from incompletely processed pork. The pork products were manufactured by a wholesaler in the Bronx and distributed to thirteen retailers throughout the city. In spite of the fact that the department of health requires the holding of pork used in these products at 5 F. for a period of at least

twenty days, the manufacturer did not hold the pork at the low temperature necessary to prevent the disease from occurring. On March 14 inspectors of the health department visited the Bronx plant and subsequently placed an embargo on its pork products. A similar embargo was placed at thirteen retail stores on products from the Bronx manufacturer.

**Physician Named in Bandage Swindle.**—On March 29 the government filed a forty-four count criminal information against Dr. Abraham Freitag charging that he made more than \$500,000 in the black market on materials allotted to him for bandages for wounded servicemen, according to the *Chicago Sun*. The physician is also said to be an inventor of a bandage cut on the bias, and one of his companies, the Bias Coating Corporation, was said to be named in the information. It was also stated in the information that Freitag diverted into the black market 2,996,340 yards of cotton sheeting, muslin, percale and cotton print. He was said to have paid from 10 to 12 cents a yard for these materials, selling them for from 28 to 35 cents a yard to manufacturers of curtains, handkerchiefs, infants' wear, aprons and house dresses. According to the information, Dr. Freitag's company used for bandages only 1,000,000 yards of the 2,996,340 yards of material allotted by the WPB.

**United Medical Service Holds First Annual Meeting.**—Formal election of officers and board members who have been serving in a temporary capacity since the foundation of United Medical Service, Inc., in June 1944 marked the first annual meeting, April 2, at 370 Lexington Avenue. The following officers were elected to serve for one year: Dr. Nathan B. Van Etten, chairman of the board of the executive committee; Rowland H. George, president; Dr. Charles Gordon Heyd and Frank Van Dyk, vice presidents; Paul G. Drescher and Harry Sesan, assistant vice presidents; John S. Linen, treasurer; Dr. De Witt Stetten, secretary; James de Socarras, assistant secretary, and Dr. Frederick E. Elliott, director of medical services. In addition, a number of board members and chairmen of standing committees were chosen. The United Medical Service was created early in 1944 following approval by the state medical society (*THE JOURNAL*, May 27, p. 296, and Oct. 7, 1944, p. 377, and Feb. 10, 1945, p. 347).

**Indictments Reveal Narcotics Ring.**—Seventeen men were indicted as the controlling members of a narcotics ring that has its source of supply in secret, illicit poppy fields in Mexico, the *New York Times* stated March 27. Charges were made in eight indictments opened in federal court at the instance of United States Attorney John F. X. McGohey, who had obtained the true bills secretly March 5 on the basis of extensive investigations made by agents of the Treasury Department. It was stated that the defendants obtained opium from Mexico and processed it in New York, mixing it with milk sugar. The stuff they sold to other distributors had a narcotic content of 70 per cent. At \$600 an ounce they sold 3 to 4 million dollars' worth of this. The *Times* stated that the dealers to whom the defendants sold the product added more sugar and as the narcotic passed through the successive stages of distribution it got weaker and weaker. Addicts arrested in New York were found to possess supplies of less than 1 per cent narcotic content and yet were paying as much as \$30 an ounce for the denatured drugs, it was reported.

**Central Bureau for Jewish Medical and Welfare Agencies.**—A central bureau for the Jewish aged is now being organized in New York to coordinate the services of all existing medical and welfare agencies for the care of aged Jews. According to the *New York Herald Tribune*, in addition to organizing present facilities the bureau also will serve in an advisory capacity with a central information service referring individuals to the institutions providing the specialized care they need, and as a research agent. The bureau will investigate additional institutional resources for the chronically ill, nursing homes, convalescent homes, special medical clinics, boarding homes, visiting housekeeping service, home medical care and homes, group work opportunities. The bureau is sponsored by thirty-five organizations which provide the bulk of medical and welfare services available to aged Jews, and twenty of these, including Mount Sinai Hospital, Montefiore Hospital for Chronic Diseases and Bronx Hospital, have already agreed to cooperate. The Federation of Jewish Philanthropies of New York has agreed to supply the main financial support of the bureau during its experimental stage, though each cooperating institution also will be expected to support the bureau. The autonomy of the individual agencies will be preserved.

**Physicians to Be Asked to Share Facilities with Returning Colleagues.**—A new service designed to help discharging army and navy physicians get offices, homes, furniture and scientific equipment was announced March 26 by the Medical Society of the County of New York. Plans have been approved by the directors of the society. The new pro-

gram, which is under the sponsorship of the society's new committee on public relations, includes finding "part or full time employment in governmental or private service" and "opportunities for postgraduate instruction." A Medical Veteran's Aid Fund, to be raised through donations of members (*THE JOURNAL*, July 15, 1944, p. 801), would give non-interest bearing small loans to tide a veteran over until his government appropriations arrive. According to an announcement in the *New York Times*, 1,700 of the 6,200 members of the society are in military service. The difficulty in finding offices to reestablish practice of fifty members of the society thus far discharged has indicated that steps must be taken now before the problem becomes acute, it was stated. According to a report in the *Times*, a major function of the service would be to survey doctors and housing facilities according to areas, to assist medical men in resuming practice in neighborhoods where they were formerly located. A new trend in the sharing by doctors of offices and equipment is predicted. Advocating "doubling up," individual doctors' offices and full time use of equipment were called "wasteful." *New York Medicine* will carry a questionnaire asking doctor readers willing to share office, equipment and telephone service to fill out the form and mail it to the new service. The questionnaire is patterned after one devised by Dr. Charles F. McCarty, Brooklyn, director of the Kings County Medical Society, which appears in its bulletin every other month.

## OHIO

**Medical Academy to Buy Controlling Interest in Journal Publishing Company.**—On March 6 the Academy of Medicine of Cincinnati voted unanimously in favor of a motion to approve the proposal of the council to buy a controlling interest in the Academy Journal Publishing Company. Based on this action, the council has adopted a series of resolutions which were necessary to complete the transaction. As soon as the transfers can be made, the Academy of Medicine will own at least 100 of the 183 shares of *Journal* stock outstanding, assuring a majority control of the editorial and business policies of the *Journal*. Dr. Eugene B. Ferris Jr., assistant professor of medicine, University of Cincinnati College of Medicine, will act as editor in chief for a three year period. Pending submission of an amendment to the academy by-laws to set up a permanent editorial board or committee, a temporary board will be appointed by the president of the academy and Dr. Ferris to assume immediate charge of the *Journal*. The publishing company's board of directors will adopt its own set of resolutions to carry out this change in management procedure. It is expected that, starting with the May 1945 issue, the *Journal* will become the official organ of the Academy of Medicine and its policies would then be under academy control. At the start, an effort will be made to enlarge the scope of the *Journal* to include news of academy actions and of academy members, college of medicine, current news about the faculty, students and alumni, scientific material presented at academy meetings and at hospital staff meetings, sectional meetings, college of medicine conferences and clinics, and news of developments in city and county public health fields and that of the public health federation's various agencies. Scientific material used will be aimed to meet the needs of physicians in active practice.

## PENNSYLVANIA

**Personal.**—Dr. and Mrs. Frank J. Kessler, Easton, recently celebrated their golden wedding anniversary. Dr. David W. Thomas observed his twenty-fifth anniversary as chief surgeon at the Lock Haven Hospital, Lock Haven, February 16. A dinner was held in his honor.

**Society News.**—Dr. Harry E. Bacon, Philadelphia, will address the Dauphin County Medical Society in Harrisburg, April 17, on "Carcinoma of the Rectum and Sigmoid." Dr. James Flexner, White Plains, N. Y., will speak before the Lackawanna County Medical Society, Scranton, April 17, on "Physiological Approach to Gastroenterology as It Influences Etiology and Therapy." Dr. Matthew S. Ersner, Philadelphia, will address the society, April 24, on "Modern Conception of Intranasal and Extranasal Deformities Beginning with Intrauterine Life—Delivery and the Development from Childhood to Maturity."

## Philadelphia

**Seminars on Mental Hygiene.**—The Philadelphia County Medical Society recently initiated a group of seminars on psychiatric subjects. The first group of lectures, which are designated for members of the county medical society, was given March 29 by Drs. Oliver Spurgeon English on "The Depressions" and Arthur P. Noyes, Norristown, "Schizophrenia."

## RHODE ISLAND

**Reginald Fitz Presented with Chapin Medal.**—The Rhode Island Medical Society at its midwinter meeting, February 5, presented the Charles V. Chapin Memorial Award to Dr. Reginald Fitz, Boston. In 1944 the Providence City Council passed an ordinance creating a standing committee of the council to be known as the Dr. Charles V. Chapin Memorial Award Committee. A stipulation in the ordinance requires the provision of a suitable medal to be presented to the speaker who delivers the Chapin Memorial Oration during the annual meeting of the Rhode Island Medical Society. Dr. Reginald Fitz was selected by the committee on arrangements to deliver the Chapin Oration during the meeting of the state society in Providence in May 1944, but since the medal was not prepared at the time he gave his address the actual presentation was held up until the recent meeting. The presentation was made by the chairman of the city council committee.

## TEXAS

**Lectureship Named for Edward Cary.**—The Edward H. Cary lectureship was established recently at the Southwestern Medical College of the Southwestern Medical Foundation, Dallas, as an expression of appreciation to Dr. Edward H. Cary, president of the Southwestern Medical Foundation, for his work in connection with the foundation and the medical school. It is anticipated that three lectures will be presented annually, the first of which has already been given by Dr. Tom D. Spies, associate professor of medicine, University of Cincinnati College of Medicine.

**Pediatric Conference.**—A postgraduate course in pediatrics will be held at the University of Texas Medical Branch, Galveston, May 14-19, under the auspices of the University of Texas child health program and the maternal and child health bureau of the Texas State Board of Health. The course will be limited to forty physicians, with tuition furnished by the state board of health. Preference will be given to physicians of Texas recently returned from the armed services and to physicians participating in the various well baby conferences in Texas. The faculty will include leading pediatricians from the Yale, New Haven, Conn., University of Rochester, New York, and Louisiana State University, New Orleans, schools of medicine, in addition to the staff of the University of Texas Medical Branch. Application blanks for registration may be obtained from Dr. Arild E. Hansen, Galveston.

**Millions Given to Local Hospitals.**—Mr. and Mrs. H. R. Cullen, Houston, on March 1 announced gifts of one million dollars each to Methodist, Memorial and Hermann hospitals, Houston, and one million dollars to the Episcopal Church for the construction of a hospital. The *Medical Record and Annals* announces the distribution of the funds as follows: Memorial Hospital announced that the money will be used for construction of a nurses' home and school on a tract near the hospital, recently donated by Mrs. J. W. Neal, as part of an expansion program in which other gifts will be included. Methodist Hospital is considering the use of the Cullen gift as basis for constructing a new hospital on a new site. The Episcopal Church has plans drawn for a hospital which will be constructed in the new medical center, between Hermann Hospital and the Navy Hospital now under construction. Hermann Hospital will use the Cullen gift in an expansion program which will total \$4,500,000 and include a new hospital building with about 450 beds, an office building for doctors and a nurses' building to provide space for the school and residence for nurses.

## WEST VIRGINIA

**Changes in Health Personnel.**—Hi Eastland Steele, who has been with the bureau of vital statistics, Bureau of the Census, Washington, D. C., for nearly ten years, has been appointed director of the division of vital statistics in the health department to succeed Dr. Martin B. Woodward, who resigned to accept a place on the staff at Washoe County General Hospital, Reno, Nev. (THE JOURNAL, January 27, p. 238). Robert L. Smith, P. A. Surg., U. S. Public Health Service, Los Angeles, has been appointed assistant director of the bureau of tuberculosis. For the past two years he has been with the division of tuberculosis control, U. S. Public Health Service, at Bethesda, Md. Recently he completed a course in the school of public health at the University of Michigan.

**State Health Board Increases Scope.**—Under a bill passed recently the state health department shall have advisory medical supervision of all the state emergency, tuberculosis and mental hospitals. The state board of control will continue

to exercise full control of the business and fiscal affairs of all the institutions. Under the old law the state health department had the medical supervision of tuberculosis sanatoriums only. The new law authorizes the state health commissioner to establish a bureau of mental health and to conduct mental hygiene clinics, utilizing the professional services of the state mental hospitals. He will cooperate with the state department of education and other school authorities in making available to schools the services of psychologists and psychiatrists, by conducting educational programs and by other means approved by the public health council.

## GENERAL

**Sterling Drug to Bid for Shares of Winthrop Chemical Company.**—After announcement by the Alien Property Custodian March 21 that one half of the capital shares of Winthrop Chemical Company, Wilmington, Del., would be auctioned on April 23, James Hill Jr., New York, president of Sterling Drug, Inc., owner of the remaining Winthrop shares, disclosed that Sterling would bid \$9,500,000 for the custodian's holdings, newspapers announce.

**Association for the Advancement of Science.**—Charles F. Kettering, Sc.D., Dayton, Ohio, was elected president of the American Association for the Advancement of Science, succeeding Dr. Anton J. Carlson, Chicago. Among vice presidents are Dr. Warfield T. Longcope, Baltimore, medical science; Frank D. Kern, Sc.D., State College, Pa., zoology; Alfred I. Hallowell, Ph.D., Evanston, Ill., anthropology; Florence L. Goodenough, Ph.D., Minneapolis, psychology, and Henry Eyring, Ph.D., Princeton, N. J., chemistry. Malcolm H. Soule, Sc.D., Ann Arbor, Mich., has been reelected secretary of section N (medical science) of the association.

**Sale of Surplus Drugs Held Menace to Public Health.**—The "apparently indiscriminate release of enormous quantities" of surplus war supplies of potent medicines and drugs by the procurement division of the Treasury Department represents "a grave menace" to public health, the board of control of the National Wholesale Druggists' Association warned March 14 in a bulletin to the membership following a meeting in the Hotel Pennsylvania. According to the New York *Herald Tribune*, March 15, as evidence of the dangers involved, E. Allen Newcomb, secretary of the association, is reported to have said that on a recent visit to a storage depot he saw several thousand bottles of hydrogen peroxide which had evaporated to such an extent in government storage that the antiseptic qualities of the fluid had been lost. He cited the sale after World War I of condemned ether which finally found its way into hospitals, where it was blamed for several deaths. Under present procedures, Mr. Newcomb said, drugs are sold by the government to the highest bidder, and the only protection to the public is the label on the goods. The meeting yesterday adopted a resolution declaring that "potent drugs and medicine should be distributed only through those who are thoroughly familiar with the medicinal qualities of such products."

**Edwin Cohn Receives First Passano Foundation Award.**—As the result of a nationwide poll among leaders in medical sciences, Edwin J. Cohn, Ph.D., professor of biochemistry, Harvard Medical School, Boston, has been chosen as the first winner of the Passano Foundation Award, presentation of the \$5,000 cash prize to be made in the Osler Hall of the Medical and Chirurgical Faculty of Maryland, Baltimore, May 16. Dr. Cohn, who is distinguished for research on the fractionation of blood, will read a paper concerning the applications of his work on blood plasma to the field of clinical medicine during the presentation ceremony. Mr. Edward B. Passano, chairman of the board of the Williams & Wilkins Company, will present the award. The Passano Foundation was established in 1944 by the Williams & Wilkins Company, medical publishers of Baltimore, to aid any way possible the advancement of medical research, especially research that bears promise of clinical application. The foundation was named for Mr. Edward B. Passano, who has been identified with the development of scientific publishing for more than thirty-six years (THE JOURNAL, Feb. 19, 1944, p. 521). Drs. Emil Novak, associate professor of obstetrics, Johns Hopkins University School of Medicine, Nicholson J. Eastman, professor of obstetrics at Johns Hopkins, and George W. Corner, director of the Embryological Laboratory of the Carnegie Institution of Washington, represent the medical profession on the board of directors of the foundation. Dr. Cohn received his doctor of philosophy degree at the University of Chicago in 1917.

#### Rehabilitation

The vast scale of war injuries, not only in the fighting forces but also in civilians, in consequence of bombing from the air has produced a corresponding problem of rehabilitation. More than 250 hospitals are now using rehabilitation methods, which include physical therapy, remedial exercises, outdoor games and handicrafts. This is nearly twice as many as a year ago, when the Ministry of Health made a special appeal to civilian hospitals to establish a rehabilitation department as soon as possible. Rehabilitation is a service, which aims at securing quicker and more complete recovery not only in accident cases but also in almost every form of illness and disability. Passive physical therapy, which includes heat, massage and electrotherapy, was formerly the main method of rehabilitation in most hospitals. This is largely giving place to active movements by the patients themselves. These include remedial exercises to strengthen the body generally and to restore function to the affected region, organized games to promote freedom and spontaneity of movement, and occupational therapy to give regular and gentle exercise to particular groups of muscles and to serve also as a form of mental relaxation. Lectures, discussions, musical entertainments and books provide mental stimulus during the rest periods.

Special attention is paid to the psychologic and economic aspects of the problem. The patient's full confidence and cooperation need to be secured; his personal and domestic anxieties must be allayed and, above all, if he is discharged before fit to return to work he must not be allowed to drift. The goal is complete restoration of capacity and resettlement in satisfying work. To this end close touch is maintained with the Ministry of Labor so that he may be assisted to take up suitable employment or, if necessary, to attend a vocational training center. Some hospitals have obtained the use of local halls for the expansion of their work; others have been supplied with huts for remedial exercises.

Most of the hospitals have appointed a member of the staff as a rehabilitation medical officer. Many such officers have attended special courses at selected rehabilitation centers. Lectures and demonstrations have been given by experts on the application of rehabilitation methods to various types of medical and surgical disability. Other courses have been provided for physical therapy technicians, handicraft teachers and others who are helping in this work. To help with the resettlement of disabled persons in industry, large firms have established special workshops in neighboring hospitals in which disabled employees may be restored to their working capacity by exercising the affected limbs in suitably adapted work under supervision.

#### Gift from the American Society of Anesthetists

Many medical officers of the United States Army attended an interesting ceremony in the hall of the Royal Society of Medicine, when a talking film projector, a gift from the American Society of Anesthetists, was presented in recognition of the friendly relations between the American and British anesthetists which have been accentuated by the war. The film was handed over by Col. Ralph M. Tovell, consultant in anesthesia to the chief surgeon of the American Expeditionary Forces in Europe. He said "We came here when our countries needed each other's help. We have listened to your men of renown; we have learned a great deal. Much good has accrued to the benefit of the sick and wounded. We have been deeply appreciative of your full cooperation and the friendships made will be lasting. We have written home of these things, and

our parent civilian organization, the American Society of Anesthetists, without instigation from members on this side of the water, has procured a 16 mm. sound projector, which has been sent across for presentation to you. It is given as a token of appreciation for your hospitality and kindness to members shown in times of peace and war." In accepting the gift Dr. Francis Evans, president of the section of anesthetists of the Royal Society of Medicine, said that the one hope of the world today was a complete alliance of the English speaking people—not only a political alliance but the deep understanding that came from personal contacts and such kindly acts as this. Surgeon Rear Admiral Gordon-Taylor\* returned thanks for the whole society and recalled that this was by no means the first gift from American anesthetists to Britain.

### SWITZERLAND

(From Our Regular Correspondent)

GENEVA, Feb. 15, 1945.

#### Federal Examinations in Medicine

Although education and training are under the responsibility of each "cantonment," there are a number of examinations or diplomas which are federal, and the requirements are fixed by the Federal Education Department in Bern. Among these the most important are the medical examinations. Last year 103 doctors were granted diplomas; 13 were women and 30 came from the two Swiss French medical schools of Geneva (6) and Lausanne (24), the latter being famous for its medical education. The others came from the Swiss German faculties: Bâle (22), Berne (26) and Zurich (23) and 2 from Italian Switzerland. There were 2,400 medical students in the Swiss medical schools in 1944. A few medical students shift to other studies in the course of the terms, but the main portion do not complete medical school. An inquiry is proceeding to determine what becomes of these students.

#### Swiss School for Male Nurses

In the specialized press and in the general daily press, there is a campaign for a school for male nurses. The present war has shown the necessity of male nurses, and many doctors in the Allied armies have complained about how difficult it is to find male nurses to work in the front lines. If by any chance the Swiss had to fight, this shortage or, rather, this total absence of male nurses in the country (except in such specialized fields as psychiatry) would prove catastrophic for the field units. The chief medical officer of the army has well understood this and has already decided to create courses for the training of male nurses in surgery. Apart from the services male nurses can render in wartime, the general feeling is that in peacetime also they are indispensable. The plan is to create a Swiss school for male nurses, giving theoretical as well as practical training.

#### The Right to Operate

With the introduction of a new penal code, new solutions have been found for problems related to medicine and in particular to surgery. It seems interesting to state briefly the position of the medical man now toward some of these problems:

1. Is it the duty of the doctor to treat a patient, or has he the right to refuse his treatment? Nothing can oblige him to treat a patient, but if death or severe harm ensues he may have to suffer sanctions given in the new penal code.

2. Is it possible for the doctor to take into account neither the will of the patient nor that of his representatives to do as he thinks of use to his patient? This is a very difficult question, but in case of necessity the doctor can always take a decision without concerning himself with what legal representatives say. Example: A boy has appendicitis; the parents belong to a religious sect which is opposed to any operation. The doctor would not be prosecuted if he operates.

## Deaths

**Lyle Gillett McNeile**, Los Angeles, Los Angeles (Clinical) Medical Department of the University of California, 1910, emeritus professor of obstetrics and gynecology, a department which he organized in 1931 at the University of Southern California School of Medicine, where he served as instructor, assistant professor, associate professor and professor of obstetrics and where a chair in obstetrics bearing his name was recently created, honoring his thirty five years of service, member of the first faculty of the school of medicine when it became affiliated with the University of Southern California in 1909, formerly professor of clinical obstetrics at the College of Medical Evangelists, resident physician Sloane Maternity Hospital, New York, 1909, and the Chicago Lying in Maternity Hospital, 1910-1911, founder and director of the Los Angeles Maternity Service, a municipal dispensary of the city health department, chairman of the Section on Obstetrics, Gynecology and Abdominal Surgery of the American Medical Association 1935-1936, specialist certified by the American Board of Obstetrics and Gynecology, Inc., fellow of the American College of Surgeons, served as president of the Pacific Coast Society of Obstetrics and Gynecology, senior attending obstetrician, Los Angeles County Hospital, visiting obstetrician, Cedars of Lebanon Hospital, consulting obstetrician at the Hollywood Hospital, author of "Notes on Pathological and Operative Obstetrics" and "Obstetrical Mammin Practice"; died February 25, aged 59.

**Charles Henry Lawrence** ♂ Boston, Harvard Medical School, Boston, 1908, assistant professor of medicine at the Tufts College Medical School, formerly assistant professor of endocrinology at the Boston University School of Medicine, fellow of the American College of Physicians, member of the American Clinical and Climatological Association, specialist certified by the American Board of Internal Medicine, physician-in-chief of endocrine clinic and consulting physician of the courtesy staffs of the New England Baptist and Robert Breck Brigham hospitals, member of the associate staff, Faulkner Hospital, consulting physician, Charles Choate Memorial Hospital, Woburn, and the Symmes Arlington Hospital, Arlington, Mass., consultant in endocrinology at the Joseph H. Pratt Diagnostic Hospital, served in the U S Public Health Service, died March 13, aged 62.

**Emmet Leroy Wemple**, Verdugo City, Calif., University of California Medical Department, San Francisco, 1900, member of the American Medical Association, awarded the Croix de Guerre by the French government for distinguished service during World War I, at one time associated with the U S Public Health Service Reserve, and a medical officer for the U S Veterans Bureau in Los Angeles, medical examiner for the Veterans Administration for the La Crescenta-Tujunga area, a medical examiner for local draft board number 181 during World War II, received the Silver Beaver award for his efforts in the boy scout movement, president of the Crescenta Mutual Water Company, a charter member and past president of the Montrose-La Crescenta Kiwanis Club; president of the Crescenta Canada Rotary Club, died February 9, aged 69, of pulmonary carcinoma.

**Will Leroy Pyles** ♂ Colonel, U S Army retired, New York, Columbian University Medical Department, Washington, D C, 1901, Army Medical School, 1903, entered the U S Army as an assistant surgeon in 1902, rose through the various grades to that of colonel June 24, 1928, retired Feb 28 1942, served twice in the Philippines, commanded Goigas Hospital in Ancon, Panama, for four years, during World War I served as commanding officer of the army hospital in Louisville, Ky., formerly army surgeon in the Second Corps area in New York and the Fifth Corps area in Columbus, Ohio, fellow of the American College of Surgeons, received the doctor of public health degree from Johns Hopkins University, Baltimore, in 1923, died in the Veterans Administration Facility March 12, aged 67.

**Arthur Edward Smith** ♂ Minneapolis, University of Minnesota College of Medicine and Surgery, Minneapolis 1905, specialist certified by the American Board of Ophthalmology, member of the Minnesota Academy of Medicine, American Academy of Ophthalmology and Otolaryngology, American Association of Railway Surgeons and Sons of the American Revolution, fellow of the American College of Surgeons, served as chief oculist for the Soo Line Railroad, voluntary assistant at Kruckmann Clinic, Berlin, Germany, in 1912 and the Dimmer Clinic in Vienna, Austria, in 1913, served during World War I served an internship from 1905 to 1908 at the

Northwestern Hospital, where he was on the oculist staff where he died February 16, aged 65, of carcinoma of prostate.

**Walt Ponder Conaway** ♂ Atlantic City, N J, University and Bellevue Hospital Medical College, New York, specialist certified by the American Board of Obstetrics and Gynecology, Inc., first vice president in 1913 and member of the House of Delegates of the American Medical Association from 1931 to 1938, president of the Medical Society of Jersey in 1927, served as president of the Society of Surgeons of New Jersey, member of the New York Academy of Medicine, New York Obstetrical Society, Philadelphia Pathological Society and the Philadelphia Obstetrical Society, past president of the Philadelphia Medical Club, fellow of the American College of Surgeons, attending gynecologist, Atlantic City Hospital, died January 12, aged 71, of carcinoma of the colon.

**Ralph Hopkins** ♂ New Orleans; Medical Department Tulane University of Louisiana, New Orleans, 1899, professor of dermatology emeritus at his alma mater, formerly of faculty of the Graduate School of Medicine, Tulane University of Louisiana, member and at one time vice president of the American Dermatological Association, specialist certified by the American Board of Dermatology and Syphilology, member of the American Society of Tropical Medicine, International Leprosy Association and the Society of Investigative Dermatology, formerly associated with the U S Public Health Service, for many years on the staff of the U S Marine Hospital (National Leprosarium) at Carville; died March 12, aged 69.

**Andrew Louis Glaze** ♂ Birmingham, Ala., Vanderbilt University School of Medicine, Nashville, Tenn., 1912, specialist certified by the American Board of Dermatology and Syphilology, member of the American Academy of Dermatology and Syphilology, past president of the Southern Dermatological Society, president of the Jefferson County Medical Society in 1942, served overseas with the rank of major in the medical corps of the U S Army and a commander of a field hospital while in France during World War I, consulting dermatologist, Baptist Hospital, St Vincent's Hospital, St. Highlands Infirmary and Hillman Hospital, where he died January 31, aged 57.

**George Frederick Roeling** ♂ New Orleans, Medical Department of Tulane University of Louisiana, New Orleans, 1908, specialist certified by the American Board of Psychiatry and Neurology, Inc., member of the American Psychiatric Association, American Medical Association and the New England Society of Psychiatry, formerly coroner, city alchemist, medical superintendent of the City Hospital for Mental Diseases, consulting neuropsychiatrist, Charity Hospital, visiting neuropsychiatrist, U S Marine Hospital (National Leprosarium) at Carville, La., died January 12, aged 58, of coronary occlusion.

**George Terrell Singleton** ♂ Wichita Falls, Texas, Baylor University College of Medicine, Dallas, 1923, interned at Baylor Hospital in Dallas, formerly resident physician at Chicago Eye, Ear, Nose and Throat Hospital, served as a field artillery officers' training school during World War I, a member of the Wichita Falls Independent School District board, head of the Singleton Clinic, which he established, the staffs of the Bethania Hospital and the Wichita General Hospital, where he died January 13, aged 52, of intestinal obstruction.

**Cyrus Pilgrim McRaven** ♂ Macomb, Ill., National University of Arts and Sciences Medical Department, St. Louis, 1915, past president of the Pike-Calhoun Counties Medical Society, health officer for the bicounty health unit, comprising McDonough and Fulton counties, served overseas during World War I served as physician for the Western State Feeder College and as examining physician and member of the local advisory board of the local draft board, died in the Barr Hospital, St. Louis, February 13, aged 59, of bronchogenic carcinoma.

**Merton Orris Blakeslee** ♂ Lapeer, Mich., University of Michigan Homeopathic Medical School, Ann Arbor, 1911, member of the American Psychiatric Association; served as medical examiner on Selective Service Board in New Mexico at one time health officer of Jackson, for many years, superintendent of the New Mexico Home and Training School for Mental Defectives at Los Lunas, N. M., hospital physician and from 1920 to 1928 assistant superintendent at the Lapeer State Home and Training School, found dead February 12, aged 65.

**LeRoy Abbott**, Wilton, Wis., Bennett Medical College, Chicago, 1885, in 1935 was honored with a dinner, under the auspices of the Monroe County Medical Society, to celebrate

## Deaths

**Lyle Gillett McNeile**, Los Angeles; Los Angeles (Clinical) Medical Department of the University of California, 1910; emeritus professor of obstetrics and gynecology, a department which he organized in 1931 at the University of Southern California School of Medicine, where he served as instructor, assistant professor, associate professor and professor of obstetrics and where a chair in obstetrics bearing his name was recently created, honoring his thirty-five years of service; member of the first faculty of the school of medicine when it became affiliated with the University of Southern California in 1909; formerly professor of clinical obstetrics at the College of Medical Evangelists; resident physician, Sloane Maternity Hospital, New York, 1909, and the Chicago Lying-in Maternity Hospital, 1910-1911; founder and director of the Los Angeles Maternity Service, a municipal dispensary of the city health department; chairman of the Section on Obstetrics, Gynecology and Abdominal Surgery of the American Medical Association, 1935-1936; specialist certified by the American Board of Obstetrics and Gynecology, Inc.; fellow of the American College of Surgeons; served as president of the Pacific Coast Society of Obstetrics and Gynecology; senior attending obstetrician, Los Angeles County Hospital; visiting obstetrician, Cedars of Lebanon Hospital; consulting obstetrician at the Hollywood Hospital; author of "Notes on Pathological and Operative Obstetrics" and "Obstetrical Manikin Practice"; died February 25, aged 59.

S. Public Health Service; for many years on the staff of the U. S. Marine Hospital (National Leprosarium) at Carville; died March 7, aged 69.

**Andrew Louis Glaze** ♂ Birmingham, Ala.; Vanderbilt University School of Medicine, Nashville, Tenn., 1912; specialist certified by the American Board of Dermatology and Syphilology; member of the American Academy of Dermatology and Syphilology; past president of the Southeastern Dermatological Society; president of the Jefferson County Medical Society in 1942; served overseas with the rank of major in the medical corps of the U. S. Army and a commander of a field hospital while in France during World War I; consultant dermatologist, Baptist Hospital, St. Vincent's Hospital, South Highlands Infirmary and Hillman Hospital, where he died January 31, aged 57.

**George Frederick Roeling** ♂ New Orleans; Medical Department of Tulane University of Louisiana, New Orleans, 1908; specialist certified by the American Board of Psychiatry and Neurology, Inc.; member of the American Psychiatric Association, American Medical Association and the New England Society of Psychiatry; formerly coroner; city alienist; medical superintendent of the City Hospital for Mental Diseases; senior visiting neuropsychiatrist, Charity Hospital; visiting neuropsychiatrist, U. S. Marine Hospital (National Leprosarium) Carville, La.; died January 12, aged 58, of coronary occlusion.

**George Terrell Singleton** ♂ Wichita Falls, Texas; Baylor University College of Medicine, Dallas, 1923; interned at the Baylor Hospital in Dallas; formerly resident physician at the Chicago Eye, Ear, Nose and Throat Hospital; served with a field artillery officers' training school during World War I; a member of the Wichita Falls Independent School District board; head of the Singleton Clinic, which he established; on the staffs of the Bethania Hospital and the Wichita General Hospital, where he died January 13, aged 52, of intestinal obstruction.

**Cyrus Pilgrim McRaven** ♂ Macomb, Ill.; National University of Arts and Sciences Medical Department, St. Louis, 1915; past president of the Pike-Calhoun Counties Medical Society; health officer for the bicounty health unit, comprising McDonough and Fulton counties; served overseas during World War I; served as physician for the Western State Teachers College and as examining physician and member of the medical advisory board of the local draft board; died in the Barnes Hospital, St. Louis, February 13, aged 59, of bronchogenic carcinoma.

**Merton Orris Blakeslee** ♂ Lapeer, Mich.; University of Michigan Homeopathic Medical School, Ann Arbor, 1913; member of the American Psychiatric Association; served as medical examiner on Selective Service Board in New Mexico; at one time health officer of Jackson; for many years superintendent of the New Mexico Home and Training School for Mental Defectives at Los Lunas, N. M.; hospital physician and from 1920 to 1928 assistant superintendent at the Lapeer State Home and Training School; found dead February 12, aged 65.

**LeRoy Abbott**, Wilton, Wis.; Bennett Medical College, Chicago, 1885; in 1935 was honored with a dinner, under the auspices of the Monroe County Medical Society, to observe 10

completion of fifty years of practice; died January 7, aged 86, of cerebral hemorrhage.

**Edward Gurdon Aldrich**, Somerville, Mass.; College of Physicians and Surgeons, New York, 1895; died January 1, aged 79, of acute myocardial failure.

**James Ankrom Baker**, Middlebourne, W. Va.; Maryland Medical College, Baltimore, 1904; part time health officer for Tyler County; served during World War I; died in St. Joseph's Hospital, Parkersburg, February 26, aged 69.

**Frederick Louis Barnes**, Oskaloosa, Iowa; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1899; member of the American Medical Association; died January 28, aged 70, of cerebral thrombosis.

**Charles Howard Bee** @ Indiana, Pa.; Medico-Chirurgical College of Philadelphia, 1905; past president of the Indiana County Medical Society; on the staff of the Indiana Hospital, where he died December 28, aged 69, of shock following an operation for a fractured hip incurred in a fall.

**Joseph Tower Berry**, Belding, Mich.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1906; died February 9, aged 71, of cardiac failure.

**Lovisa Ida Blair** @ Wilkes-Barre, Pa.; Woman's Medical College of Pennsylvania, Philadelphia, 1912; died December 27, aged 66, of coronary thrombosis and pernicious anemia.

**William Sanford Carpenter**, Altoona, Iowa; University of Louisville Medical Department, Louisville, Ky., 1894; member of the American Medical Association; served as county coroner; served during World War I; died December 2, aged 73.

**William Willis Carrier**, Summerville, Pa.; Western Pennsylvania Medical College, Pittsburgh, 1904; member of the American Medical Association; died December 14, aged 70, of coronary occlusion and arteriosclerosis.

**Albert John Charlton**, Lowden, Iowa; Pulte Medical College, Homeopathic, Cincinnati, 1897; died in Des Moines January 27, aged 74, of coronary occlusion.

**Richard Allan Clark**, Detroit; McGill University Faculty of Medicine, Montreal, Que., Canada, 1870; died February 22, aged 96, of chronic myocarditis and arteriosclerosis.

**Theo F. Clark**, Baldwin City, Kan.; Eclectic Medical University, Kansas City, Mo., 1915; Kansas City College of Medicine and Surgery, Kansas City, Mo., 1920; died February 12, aged 78.

**Peter Kraft** @ Duluth, Minn.; Ludwig-Maximilians-Universität Medizinische Fakultät München, Munich, Bavaria, Germany, 1893; on the staffs of St. Mary's and St. Luke's hospitals; died January 12, aged 78, of pneumonia and multiple cerebral hemorrhages.

CAPT. SEYMOUR R. KATZ  
M. C., A. U. S., 1917-1944

MAJOR EDMUND S. KANES  
M. C., A. U. S., 1905-1944

LIEUT. COMDR. WAYNE H. STEWART  
(MC), U.S.N.R., 1909-1944

**Arthur H. Brownell**, Oneonta, N. Y.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1887; member of the American Medical Association; died January 10, aged 80, of arteriosclerosis and senility.

**Joe Ray Carder**, Clarksburg, W. Va.; Medical College of Virginia, Richmond, 1925; member of the American Medical Association; served overseas during World War I; died suddenly March 1, aged 51, of heart disease.

**Augustus Garland Lee** @ Texarkana, Ark.; Barnes Medical College, St. Louis, 1901; on the staff of the Texarkana Hospital, where he died January 17, aged 69, of cerebral hemorrhage.

**Thomas Hosterman MacKinnon**, Brooklyn; McGill University Faculty of Medicine, Montreal, Que., Canada, 1889; member of the American Medical Association; on the staff of St. Catherine's Hospital; died February 10, aged 81, of uremia.

## KILLED IN ACTION

**Seymour Robert Katz**, Chicago; University of Illinois College of Medicine, Chicago, 1941; served an internship at the Cook County Hospital; commissioned a first lieutenant in the medical corps of the Army of the United States on June 6, 1941; later promoted to captain; killed in action in the Southwest Pacific area, May 28, 1944, aged 27.

**Edmund Stanley Kanes** @ Rumson, N. J.; Georgetown University School of Medicine, Washington, D. C., 1933; served an internship at the Monmouth Memorial Hospital, Long Branch, where he had also been a member of the surgical staff; commissioned a first lieutenant in the

medical reserve corps of the U. S. Army on Aug. 14, 1935; began active duty in the Army of the United States on April 1, 1941; later promoted to captain and major; killed in action in the European area, July 11, 1944, aged 39.

**Wayne Henry Stewart**, Coraopolis, Pa.; University of Pittsburgh School of Medicine, 1933; member of the American Medical Association; interned at the Allegheny General Hospital in Pittsburgh; member of the staff of the Sewickley Valley Hospital, Sewickley; commissioned a lieutenant (jg) in the medical corps of the U. S. Naval Reserve on Feb. 9, 1940; promoted to lieutenant on June 15, 1942 and later lieutenant commander; killed in action in the Asiatic area Oct. 25, 1944, aged 35.

**Bernard McLaurine**, Lincoln, Ala.; Birmingham Medical College, 1910; member of the American Medical Association; died January 17, aged 59, of coronary occlusion.

**Walter Lee McManus**, Greensboro, N. C.; Atlanta (Ga.) School of Medicine, 1906; died in Danville, Va., January 8, aged 68, of cerebral hemorrhage.

**Robert Gray McPherson**, Graham, N. C.; University of North Carolina School of Medicine, 1908; member of the American Medical Association; died January 14, aged 64, of arteriosclerosis.

**Asa Meeks McRee**, Trenton, Tenn.; Vanderbilt University School of Medicine, Nashville, Tenn., 1897; a director of the Citizens National Bank of Trenton; died January 7, aged 72, of hypertension and arteriosclerosis.

**Francis Joseph Magilligan** Ⓢ Brooklyn; Bellevue Hospital Medical College, New York, 1890; died February 5, aged 84, of bronchopneumonia.

**Albert Cloyd Miller**, Columbus, Ohio; Western Reserve University Medical Department, Cleveland, 1897; died February 10, aged 71, of angina pectoris.

**Charles Frederick Ober**, Manchester, N. H.; University of the City of New York Medical Department, 1879; member of the American Medical Association; died January 29, aged 96, of arteriosclerosis.

**John Edwin Porter** Ⓢ Knob Noster, Mo.; Marion-Sims College of Medicine, St. Louis, 1897; surgeon for the Missouri Pacific Railway at Knob Noster; died January 6, aged 77, of heart disease.

**John Purman**, Pittsburgh; Jefferson Medical College of Philadelphia, 1881; member of the American Medical Association; a founder of the Homestead Hospital, Homestead; died January 14, aged 84, of Paget's disease and heart disease.

**Janet Douglas Quinn**, Springfield, Ohio; Eclectic Medical Institute, Cincinnati, 1894; died in the City Hospital January 23, aged 87, of carcinoma of the urinary bladder.

**Robert Davis Reynolds Jr.**, Ozark, Ala.; Medical College of Alabama, 1905; member of the American Medical Association; died January 25, aged 62, of coronary thrombosis.

**Frederick S. Tillapaugh**, Hannibal, N. Y.; College of Physicians and Surgeons, Baltimore, 1888; died in the Albert Lindley Lee Memorial Hospital, Fulton, January 10, aged 85, of arteriosclerotic heart disease.

**Walter Charles Tipton**, Sylvester, Ga.; Atlanta School of Medicine, 1908; honorary member of the Medical Association of Georgia and member of the American Medical Association; formerly associated with the Indian Service; chairman of the city board of education; died suddenly December 12, aged 62.

CAPT. JOSEPH BARRE TRAYWICK  
M. C., A. U. S., 1910-1944

CAPT. FRANKLIN LYLE WATTERS,  
M. C., A. U. S., 1909-1944

CAPT. HARRY WINER  
M. C., A. U. S., 1913-1944

**Royal Watson Pinney**, Derby, Conn.; College of Physicians and Surgeons, New York, 1888; member of the American Medical Association; died in the Griffin Hospital January 31, aged 80, of cerebral hemorrhage with right hemiplegia.

**James R. Wells**, Stone Mountain, Ga.; Atlanta Medical College, 1897; died January 1, aged 72, of coronary thrombosis.

**Norman M. Windsor**, St. Louis; Barnes Medical College, St. Louis, 1900; died January 25, aged 73, of carcinoma.

## KILLED IN ACTION

**Joseph Barre Traywick**, Cameron, S. C.; Medical College of the State of South Carolina, Charleston, 1937; member of the American Medical Association; interned at the Roper Hospital, Charleston, where he served a residency in pediatrics; served a residency in pediatrics at the University of Virginia Hospital, Charlottesville; commissioned a first lieutenant in the medical corps, Army of the United States, on July 7, 1942; later promoted to captain; awarded Silver Star; killed in action in Germany Nov. 8, 1944, aged 34.

**Franklin Lyle Watters**, Detroit; Syracuse University College of Medicine, 1935; interned at the Highland Park General Hospital, Highland Park, Mich.; member of the American Medical Association; commissioned a first lieutenant in the medical corps, Army of the United States, on May 20, 1942; later promoted to captain; a flight surgeon, group 387 of the 9th Air Force Bomber Command;

embarked for overseas in June 1943; awarded the Silver Star and Purple Heart; received the Soldiers Medal for rescue work at an American Base in England; posthumously awarded the Oak Leaf Cluster to the Soldiers Medal for heroic rescue in which he lost his life; killed by explosion of bombs while rescuing trapped members from a burning crashed bomber in France, Dec. 9, 1944, aged 35.

**Harry Winer**, Boston; American University of Beirut School of Medicine, Lebanon, 1942; diplomate of the National Board of Medical Examiners; served an internship at the Cambridge City Hospital, Cambridge, Mass.; commissioned a first lieutenant in the medical corps, Army of the United States, on Dec. 22, 1942; began active duty on Jan. 15, 1943; later promoted to captain; killed in action in the European theater of operations, Sept. 15, 1944, aged 30.

## Correspondence

### MEDICAL COOPERATION WITH BLUE CROSS PLAN

*To the Editor:*—Certain statements and conclusions in Dr. Lester H. Perry's article entitled "The Coordination of Medical and Blue Cross Plans" in *THE JOURNAL*, February 10, could be set with advantage in proper relationship to the facts. The Perry presentation was excellent and his conclusions are sound for the most part; this article is not intended as a criticism of his efforts but to complement them, since he apparently was not acquainted with the best instance to complete his case. He should have known about Oregon and Washington.

Doctors of the Pacific Northwest states have established that a cooperative prepaid medical and hospital service plan, sponsored and operated by regular physicians, can continue successfully without any reference to the Blue Cross plan, and certainly without the slightest tendency to succumb to the administrative or other domination of the hospital organizations. Why they have not succumbed to the general trend should encourage other parts of the country to reexamine their own positions in relation to cooperation with the Blue Cross. It may suggest how the trend may be controlled or possibly reversed.

The first law in the nation legalizing and setting forth the requirements for prepaid health plans was the Hospital Association Act passed by the Oregon legislature at its 1917 session. Oregon's experience with prepaid health plans antedates this, however, the first such plan tracing its ancestry to the turn of the century. In 1906 a lay-owned commercial enterprise was launched to explore the prepaid health field and is still doing business. In 1913, 1923 and 1925 other commercial ventures were launched. All these were strictly profit motivated commercial enterprises conducted without reference to any desires or wishes of regular medical circles, but they have had the advantage of serving as trial horses.

The first prepaid medical coverage plan sponsored by regular physicians was the Pierce County Industrial Medical Bureau, established in Tacoma, Wash., in June 1917. The first in Oregon originated in Corvallis, Benton County, in 1926, followed in 1930 by a similar plan in Salem, and in 1932 the Multnomah Industrial Health Association began operations in Portland. In 1931 and 1932 the Washington State Medical Bureau sprang up in various parts of that state. Today both states are thoroughly covered by these organizations.

Social Security Board figures show that Oregon leads the nation, with 14.2 per cent of its population covered by these plans. Second in the nation is the state of Washington, with 12.9 per cent of its population covered. The California and Michigan plans, about which one hears so much, cover 7.7 per cent and 9.4 per cent respectively of their populations.

In Oregon and Washington the doctors may be excused for feeling a little sorry for the rest of the country, where the Blue Cross people seem to be running away with the prepayment plans and the medical profession finds itself at their mercy. In the Northwest the doctors, not the hospital people, are carrying the ball and doing an excellent job of it. This was confirmed during the recent visit of Louis J. Reed, Ph.D., of the U. S. Public Health Service, who admitted that the situation is unique in the entire country. This is due to the fact that Northwest doctors consider that the hospitals in final analysis are just another instrument with which doctors work, and this is no reflection whatever on the recognized usefulness of hospitals. The doctors are fully willing to work and do work with hospitals and hospital organizations and are deeply and genuinely concerned with the welfare of hospitals. But at the same time they insist that there shall be no case of the tail wagging the dog.

Many and varied experiences have tended to strengthen the conviction of these doctors that their views of the relationship between themselves and the hospital organizations are correct. On the basis of these experiences they are firmly convinced of three things:

1. Despite denials to the contrary by Blue Cross authorities there have been several definite instances of attempts made by hospital organizations or their representatives to intimidate, dominate or control the medical profession or to subordinate the profession to hospitals or health centers. A few specific, substantiated instances are illustrative.

During the period from July to September of 1942 Blue Cross agents or solicitors in Clatsop County, Oregon, attempted to sell medical coverage, doctors' services, without the consent of the profession or the doctors involved, as an adjunct to or a part of the Blue Cross plan.

In the December 1943 issue of *Northwest Medicine* there appeared in full text a true reprint of a letter addressed under date of Oct. 19, 1942 from the Northwest Hospital Service plan to the manager of the Multnomah Medical Service Bureau, Portland, which among other items contained the following statement:

... However, it is felt that, unless some definite decision on your part is reached by October 26, relative to the joint sales of Medical and Hospital Service, we must of necessity look at the Multnomah Medical Service Bureau as a purely competitive organization, which we believe in all fairness justifies our entrance into the field of prepaid medical care. Therefore if negotiations fail to be completed by that date, the Committee, representing the Portland hospitals, has instructed the sales department of the Service Plan, effective November 1, to enter the field of prepaid medical care.

This threat was never carried out. It should be stated in all fairness that the signer of this letter, then and now president of the northwest Blue Cross affiliate, subsequently admitted in addressing the Multnomah County Medical Society that this letter was a grievous error in judgment, and efforts have been exerted to overcome this *faux pas*.

That the attitude may not have changed materially, or the threat of engulfment by Blue Cross administratives entirely subsided, is the opinion of many physicians especially in the state of Washington. As furthering their belief, they point to a piece of legislation from hospital organization sources currently introduced into the Washington state legislature. This bill, they contend, is loaded with enough jokers actually to permit hospital organizations to practice medicine while being highly restrictive of competition in the hospital organization field.

2. There have been numerous instances in which the direction and policies of hospitals and hospital organizations have been captured from true hospital people who understand doctors and doctor problems, by lay members of many hospital boards to the detriment of the medical profession. This conclusion was likewise confirmed by Dr. Reed and in part was one of the factors among others which led the physicians of Seattle to have their King County Medical Service Bureau erect and operate their own Doctors Hospital.

3. Many doctors in the Northwest, on the basis of past and present performance, feel that they cannot rely on hospitals and hospital organizations to safeguard or adequately protect the best interests of the medical profession.

The crux of the argument as far as the Northwest is concerned boils down to the fact that the doctor organizations over many years before Blue Cross was formed have been doing the job which Blue Cross people contend is their own peculiar function, so that the field was adequately covered before the advent of Blue Cross.

The position taken by Oregon and Washington doctors as a result of their experiences has been subjected to criticism, and numerous efforts have been made to have them turn the hospitalization end of the business of the bureaus over to the Blue

Cross, although the present method of operation protects component hospitals against credit losses, which is stated to be one of the chief functions of Blue Cross. Among other things they have been told they are out of step with the rest of the nation. If they are, they apparently intend to remain that way unless convinced that they are in error, but to date they have not been favored with any convincing evidence that their stand is fundamentally wrong.

It has been claimed that efforts to cooperate with the Blue Cross have heretofore resulted invariably in concessions being made by doctor organizations, so that cooperation becomes coordinated in one direction only. Oregon and Washington would seem to be the outstanding if not the only major exceptions. This may indicate that there is still a possibility of arresting and reversing the trend if this is desired. Physicians of the country who may be interested will find their colleagues of the Northwest ready to pass along any "know how" in these matters which they have acquired by virtue of historical accident furnishing them with the longest experience in this field.

GORDON B. LEITCH, M.D., Portland, Ore.

### PUNISHMENT FOR VENEREAL DISEASE IN THE ARMED FORCES

*To the Editor:*—In the communication of Lieut. Israel Zeligman (MC), U.S.N.R., in THE JOURNAL, Dec. 30, 1944 he mentioned that the editorial in THE JOURNAL of October 28 entitled "Punishment for Venereal Disease in the Armed Services" was a misconception and left a wrong impression with the readers and then went on further to state that venereal disease was still considered as misconduct and a man had to make up for lost time due to a venereal disease.

The interpretation given by the editor was correct and venereal disease is being classified as any other disease, as evidenced by the fact that it is considered in line of duty and is misconduct only if an individual fails to comply with existing regulations, requiring him to report and receive treatment for such disease. Lost time is not made up for any disease in line of duty unless proved to be misconduct.

LOUIS GUSS, Captain, M. C., A. U. S.  
Base Venereal Disease Control Officer.

### STUDIES ON ALCOHOL

*To the Editor:*—May we call your attention to a minor misstatement in the concluding lines of Dr. Rotman's article on alcoholism in the March 10 issue of THE JOURNAL. He says "The proper approach to the problem [alcoholism] is exemplified in the pioneering efforts of the Yale projects of the Research Council on Problems of Alcoholism, wherein all facets of the problem are under scientific investigation and wherein particular stress is placed on the biologic, physiologic, sociologic, anthropologic and religious aspects." We raise, of course, no objections to Dr. Rotman's flattering estimate of the possible merits of our activities. We wish simply to record that, while we admire the work of the Research Council on Problems of Alcohol, not one of our activities has any connection with that organization. In origin, finance, policy and all other aspects our activities are solely a venture of the Laboratory of Applied Physiology of Yale University and of the *Quarterly Journal of Studies on Alcohol* published from that laboratory.

HOWARD W. HAGGARD, M.D.  
E. M. JELLINEK, Sc.D.  
Laboratory of Applied Physiology,  
New Haven, Conn.

## Society Proceedings

### MEDICAL CORRECTIONAL ASSOCIATION

#### An Affiliate of the American Prison Association

*Annual Meeting, at the Hotel Pennsylvania in New York  
on Thursday, Oct. 12, 1944*

MORRIS PLOSCOWE, LL.B., New York, Presiding

Officers of the association for 1944: President, Lawrence Kolb, M.D., Washington, D. C.; vice president, Morris Ploscowe, LL.B., New York; vice president, Ray L. Huff, Washington, D. C.; secretary-treasurer, Robert M. Lindner, Ph.D., Lewisburg, Pa. Councilors, Augusta F. Bronner, Ph.D., Boston; George Geil, M.D., Springfield, Mo.; John D. Reichard, M.D., Lexington, Ky.; Robert V. Seliger, M.D., Baltimore; Lowell S. Selling, M.D., Detroit.

Officers of the Association for 1945: President, Robert V. Seliger, M.D., Baltimore; vice president, Robert H. Felix, M.D., Washington, D. C.; vice president, Robert M. Lindner, Ph.D., Lewisburg, Pa.; secretary-treasurer, Edwin J. Lukas, LL.B., New York; Councilors, John D. Reichard, M.D., Lexington, Ky.; Edward C. Rinck, M.D., Lewisburg, Pa.; Dorothy G. Sproul, M.D., Alderson, W. Va.; Lawrence F. Woolley, M.D., Towson, Md.

#### Alcohol and Crime

EDWIN J. LUKAS, LL.B., New York: Although some of the earliest social prophets had proclaimed the existence of a definite association between alcohol and crime, I find that in 1944 eminent sociologists, psychiatrists and criminologists do not wholly accept these doctrines. A statement is attributed to a famous Boston judge that more than 90 per cent of the adult population of misdemeanor prisoners in Massachusetts prisons are there because of offenses caused by drunkenness and that about 50 per cent of the felons receiving sentences to penal institutions have committed offenses related to alcoholism. The State Probation Commission of New York stated in 1917 that "between alcohol and crime there has always been a close relationship. . . . We believe that most delinquents who have passed the adolescent period are to some extent addicted to the use of intoxicants. These findings harmonize with the statistics reported elsewhere: Sixty-six per cent of the inmates of the Massachusetts State Prison in 1927 were said to be alcoholic addicts. The United States Crime Commission once reported that 50 per cent of the prison inmates in the United States were induced to commit crimes by alcoholism. The 1930 report of the United States Department of Justice asserted that alcohol is responsible for 80 per cent of those antisocial tendencies necessitating the maintenance of jails and corrective institutions.

The fearful implications observable in this popular association of alcohol with crime are considerably minimized by the findings of modern researchers. From a recent study made by Dr. Ralph S. Banay, formerly chief psychiatrist at Sing Sing Prison, this significant finding is derived: "Not all inmates who are included in previous or more recent alcoholic statistics can be justly classified as such, and their habits run parallel to criminality rather than being etiological. . . . The significant finding of the present study is that in 25 per cent of the total offenders alcoholism was closely related to the commission of the crime or was directly responsible for it." Dr. Banay's findings constitute a transitional phase between the thinking that alcohol is at the "root and foundation" of all crime and the theory that it has been greatly overestimated as a crime causative, though criminalism and alcoholism may be found to coexist in a given number of institutionalized offenders. To this latter fact no greater significance need be given than that certain psychologic characteristics might be noted to be held in common among those institutionalized. Instead, the dogma is emerging that the relationship of alcohol to crime is probably the same as the relationship of crime to psychopathy. Gray and Moore

state that "it does not appear from these data that the alcoholic and the abstaining criminal, either male or female, differ very greatly. . . ." And Taft stated that "the prevalence of alcoholism among criminals need not indicate causation at all. Crime and excessive use of alcohol may both be products of the same adverse social conditions or even of the same bodily states. . . ."

Somewhere between the extreme views concerning the role of alcohol in the commission of crime we might interpose what would seem to be a fair statement of the situation: Crime is symptomatic of an underlying behavior disorder produced by the admixture of many factors. Alcohol, constituting a means of escape from painful reality, brings about a toxic state by which the influence of inhibitions is excluded. Poorly integrated personality, emotional instability, conflicts with the environment and frustration are among the principal characteristics of the recidivating criminal offender; but so too are they among the principal characteristics of the alcoholic addict. In that sense dependence on alcohol as a mechanism for dissolving controls and giving full sway to instinctual drives is, like crime itself, merely a manifestation of an underlying disorder. Such dependence may also, like antisocial behavior, be caused by the interaction of economic, social and psychological factors.

#### Integration of Psychiatric Service with Court Procedures

DR. LAWRENCE F. WOOLLEY, Cantonsville, Md.: In most courts in the United States defendants are subjected to psychiatric examination because it is asked for by a prosecutor, the defense attorney or the judge. Under such a system many cases are missed in which psychiatric advice would be helpful. Some states, notably Colorado and Massachusetts, have provided for the automatic examination of criminals under certain conditions. The consultants appear as friends of the court instead of for the prosecution or defense.

On Nov. 1, 1936 there became effective in the federal jurisdictions of the United States paragraph 6, subdivision 3, of schedule A of the Civil Service Rules and Regulations. This provides for the appointment by the Public Health Service of a panel of psychiatrists in each jurisdiction who serve as consultants in psychiatry for the advice of the court. In the federal jurisdictions of Maryland, where we deal with unusually enlightened judges and highly competent and socially minded probation officers, passage of this regulation resulted in a more extensive use of psychiatric help. The foundations for this expansion of activity had been laid by the intelligent, constructive work of such men as Dr. Adolf Meyer, Dr. John Rathbone Oliver and Dr. Manfred Guttmacher. Selection of defendants for examination still depends on the recognition of a problem in psychiatry by some of those interested in the proceedings. Many cases are missed in which psychiatric advice would be helpful. Some corrections and improvements should be carried out, so that a more definite and uniform procedure might result. Provision could be made for the routine psychiatric examination of all defendants coming before the federal courts. It would be of advantage to create the position of psychiatrist to the court on a full time basis and at an adequate salary instead of depending on individual consultations on a fee basis. This would assure a continuity of interest and uniformity of service. Also the psychiatrist could be available for consultation at any time he might be needed or helpful. Such full time appointments have been satisfactory in many juvenile courts, family relations courts, city courts and others of local jurisdiction.

#### What the Psychiatrist Wants from the Social Worker

DR. ROBERT V. SELIGER, Baltimore: Psychiatrists expect social worker colleagues to know everything about the individual and his problem, including his family, social, racial, religious, scholastic, economic and occupational background and setting. We expect the social worker to have a clinical knowledge of psychiatric types, reaction illnesses and personality makeups and knowledge of the required therapeutic approach, including diagnosis and recommendations for placement. We

want the social worker to aid in preventive work which involves teaching proper attitudes regarding mental health and illness. The public has no knowledge concerning the extent of mental illness and lack of adequate resources; ignorance and fear of "insanity" still impede even curative measures in many communities. It is imperative that scientific facts about mental health and public welfare be made public and that the public be roused to action. Social workers have a threefold duty: to exert a direct personal influence, to "spot" early signs of psychiatric or other illnesses and take prompt steps toward obtaining help, and to educate and enlighten. No one has a greater opportunity to contribute in this work of education and prevention than has the social worker.

#### Treatment in the Postwar Prison from the Point of View of the Psychiatrist

DR. MARION R. KING, Washington, D. C.: Not many years ago there was much enthusiasm concerning the prospects of psychiatry in prisons. It now seems that ideals were set too high by both psychiatrists and prison administrators. Since startling achievements have not been forthcoming, this expectancy has naturally diminished and in some places has been replaced by an unfavorable reaction. There is no longer any question concerning the detection and treatment of feeble-minded and psychotic prisoners, who comprise at least 3 and 1 per cent of the population respectively. The findings and recommendations pertaining to these groups are acceptable and regarded as helpful even by extreme critics. On the other hand, we find that there is much inconsistency in regard to the diagnosis of psychoneuroses and psychopathic states. For example, the number of prisoners classified as psychopathic in one prison was found to be less than 10 per cent of the population, whereas in another it was more than 60 per cent. Both institutions have well qualified psychiatrists, and no significant difference is known to exist in the type of offenders confined in them. This disparity is largely due to lack of standards in measuring such disabilities. Until we know more about such disorders, such diagnoses should be limited to cases with symptoms of pronounced or moderate degree, which will usually result in the uniform classification of about 15 per cent of the institutional populations in categories other than the mentally defective and psychotic groups. One of our first objectives then should be reorientation with respect to diagnoses. To accomplish this objective it is essential that well organized research work be carried out. Because of the prevailing difficulty in differentiating between untrained and socially maladjusted individuals and those who are truly mentally ill, every effort should be made to establish standards with respect to diagnosis, treatment and prognosis.

#### The Point of View of the Psychologist

DR. BENJAMIN FRANK, Washington, D. C.: In this discussion we are limited to the possibilities of treatment within the institution. The difficulty lies in the contradictions which arise as a result of attempting to apply modern ideas and present day knowledge within the framework of outmoded physical structures, inherited institutional routines and a traditional legal philosophy. The only way to resolve the dilemmas which beset the prison administrator is to permit the professional staff to participate in the formulation and administration of institutional policies. The chief objective of any treatment program is to reconcile the principle of punishment with that of treatment. The psychologist should also have some responsible share in the execution of the program. After placement there should be provision for a constant referral of cases back to the psychologist for follow-up purposes and for a check on test results and clinical evaluations. The psychologist should also be given the opportunity for research. The psychologist may also have some contribution to make to the formulation of a sound disciplinary policy and to the administration of disciplinary measures. The reformatory movement, which started out so hopefully under Brockway, failed to a large extent because it was founded on a concept of discipline which was psychologically unsound. The therapeutic value of discipline depends on

the attitude with which it is accepted. We must learn to use rewards and incentives more and the older repressive measures less. The day of a prisoner's release is the all powerful motivation on which the entire program must be built. When release is to be delayed for a long time, some constructive substitute motive must be found.

### Treatment in the Postwar Prison from the Point of View of the Physician

DR. JOHN W. CRONIN, Washington, D. C.: The fact that the patient is in prison means that he has been unable to adjust adequately, and this inability to adjust has to be evaluated before the physician can plan the therapeutic program for his patient. The physician should learn as much as he can about the internal environment of the individual—his lungs, his heart, his stomach, his liver, his kidneys, his thinking processes, his nervous system as well as the external environment of the individual—his work, his home, his friends, his social status, his financial status, his relationships to the forces of life at present and in the past. It is then only that an intelligent therapeutic and corrective program can be mapped out for the prisoner. Each new prisoner must be examined physically, psychologically and socially by trained specialists. The physician is but one member of a team of specialists, each of whom must be a keen student of human nature and penology. It is the job of the physician to make available to the other specialists his evaluation of the individual, which has been determined after intensive medical studies. The physician is also obligated to prevent the spread of disease to the associates of the prisoners. Such procedures as vaccination, immunologic inoculations and x-ray examination of the chest should be a matter of routine in a modern penal institution. The physician is responsible for the health of the inmate group individually and collectively. He is also responsible for a program of preventive medicine, and this will extend into the sociological realm. The physician must be the health counselor, available to the prisoner as well as to the administrator. The relationship of physician and patient is a confidential one whether it is within or without prison walls. The physician in the prison must stand for law and order, but it does not become him to be a law enforcement officer. Such a role immediately negates the physician's value as a therapeutician for the sick prisoner. A physician in a prison must possess understanding, patience, tolerance and a sense of justice in addition to competence in his specialized field. He is in reality a sociologist, penologist and psychologist as well as a psychiatrist in his daily dealings with his patients and associates.

Physicians as young men have worked in prisons because of the wealth of clinical material. Physicians as old men have worked in prisons because of the security it accorded them. The financial remuneration has not been large enough to attract and hold some physicians in prison work as a career. Capable physicians could be attracted and held in the professional romance of prison medicine if the members of society charged with the administering of penal institutions—not the wardens but the legislators of state or federal governments—would offer such physicians, in addition to a financial salary, the facilities for study in the causes of criminal behavior, the causes of disease and other factors influencing the necessity of having prisons. The beneficiaries of such a medical program would be not only the prisoner but society as a whole in the postwar world.

### Hypnoanalysis in the Treatment of Psychopathic Characters

ROBERT M. LINDNER, PH.D., U. S. Public Health Service (R): Hypnoanalysis, in the form developed in our researches at Lewisburg, Pa., can be described as an incisive approach which more rapidly than other psychotherapeutic methods cuts to the core of psychogenic and behavior disorders and enables the therapist to come to grips with the root causes in the dynamics of the disorder confronting him. This it does by utilizing hypnosis as an agent in the therapy, both as a tool for penetration below the resistances presented by the patient, and in synthesizing and enforcing the new and more wholesome attitudes. The term of therapy is far briefer than that of

psychoanalysis, and the results so far appear more than ordinarily promising. No one case has occupied more than fifty hours of my time, and to this writing there have been no failures. Investigation begins with an intensive training in hypnosis until a patient can attain the trance state immediately on request, regress to earlier periods of life, recall crucial historical periods in his life and follow posthypnotic suggestions with ease. Once the clinician is assured of the patient's mastery of the foregoing, free association periods occupy the middle phase of therapy. The patient associates freely as he would in an orthodox analysis, but rather than await the disappearance of resistances they are disintegrated through hypnosis. Dreams, problems and other matters of concern are handled similarly to their manner of disposition in ordinary analysis. The final phase of hypnoanalysis is concerned with synthesizing and redistributing the psychologic energies formerly exploited by the pathologic condition. Posthypnotic suggestion is used to engraft new attitudes and views directly on to the personality.

Central to hypnoanalysis, and unique with it, is the continual validation of analytic material received through the peculiar alternation of associative and hypnotic sessions. An unusual phenomenon transpires when the method is used. Once material has been disclosed under hypnosis, if it is memorially valid it tends to reappear spontaneously in free association. Beyond this almost surgical function of hypnosis in distintegrating resistances, it provides something that has been wanted for years in analytic work: a method for checking data produced by the patient. Hypnoanalysis in no way alters the theory of interpretations of behavior which we receive from modern dynamic psychoanalytic psychology. Rather, hypnoanalysis makes more evident more quickly the theoretical and practical benefits of psychoanalysis.

The most significant successes of the hypnoanalytic method have been obtained with that group of persistent, irritating and, until recently, hopelessly regarded individuals known as psychopathic personalities. Analysis of the routine variety fails with such persons because the rapport or transference could never be established by passive orthodox methods. The success of hypnoanalysis is due to the powerful transference relationship which exists from the beginning of therapy and which can be controlled as by a pressure gage by the clinician from moment to moment.

## Medical Examinations and Licensure

### COMING EXAMINATIONS AND MEETINGS

#### BOARDS OF MEDICAL EXAMINERS

##### BOARDS OF EXAMINERS IN THE BASIC SCIENCES

Examinations of the boards of medical examiners and boards of examiners in the basic sciences were published in THE JOURNAL, April 7, page 946

#### NATIONAL BOARD OF MEDICAL EXAMINERS

NATIONAL BOARD OF MEDICAL EXAMINERS: Part III. Various centers, June. Exec Sec, Mr. E S Elwood, 225 S 15th St, Philadelphia.

#### EXAMINING BOARDS IN SPECIALTIES

AMERICAN BOARD OF INTERNAL MEDICINE. *Oral* New Orleans May 21-22, Philadelphia, June 7-8 and Chicago, June 27-29. *Written* Oct 15. Final date for filing application is Aug 1. Candidates in the armed forces may take the examination at their station with the permission of their medical commanding officer. Asst Sec, Dr. W. A. Werrell, 1301 University Ave, Madison 5, Wis.

AMERICAN BOARD OF OBSTETRICS & GYNECOLOGY. Part II. *Oral* Atlantic City, June 13-19. Sec, Dr. Paul Titus, 1015 Highland Bldg, Pittsburgh 6.

AMERICAN BOARD OF OPHTHALMOLOGY. New York, June 13-16, Chicago, Oct 4-6, and Los Angeles, January. Sec, Dr. S. Judd Beach, 56 Ivie Rd, Cape Cottage, Me.

AMERICAN BOARD OF ORTHOPAEDIC SURGERY. Part I. *Oral and Written* New Orleans, Sept 28-29, New York, Oct 5-6, Chicago, Oct 12-13 and San Francisco, Oct 19-20. Final date for filing application is August 1. Sec, Dr. G. A. Caldwell, 3503 Prytanis St, New Orleans 15.

AMERICAN BOARD OF OTOLARYNGOLOGY. Chicago, Oct. 3-6. Sec, Dr. Dean M. Lierle, University Hospital, Iowa City, Ia.

AMERICAN BOARD OF PATHOLOGY. Philadelphia, June 13-14. Final date for filing application is May 15. Sec, Dr. F. W. Hartman, Herff Ford Hospital, Detroit 2.

AMERICAN BOARD OF RADIOLOGY. *Oral*. New York, June 3. Final date for filing application is May 1. Sec, Dr. B. R. Kirklin, 102 110 Second Ave S W, Rochester, Minn.

AMERICAN BOARD OF SURGERY. *Written*. Various centers, October. Final date for filing application is Aug 1. Sec, J. S. Rodman, 225 S 15th St, Philadelphia 2.

AMERICAN BOARD OF UROLOGY. *Written*. Chicago, Dec 9. *Oral*. Chicago, Feb 19-22. Sec, Dr. Gilbert J. Thomas, 1409 W. 11th St, Minneapolis 4.

## Current Medical Literature

### AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1935 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (\*) are abstracted below.

Inadequate Action of Penicillin Against Brucella Abortus in Vivo. E. L. Stubbs, I. Live, F. G. Sperling and W. Kocholaty—p. 78.

### Diabetes Mellitus as Observed for Ten or More Years.

—Four reports from the University of Pennsylvania present a study of 100 patients who had had diabetes for ten years or more. Observation on these patients showed that diabetes does not always progress to greater severity. Comparison of the diet and insulin at the beginning and at the end of a five year period revealed that the diabetes of 45 per cent of the patients had not advanced. Ten patients required less insulin at the end than at the beginning of the period. Of the 55 who required more insulin, a number had also received increases in diet. Acidosis occurred in 3 of the group. Anemia of a mild degree was present in 26 patients. Chronic or repeated acute infections occurred in 39 patients. Hypertension (systolic blood pressure 160 mm.) was present in 38 per cent, all past 50 years of age; the incidence increased with each decade. The incidence of hypertension apparently was not dependent on duration, control or severity of the diabetes. Only 3 patients under 50 had abnormalities of the heart which could be attributed to their diabetic state. The 3 patients were 24, 30 and 47 years of age and had had diabetes for fifteen or sixteen years. The low incidence of cardiovascular abnormalities in this younger group receiving the high carbohydrate-low fat diet compared to reports in the literature on a high fat-low carbohydrate diet is suggestive of the value of the high carbohydrate-low fat diet in reducing the incidence of premature cardiovascular abnormalities. Complicated cataracts were fewer in diabetic patients treated for ten years than in the untreated. Subcapsular "snow flake" cataracts were still found in the diabetic patients treated for ten years. The diabetic patients treated for ten years show an incidence of sclerosis similar to that of the nondiabetic and to the diabetic of varying duration and therapy. Deep retinal hemorrhages and exudates increase with the duration of diabetes and may be slightly decreased by closely observed therapy. Of the 89 patients who were studied from the standpoint of arteriosclerotic occlusive disease in the legs, 3 patients of those under

50 years of age and 30 of those over 50 had evidence of peripheral arteriosclerosis. Premature arteriosclerosis (below 50) was therefore not common in this group. The severity of the diabetes did not affect the incidence of arteriosclerosis, but the adequately controlled patients had a low incidence of arterial disease. The females had a much higher incidence of arteriosclerotic occlusive disease than males. There were no amputations in the entire group. Neuritis in the extremities was present in 31 of the 89 patients, chiefly in those with arteriosclerosis.

**Cold Agglutinins and Atypical Pneumonia.**—McNeil says that during the fall months of 1943 a small epidemic of primary atypical pneumonia occurred at the Aberdeen Proving Ground, Maryland, and was followed closely in the laboratory, particularly in regard to the changing titer of serum cold agglutinins. One death is reported with interesting pulmonary pathologic changes. Although all of the characteristic cases of atypical pneumonia in this group showed high titers of cold agglutinins, this reaction was not consistent in a subsequent epidemic. The diagnosis of primary atypical pneumonia was based on (1) symptoms of sore throat, headache, chills and fever, paroxysmal dry cough, substernal pain, generalized aches, (2) negative lung signs from four to seven days, changing to rales, without consolidation usually in the lower lobes, (3) chest x-ray evidence from the fourth to the tenth day, (4) negative sputum examination for pathogenic bacteria and (5) normal white blood cell count and differential or slight leukocytosis. Fifteen patients were found to comply with this critical standard. Each patient suspected of developing primary atypical pneumonia had blood withdrawn for cold agglutinin titration every fourth day. The reaction was negative for six days, became positive in six to eight days, reached a peak between the tenth and the fourteenth day and then gradually decreased during convalescence. High titers of cold agglutinins were observed during the most serious stage of the disease (ten to fourteen days). One patient became critically ill and another died in this stage; both had pulmonary edema. The pathologic picture seen in the fatal case was strikingly similar to multiple pulmonary infarction with edema but without thrombosis. It seems logical, however, that small groups of agglutinated cells could form in a relatively cold extremity, act as multiple emboli and cause the pulmonary "infarction" picture.

Myxoma of Lower Eyelid. A. E. Town—p. 68.

**Ocular Signs of Myasthenia Gravis.**—Walsh bases his report on 63 cases of the disease observed at Johns Hopkins Hospital. Ocular symptoms or signs were present in all cases. Purely "ocular" myasthenia gravis was observed several times, but in such cases there is always the possibility of spread of the weaknesses. The ocular symptoms and signs usually appear early in the course of the disease, but occasionally they are a late development. Ptosis is the most constant ocular sign. Weakness of the orbicularis oculi may occur in the absence of ptosis or with it. Probably weakness in closure of the lids is overlooked more often than any other common ocular sign. Limitation of ocular movements occurs unilaterally or bilaterally and in almost all combinations. When pupillary abnormalities are present, it is doubtful if the case is one of

after sufficient experience with this effect, continued to prefer alcohol to nonalcoholic liquids until their neuroses were relieved by various procedures. Discussing the significance of these observations with regard to the therapy of alcoholic addiction in man, the author suggests that neurotic human beings sometimes resort to alcoholism as one means of escape from their pressing intrapsychic conflicts. In the treatment of alcoholic addiction, therefore, the psychiatrist must treat the emotional conflicts and maladjustments of his patients in order to mitigate their need for the drug. Human beings in their complex social milieu present relationships of much greater intricacy than do experimental cats, but the psychobiologic principles discussed here have a bearing on the problems of chronic alcoholism.

**Neurosis and Alcohol.**—In the experimental studies described by Masserman, 16 cats were trained to adapt themselves to situations of increasing complexity; first they opened a box of food, then they were taught to feed only after specific sensory stimuli, and finally they learned to manipulate a switch in various positions to actuate their own feeding signals. When alcohol was administered, these patterns disappeared in the order of decreasing complexity of integration until only the original, primitive feeding reactions remained. After recovery the animals were subjected to a severe motivational conflict and developed inhibitions, phobias, loss of dominance, somatic manifestations of anxiety and other behavioral abnormalities typical of an experimental neurosis. Alcohol partially disintegrated these complex responses, restored direct goal behavior and thereby temporarily relieved the neurosis. Ten of the animals,

**Modification of Sano's Plasma Fixation of Skin Grafts.**—Methods have been devised which have helped eliminate difficulties encountered in the application of skin grafts after the procedure of Sano. Jenney describes the use of hobbinet on the drum of the Padgett dermatome and a mirror which is attached to the cutting arm. The graft adheres to the rubberized hobbinet and can be easily handled and placed on the recipient area. Thin grafts are not mutilated. The graft can be cut into any shape to cover accurately the area to be grafted. The pieces are pasted on. The graft can be easily applied to areas which are surrounded with scar tissue which would make suturing impossible. Contraction of the graft can be overcome by merely stretching the rubberized fabric. Widely expanded areas resulting from excision of scars can be made smaller by

"tucking in" the skin as the graft is pasted on. The graft can be made to conform to any elevation or depression. It can be molded over forms to line cavities as in buccal inlays or line the ends of tubes. Among the advantages of the use of the mirror are that reflected light from the mirror gives complete illumination of the graft. It is in full view of the operator at all times. The drum does not interfere with the operator's vision, and adjustments for thicker or thinner cuts can be made. The proper cutting angle is fixed if the operator holds his head in a steady position; if the cutting edge is seen, the angle is correct; if it moves up or down, it is incorrect. Variations in the thickness of the graft can be made by viewing the cut in the mirror.

**Chlorophyll Derivatives with Antibacterial Agents in Wound Healing.**—Smith and Livingston present studies on 192 guinea pigs with bilateral, symmetrical, infected surgical lesions. Topical treatment with 1 per cent chlorophyll ointment was combined with various sulfonamides, with penicillin and with an iodine preparation, 24 animals being used in the experiment with each antibacterial agent, the controls being divided into three equal groups of 8 animals. One third are treated with base alone, one third with base plus chlorophyll and the third with base plus antibacterial agent. The topical use of penicillin in strength of 250 Oxford units per gram of ointment combined with 1 per cent of chlorophyll gave the most spectacular results, with healing complete in 10.6 days as compared to 14.3 with chlorophyll alone and 15 days for penicillin alone. The sulfonamides in combination with chlorophyll showed some acceleration of healing through their control of infection, which appeared to be roughly proportional to their solubility. Carboxysulfathiazole was by far the most effective of the sulfonamides, nearly equaling penicillin in this respect. Sulfanilamide, sulfamerazine and succinylsulfathiazole alone in the ointment base actually caused some delay in healing. The iodine preparation used in the same manner was of about the same order of effectiveness as sulfanilamide, sulfathiazole and sulfadiazine. Experiments carried out on 8 dogs with larger wounds gave comparable results to those in the guinea pigs. The ointment base proved to be entirely satisfactory for clinical use. In a small series of guinea pigs chlorophyll was used as a dusting powder in combination with the various agents. The results were not as satisfactory as with ointments, and further studies do not seem warranted.

**Muscle Hernias of Legs.**—Simon and Sacchet report observations on 12 patients with muscle hernias of the legs. Three had large solitary hernias of the tibialis anticus muscle, all due to direct trauma. In 2 cases the symptoms were severe enough to justify surgical repair, which was successfully accomplished by fascial transplant. Nine patients had multiple small hernias which developed spontaneously, with congenital weakness as a predisposing factor in some. Hernias of the leg muscles are characterized by a soft semifluctuant swelling, which increases in size when the limb is dependent or the muscle is relaxed and decreases in size or disappears when the muscle involved is contracted. It is reducible on pressure when a distinct fascial defect can be palpated. There are three types: 1. Those due presumably to congenital defect, none of which were observed. 2. Those due to direct trauma, as fractures, lacerations and operations or to indirect muscle violence; these are usually single and large and produce symptoms for which surgery is indicated. 3. Those of the idiopathic type, which appear spontaneously, particularly after muscular activity is increased; they are usually small, are often multiple, present less severe or no symptoms and frequently require no treatment. They are apparently quite frequent, especially among young active males. Differentiation between muscle hernias and varicosities is often confusing. Other conditions to be differentiated are localized varicose veins, lipoma, angioma and other tumors. Surgical treatment when indicated consists in reduction of the herniated muscle and repair of the defect, usually by fascia transplant or suture. The results are usually good. The authors emphasize the importance of careful repair of fascial defects arising from trauma or after operations in order to prevent later development of hernia.

**Pulmonary Resection in Pulmonary Tuberculosis.**—Overholt and Wilson performed 36 pneumonectomies and 24 lobectomies in 60 consecutive resections. They stress that resection of a tuberculous lung is usually accomplished with greater ease than in cases of pulmonary suppuration or malignancy. Individual ligation of the hilar structures and the careful closure of the bronchus with silk sutures and a reinforcing pleural flap have almost eliminated bronchial fistula and empyema as complications. Contralateral spread remains the greatest hazard in pulmonary resection for tuberculosis. Ulceration of the bronchial stump occurred in 8.5 per cent of the patients. This can be diagnosed only by routine bronchoscopy following resection. It may occur early or late in the postoperative period. Active tuberculosis in the lung to be removed is not a contraindication to resection. Waiting for stabilization of the lesion frequently robs these patients of their only chance to get well. Tuberculous bronchitis is not a contraindication but often an indication for resection. A contralateral lesion is not a contraindication to resection unless it is uncontrolled or uncontrollable. The total operative fatality is 11.6 per cent. The operative fatality in the 47 "reasonable risk" cases is 4.3 per cent and in the 13 "desperate risk" cases is 38.5 per cent. When the patient is in good general condition, the operative fatality for lobectomy and pneumonectomy is almost identical. Pulmonary resection should be considered as a possible method of treatment in outlining therapy for tuberculous patients. Ideally it should be applied before extension of disease and complications occur.

**Treatment of Bacterial Endocarditis.**—Analysis of 250 cases of subacute bacterial endocarditis observed between 1927 and 1939 disclosed the ineffectiveness of all methods of therapy prior to the introduction of the sulfonamide drugs. Sulfanilamide, sulfathiazole and sulfadiazine at times gave transient benefit but did not result in any recoveries. Sulfapyridine reduced the fever in a majority and frequently rendered blood cultures negative but cured only 4 of 197 patients. Neoarsphenamine, the sulfonamides together with intravenous typhoparatyphoid vaccine or with hyperthermia, and various other measures gave no lasting help. Sulfapyridine proved to be the most active of the drugs in lowering the temperature—not a mere "antipyretic" effect—and in rendering blood cultures negative—a sterilization of the blood stream—but its benefits passed off in a few days to two months. The failures of sulfapyridine to cure appear related to complications of the disease, toxic effects of the drug, its bacteriostatic rather than bactericidal mechanism, a low concentration of drug within the vegetations, its ineffectiveness against some strains of nonhemolytic streptococci and the almost regular development of resistance to its action. Heparin has been beneficial only when sulfapyridine reduced the temperature to normal or near it and sterilized the blood stream. Decreasing the blood coagulability during a period of such antibacterial effect has almost regularly resulted in recovery. Avoidance of the previous use of sulfapyridine, because of the readiness with which fastness develops, and the persistent continuance of treatment have been the two rules of success with this method. In addition to 2 cases in the original series, the author has observed 10 further apparent recoveries. Penicillin, effective in vitro against nonhemolytic streptococci, can reduce the temperature and sterilize the blood in cases of subacute bacterial (streptococcal) endocarditis, but when the drug is discontinued fever and bacteremia have recurred in all but 2 of such cases reported to date. Substituted for sulfapyridine in the heparin-chemotherapy method, penicillin was partially effective in a case treated by the author but pleomorphic streptococci persisted on the culture plates; these disappeared with supplemental sulfadiazine, and the patient has remained well since. Others also have reported apparent recoveries with the use of penicillin and heparin. Penicillin excels sulfapyridine in its low toxicity and reduced tendency to induce drug fastness, but further data are needed to evaluate its effectiveness.

**Histoplasmosis.**—Parsons and Zarafonitis report 5 cases of histoplasmosis which have been observed at the University of Michigan Hospital, 1 case that originated in Ohio, diagnosed in the Department of Pathology of the University of Michigan, and 1 case diagnosed by Steiner at the University of Chicago. A review of the literature disclosed 71 cases. Histoplasmosis is a fungous disease which is being found with increased frequency. It has proved fatal in most instances. The most common signs and symptoms are fever, hypochromic anemia, hepatomegaly, splenomegaly and lymphadenopathy. Anorexia and loss of weight are common. Ulceration of the oral mucosa (particularly the tongue), various types of cutaneous lesions and ulceration of the pharynx and larynx occur frequently. The yeastlike, or parasitic, form of the fungus is found in cells of the large macrophage or reticuloendothelial system. At necropsy the organs are found to be involved in the following order of frequency: spleen, liver, visceral lymph nodes, lungs, bone marrow, oral mucosa, adrenals, gastrointestinal tract, peripheral lymph nodes, kidneys and larynx. The disease affects persons of all ages. The port of entry of the fungus is still not known, but evidence is accumulating that the mouth is the most frequent site of entrance. The large number of patients who have ulcerated lesions of the mouth, pharynx and gastrointestinal tract point to this conclusion. The many lesions of the nose, pharynx, larynx and lungs are evidence that the respiratory tract is also a port of entry. A smaller group of cases suggests entrance through the skin. The fungus is unknown in its vegetative form in nature, but the parasitic form has been identified in the dog. What appears to be the same organism has also been found in mice, rats and ferrets. Treatment of histoplasmosis is still experimental. The authors have used antimony preparations, such as neostam (stilbamine glucoside) and neostibosan and also some of the new diamidine preparations, particularly stilbamidine. These preparations hold promise for the future. Roentgen rays and radium have been used with equivocal results. Diseases which must be differentiated most frequently from histoplasmosis are tuberculosis, Hodgkin's disease, aleukemic leukemia and malignant neoplasms. Antemortem diagnosis has most frequently been provided by microscopic examination of biopsy material. Blood cultures, cultures of biopsy material and smears or scrapings from superficial lesions have led to diagnosis in several instances.

**Physical Inactivity and Tolerance for Sugar.**—Blotner studied the effect of prolonged physical inactivity on the dextrose tolerance of 86 nondiabetic patients—70 adults and 16 children—who had been confined to bed for one month to thirteen years by various pathologic conditions. A comparison was made between the dextrose tolerance of these patients and that of active adults and children. It was found in general that the sugar tolerance was diminished in the patients who had been confined to bed for considerable periods. The fasting blood sugar ranged from 70 to 130 mg. per hundred cubic centimeters, and the fasting urine was free from sugar. After the ingestion of dextrose the concentration of blood sugar rose to abnormal levels, the maximum being 364 mg., and varying amounts of sugar were found in the urine. In many of the adults there was a high renal threshold for dextrose. In some patients who later became ambulatory for several months the sugar tolerance returned to normal. Age, hypertension, vascular disease, obesity and infection in themselves did not appear to be significant as causes of diminished sugar tolerance. The arteriovenous differences in the blood sugar of inactive persons after ingestion of dextrose was normal or greater than normal.

which indicates that the muscles of the physically inactive patients are capable of utilizing sugar normally. It is suggested that during prolonged physical inactivity the pancreas is at rest because in this state there is not the demand for rapid storage and utilization of sugar that there is during activity. Consequently there may ensue diabetic-like reactions to dextrose tolerance tests even with normal fasting levels of blood sugar.

**Lempert Fenestra Nov-Ovalis with Mobile Stoppie.**—Lempert has used fenestration of the labyrinth in the treatment of 1,000 patients with clinical otosclerosis over a period of seven years. Serviceable hearing for all social and economic purposes was restored and continuously maintained in a large percentage. Closure of the newly created fenestra by new bone formation and damage to the organ of Corti as a result of serous labyrinthitis were found to be the two major obstacles to the still greater success of this surgical treatment. Study of these two factors revealed that it is not necessary to keep the newly created fenestra continuously open in order to maintain the hearing improvement obtained following fenestration, provided the closure can be kept mobile. The Lempert fenestra nov-ovalis with the mobile stoppie was evolved. This is a new technic based on a surgical principle different from any heretofore employed for the improvement of hearing in clinical otosclerosis. The newly created fenestra is immediately closed with a mobile cartilaginous stoppie which simulates in function the normal stapedial footplate. Lempert is now employing this technic exclusively, because he is convinced that time and a large number of cases will eventually prove that both major causes of defeat encountered with previously employed technics based on the principle of keeping the fenestra open can thus be conquered.

**Pancreatic Necrosis in Electric Shock.**—During the past year Glazer has studied 3 cases of fatal electric shock and observed extensive pancreatic necrosis. Textbooks on electropathology fail to mention these pancreatic changes except that Siroli observed them in animals dying of electric shock. Wider recognition of pancreatic necrosis in electric accidents is important, because in nonfatal cases minor pancreatic changes may occur, which could be determined by studies of the serum amylase. Awareness of this possibility is important for early diagnosis and treatment and for the recognition of possible late sequelae. Minor pancreatic changes may give no immediate symptoms but may later cause pancreatic insufficiency. This is especially important in industrial cases from a medicolegal standpoint.

### Internal Fixation of Fractures of Neck of Femur.

Two operative procedures have been advocated for the introduction of the three flanged nail in the treatment of fractures of the neck of the femur. These are the intra-articular and extra-articular methods. Boucher's experience is limited to insertion and nailing by the extra-articular technic, which in his opinion is much less hazardous than the intra-articular method. The extra-articular method involves less shock and less danger of sepsis. None of the 47 cases reviewed here showed signs of sepsis, and the wounds healed without discharge. The author followed the method suggested by Hey-Groves and Watson-Jones, with slight personal changes. The main features of this method of introducing the nail are accurate measurements of its length and accurate introduction of the guide wire well into the head, leaving the guide in position until the nail has penetrated so far into the head that one is absolutely certain that no rotation can take place if the nail is inserted farther and the guide has been withdrawn. The guide wire is localized in the neck by anteroposterior and lateral x-ray plates, after it has been inserted with the aid of Hey-Groves guides and the sense of sight and touch. The patients treated ranged in age from 54 to 89 years, most of them being in the eighth decade. Nineteen patients had complications on admission that influenced the end results. The fractures were more common in women than in men, the ratio being 5:1. The end results were good in 34 patients, fair in 4 and bad in 4; 5 patients died.

**Protein Intake in Cancer.**—As a means of determining the possible importance of protein intake in the management of malignant disease, Connell conducted feeding experiments in mice bearing Belough sarcoma transplants. By the deliberate restriction and selection of the protein content in a diet of adequate caloric value, a profound retardation of the advance of Belough sarcoma was observed. This inhibition of the rate of tumor growth is not accompanied by serious loss in weight or

the appearance of other untoward symptoms. The author thinks that the retardation of tumor growth on diets of low caloric intake reported by earlier investigators can be explained in part on the basis of restriction of the protein constituent.

**Pulmonary Resection Complicated by Tuberculous Bronchitis.**—According to Overholt and Wilson, tuberculous tracheobronchitis has been established as one of the most common and most serious complications of pulmonary tuberculosis. Numerous clinical studies have revealed not only the limitations but also the danger of many collapse procedures in such cases. The authors present data on 30 cases of endobronchial tuberculosis in which pulmonary resection was performed. Of these 30 cases, 12 were desperate risks and 18 were reasonable risks. Patients facing an early fatal course were considered as desperate risks. The operative mortality in reasonable risks was 5.5 per cent and in desperate risks 58.3 per cent. Tuberculous empyema and permanent fistula were eliminated as complications of pulmonary resection in all except 1 of the 19 patients treated after January 1942, when individual ligation technic was employed and the bronchial stump was routinely reinforced with pleura. Ulceration in the bronchial stump and contralateral spread were the most common complications and continue to challenge the thoracic surgeon. Tuberculous bronchitis is not itself a contraindication. On the contrary, this complication often is an indication for resection. Active tuberculosis in the lung to be resected, even if it is rapidly spreading, is not a contraindication to resection. In fact, delay may rob these patients of their only chance to get well. A contralateral lesion in itself is not a contraindication to resection unless this lesion is uncontrolled or uncontrollable. The authors conclude that pulmonary resection should not be considered as a competitive but rather as a supplementary type of therapy to the other well established forms of treatment.

**Dermatitis in the Fish Industry.**—According to Schwartz and Tabershaw various types of dermatologic conditions may result from the handling of fish. Abrasions, lacerations and fissures are common throughout the industry, and infection with staphylococci and occasionally with streptococci occurs frequently. They differ in no way from any chronic boil and yield to cleanliness, hot soaks and prevention of further irritation. Bites have been known to occur from dogfish. Dermatitis and infection may occur from the various stinging fish. The treatment for the bites of fish consists in opening the wound and washing it with a strong solution of permanganate. The conjunctivitis which occasionally occurs in workers engaged in washing sardines is probably due to the presence of portions of jellyfish or strings of sea nettles adhering to the scales of sardines, or to hydrogen sulfide evolved from decaying fish. "Redfeed" dermatitis occurs when mackerel are in season. Mackerel feed on minute crustaceans, one of the most common of which is "redfeed," a reddish orange crustacean occurring in vast swarms. This redfeed, plus digestive juice from the stomach of the mackerel, burn the hand. After one or more days of exposure to this material the skin of the hands becomes swollen and intensely red, with numerous superficial ulcerations. The lesion is painful but heals quickly on application of compresses of boric acid or dilute epsom salt, followed by boric acid or zinc oxide ointment and avoidance of further contact with the material. Erysipeloid is derived chiefly from contact with gurry or the remains of fish that has undergone putrefactive changes. In handling gurry, abrasions, laceration or puncture of the skin is common and erysipeloid may result. Treatment of erysipeloid consists in first evacuating the organism, if possible. Fishermen from experience have learned to make bone punctures bleed if the punctures do not do so spontaneously. The treatment used successfully in one plant has been frequent and prolonged chlorine soaks followed by the application of ointment of ichthammol. The sulfonamides and x-ray therapy have also been used successfully, and in severe cases the use of immune serum may be advisable. Dermatitis from fish may be prevented by the use of rubber gloves.

**Cephalin-Cholesterol Flocculation Test.**—Wade and Richman describe the procedure they followed in performing the cephalin-cholesterol flocculation test and report the results obtained on several groups of patients. The scrums of 178 patients with known diffuse parenchymatous liver disease brought about flocculation of the cephalin-cholesterol emulsion in 173 instances. Of 45 patients with discrete lesions of the liver involving only a small part of the parenchyma only 24 showed significant flocculation. Of 180 patients in whom a reasonable suspicion of dysfunction of the liver existed 67 exhibited definite flocculation. Cholecystitis and cholelithiasis were responsible for 21 of these, chronic passive congestion for 24 and chronic alcoholism for 8. The possibility of detecting early cirrhosis among patients suffering from alcoholism has been studied carefully. Although 20 per cent of such patients

had a significant flocculation, none have returned with clinical cirrhosis even though two to three years have elapsed in some instances. Control tests were made on 105 persons. Those from subjects without known disease were negative in all instances. Flocculations thought to be significant did occur, however, in 19 patients who were not suspected of having liver disease. Twelve of the 19 positive reactions occurred in the presence of infection. "False positives" have been observed also in the presence of allergic disease or during the puerperium or neonatal period. With diffuse parenchymatous liver disease the cephalin-cholesterol test surpassed the other tests in the frequency with which supposed hepatic dysfunction was detected. The intravenous hippuric acid and the sulfobromophthalein tests both gave more frequent indication of liver disease in the presence of discrete or focal lesions of the liver. The sulfobromophthalein test (Mateer's modification) in the absence of jaundice gives the most consistent evidence of liver disease. The intravenous hippuric acid and cephalin-cholesterol flocculation tests are next most reliable. The serum diastase test is least valuable of the tests examined. The authors found the cephalin-cholesterol flocculation test of no value in the differentiation of obstructive and nonobstructive jaundice.

**Pharmacology of Atabrine.**—Barlow and his associates investigated atabrine prepared by the American process from both American and German intermediates with atabrine prepared by the German process from German intermediates. These preparations of atabrine were compared on rats, ducks and dogs. It was found that when given by mouth to mice the toxicity of quinine dihydrochloride, atabrine base in water, atabrine base in oil and atabrine dihydrochloride increases in the order named. The latter was only 25 per cent more toxic than quinine. The acute toxicity of four salts of atabrine was determined in the mouse by three different routes of administration. Atabrine manufactured by the American process from American intermediates was no more toxic to the rat than that manufactured from German intermediates by either the German or the American process. The 3 specimens were deposited to the same extent in the tissues of dogs. While the effects of the 3 specimens on the growth of ducks were not different, the atabrine from American intermediates produced significantly fewer deaths than that from German intermediates. Studies in which rats were given a massive dose of atabrine by mouth show that high concentrations are reached in the tissues, and especially the liver, during the first eight hours and thereafter the amount of drug decreases, but measurable quantities still are present ten days later. After forty-nine days of continuous administration of large doses the livers of young rats showed a deposit of 4.58 mg. of atabrine per gram of tissue and the blood level was 300 micrograms per hundred cubic centimeters. Detectable amounts were still present fifty-six days later. The injuries to the liver and other visceral organs resulting from large doses of atabrine healed well during the two months after medication was discontinued.

**Enriched Flour as Sources of B Complex.**—According to Westerman and Bayfield about one third of the total calories of American and British diets is obtained from bread and cereals. For European countries other than Britain, this figure is increased to 50 per cent or more. As flour occupies such an important place in the diet, it is desirable that it be of high nutritive value. The authors made four series of experiments

on albino rats to compare the relative growth promoting values of whole wheat, Morris type flour, patent flour enriched at the old levels and patent flour enriched at the new levels as a source of the B complex vitamins. The results indicate that whole wheat is a better source of the B complex vitamins than either Morris type flour or patent flour enriched at the old levels, when these materials make up 30 or 50 per cent of the diet. At a 30 per cent level whole wheat is slightly better than patent flour which has been enriched at the new levels. Whole wheat and new enriched flour promote the same amount of growth when fed at a 40 per cent level, while at a 50 per cent level the new enriched flour is better as a source of the B complex vitamins than whole wheat.

**Disappearance of Renal Calculi After Use of Solution G.**—Hamer and Mertz show that the recent announcement of solutions G and M have stimulated renewed interest in attempts to dissolve alkaline urinary calculi. The formula for solution G is monohydrated citric acid 32.25 Gm., magnesium oxide (anhydrous) 3.84 Gm., sodium carbonate 4.37 Gm. and water sufficient to make 1,000 cc. Lack of complete success with the use of these solutions seems to be dependent on one or more of the following factors: (1) failure of the solution to bathe the calculous mass completely, (2) variations in the chemical composition of different portions of the stone, (3) changes in the character of the surface of the stone occurring during treatment and (4) insufficient treatment. The authors discuss these different factors. Solutions G and M influence only stones composed of calcium phosphate, or carbonate or magnesium ammonium phosphate. They have no appreciable effect on uric acid or calcium oxalate stones. Insufficient treatment may be due to inability of the patient to tolerate the solutions. Solution M is not so acid or so irritating as is solution G, nor does it have so great a solvent action. The amount of solution varies from 1,500 to 3,000 cc. each twenty-four hours. The duration of treatment has been from ten days to three or four months. The size of the pelvis will govern the amount of fluid injected at each treatment. When the hand syringe method of injection is used, available nursing care will govern the interval of the injection, which should not be longer than one or two hours. The pelvis and the calices should be filled with the solution four to six times at each treatment. Successful treatment with the hand syringe will require more time than will treatment with an apparatus such as Kinsell has designed, as the more constantly the stone is bathed by the solution the shorter will be the treatment. Hamer and Mertz report the case of a

woman, aged 27, who had alkaline renal calculi. These had been present since a pyelolithotomy performed three years previously. The principal stone mass was removed at a second pyelolithotomy, and several clusters of calculi left behind were dissolved by the persistent use of solution G. Ten months following dismissal from the hospital the kidney function was improved and the x-ray remained negative for stone shadows.

**Castration or Estrogenic Substance in Prostatic Carcinoma.**—Nesbit and his collaborators in 1942 reported 75 cases of prostatic cancer treated by castration. In April 1944 they completed a follow-up of 50 cases treated with administration of estrogenic substance alone. The present report compares the results in these two groups. There appear to be no significant differences in subjective response. Objective changes of regression in the primary tumor as well as in the metastases occurred in a significantly greater proportion of castration cases than in the cases treated with diethylstilbestrol. Neither form of treatment affords a prophylaxis against the development of or the increase in metastases. The serum acid phosphatase level is not a reliable index of metastatic carcinogenic activity. Substantial evidence has been offered to prove that the pain in a postcastration failure case has been controlled by administration of estrogenic substance.

**Amino Acids Intravenously in Surgical Patients.**—Davis explains the value of protein digest intravenously during the first days following an operation when the diet is inadequate. His plan has been to give 1,000 cc. of protein digest (amigen) with 5 per cent dextrose intravenously twice a day until the nausea has stopped and the patient is able to take a soft diet. Following many operations the period is one day on the protein digest, in others two, and in many cases, notably peritonitis, bowel resections and intestinal obstructions it might

be several days or even a week in which the entire nourishment is given by intravenous protein digest. Clinically its use results in improved strength, appetite, wound healing and accelerated recovery. The convalescence is shortened, and complications are decreased.

**Cause of Death in Diabetes.**—Robbins and Tucker made postmortem studies on diabetic patients at the Mallory Institute of Pathology in Boston. They present an analysis of the causes of death of 307 diabetic patients over the age of 12 as determined by necropsy. For purposes of comparison the necropsies on approximately 2,800 consecutive nondiabetic patients were reviewed for anatomic causes of death. The most frequent cause in the diabetic group was pulmonary infection (25.6 per cent); cardiac decompensation and coronary occlusion follow, with 12.3 per cent and 10.8 per cent respectively. The relative frequency of fatal carcinoma was 8.4 per cent, that of acute pyelonephritis, decompensated, was 7.3 per cent, and that of uncomplicated coma was 7.2 per cent. Cerebral vascular disease accounted for only 5.2 per cent of the deaths. In the control group pulmonary infection again led with 24.2 per cent. Death due to carcinoma was second, with 14.7 per cent. Cardiac decompensation followed, with 12.6 per cent, whereas coronary occlusion and acute pyelonephritis were far down on the list, with 4.2 and 1.6 per cent respectively. Several clinical impressions were confirmed. The diabetic patient lives as long as the nondiabetic. Coronary occlusion, peripheral vascular disease, infections of the extremities and acute pyelonephritis are more frequent causes of death of the diabetic patient.

**Chickenpox, Herpes Zoster and Acute Anterior Poliomyelitis.**—McGarrahan presents case histories which further contribute to facts pointing to an interrelationship between chickenpox and herpes zoster. Treatment of chickenpox will

intravenous thiamine hydrochloride brought the disease to an abrupt end in about six hours. He relates the coincidence of acute anterior poliomyelitis, herpes zoster and chickenpox in 3 members of the same household. A girl aged 6 with acute anterior poliomyelitis made unusual progress when given 50 mg. of thiamine hydrochloride and 150 mg. of niacin intravenously during the acute stage. The value of thiamine hydrochloride in the treatment of herpes zoster is well established. Its value in treating chickenpox is strongly indicated here. Its use in infantile paralysis is an opportunity not to be overlooked. The niacin in the case presented may have been as important as the thiamine, but it is fair to assume, in view of the role of thiamine in the maintenance of nerve function, that its importance is primary and that the patient with infantile paralysis faces a better prospect with an available (parenterally administered) excess of thiamine than with a deficit.

**Etiology of Acute Diarrheal Diseases.**—Hardy and Watt of the United States Public Health Service say that study of the acute diarrheal disease was initiated in 1936. Various aspects of the problem were investigated in regions of high, very high, medium and very low reported mortality from dysentery, diarrhea and enteritis. The areas selected and duration of study are as follows: New Mexico 1936-38, Georgia, 1939-40, New York 1939-40 and 1942, and Puerto Rico 1941-42. A representative county in New Mexico and one in Georgia, and a town and a rural community in Puerto Rico were selected for intensive study. The New York data were collected in Manhattan and in selected state institutions. Both bacillary and protozoan causes of these disorders were sought. The newer highly selective culture mediums for *Shigella* were employed for the bacteriologic examinations. In all areas investigated the *Shigella* paratyphenteriae group was found most commonly in these diseases. Twenty-three epidemics of diarrheal disease were investigated. Nine were explosive, thirteen nonexplosive, and one was mixed. In seven of the explosive outbreaks the epidemic and the individual cases had a sudden onset and a brief though stormy course. There were no secondary cases. Gram negative pathogenic bacilli were not found on fecal cultures. These were typical food poisoning outbreaks. The other

two explosive epidemics were due to *Shigella* ("Newcastle") and *Salmonella typhi* murium respectively. In these the primary cases appeared throughout one week, though chiefly within three days. Secondary cases were found. The usual duration of illness was two to five days. Clinically the cases were clearly differentiated from those in the food poisoning outbreaks, and stool cultures were positive. The nonexplosive outbreaks were widely scattered, three in military camps, three in civilian groups and seven among the inmates of mental institutions. Preceding the epidemics, cases of diarrheal diseases had occurred only sporadically. The unusual incidence began insidiously, increased gradually and was maintained persistently. The cases varied in severity and duration. In all instances these outbreaks were found to be due to some single variety of *Shigella* paratyphenteriae. The mixed epidemic was an explosive "food poisoning" outbreak superimposed on a nonexplosive *Shigella* epidemic.

**Wernicke's Disease.**—Riggs and Boles present a study of 42 patients in whom the diagnosis of Wernicke's disease was confirmed by necropsy. A history suggesting chronic alcoholism was obtained in only 18, while all the patients either showed clinical signs of a deficiency state or, at necropsy, presented evidence of organic disease which would contribute to such a condition. The diagnosis in these 42 cases was made almost invariably at necropsy on the basis of characteristic brain changes. The clinical syndrome described by Wernicke was found to be of little value as a criterion of diagnosis. Disturbance of psychic function was present in all cases, usually as an initiating symptom, and in 70 per cent it was associated with other signs of involvement of the nervous system. The classic triad of clouding of consciousness, ophthalmoplegia and ataxia was not noted in its entirety in a single patient. The clinical and necropsy findings in 42 patients with Wernicke's disease suggest that in these individuals nutritional deficiency provided the essential background for the condition. Alcohol, although contributing to the deficiency state in at least 43 per cent of the group, was apparently not a primary factor in the genesis of the disease.

**Ophthalmoplegia in Toxic Diffuse Goiter.**—Rundle and Wilson use the expression "ophthalmic type of Graves' disease" to describe cases in which the ocular changes occur without goiter or hyperthyroidism. This paper is based on data from 32 patients of the purely ophthalmic type and from 57 patients with the ordinary type of toxic diffuse goiter with hyperthyroidism. The vertometer was used for measuring the duction movements of the eye. Elevation, depression, adduction and abduction of the eye are measured from a standard central position in which the subject looks directly forward, Reid's base line being horizontal. A table which shows the incidence and severity of ophthalmoplegia in the ophthalmic and thyrotoxic forms of toxic diffuse goiter reveals that of the 32 patients with the ophthalmic type 22 had moderate or severe ophthalmoplegia, whereas of the 57 with the thyrotoxic type only 5 had moderate or severe ophthalmoplegia. There seems to be an inverse relationship between ophthalmoplegia and hyperthyroidism in toxic diffuse goiter. The expression "Graves' disease" may conveniently be used to include ophthalmic forms in which hyperthyroidism is slight or absent as well as ordinary thyrotoxicosis. Disorders of the eye muscles are an integral feature of both. In the ophthalmic forms ophthalmoplegia differs in degree but not in kind from that in thyrotoxicosis. Ophthalmoplegia in toxic diffuse goiter tends to be bilateral and has a well defined pattern. Paralysis of elevation is frequent and severe. It depends primarily on weakness of the superior rectus muscle. Taken together the horizontal ductions are more liable to paralysis than depression. Paralytic squint is a frequent complication and depends on asymmetry in the power of corresponding recti.

**Bulging of Eyelids with Exophthalmos.**—In this paper Rundle and Wilson direct attention to the fatty swelling of the lids occurring with exophthalmos in thyrotoxicosis, giving particular attention to the clinical characteristics and the mechanism. Such swelling is not confined to patients with toxic diffuse goiter but is found in a variety of conditions characterized by overfilling of the orbit and exophthalmos. It is, in fact, simply a protrusion of the normal lid and is not due to edema of the palpebral tissues as generally stated. Variations in protrusion or recession accurately reflect changes in the degree of orbital filling. In wasting of the orbital tissues the eye is sunken. The lids are retracted. Bulging of the lids due to prolapsing fat has well defined clinical appearances. In the upper lid these are best observed with the eye closed,

in the lower with the eye open. After discussing prolapsing orbital fat as the cause of bulging, the authors show how it is differentiated from edema of the eyelids. Further they demonstrate the correlation between lid protrusion and proptosis and then discuss the mechanics of exophthalmos and lid protrusion. Disparity between the bulk of the contents and capacity of the orbit may arise from a variety of clinical conditions, but some expression such as orbital overfilling, overcrowding or disproportion is necessary to describe their basic and common pathology. In its strict sense exophthalmos is only one of the consequent signs. Lid protrusion is another. It remains for clinical investigation to determine others and so to decide which of the manifold eye signs described in toxic diffuse goiter are explicable on this simple basis. Unfortunately "exophthalmos" is often used in an omnibus sense to describe all such cognate signs. The authors conclude that variations in the plane of the eyelids, sunken, normal or bulged, reflect corresponding variations in the degree of orbital filling, as do correlative changes in position of the eye. The clinical characters of sunken and bulged lids are well defined and, together with the exophthalmometer reading, enable departures from the average degree of filling to be detected.

 Cardiac Insufficiency of Rare Etiology: Case. S. Grinschpun and S. Awad.—p. 829.

**Nervous Complications of Typhoid and Paratyphoid.**—According to Uiberall acute and subacute nervous complications may appear early or late in the convalescence from typhoid or paratyphoid. The symptoms are those of encephalitis, myelitis and polyneuritis with more or less extensive involvement of the nervous plexuses or the peripheral nerves. He reports 7 instances complicating late convalescence from typhoid. There were 2 instances of encephalitis, 1 each of myelitis of the Landry type and of focal anterior poliomyelitis and 3 instances of neuritis. In 1 of the last 3 cases crural neuritis was caused by paratyphoid A infection. He reports also a case of meningitis caused by *Salmonella schottmuelleri*.

## Book Notices

**Committee on Public Health Relations. The New York Academy of Medicine: Report of Activities for the Year 1943.** Paper. Pp. 32. New York: The Academy, [n. d.].

This report reviews the active program in public health relations which should be studied by medical societies across the nation. It is a real program of public health relations, not merely a program of publicity. The committee of public health relations of the academy has actually gone to work and made studies, held conferences with interested groups and made contributions to a long list of problems and topics. The index alone gives an idea of the range of this committee's activities. Alphabetically the committee has had under consideration in 1943 abortions, adolescent delinquency, barbiturates, the Beveridge plan, malaria and world health, butter substitutes, pasteurization of certified milk, medical examinations by the Civil Service Commission, qualifications for a director of health education in schools, eye clinics, training the handicapped for war work, industrial medicine, inhalational therapy, qualifications of an ophthalmologist in the labor department, margarine, maternal mortality, qualifications of a commissioner for the mental hygiene department, payment of physicians in municipal hospitals, practical nurses, optical plans, the opticians' bill, optometrists in eye clinics, central file of psychiatric histories, the Public Health Research Institute of the City of New York, rebates, ringworm of the scalp, the compulsory examination of school teachers, social hygiene, speech rehabilitation, tuberculin tests, venereal disease instruction and youth correction authority. A real program of public health relations involves service, not merely publicity. This report exemplifies and summarizes such a program. It is recommended to the secretaries, medical or lay, of medical societies and to public health officials everywhere.

**The First Woman Doctor: The Story of Elizabeth Blackwell, M.D.** By Rachel Baker. Cloth. Price, \$2.50. Pp. 246, with illustrations by Corinne Malvern. New York: Julian Messner, Inc., 1944.

This is the simply told narrative of Elizabeth Blackwell, M.D., who was the first woman to enter and graduate from an American medical college. Perhaps the courage which led her to drive to her goal is best characterized by her decision as a little girl. When asked what she intended to do when she grew up she said she did not know but that whatever she did it would "be something hard." Her selection of medicine as a career completely fulfilled this formula, because no woman had ever entered this profession in this country, at least through the orthodox channels of a medical school. The sequence of events in Dr. Blackwell's life to accomplish "something hard" includes her struggles to gain admission to a medical school, successful finally in the now defunct Geneva Medical College of New York State (from which she graduated in 1849), to find a place to live among people hostile to the innovation of a woman medical student, to achieve acceptance by fellow students and faculty and later, as a graduate physician in schools of Paris, to establish a practice and to organize a hospital and finally a medical school for women in New York.

It was essential that Elizabeth Blackwell should undergo the physical and psychologic hardships of the "first woman doctor." After a hundred years the contributions and even the indispensability of women in some fields of medical science are unquestioned. The most compelling obstacles to women today are not primarily the medical schools or the profession but rather the public, which in many instances prefers a man to a woman doctor and also in women themselves, whose interest in this career is limited to a few. It has now been decreed that able bodied men may not enter the career of medicine for a period of years. Under these conditions it would be desirable to have increased numbers of competent women qualified for the study and practice of medicine. However, these are not to be had in large numbers. In most of our medical schools the proportion of women applicants to those accepted is about the same as in the case of men. Qualified women encounter no seriously greater difficulty in obtaining admission to most of our medical schools than is true of qualified men.

**Medical Diseases of War.** By Sir Arthur Hurst, M.A., D.M., F.R.C.P., Consulting Physician to Guy's Hospital, London. With the co-operation of H. W. Barber, M.A., M.B., F.R.C.P., Physician-in-Charge of the Skin Department, Guy's Hospital, and others. [Fourth edition of present war; Seventh of World War I.] Cloth. Price, \$6. Pp. 511, with 49 illustrations. Baltimore: William Wood & Company, 1944.

This book should prove interesting reading to the average medical officer and even to the physician in private practice. It consists of twenty-nine chapters, of which seventeen directly or indirectly concern the central nervous system, great emphasis being placed on the control of disorders of the mind such as neuroses and hysteria. While the cited experiences seem to date mostly to the first world war, the principles are mostly still valid and the reader will gain considerable information from the chapters relating to hysteria, disorders of speech and functional disorders. Other chapters concern trench fever, typhus, typhoid and paratyphoid fevers, dysentery, "epidemic jaundice," malaria, meningococcic fever, diphtheria, tetanus, war nephritis, skin disease in war and gas poisoning. Some of these chapters are not quite up to date concerning treatment; for example, no mention is made of DDT in the control of typhus, of succinyl-sulfathiazole in the control of bacillary dysentery and of iodine compounds for amebic dysentery. Perhaps this is explained by the dateline, which is December 1943. A helpful chapter would be one on the relation of chemotherapy to the treatment of diseases of war, as chemotherapy is playing an ever increasingly important role. The first edition was published in 1916, the present volume being the seventh edition and the fourth of the present war. Cooperating with the author are seven persons who have special knowledge in their respective fields.

**Industrial Nutrition.** By Ludwig Teleky, M.D. Industrial Commentaries Volume 2, Number 1. Boards. Price, \$2. Pp. 64. Chicago: H. M. Van Hoesen, Jr., Industrial Commentaries, 1944.

This little book is one of a series of "industrial commentaries." It touches on the high points of nutrition and attempts to relate them to industrial nutrition. Too much space is devoted in the early part of the book to a loose presentation of the elementary facts of nutrition. The scanty food tables given serve no real purpose. An enumeration of the classes of foods gives a disjointed assemblage of facts, some of which are meaningless and inaccurate. Some recommendations are at variance with those of recognized authorities. From the nutritional standpoint the book is superfluous. Its comments on nutrition as related to industry are based on a limited number of published reports and excerpts from textbooks as well as general observations concerning the methods of food supply in industrial plants. Some of the important points of controversial nature are mentioned but inadequately discussed. Insufficient emphasis is placed on the important and difficult problem of nutritional education of the worker. This book can scarcely be recommended as a worthwhile source of information on its subject.

**Synopsis of Neuropsychiatry.** By Lowell S. Sellings, Sc.M., M.D., Ph.D., Director, Psychopathic Clinic, Recorder's Court, Detroit, Michigan. Fabrikoid. Price, \$5. Pp. 500. St. Louis: C. V. Mosby Company, 1944.

In the early days of medicine synopses were valuable, since for the medical student disease was a problem of memorizing signs and symptoms. As medicine became dynamic, the value of such books lessened. In the field of psychiatry, synopses have never been of any help to the serious student. It is an anachronism that this year sees the publishing of a new synopsis of neuropsychiatry. Within the span of 472 pages the author attempts to outline the existing knowledge of organic and functional diseases of the nervous system. The work is replete with errors and inaccuracies.

**The Story of a Hospital: The Neurological Institute of New York, 1909-1938.** By Charles A. Elsberg, M.D. Cloth. Price, \$3.50. Pp. 174, with illustrations. New York & London: Paul B. Hoeber, Inc., 1944.

The author has written a most interesting story. It describes the early life of the first neurologic institute, with all its trials and tribulations. Following this there are nine chapters given to the advancement and progress of the institute. The appendix has two chapters listing the trustees and the staff of the institute from 1909 to 1938. This small book should be purchased by every neurologist and neurosurgeon.

## Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

### AIR CONDUCTION AND BONE CONDUCTION HEARING AIDS

**To the Editor:**—As consulting physician to the Vocational Rehabilitation Service of the Department of Education, I have been asked a number of questions by the field workers concerning the relative efficiency of hearing devices, chiefly in regard to air conduction and bone conduction. 1. Does bone conduction decrease with the age of the patient? 2. Is there any evidence of gradual loss of hearing in the high frequency levels over a period of years with bone conduction? 3. How much increase over air conduction must bone conduction have before it is considered to be the preferable form of device to use?

R. B. Aiken, M.D., Burlington, Vt.

**ANSWER.**—1. Bone conduction does not decrease with age unless the hearing impairment originates in a nerve: senile nerve deafness is, of course, always accompanied by decrease of hearing by bone conduction.

2. Senile nerve deafness affects the high tones in every one past the age of 60 and in some below this age, and with this nerve impairment there is a loss of hearing by bone conduction for these high tones.

3. The bone conduction type of hearing aid, as a rule, has no great advantage over air conduction, as the latter earpiece fits tightly enough into the external auditory meatus so that there is actually considerable bone conduction involved. In cases of nerve deafness the air conduction type must always be used. In cases of conduction deafness with good hearing by bone conduction, either the air conduction or bone conduction type may be used; this decision may rest on the patient's preference more than on the hearing tests.

### EFFECTS OF RADIUM ON BONE GROWTH

**To the Editor:**—I have recently seen several conflicting reports as to the bad effects of radium on the growth of bone when applied for the treatment of hemangiomas. I refer particularly to the treatment of cavernous hemangiomas with gamma radiation over the wrist joint, the ankle or the knee, where presumably the ends of the long bones would be subjected to a moderate amount of irradiation. Would it be considered safe and without serious effect on the growth of the bones to treat hemangiomas in these areas with radium?

M.D., New Jersey.

**ANSWER.**—Large doses of radium or any type of radiation will cause bone necrosis whether applied to normal or to pathologic bone. It is not necessary to treat cavernous hemangiomas with radium or radiation in such a manner as to cause bone necrosis. In youngsters before ossification is complete it is always dangerous to give radiation to the ends of the long bones, as it may lead to disturbances in growth; therefore, whenever treating a lesion by radiation over the ends of long bones it is well to be cautious in the amount of treatment and, if possible, the epiphyses and metaphyses should be completely protected.

### DETERMINING BLOOD CHOLESTEROL

**To the Editor:**—How much difference is there in using serum or in using plasma when determining blood cholesterol by the method of Bloor? The textbooks specify "plasma or serum," but the determinations on identical blood using each give rather great differences. What are the normal values for cholesterol, using both serum and plasma?

Clifford W. Atherton, M.D., Peoria, Ill.

**ANSWER.**—It has been generally accepted that the total cholesterol concentration of the serum and of the plasma is the same, but normal values for the Bloor method should not be given without some explanation.

Grigaut, who presented the first colorimetric method of estimating cholesterol in the blood with the Liebermann-Burchard color reaction (*Compt. rend. Soc. de biol.* 68:791, 1910), in 1913 presented data on simultaneous analyses of serum and plasma in his book, *Practical Chemical Analysis of Blood*, ed. 2, (Myers, V. C.: Practical Chemical Analysis of Blood, ed. 2, St. Louis, C. V. Mosby Company, 1924, p. 124) in which practically identical findings were found in serum and in plasma. It would not appear that this observation has been questioned, since some workers employ plasma while others use serum.

The Autenrieth and Funk method (*München. med. Wchnschr.* 60:1243, 1913), which Bloor and many early workers in this country employed, was simply an adaptation of the Grigaut method for use with the Hellige colorimeter. Although Bloor when he first adapted this method to his alcohol-ether extract of blood saponified the extract with sodium ethylate (*J. Biol. Chem.* 23:320, 1915), he later omitted the saponification when he found that the cholesterol esters also gave the color reaction (*ibid.* 24:227, 1916). He observed that the results with the simplified method averaged 20 per cent higher than with the older procedure in which saponification was employed. Bloor suggested, as a possible explanation for the lower values obtained, the action of the strong alkali when saponification was employed. Many other explanations for this difference have been suggested by different workers. However, it remained for Gardener and Williams (*Biochem. J.* 15:371, 1921) to note that esterified cholesterol reacts at a greater rate in development of color than does free cholesterol. Kelsey, in Bloor's laboratory, has verified this observation (*J. Biol. Chem.* 127:15, 1939) and has shown that cholesterol palmitate gives 30 per cent more color than does free cholesterol. Since Sperry (*ibid.* 114:125, 1936) has shown that the total cholesterol in the normal human serum averages 73.1 per cent cholesterol esters with a relatively constant ratio, this explains why the results with the commonly used Bloor (1916) method are about 20 per cent too high for total cholesterol.

Bloor obtained a range of values for total cholesterol of 190 to 310 mg. per hundred cubic centimeters of plasma for normal adults, with an average of 220 mg. for males and 240 mg. for females. This would be equivalent to a range of about 150 to 250 mg. for true cholesterol.

### RUPTURE OF INTERVERTEBRAL DISK IN THORACIC SPINE

**To the Editor:**—I have never seen any discussion in *The Journal* of ruptured intervertebral disk in that area of the spine below the eighth cervical space and above the lower lumbar region. Is this condition never found in that region? Does the bony frame of the thorax lend support to the midspine so that no such mishap can occur? If so, since many cases of ruptured disk do not seem to have any definite history of trauma or disease, why does not the same occur in the thoracic area? At least one writer has stated that many instances of ruptured disks occur apparently spontaneously in the usual areas; may not this type of rupture occur also in the usually unreported area of the spine? A ruptured disk in the thoracic area, of course, would present a problem in diagnosis of more than average difficulty. An error in diagnosis would almost certainly occur unless an x-ray examination showed a noticeably narrowed interspace. Have any papers on this subject appeared?

Paul P. Halleck, M.D., Broadus, Mont.

**ANSWER.**—Rupture of an intervertebral disk may occur in any region of the spine in which the disk is found and motion is present between the contiguous vertebral bodies. The ruptures occur most commonly where the range of motion and the stresses and strains of physical activity are greatest. There is comparatively little movement in the normal thoracic spine because of the splinting effect of the ribs and the sternum. For this reason injuries to the intervertebral disk are relatively uncommon between the eighth cervical and the last thoracic vertebral disk interspace.

It is possible that ruptured disks in the thoracic region have occurred more often than they have been diagnosed. The attention of most physicians has been focused at the lumbosacral level and on the cervical spine, and few reports are available on protrusions of the thoracic disks. A small monograph entitled "The Intervertebral Disc," by F. Keith Bradford and R. Glen Spurling, published by Charles C. Thomas of Springfield, Ill., and Baltimore in 1941, contains a reference to thoracic disks on page 106. They described the finding at operation of a herniation of a disk between the thoracic fourth and fifth vertebral bodies in 1 patient.

### TRYPTOPHAN DEFICIENCY

**To the Editor:**—Can you give me information concerning the use of amino acids, particularly tryptophan, "to retard baldness, sex gland deterioration, malformation of tooth enamel and cataracts" as quoted from the *R. and C. Medical Pocket Quarterly* and apparently based on a study at the Johns Hopkins University Medical School, Baltimore?

Michael D. Moran, M.D., Farmington, N. H.

**ANSWER.**—Observations by Albanese and Buschke (*Science* 95:584 [June 5] 1942) have shown that tryptophan deficiency in rats give rise to alopecia, sex gland deterioration, defective enamel formation and cataracts. There is as yet no published information regarding the prevention or treatment of such pathologic conditions in man with tryptophan or other amino acids.

## THE PROBLEM OF THE CHRONICALLY ILL PATIENT

HERMAN L. KRETSCHMER, M.D.  
President of the American Medical Association

CHICAGO

The problem of caring for the chronically ill patient is intimately associated with the care of the aged and aging. Chronic invalidism in 80 per cent of the cases occurs after the age of 35, whereas it occurs in only 5 per cent before the age of 14. We are rapidly becoming a nation of elders. The aging of the population has far reaching significance not only medically but interlacing with all spheres of man's life and the social structure.

In 1900, 17 per cent of the total population of the United States were 45 years old or more. In 1940, 26.5 per cent exceeded 45 years of age. Conservative estimation by the U. S. Census Bureau, assuming that there will not be new immigration, predicts that in another forty years the structure of our population will be further changed. In a study made by the Committee on Economic Security, Social Security Board, it was determined that by 1970 more than one half of the people will be over 45 years of age and that each hundred of the working population will have to carry about 45 persons over 65 years of age, assuming that the old people have not saved enough money to support themselves.

The physician will have an important role in adjusting the aging to their changing capacities as more persons reach the older age period. He will be called on to treat larger and larger numbers of patients who suffer from diseases of advanced life. As a result of intensive study being given to this problem by the physicians of this country a new department of medicine was born: geriatric medicine.

The constant growing interest and application of the advances of medicine, surgery and allied sciences have resulted in an extension of the life span from 42 years in 1900 to 65 years in 1944. The ever increasing number of people in the older age groups have created new problems, of which the medical profession is keenly aware. One is purely medical and has to do with chronic illness. Its prevention and treatment are receiving the serious consideration of the medical profession. The other is a social problem and has to do with employment and security.

The problem of the chronically ill and the increase in the older age groups has its origin in the drastic changes in the causes of death which have occurred as a result of the advances in medical science and public

health during the past fifty years. Among the outstanding achievements of scientific medicine and public health programs were the reduction of infant mortality and the prevention of the acute infectious diseases, such as typhoid, diphtheria, smallpox and scarlet fever, the institution of better sanitation and the improvement in the milk supply, all of which have been great factors in lowering morbidity and mortality among infants and children. The steady reduction in the morbidity and mortality of tuberculosis has been a great triumph for modern medicine.

The improved methods of diagnosis and the early recognition of disease resulting in rapid and early cures have been factors in extending the life span. A better brand of obstetrics is being practiced. In 1943 more than 3 million babies were born with the lowest maternal and infant mortality in our history. There has been a great improvement in surgical mortality as the result of better medical education, better training of the intern and resident, advances in preoperative and postoperative care, choice of anesthetic, use of blood plasma, blood transfusions, penicillin and the sulfonamide drugs. All have resulted in saving more lives and having more patients reach older age groups. Operative mortality from prostatic obstruction fifteen years ago varied from 12 to 15 per cent. Thanks to transurethral resection the mortality has been reduced to less than 0.5 per cent, still further increasing the number of people in the older age group. The modern treatment of syphilis will no doubt reduce the number of patients who later on would suffer from mental diseases and various changes in the heart and blood vessels.

From a perusal of the current literature one gains the impression that the subject of the chronically ill patient is a new topic, that it is the number 1 medical problem in this country and that the ordinary physician is not interested in this group of patients. I disagree with all three statements.

As a result of the factors that have been mentioned, the number of persons suffering from chronic illness will no doubt increase. In a study of this problem, purely from the point of view of helping the patient, there is no place for padded statistics. We should distinguish between persons who suffer from chronic illness and who are working every day and those who are suffering from a chronic illness that is disabling. The inclusion of remedial conditions is not exactly scientific. Diseases of the female organs, such as chronic vaginitis, lacerations and disturbances of menstruation, diseases of the skin including boils, impetigo, abscesses, chronic tonsillitis, bronchitis, hemorrhoids and deafness seem to me to be wholly out of place. Some deafness can never be cured. The war has done much to point the way. Many patients who were formerly called chronic sufferers have found useful employment in war plants and are doing a magnificent job; for example,

Read before the Institute of Medicine of Chicago at the annual meeting of the Central Service for the Chronically Ill, March 6, 1945.

the man completely deaf makes a perfect riveter. Not only is he conscious of his role in the war effort but he also preserves his self respect by his earnings. Many of the patients who fall into the so-called group of chronically ill are not necessarily thereby rendered invalids or completely handicapped. The patient with a mild hypertension can carry on his usual daily tasks with proper medical supervision and although he may suffer from a chronic illness he is not disabled and certainly does not call for long term hospitalization.

Prevention is and should be the first consideration in treatment. Prevention of chronic illness begins with health education on proper personal hygiene, right living and suitable diet, with particular emphasis placed on the importance of an annual physical examination. This often reveals foci of infection, such as infected tonsils and teeth, which can then be removed long before the arthritis or hypertension begins.

The family has an important role in the care of the chronically ill. The patient's invalidism is too often created or increased as much by the attitude of his family and friends as by the physical condition itself. Friends and relatives in their sympathy for the patient's ill fortune may know of no other way to offer help than to shelter and overprotect the patient to the point where his spirit may develop handicaps more severe than those which cripple his body.

We are living in an era in which many think first of institutions and of governmental aid; what burdens the individual cannot carry, Washington is asked to underwrite. The family spirit has diminished. A change of attitude must take place—that the glory of youth too will vanish and that the young person has an obligation to the other members of his family. We have become so institutionally minded for almost every kind of medical and social problem that we are apt to lose sight of the fact that a label on bricks and mortar does not mean a magical solution of the problem.

Industry too has an important role to play in this problem. Careful consideration should be given to the aging; and effort must be made to place the older worker in a position commensurate with his capacities so that he may feel that he is taking part in production, thereby retaining his self respect. He should not be shunted off into an inconsequential position when he still is able to perform productive work.

As essential as hospitals and institutions are to care for those cases which cannot remain in the home because of the nature of the disease, they are many times abused. The medical profession has been well aware of the need for more adequate provisions for the institutional care of the chronically ill, the convalescent and the incurable. In a report by the Committee on Medical Economics of the Chicago Medical Society<sup>1</sup> it was recognized that the establishment of suitable institutions for these three types will relieve the public hospitals for acute diseases of chronic invalids who no longer need that expensive type of care, that it will afford convalescents an opportunity for complete recovery after severe operations or illnesses, and that it will provide a comfortable home for those incurable persons who are hopelessly handicapped.

Whether or not the chronically ill should be hospitalized in institutions dedicated to that purpose or whether they should be housed in wings built as additions to

our present hospitals for acute diseases is a subject still under debate. Some believe that they should be cared for in the separate wings of the so-called acute hospitals and others believe that special hospitals should be built for that particular purpose.

In planning for extension of institutions or hospitals for the future, we should bear in mind the fact that prevention may reduce the number of cases that will require institutional care and that such extensive expansion might not be necessary.

Certainly for those patients for whom any significant degree of rehabilitation can be anticipated, active steps must be taken to restore independence and self reliance as fully and as rapidly as possible. This is of fundamental importance not only to the patient and his family but to society, and efforts must be made as fast as possible to provide the additional facilities and services needed in our communities to accomplish this.

Management of these patients depends in part on the severity and in part on the type of illness. A certain number of them can be managed as ambulatory patients in the home, with visiting nurse and medical services. When a patient has to be hospitalized, hospitalization should be continued until he can return to his home.

For the aged who are fairly active physically and mentally and are still continuing with their work, it has already been mentioned how their mental attitude and morale are sustained if they are given employment.

Those who are fairly normal mentally but are physically disabled and dependent, medical service which is palliative should be given so that they may not suffer needlessly. Commitment to an institution should be deferred as long as possible, as the home accords them the happiest surroundings and their usefulness can be maintained by giving them some light duties to perform. These people, if committed to an institution, soon become helpless old men and women, because mental changes are hastened by the shifting of the environment.

The group which needs either skilled nursing care or intensive medical treatment can be confined to a hospital designed for this purpose.

For those who are completely helpless and permanently incapacitated, domiciliary care is all they need.

#### POSSIBLE STEPS TOWARD MEETING THE PROBLEM

The existing facilities in most communities for the care of the chronically ill are inadequate, and a well planned and integrated service is needed. Before this can be accomplished, some clear thinking on the basic issues which are involved is necessary. A practical program for meeting the problems of chronic illness must look ahead far into the future. The problems involved are too big and too complex to give promise of any simple or early solution, and we must shape our activities toward long-term objectives. These objectives will of necessity be achieved through various approaches, chief among which will be:

1. The prevention and alleviation of chronic illnesses and the disabilities which they cause. This I have already discussed earlier in this paper. To reiterate, the medical profession is interested both in the prevention and in the treatment of chronic illness.

2. The provision of institutions and other facilities and services for the care and treatment of patients already disabled by chronic illness.

3. A sound method of meeting the costs of care for those patients who are financially unable to meet their own expenses.

1. Report of the Medical Care Required and Available in Cook County, A Study by the Committee on Medical Economics of the Chicago Medical Society, May 1939.

Before any sound program can be instituted, careful and serious consideration must be given to the fundamental questions, as:

1. The relative distribution of responsibility which should be maintained by voluntary, philanthropic and proprietary services for establishing and operating the necessary homes and hospitals.

2. The responsibility which should be assumed by the government for the indigent.

3. The desirable size and location of the facilities to be established.

4. The extent to which beds are needed in hospitals or treatment centers as distinguished from homes for patients who cannot hope to profit from treatment and need only continued personal care and nursing attention.

5. The most satisfactory method of financing care for patients unable to pay the costs of care, in whole or in part.

6. The most effective means of maintaining adequate standards of care in institutions serving these patients, i. e. through licensing laws, periodic inspection by state or local authorities, and so on.

Whether there are to be special institutions for the chronically ill, i. e., chronic disease hospitals separate and apart from those serving acutely ill patients, or whether they are to be separate wings or additions to these hospitals. Much discussion must be given to this question.

122 South Michigan Avenue.

## INFLAMMATORY LESIONS OF THE UPPER GASTROINTESTINAL TRACT

A. H. AARON, M.D.

BUFFALO

It is some years since we who are interested in the surgical and medical aspects of lesions of the gastrointestinal tract have had the opportunity to meet in joint session to discuss and consider subjects of mutual interest and concern. In the period of time allotted to me I shall confine my remarks to a discussion of certain advances in the diagnosis and treatment of lesions of the stomach and duodenum that have taken place in this period.

An additional duty has been imposed on us at this time to evaluate and apply the observations made by medical personnel of the armed forces to the civilian population, and the continuation of the care of those members of the military forces who are returning home with lesions of the upper digestive tract.

### CRITERIA FOR HEALING OF ULCERATING LESIONS OF THE STOMACH

It is essential that, if possible, a patient who has an ulcerating lesion of the stomach be assured that it is completely healed and remains healed. Although the location and size of the ulcerating lesion have certain prognostic significance, and Palmer<sup>1</sup> has shown that certain ulcerating malignant lesions of the stomach may heal and confuse the picture, the following will, in a majority of instances, serve as a guide:

1. A complete cessation of all symptoms.
2. Maintenance or gain in weight.
3. Persistent absence of occult blood from the feces.
4. Disappearance of the anemia of the iron deficiency and essential factor type.
5. A normal sedimentation rate.
6. Roentgenologic evidence of complete healing.
7. If possible to secure, confirmation by gastroscopy.

Only by repetition of these studies over a period of four to six weeks' observation can we make any inroads on the difficult problem of determining whether an ulcerating lesion of the stomach has healed and remained healed and is thus most likely benign. If this does not occur, the patient is entitled to surgical intervention.

### ROUTINE OR MASS X-RAYING OF THE STOMACH AND DUODENUM OF PERSONS WITHOUT GASTRIC SYMPTOMS

Fordyce B. St. John<sup>2</sup> has routinely examined the stomach and duodenum of 2,413 patients without digestive symptoms by fluoroscope and revealed 54 with deformed duodenal bulbs without symptoms of ulcer (some of these were actual craters but the majority showed deformity of healed ulcers), 7 with cardiospasm, 25 with diaphragmatic hernias (2 very large), 2 with carcinomas of the stomach, entirely unsuspected, which were the earliest that ever occurred in their practice, 1 with lymphosarcoma of the stomach and 1 with a gastric polyp. A number of functional derangements were revealed by alterations in motility, tone and emptying time. This is an outstanding advance and one which we must all heed and consider. One might argue that such fluoroscopy is inaccurate. Nevertheless, the fluoroscopies were performed by experienced roentgenologists, and, as it has been said, "An examination is as good as the roentgenologist and no better." Their concern was whether or not the stomach or duodenum showed any abnormality. Fluoroscopy of the upper gastrointestinal tract may in time occupy the same position as similar studies of the lungs.

### PEPTIC ULCER IN CHILDREN

Bird, Limper and Mayer have collected 243 proved cases showing that, in a group of 111 from infancy to age 7, the ulcers were of an acute nature but that those that occurred between the ages of 7 to 15 possessed characteristics more of the nature of that which occurs in adults. They insist that "peptic ulcer is not as rare in children as it is overlooked." In their series of the 132 older children 78 were male and 45 female. Eighty-five of the ulcers were in the duodenum or pylorus. I have observed 2 duodenal ulcers during the past year in children of 10 and 16. In the boy of 16 the onset of definite periodic distress was at the age of 12, and in the child of 10 the onset was at the age of 8. These 2 ulcers were of the chronic type and not the superficial that is so often spoken of as occurring in childhood.

The conclusions that may be drawn from this group are:

1. Children with continued digestive disturbances should have their upper gastrointestinal tract studied by means of the x-rays to reveal the possibility of the presence of peptic ulcer.

2. In view of the fact that the psychosomatic factors are considered of great etiologic significance in

2. St. John, F. B.; Swenson, P. C., and Harvey, H. D.: An Experiment in Early Diagnosis of Gastric Carcinoma, *Ann. Surg.* 119:225 (Feb.) 1944.

Read before the joint meeting of the Section on Surgery, General and Abdominal, and the Section on Gastro-Enterology and Proctology at the Ninety-Fourth Annual Session of the American Medical Association, Chicago, June 16, 1944.

1. Palmer, W. L.: The Healing of Carcinomatous Gastric Ulcer, to be published.

peptic ulcer in the adult, what are these factors in childhood? We know that children present many psychiatric problems, but I am not sure that they are of the same nature as those that occur in adults. These in the adult are considered of direct relationship to the intense, active type, or, as Sara Jordan<sup>3</sup> designated them, "the doers." It is evident that we shall have to correlate those of the child and the adult in a consideration of causative factors.

#### INDICATIONS FOR THE SURGICAL TREATMENT OF ULCER

1. Perforation.
2. Recurring hemorrhage or hemorrhage in the older ulcer type.
3. Pyloric obstruction.
4. Suspicion of the presence of a malignant ulcer.
5. Revamping of previous surgical procedures.
6. Frequent recurrence, intractability to medical care.
7. The type of work of the individual and necessity of his rapid resumption of essential work.

#### EARLY SURGICAL INTERVENTION IN THE INDIVIDUAL WHO CANNOT INDULGE IN PROLONGED MEDICAL CARE

In a recent communication on the management of peptic ulcer of both the stomach and the duodenum, largely duodenal, in Navy personnel, Walters and Butt<sup>4</sup> stated that they believe that possibly a larger majority of these patients who have active, chronic or recurring ulcers may be returned to active duty at sea or in a combat zone if partial gastrectomy is performed. They state that a surgical operation should be performed on the basis of the reasons I have previously mentioned but emphasize that the decision to do this might be reached without too much delay or long periods of medical treatment. Of a group treated medically, 25 per cent were returned for further repeated periods of hospitalization and medical care. They concluded that a higher percentage treated surgically were returnable to active duty and remained well and that surgical treatment deserves wider use but frankly stated that this needed further study to determine whether radical treatment by gastric resection is warranted and that a comparison of those treated by early surgical intervention and medical methods must be made to evaluate the inauguration of this early radical surgical procedure.

It is evident that we who are interested in the medical management of peptic ulcer and attendant difficulties must as far as possible come to some common ground of application of accepted principles if we are to succeed in removing the term "intractability" to medical treatment as an indication for surgical intervention. In 1943 Boles<sup>5</sup> well said "Before one advises operation, however, for a so-called intractable ulcer it should be thoroughly understood that it is the ulcer and not the patient that is intractable. Intractability of a patient is not going to be cured by any surgical operation." At that time Sara Jordan emphasized that she believed that the patient was frequently intractable, and I should like to suggest, in addition, that perhaps the physician is intractable to the intrusions on his time in explaining the situation to the patient.

This leads to the inquiry: What is adequate medical care? How can one determine intractability? Is it the ulcer or the patient that is intractable?

#### FREQUENT RECURRENCE; INTRACTABILITY TO MEDICAL CARE

Millions of American men and women have been examined and x-rayed by induction boards and by Army and Navy medical personnel. And thousands of peptic ulcers have been discovered, treated and classified as cured, and individuals returned to civilian life to continue under the observation of their family physician. This new responsibility is now ours, but these examinations also unfortunately revealed that there were numerous patients with peptic ulcer who had not sought medical care, and not been diagnosed, or treated adequately.

Modern medical trends have developed the pediatricians, who have adequately cared for us up to the time we enter the educational or working fields, and deep interest has been evinced by clinicians in the group from age 35 on. The age period of 18 to 35 has been considered man's best health period, but it is in this group that early tuberculosis, diabetes, syphilis and rheumatic heart disease have been discovered. Army examinations suggest that we have, in this age group, a number of patients with undiscovered and incompletely treated peptic ulcers.

This is in part due to the fact that the patient with epigastric distress and discomfort is rapidly relieved by taking proprietary, advertised antacid substances so that he never seeks the physician for study, or on the inauguration of treatment by the physician the therapeutic response is so spectacular that roentgenologic studies and follow-up observations are not carried out over a long enough time to make a diagnosis and substantiate a cure. It is evident that these are some of the factors that result in the production of the intractable ulcer.

Therefore, in order to inaugurate adequate treatment to prevent intractability of both patient and ulcer young persons must be educated to the fact that if they have upper gastrointestinal symptoms over a period of time they should seek medical care, and no patient presenting himself to the physician with a history of periodic epigastric distress lasting over a period of two weeks should be denied a careful history and roentgenologic studies.

Those interested in tuberculosis have formulated plans and procedures to meet this problem, and similar efforts are being made by physicians devoting their attention to the diabetic and to patients with rheumatic heart disease. And now we have had revealed to us the necessity of inaugurating and carrying out a similar program in order to control and cure peptic ulcer in its incipience.

From the vast wealth of material as to the etiology of peptic ulcer, most of us believe that the following facts can be stated:

1. For some undetermined reason an area of the stomach and duodenum loses its ability to resist the digestive action of the acid-peptic secretion.
2. Surgical experience extending over a period of years seems to reveal that the production of the achlorhydric stomach is necessary in order to avert postoperative peptic ulcer.

#### THE EXISTENT STATE OF THERAPY

Surgeons went through a period of various operations (pyloroplasty, gastroenterostomy, partial resection, resection, denuding of the lining, jejunal implants, severance of nerve connections, alterations in the position of new openings) and other procedures too numerous to mention. They have benefited by their experience

3. Jordan, Sara M., in discussion on Boles.<sup>5</sup> Management of Ulcers  
4. Walters, W. L., and Butt, H. R.: *Ann. Surg.* 118:489 (Oct.) 1943.  
Among Naval Personnel.  
5. Boles, R. S.: Prevention and Management of Peptic Ulcer, J. A. M. A. 121:640 (Feb. 27) 1943.

and have emerged with procedures for the production of achlorhydria as the basic principle of their treatment.

It is interesting to note that this idea was first laid down as a medical dictum, and it is my intention to discuss the possibility that we may not have emerged from our state of medical confusion. This is indicated by the following list of antacids, adsorbers and antispasmodics offered to us to control the acid-peptic secretion, motility, tone and color (engorgement) for the treatment of peptic ulcer:

*Alkalis.*—Alcaroid, Alucol, Alutabs, Anachloric Tablets, bis-muth salts, Bisodol, Cal-Bisma, calcium carbonate, calcium phosphate, Ca-Ma-Sil, cerium oxalate, Citro-Carbonate, compound chalk powder, Creamalin, creta preparata, kaolin, liquor calcis, magnesium carbonate, magnesium oxide, magna bismuth, milk of magnesia, mistura cretae, Neutralon, Nutrachloric Tablets, pulvis cretae aromata, sodium bicarbonate, Tri-Calsate, Trimax Tablets.

*Alumina and Trisilicate.*—Amphojel, Alumina-Gel, aluminum hydroxide, aluminum silicate, gastric mucin, Gelusil, Kaomagma, Magmasil, Malcogel, Metamucil, Trinesium, Trisogel.

*Miscellaneous.*—Atropine sulfate, belladonna, Bellafoline, Bellafoline and Phenobarbital, Bellerger, novatropine, papaverine, Pavatrine, Syntroge, Syntropan, Trasentine, histidine, Larostidin.

#### PHYSIOLOGIC FACTORS

1. As shown by others and spectacularly this year by Wolf and Wolff<sup>6</sup> in their patient with a gastric fistula and a portion of the stomach herniated on the abdominal wall, resentment, hostility, anxiety and aggressiveness produced hypersecretion, hypermotility, increased congestion, deeper color and even superficial ulceration. On the other hand sadness, discouragement and self reproach produced pallor of the mucosa under observation and hyposecretion.

2. Acid gastric secretion is controlled by the sight of food, the odor of food, the presence of food in the stomach and intestine, through endocrine factors and secretagogue substances in the prepyloric portion of the stomach and intestine.

#### TREATMENT

The young person with periodic distress and discomfort in the epigastric area with relief through food or alkali must have a fluoroscopy done. If he presents the psychosomatic make-up I have mentioned, and if he has hypermotility and hyperirritability of the prepyloric region of the stomach or duodenum, I think he should be considered as possessing the precursors of peptic ulcer, and rather than waiting for the formation of a definite crater should be treated accordingly and observed over a period of time.

*First Phase.*—Early peptic ulcer patients discovered in this manner will respond to a broad generous diet with an elimination of only the condiments and roughage, the most important factor being the timing of the taking of their meals. They should have their three regular meals a day and, in addition, feedings between meals and at bedtime and should be awakened once at night for a feeding, which should consist of sweet cream, egg-nogs or bread and butter. Alcoholic drinks should not be taken. The treatment of the diabetic was a failure on the strict, narrow diet list, and we must not fall into that error. As has recently been shown by Ivy,<sup>7</sup> excess caffeine intake is to be avoided; but a cup of coffee, one half cream, once a day may satisfy a

dietetic habit and give one a more cooperative patient. The same may hold for smoking. It has not been possible to show, in the gastric fistula man, that restricted smoking produces any of the evidences mentioned under the psychosomatic factors.

*The Second Phase.*—This part of the treatment is the most difficult—that is, the removal of the psychosomatic factors. This can be accomplished by the presentation to the patient of some of the booklets on ulcer such as prepared by Crohn and by Alvarez. They are excellent. I do not think they take the place of the period of time spent by the attending physician in meeting the problems of the individual. If we are to succeed in the treatment of the disease, this must be done. Every practicing physician and surgeon must grasp some of the fundamentals of the simple psychology necessary to handle these patients. There are not enough trained psychologists to handle the already existent serious cases, and classes have had to be formed to take care of that situation.

The ulcer patient should be treated with wise counsel and adjustment and a personal form of psychiatry such as the following:

George, you have an ulcer in your stomach outlet. This sore may be produced by powerful acids in your stomach. Anxiety, resentment, hostility, fatigue and aggressiveness make the stomach too active and secrete too much juice. When you get angry, flare up and get upset about things at home and the office you offset much of the medical care you are following. You must take your medicines regularly and follow your diet or it will not heal. These ulcers usually do not rupture or turn into cancer if you follow out these simple instructions.

Under the educational plan and the diet, a vast number of ulcer patients feel safe and protected and show immediate improvement. Substantially this is what hospitalization accomplishes. Then your strong weapon is to have them return in four weeks for fluoroscopy. The imparting of the information that it is healing is an added stimulus to cooperation.

After eight to ten weeks and thereafter for one year have this patient return for fluoroscopy and a bit of conversation, and you will be astonished at the excellent results. It is unnecessary to take a plate except for the first time for record. The patient is pleased with your interest, and you get the same cooperation that you do from the patient who is taught to test his urine for sugar, and takes pride in reporting the fact it is negative.

"The dietetic-educational" plan as outlined demands the time and attention of the physician. Patients who fail to respond to this form of treatment in ten days will need the introduction of therapeutic agents. Here also timing is vital.

*Sedatives.*—A simple sedative such as phenobarbital alone, and not in combination, and in the tablet form, at a dosage of  $\frac{1}{2}$  to 1 grain (0.03 to 0.06 Gm.), is administered half an hour before meals and at bedtime as a psychologic block. It should not be combined with any other agent, because one cannot in this way manipulate the dose according to its effect. One important point is the necessity at times of administering a sedative of this type previous to a period of anticipated stress or strain.

*Alkalis and Adsorbers.*—One, two and three hours after meals administer a 15 grain (1 Gm.) tablet or capsule of calcium carbonate, prescribing a hundred at a time. This will last the patient approximately ten days and conveys to him the necessity of carrying out

6. Wolf, Stewart, and Wolff, H. G.: Human Gastric Function, New York, Oxford University Press, 1943.

7. Ivy, A. C.: Subacute Gastric Ulcers, *Gastroenterology* 2:274 (April) 1944.

his therapy over that period of time. Calcium carbonate is official. It is an excellent neutralizer. It is without systemic effects.

We are also concerned with the fact that peptic activity enters into the etiology of ulcer. It has been shown by Komarov<sup>8</sup> that mucoproteins inhibit peptic activity. Aluminum hydroxide possesses the property of precipitating mucoproteins and aids in diminishing peptic digestion. Aluminum hydroxide tablets each containing 10 grains (0.6 Gm.) can be used similarly to calcium carbonate. Aluminum products act by neutralization and adsorption and bottling up of the hydrochloric acid.

Both of these agents may produce obstipation, and fecal impaction should be avoided by the use of plenty of fluids and the rectal instillation of liquid petrolatum or a glycerin suppository.

*Belladonna.*—We may be able to block out impulses over vagal routes by the use of belladonna. Extract of belladonna must be given in dosage to produce dryness of the mouth and blurring of the vision in order to diminish the hypermotility and tonicity of the stomach. It is useless to administer it and hope for results unless this is done. It is necessary to get therapeutic action the same as one digitalizes a patient.

It is advisable to use extract of belladonna  $\frac{1}{8}$  grain (8 mg.) because it is more controllable and give it twenty minutes before meals. Its use in the liquid form or in combination with other agents may be inaccurate. The physician prescribes in drops and gives too small a dose or, if he prescribes in minims, fails to supply a standardized minim dropper or glass. It should be noted that belladonna decreases the secretion of mucin, which evidently is one of the protective factors of the mucosa of the stomach against hydrochloric acid.

Driscoll and Aaron,<sup>9</sup> in an analysis of 160 cases of carefully followed peptic ulcer, found that the "dietetic-educational" plan with the proper timing of the administration of medicinal agents suggested was the most successful in their hands in the treatment and prevention of peptic ulcer.

#### CONCLUSIONS

An ulcerating lesion in the stomach must by accepted standards be proved to have healed and remained healed.

Mass x-ray examination of persons without gastric symptoms seems a logical step in the discovery of early lesions of the stomach and duodenum.

Peptic ulcer in children may be overlooked.

Hypermotility and irritability of the stomach in young people with a certain psychiatric makeup offers fertile ground for the formation of peptic ulcer.

Peptic ulcer has been undertreated rather than overtreated.

The timing of the taking of food and the administration of therapeutic agents is essential.

Diet, education and the physician's interest in the patient's problems may prevent intractability.

The premise of this treatment is that we are attempting to treat the preulcer or early ulcer case, and thus it is ambulatory in its type.

A small group of therapeutic agents used over a period of time gradually will aid in the elimination of the existent therapeutic confusion.

## INFLAMMATORY LESIONS OF THE STOMACH AND DUODENUM

FRANK H. LAHEY, M.D.

BOSTON

This paper deals with the acute and subacute processes associated with peptic ulcer. Duodenitis as an entity unrelated to duodenal ulcer is so rare that its surgical consideration is unnecessary. Gastritis, on the other hand, is a different problem. The type of gastritis so commonly associated with malignant lesions may not be an inflammatory process, and certainly the acute gastritis so often associated with alcohol and other chemical irritants need not be considered here. This paper, therefore, will be limited largely to the inflammatory lesions promoted by peptic ulcer, gastric, duodenal and jejunal.

A few years ago a discussion of "Inflammatory Lesions of the Stomach and Duodenum" would have been devoted largely to the value of medical treatment versus surgery. Today the ulcer problem has attained a satisfactory degree of standardization and agreement between the advocates of the two methods of treatment.

I should like to discuss the changes and modifications of our views on the basis of experience with 8,516 patients with ulcer under bed management. Of this number 571 were gastric ulcers. The medical profession has in the past erred in the management of gastric ulcer by being too radical, with the idea that all gastric ulcers should be submitted to subtotal gastrectomy and also at times by being too conservative, with the result that early gastric carcinoma has been overlooked.

There is a compromise between these two positions. On the other hand, the depressing results in the treatment of carcinoma of the stomach with its low operability rate, high mortality and limited number of nonrecurrences at the end of five years properly encourages a more aggressive point of view concerning the management of patients with suspected gastric cancer.

Our criteria against surgical intervention in the gastric ulcer patient are that the lesion under medical management must disappear by roentgenologic examination, the patient must be symptom free, occult blood must disappear from the stools, and gastroscopic examination must show that the mucosal defect made by the ulcer is completely covered over in healing. If these conditions are maintained for a year, subtotal gastrectomy can be omitted, since medical treatment has been successfully applied.

I have never seen a benign ulcerating lesion of the greater curvature. While these have been reported, anything other than radical surgery for the patient with an ulcer on the greater curvature is futile.

Prepyloric gastric ulcers are extremely dangerous but not necessarily malignant, and they may with safety be given the aforementioned trial of medical treatment.

I wish to call attention again to a condition previously described by Dr. Jordan and me; that is, a persisting prepyloric spasm which on roentgenologic examination resembles cancer and does not disappear on treatment. In such cases exploration is justified after explaining to the patient the probability of negative findings. Even though exploration is negative, that is better than letting an early malignant lesion become inoperable.

From the Department of Surgery, the Lahey Clinic.  
Read before the joint meeting of the Section on Surgery, General and Abdominal, and the Section on Gastro-Enterology and Proctology at the Ninety-Fourth Annual Session of the American Medical Association, Chicago, June 16, 1944.

If a gastric ulcer fulfils the requirements, closes and then reopens, this patient is an immediate candidate for high subtotal gastrectomy.

In doubtful gastric lesions and in those which have closed, the responsibility for reexamination every two months for a year should not be left to the patient but should be assumed by the physician. From experience I have learned that if the responsibility is left with the patient he may fail to return until too late, when an earlier check would have made surgical removal possible. The patient should be informed that if he does not return when notified and develops an inoperable lesion the responsibility is his. Only by this precaution of not leaving the responsibility with the patient can the occasional early malignant lesion be found early enough to make a cure possible.

Duodenal ulcer continues to be more common than gastric ulcer, and while it does not involve the problem of malignant degeneration it is much more complicated than gastric ulcer and has a greater potential variety of troublesome complications.

The management of duodenal ulcer remains essentially the same. For perforation the only treatment is

TABLE 1.—Results of Tube Drainage—Cases in Which Operation Was Not Done

Case	Duration of Obstruction	Residue % 6 Hours	Tube Drainage, Oz. per Day	Operation	Recurrence

14	5 mo.	90	20-5-1	No	
15	?	50	10-10-10-4	No	

When the drainage decreased, operation was unnecessary, but when it did not, operation ultimately had to be performed in most cases.

simple closure of the ulcer. The physician has one obligation in the presence of a perforated ulcer and that is the saving of the patient's life, delaying all other therapeutic measures, medical or surgical, until this is accomplished.

Intractable pain, after good medical management, involves either the acceptance of the pain or a surgical procedure.

There are two distinct types of pyloric obstruction. Cicatricial pyloric obstruction which is produced by the contracting scar of a healed ulcer causes no active ulcer symptoms. Since this type of obstruction is purely mechanical in character, gastroenterostomy justifiably can be applied.

The second type of pyloric obstruction, which is associated with a chronic or subacutely active duodenal ulcer, is caused chiefly by the scarring due to repeated ulcer activity. Some of the obstruction is due to associated edema and pylorospasm. When such a patient has been put to bed, with neutralization and rest, the pylorus often has been opened, only to close again after dismissal from the hospital and resumption of activity under the stress and strain under which the original pyloric obstruction developed.

For years we sought to establish a plan whereby we could foretell earlier which patient with pyloric obstruction would have a prospect of remaining free from recurring pyloric obstruction. In 1941 Dr. S. Allen Wilkinson of the Department of Gastro-Enterology of this clinic published such a plan, the results of which

TABLE 2.—Results of Tube Drainage—Cases in Which Operation Was Done

Case	Duration	Residue % 6 Hours	Tube Drainage, Oz. per Day	Operation	Result
1	3 mo.	100	32-25-46	Posterior gastro-enterostomy	Good
2	4 wk.	?	26-26-30-23-35	Posterior gastro-enterostomy	Good

11	2 mo.	90	24-28-31	Subtotal gastrectomy	Good
12	2 mo.	?	23-22-23-23	Subtotal gastrectomy	Carcinoma of pylorus, age 20
13	1 yr.	90	89-115-93-63	Subtotal gastrectomy	Good

When operation was performed, the drainage persistently remained high over a three day period.

are shown in tables 1, 2 and 3. It consists in the introduction of a Levine tube, which is retained in the stomach for three days. Three ounces of a noncurdling mixture, preferably malted milk, with or without a dram of aluminum hydroxide mixed with it, is administered hourly. The tube is clamped for the first half hour and unclamped for the second half hour. This process is continued for twenty-four hours during three days. The total drainage for the second half hour is computed daily and recorded. When within three days there is no demonstrable drop in the amount of residue within the stomach, patients usually should be operated on at once to avoid delay and expense. While this plan cannot be accepted as 100 per cent reliable, it is a real aid in segregating those patients with pyloric obstruction

TABLE 3.—Results of Drainage in 100 Cases

Obstruction Less Than 3 Months		Obstruction More Than 3 Months

Total ultimately operated on, 44.

The longer the obstruction had been present, the more often it recurred.

who need early surgery from those in whom there is a reasonable prospect of permanent reopening of the pylorus under medical management.

Of all the indications for surgery in peptic ulcer, exclusive of perforation, hemorrhage in spite of adequate medical management is the most common and most definite indication for subtotal gastrectomy. Hemorrhage in the patient who has had good medical treatment

indicates that the ulcer is continuing to extend and erode. In addition, the ulcer is in all probability on the posterior wall and consequently will be most difficult to close and keep closed under medical management.

There are two types of ulcer bleeding, the common type with one or two hemorrhages from which the

Fig. 1.—Note jejunal ulcer adherent to transverse colon. This patient was submitted to subtotal gastrectomy. The jejunal ulcer had eroded the muscular walls of the colon, leaving a covering only of mucosa.

patient recovers, and the recurring type, massive in character, in which something must be done if the patient is to be saved. One does well to recall that hemorrhage in patients over 50 years of age is more serious than

Fig. 2.—The Finsterer resection by exclusion. Note that the ulcer and pylorus are left in place. It is in this operation, which we now employ only as the first step of a two stage procedure with later removal of the ulcer and pylorus, that the highest incidence of gastrojejunal ulcer occurs after subtotal gastrectomy.

in younger patients. Also, if surgery is to be undertaken, it must be done within forty-eight hours; otherwise, regardless of repeated transfusions, the mortality is prohibitive.

Primary jejunal ulcers have been reported, but they are so unusual that they hardly merit discussion. For practical purposes jejunal ulcers are associated either with gastroduodenostomy, gastrojejunostomy or subtotal gastrectomy. The incidence of these lesions following gastroenterostomy is at least 15 per cent and probably higher. The incidence following subtotal gastrectomy is in the neighborhood of 2 to 3 per cent.

Formerly it was generally accepted that gastrojejunal ulcers were so intractable to medical treatment, so apt to perforate and bleed, become adherent to the transverse colon and produce a gastrojejunocolic fistula, that they should all be operated on at once. We have managed a sufficient number of these ulcers successfully under medical treatment that we feel justified in giving all patients with gastrojejunal ulcers, with one exception, a trial of medical management. If a gastrojejunal ulcer is adherent to the transverse colon, it should be operated on without delay. In this type of ulcer which is about to perforate into the transverse colon and produce the gastrojejunocolic fistula with its physiologic complications and its technical surgical complications, surgery is necessary (fig. 1). Even

Fig. 3.—a, the gastrojejunal ulcer after subtotal gastrectomy; b, healing of ulcer two weeks after removal of ulcer and pylorus. Patient has remained entirely free from symptoms for a year.

though some of these ulcers do not heal under medical management, the induration about them and in the root of the mesentery of the transverse colon frequently is so lessened under this treatment that technical management is made much easier.

On the basis of our experiences with gastric resection of the so-called Finsterer exclusion type, I wish to warn against this procedure. Any surgeon who has done many subtotal gastrectomies for duodenal ulcer frequently has encountered the low type of duodenal ulcer which involves the common duct in its exudate and scar or which, as a result of repeated inflammatory reactions, has so shortened the duodenum that the point of entrance of the common duct has been drawn up into the ulcer exudate and scar. Removal of such an ulcer often leaves the duodenal stump so short that safe inversion and closure is either impossible or extremely difficult and dangerous. In order to remove this type of duodenal ulcer, I sometimes have resected the common and pancreatic ducts and implanted them into the distal loop of the jejunum after subtotal gastrectomy. This is a risky undertaking. Earlier in our experience, when we had dealt with fewer of these

indurated ulcers adherent to the common duct, a subtotal gastrectomy sometimes was done, leaving a small portion of the stomach proximal to the pylorus which has been cut across and turned in in order to avoid the hazards of taking these ulcers off the common duct. This is the operation described by Finsterer as resection by exclusion (fig. 2). In this type of resection, of which we have done twenty, the highest incidence of gastrojejunal ulcer in the stump of the resected stomach has occurred.

For many years we have been warned that to leave the ulcer in the pylorus in such an operation results in promoting high gastric acidity in the remaining portion of the stomach and so increases the incidence of gastrojejunal ulcer. In our experience secondary removal of the remaining stump of duodenum and pylorus has been most gratifying in lowering gastric acidity and in healing the gastrojejunal ulcer in the remaining gastric stump.

The following brief statement of such a striking case illustrates what prompt and dramatic relief can be accomplished in these cases when the operation is directed at the remaining ulcer, duodenum and pylorus rather than at the gastrojejunal ulcer in the remaining gastric stump:

In a case of duodenal ulcer there were recurring hemorrhages on Dec. 2, 1931, May 3, 1936 and June 30, 1936. On July 2, 1936 a high subtotal gastrectomy was done, leaving the duodenal ulcer and pylorus on account of adherence to the common duct. Hemorrhages occurred on Jan. 14, 1939, Sept. 11, 1939, May 23,

free hydrochloric acid of 8. The ulcer healed while the patient was still in the hospital. Ability to take a full diet was restored. The patient was entirely free of pain and hemorrhage (fig. 3).

Since secondary subtotal gastrectomy on a patient with a gastrojejunal ulcer is technically difficult, I believe on the basis of our experience it is justifiable,

Fig 4—Prompt filling of stomach by barium given by enema.

1940, Jan. 27, 1941, July 10, 1941, Aug. 20, 1941 and Sept. 2, 1941. Secondary subtotal gastrectomy with gastrojejunal ulcer was followed by another gastrojejunal ulcer with repeated hemorrhages and ulcer pain so severe as to require morphine. On Sept. 21, 1943, removal of the duodenum and pylorus with the contained ulcer resulted in immediate relief of pain and a

Fig 5.—Demonstration of the fistulous tract from the stomach into the jejunum and colon.

when a Finsterer resection by exclusion has been performed, to remove the original ulcer and pylorus rather than do a secondary subtotal gastrectomy.

Of all the complications of peptic ulcer, the one which most seriously affects the health of the patient and is technically most difficult to manage is, in my opinion, the gastrojejunocolic fistula. This is a gastrojejunal ulcer which has become adherent to the neighboring transverse colon and has eroded into it. This condition results in deterioration in the patient's general condition, a loss of weight all out of proportion to the lesion itself and alteration of the physiology of the intestinal tract. When the gastrojejunal fistula ruptures into the transverse colon, a portion of the food taken into the stomach passes through the fistula into the transverse colon, creating varying degrees of avitaminosis as a result of a portion of the food failing to pass through the small intestine. In the reverse direction, feces constantly are escaping from the transverse colon into the stomach to be belched as skatole laden flatus, thus seriously interfering with the desire for food.

The diagnosis of this condition often can be made by the passage of undigested food in the feces, owing to the fact that it has passed from the stomach directly into the transverse colon, by diarrhea and by the unusual and extreme emaciation associated with this fistula. In addition, the lesion usually can be demonstrated quite clearly by means of a barium roentgenogram (figs. 4 and 5).

Over the years I have tried a variety of operative procedures by which I had hoped to improve the surgical management of this complicated lesion. To undo the transverse colon from the jejunum and the stomach in the presence of a large feces-contaminated fistula, with the possibility of spilling the fecal contents of the transverse colon into the peritoneal cavity, is a hazardous procedure.

Some years ago I applied the principle of cutting off the ileum just proximal to the ileocecal valve, turning in the distal end and anastomosing the proximal end by lateral or end to side anastomosis high to the descending colon (fig. 6). This advances the fecal stream behind the gastroenterostomy and its fistula into the colon and jejunum and results in considerable improvement in the patient's general condition. At the end of two to three months the patient is in excellent condition for the second stage of the operation, which consists in subtotal gastrectomy with the removal of the gastrojejunal fistula and affected portion of the colon and jejunum.

At the second operation, with the fecal stream well established in the descending colon by the ileocolic anastomosis, the ascending colon with its blind stump of attached ileum and the hepatic flexure are mobilized, the transverse colon is mobilized and the blood supply of these structures ligated up to and beyond the gastroenterostomy close to the portion of the transverse colon as it approaches the splenic flexure. The transverse colon at the point near the splenic flexure is cut between the two rows of brads inserted by the Petz sewing machine (figs. 6 and 7). The distal end of the transverse colon is inverted, the proximal end is reinforced so that it will not leak on handling, and the ascending colon and the transverse colon are lifted up, thus visualizing the two loops of jejunum running to the gastroenterostomy. These are cut across, thus mobiliz-

Fig. 6.—First stage of two stage operation for gastrojejunal fistula consists in implanting the ileum into the descending colon after cutting the ileum across and turning in both ends. The portions of colon, jejunum and stomach to be removed at the second stage are shaded. The distal end of the ileum is inverted and closed. Inset shows the course of the fistula from the stomach to the jejunum to the colon.

ing the stomach, the duodenum is cut across and inverted, end to end anastomosis of the two ends of jejunum and the jejunal fossa is performed and a subtotal gastrectomy of the Hofmeister type is then completed without difficulty (fig. 7).

This operation seems, from the description, to be of tremendous magnitude. As a matter of fact, with the removal of the ascending colon, the transverse colon and the loop of involved jejunum, everything is so well visualized with this amount of viscera out of the abdomen that the actual anastomosis of the two cut

Fig. 7.—Second stage of operation for gastrojejunal fistula completed. The colon, jejunum and stomach with gastrojejunal ulcer and fistula have been removed. The jejunum is united by end to end anastomosis and a Hofmeister subtotal gastrectomy performed.

ends of the jejunum and the subtotal gastrectomy is easier than when an uncomplicated subtotal gastrectomy is performed.

We have now applied this procedure to 13 cases with 1 fatality. It avoids an external fecal fistula, as occurs in a colostomy proximal to the anastomosis, advocated by Pfeiffer. It makes the second stage removal of the colon, fistula, ulcer and stomach much easier.

While it is unlikely that the case here mentioned will be frequently repeated, it is a possibility that spontaneous closure of the fistula into the colon may occasionally occur following the first stage operation as in this case. We have had 1 patient who has gone over a year and a half in whom following the implantation of the ileum into the descending colon the jejunal ulcer healed, the fistula into the colon closed and the man has been entirely free from symptoms.

Our experience in the surgical treatment of peptic ulcer represents the very worst types of peptic ulcer, since every patient on whom we operate is referred by the Department of Gastro-Enterology as hopeless from the standpoint of further medical management. As a result of this we see almost no simple uncomplicated ulcers. These ulcers are of long standing and usually have been through repeated acute exacerbations. The patients have often had repeated hemorrhages, and so they represent almost entirely posterior wall duodenal ulcers, scarred, deformed and calloused in character, often adherent to the bile duct, surrounded by induration and by dense adhesions in a duodenum covered with scar tissue. The gastric ulcers represent those with chronic craters and calloused edges, those that are eroded into the head of the pancreas, and often those high on the lesser curvature. Consequently the mortality figures are those which can be obtained with a truly complicated and intractable type of gastric and duodenal ulcer.

Once surgery is decided on in gastric ulcer, subtotal gastrectomy usually can be done, since involvement of the common duct does not occur. In duodenal ulcer, however, one must frequently modify the 100 per cent application for subtotal gastrectomy as a surgical method of treating these lesions.

In the patient whose ulcer has failed to heal under medical management, we start with the conviction that a high subtotal gastrectomy together with the removal of the ulcer produces in the highest percentage of cases the lowest postoperative figures in acid values. It will usually produce acid values of 10 or below, and when these figures are obtained the end results are good. We are therefore convinced that, when it can be safely applied, a high subtotal gastrectomy, that is, removal of three fourths to four fifths of the stomach together with the duodenal ulcer, is the best surgical method of treating duodenal ulcer. If, on the other hand, we were to employ subtotal gastrectomy in 100 per cent of the cases of duodenal ulcer in which we operate, regardless of the position of the ulcer and the involved structures, the mortality rate would probably be unduly high. In some cases one can to better advantage do a less satisfactory operation, with a better prospect of a live patient. With this position in mind, we have not entirely abandoned gastroenterostomy. We have applied it particularly in the very bad risk case with such complications as kidney damage, cardiac lesions, obesity or any other state which makes the patient an unduly bad risk.

In the indurated duodenal ulcer which is of cartilaginous hardness and so adherent to the common duct or so involves the ampulla of Vater that its resection would result in resection of the common and pancreatic ducts with the necessity of their reimplantation, we believe that a first stage anterior gastroenterostomy or even a gastroenterostomy as a permanent measure is justifiable.

I recently described a method of doing a high antecolic gastroenterostomy after removal of most of the omentum and the transverse colon (fig. 8). In the very adherent indurated duodenal ulcers which have caught the common duct in their scar or exudate, it is possible to employ such an anterior gastroenterostomy high on the greater curvature as a first stage and then do a resection on the adherent duodenal ulcer at the end of four to five months when its induration has quieted down and when it can be approached with greater ease and separated from the common duct with greater safety.

There are a few generalities concerning the problems of peptic ulcer which I believe should be stated. Most patients who have had peptic ulcer have had warning symptoms of its possible onset over a number of months before the ulcer has really occurred. Life insurance companies could well undertake an educational program on the recognition of the early pre-ulcer stages of this lesion when the only symptoms are those of hyperacidity and pylorospasm and urge people so to modify their habits of eating, drinking and smoking that the development of the ulcer could be avoided.

There has always been an attitude on the part of surgeons that, once the patient has had a high subtotal gastrectomy for ulcer, he is free of the ulcer and at liberty to eat and live as he chooses. This is distinctly unsound and unjust to the patient. Any patient who has had an ulcer can develop another and regardless of the extent of surgery is more

likely to have one than the patient who has not had one. Any patient who is having his gastric contents dumped directly into his jejunum, particularly if he still has high gastric acidity, can easily develop a gastrojejunal ulcer. I am therefore strongly of the conviction that any patient who has had either radical or conservative surgery for peptic ulcer should be told that, the more accurately he adjusts his eating, drinking and smoking habits for the lowering of the gastric acidity, so much will his chance be lessened of having another ulcer develop.

The mortality of subtotal gastrectomy for ulcer certainly should not be over 3 per cent, even including the gastrojejunal ulcers and the duodenal ulcers adherent to the common duct. In a series of 318 consecutive subtotal gastrectomies for ulcer, 62 of the lesions were in the jejunum. Fifty-six of the jejunal ulcers developed after gastroenterostomy and 6 after previous subtotal resection. Three deaths followed resection for jejunal ulcer, a mortality rate of 4.8 per

Fig. 8.—Anterior gastroenterostomy after removal of omentum as first stage in two stage removal of active duodenal ulcer adherent to common duct.

cent. The mortality percentage for resection for duodenal and gastric ulcer alone is 2.8 and for all types 3 per cent.

This low mortality, however, can be attained only by those who have had experience with it, and with good anesthesia, preferably continuous high spinal, promoting as it does lasting relaxation at all stages of the operation. Low mortality figures can be attained only when facilities are available for the management of postoperative complications, particularly postoperative atelectasis, which occurs so frequently following operations high in the abdomen, thus interfering with good clearing of the bronchi.

I do not intend to imply that all gastric surgery be sent to a few institutions where the surgeons have had a large experience in this field but rather that subtotal gastrectomy is a technically difficult operation. The lesions are complex in character, and to deal with them requires considerable experience. The surgical management of gastric, duodenal and jejunal ulcer often will tax the skill of the most experienced gastric sur-

geon, and such a procedure should not be undertaken casually and routinely as may many other surgical procedures. My allusion to the necessity that gastric surgery be done by those who are experienced with it is made with the hope of stimulating the reference of enough gastric surgery to a few surgeons in each community in order that they may develop wider experience with these complicated lesions and thus make them more able to keep the mortality rate within reasonable figures.

## ABSTRACT OF DISCUSSION

ON PAPERS OF DRS. AARON AND LAHEY

DR. A. F. R. ANDRESEN, Brooklyn: It is known from the history of previous ulcer attacks, and it has been shown by x-ray, that ulcers will heal spontaneously. However, a diet with frequent feedings of bland foods, and avoidance of irritants such as coffee, alcohol and tobacco, will relieve the hunger pains and will facilitate healing. In uncomplicated ulcer this healing has been demonstrated to take place promptly, whether the ulcer is large or small, and without the use of any medication. I still believe that to prevent recurrent ulcers it is necessary to eradicate all focal infections. So-called intractable ulcers are the important problem. Failure to get relief from symptoms by diet alone usually means that the diagnosis has been wrong, that there is some complication or that the ulcer is malignant. This is the type of ulcer usually seen by the specialist, and the patients, after repeated "failures of medical treatment," often migrate to the large surgical clinics. Failure of treatment may be due to the fact that the patient has been treated for ulcer when none is present, or because ulcer has been complicated by some other lesion, such as gallstones or pancreatitis or by food allergy. But most frequently failure to get relief by diet alone or even by temporary "doping" with antacids or sedatives or other medications results from an ulcer having perforated or almost perforated through the serous coat, having been walled off by adhesions to a neighboring organ, like the pancreas, gallbladder or liver or to the omentum, making it impossible for it to heal and causing deformities or obstruction. Such cases, with careful study, should be recognized from the start and prepared for operation. Differentiation between gastric ulcer and carcinoma is often difficult even at operation and occasionally even by the pathologist. It is important to realize that even pronounced improvement in symptoms may occur in a malignant case and this should not be used as a criterion of malignancy. As a carcinoma does not heal, if an x-ray repeated in two to four weeks shows decrease in the size of an ulcer crater and of the surrounding induration it is the surest evidence that the ulcer is benign. At times the crater of a malignant ulcer may be partially filled up by carcinoma tissue, but the surrounding area will show that operation is indicated at once. Routine fluoroscopy to rule out gastric cancer should be condemned, as even large carcinomas can easily be overlooked when no films have been made.

DR. MARIE ORTMAYER, Chicago: I should like to present a case with slides which demonstrates a very uncommon inflammatory gastric lesion in the hope that others may have seen similar lesions and will throw some light on the etiology. A man about 50 years old complained of mild to severe epigastric pain coming on immediately after meals and lasting from fifteen to sixty minutes. He occasionally vomited small amounts of material with relief to the distress. This had been present only two weeks before I saw him, but a weight loss of 25 pounds (10 Kg.) had extended over the previous three months. The physical examination was negative except for the weight loss, negative Kahn reaction, blood count normal and traces of blood in the stool. The Ewald test showed no free hydrochloride acid; an eighteen hour retention of eggnog was present, and Oppler-Boas bacilli and lactic acid were found in repeated gastric aspirations. The gastric x-ray examination showed some non-persistent antral spasm with what the roentgenologist thought

to be a shortening of the lesser curvature but without definite decision as to the etiology underlying the changes. Gastroscopy revealed an atrophic gastritis in the higher parts of the stomach and, surprisingly, a very large, shallow erosion on the antral lesser curvature and walls extending well above the angulus. The clinical diagnosis was gastric carcinoma, and resection was done. The resected specimen showed in the middle, straddling the lesser curvature, a 4 by 5 centimeter very shallow ulcer, with irregular edges, and surface covered by thin flakes of fibrin. The ulceration was barely perceptible and toward the cardiac end seemed to merge into the surrounding mucosa. The stomach wall at the pylorus measured 1 cm. in width, becoming thinner in the region of the ulceration. Section through the ulcer showed a fibrinopurulent membrane adhering to the ulcer base. There was an extensive infiltrative process extending through to the muscularis mucosae, which consisted of plasma cells, eosinophils and capillaries with some remnants of gastric glands. There was a large formation of capillaries near the submucosa, and all through the mucosa were occasional remnants of glands left in that section. There was a dense infiltration of perivascular, perilymphatic and perineural cells. There was no endarteritis. In the deeper layers eosinophils were prominent but plasma cells predominated. Formation of new capillaries was striking. Special stains showed no spirochetes and no bacteria of acid fast or other recognizable infection. The diagnosis was subacute to chronic erosive gastritis of undetermined etiology.

DR. HENRY A. RAFSKY, New York: The microscopic examination of the pathologic specimen is the only reliable criterion in distinguishing benign and malignant lesions of the stomach. If there is any doubt as to whether we are dealing with a benign or a malignant lesion, surgery is the only method of treatment. The x-ray evidence of healing may be misleading. I used a gastroscope on a man aged 27 with a suspected cancer. The x-rays showed a disappearance of the niche after medical treatment. Four months later a cancer was found at operation. I do not think that an ambulatory form of treatment is adequate ulcer therapy. What to do when the ulcer patient is back on our hands, if surgery fails, is a difficult problem. Should the gastrojejunal ulcer or the repeated hemorrhages be treated with further surgery or should the patient be treated medically? I have devised a method of treating these patients by inserting a tube through the stoma and splinting the stoma and giving the diseased area complete rest. A patient developed a large marginal ulcer nine months after a gastroenterostomy. An Einhorn tube was introduced through the stoma. In three weeks the niche had entirely disappeared. Another patient developed a large jejunal ulcer over twenty years after a gastroenterostomy. The tube was passed through the stoma, and the ulcer has entirely healed. The third patient had undergone a subtotal gastrectomy. He suffered from repeated hemorrhages. During the last severe bleeding episode his hemoglobin fell to 15 per cent and his red blood cells to 900,000. The x-rays did not reveal the lesion, but gastroscopy did. The patient was subsequently treated in a similar manner as the others. In the diagnosis of these cases gastroscopy should supplement the x-ray examination, because at times the latter may detect the lesion and in other cases endoscopy may be the only method of making the diagnosis.

DR. SARA M. JORDAN, Boston: I disagree with Dr. Andresen in the matter of treatment. We can't get an ulcer free of symptoms, even, much less heal it, without using both antispasmodic and neutralizing forms of treatment. We therefore would agree most heartily with Dr. Aaron that that is an essential part of treatment. Seeing as we do so many of the most distressing complications of ulcer, I believe that it is most important that we detect the ulcer early and treat it intensively at that early stage, so that the complications such as those Dr. Lahey described around the common duct will not occur. I should like to add another point which has been helpful in the diagnosis of the ulcer of the second part of the duodenum, the ulcer that has a tendency to involve later the common duct: it is often difficult to diagnose that ulcer. I am quite certain that we miss a great many of them and that we have x-rayed a patient and said he has no ulcer when actually the ulcer has

been located in that part of the duodenum and very difficult to visualize. Dr. Wilkinson made an interesting observation on that point. He feels that if the duodenum is narrowed in the second portion and dilated beyond that point we should strongly suspect that there is an ulcer there, even though there is no crater. I should like to stress the fact that both medical management patients and the patients whom we see after surgery should not only be thoroughly treated in all other respects but also thoroughly educated. Consider the different factors in the precipitation of ulcer. Here are a group of controllable factors: food, alcohol, routine rest, routine exercise and smoking. On the other side are the more or less uncontrollable factors, the psychogenic factors. If the uncontrollable factors overbalance the picture by the addition of one of the controllable factors, we have a recurrence; if, on the contrary, the patient uses care in the controllable factors and, of course, that care can be 100 per cent perfect, because it is controllable, the psychogenic factors are likely to be overbalanced by the protective ones.

DR. FRANK H. LAHEY, Boston: Ideally, all patients with ulcers should go into the hands of the gastroenterologists first, in the complicated and intractable cases surgeons would be called in consultation promptly, and when these patients had recovered from their operation they would go back to the gastroenterologists' hands for postoperative care and follow-up. Surgeons are so busy and occupied that they frequently have neither the time nor the inclination to give these patients the preoperative and postoperative management they often need. Unless the surgeon who is constantly operating on patients with peptic ulcers is getting the bad ulcers to do, the kind which are indurated and eroding on the posterior wall, these patients are not infrequently receiving surgical treatment before they need it. The ulcers that should come to surgery particularly are the eroding, indurated and scarred ulcers. Most of the simpler ulcers can be handled satisfactorily under medical management. As Dr. Aaron has mentioned, there is a great opportunity for the gastroenterologist and for the life insurance companies to do educational work in the earlier recognition and treatment of these patients in the preulcer stage. In a majority of patients with ulcer there has been plenty of warning of the impending ulcer in the form of hyperacidity, pylorospasm and hunger pain. Unfortunately, people like to eat, drink, smoke and indulge themselves generally so much when it comes to their gastric apparatus that they are as a rule unwilling to modify these habits until they are faced with a real catastrophe in the form of hemorrhage, pyloric obstruction, perforation or threatened malignant degeneration in a gastric ulcer.

**Brief History of Psychiatry.**—Farrar, together with others, divides the history of psychiatry into four periods: the first, or primitive, dates from ancient times and ends with Pythagoras; the second, or Golden Age, begins with the greatest of the Asclepiadae, Hippocrates, and ends with Galen; the third, or period of darkness, which he attributes entirely to the influence of the Church, he extends into the eighteenth century, long after the Renaissance freed the mind of man in art and science; the fourth, or modern period, is only of yesterday. In my opinion the history of the mind, to which psychiatry properly belongs, does not permit of such epochal, horizontal stratification. One may adhere to convenient division into periods only if one is constantly aware of the slight influence a few centuries have on the actual progress of the human mind. Man is still primitive in many of his ways, and a touch of madness still makes the whole world kin. The human animal persists in thinking in terms of religion, magic and prayer in matters of health and social organization. Psychotherapy still bears the imprint of primitive thought, and the modern cultist is the twin brother of the old medicine man. Despite the great progress which psychiatry has made, it is considerably more of an art than a science, while the armchair psychologist is only now being banished. The growth of this, perhaps the most important, branch of medicine has been painfully slow, retarded alike by scholasticism and metaphysics, but mainly by the primitiveness of man's emotions and the rigidity of human thought.—Wechsler, I. S.: *The Neurologist's Point of View*, New York, L. B. Fischer, 1945.

## THE POSSIBLE ROLE OF WHOLE BLOOD TRANSFUSIONS IN MILITARY MEDICINE

ELMER L. DeGOWIN, M.D.

IOWA CITY

There has been a steady increase in the use of transfusions of whole blood in civilian medicine since the introduction of sodium citrate as an anticoagulant in 1914. The procedure has become commonplace in most well equipped hospitals in the United States. The development of blood banks has still further stimulated this practice by rendering blood readily available in emergencies and by making the operation more convenient than has hitherto been possible. From this extensive clinical experience certain observations have been abundantly confirmed. Patients with chronic anemia from almost any cause improve subjectively and objectively after transfusion. They withstand major surgical procedures better when the anemia has been previously corrected by the administration of blood. Some types of infections are better combated with the aid of blood from healthy persons. But the most spectacular result is seen in shock from severe hemorrhage. Here the transfusion of blood is frequently life saving. The restoration of the lost circulating volume with whole blood is logical in theory and has proved efficacious in practice. These facts have become well known and have been accepted as the basis for sound therapy.

In 1938 and the years following, attention was directed to the therapeutic possibilities of transfusions of plasma and serum by the pioneer work of Mahoney, of Elliott, of Strumia, of Levinson and of many others. Large quantities of human plasma became available for clinical use, first as a by-product of outdated stored blood, later to be prepared for the specific purpose. It was shown that transfusions of plasma were effective in the treatment of hypoproteinemia, whether from metabolic disturbances or from chronic infections. Plasma could logically be employed in immunotherapy. The greatest interest centered, however, in the demonstration that transfusions of plasma were effective in the treatment of secondary shock.

Much confusion arose from the conflicting theories concerning the causation of secondary shock and the methods proposed for treating it. It was agreed that the restoration of the circulating blood volume was the *sine qua non*. Previously it had been demonstrated that this could be accomplished by the administration of whole blood. But many now assumed that the beneficial effect of whole blood transfusions in shock resulted entirely from the plasma components and that the erythrocytes were unnecessary. This conclusion seemed to be confirmed by experiments on animals and by observations made on patients. It was pointed out that the administration of plasma possessed advantages over whole blood in the greater stability of plasma or serum during storage and in the fact that tests for compatibility were unnecessary before transfusion. Some seemed to regard the erythrocytes as merely an unstable and dangerous element. Carrying this attitude to a *reductio ad absurdum*, one might conclude that nature

From the Department of Internal Medicine, State University of Iowa College of Medicine.

Read in a panel discussion on "Plasma and Blood Substitutes" in the General Scientific Meetings at the Ninety-Fourth Annual Session of the American Medical Association, Chicago, June 13, 1944.

had made an extravagant error in elaborating mechanisms which so carefully control the number of cells in the circulation.

Almost coincidental with the introduction of plasma and serum transfusions came the military necessity for the treatment of secondary shock on a huge scale. Our allies the British and the Russians have had nearly five years of war and we have had two and one-half in which to acquire clinical experience in bombed cities and on the battlefield. Many experimental studies have been performed. The opportunity has been presented for comparing methods of therapy. With such a wealth of clinical material it was soon evident that methods which were efficacious in civilian medicine were not necessarily applicable in warfare. Realization soon came that most of the patients seen in civil practice are in mild or moderate degrees of shock because treatment can usually be instituted promptly. In military medicine, on the other hand, the degree of shock is frequently much greater because of the longer time elapsing before treatment can be given. Failure to recognize this difference probably accounts for the early conclusions that all patients with hemorrhagic shock could be treated exclusively with transfusions of plasma or serum.

It is becoming clear that there are several clinically distinct types of secondary shock, in each of which the circulating blood volume is diminished. In shock from burns or crushing injuries concentration of the blood may occur. There is no hemoconcentration in shock associated with hemorrhage. When no loss of red cells has occurred, the circulating volume should be restored by transfusions of plasma or serum. In shock associated with hemorrhage restitution of the blood volume with plasma or serum is an effective and frequently life saving measure. If the blood loss has been great, however, there is a strong tendency for relapse to occur when plasma or serum has been employed exclusively, whereas relapses are not so frequent when whole blood has been administered. In the treatment of casualties from air raids early in the war the British concluded that 1 pint of blood should be given for every 2 pints of plasma or serum when hemorrhage is severe. This observation was subsequently confirmed in the American forces.

Some perspective on the indications for whole blood transfusions may be gained from the experience of civilian medicine. The University Hospitals of the State University of Iowa constitute a general hospital of approximately 800 beds where patients with most of the common diseases are treated. The operation of a blood bank has made available both whole blood and plasma in quantity. Either is readily obtained in sufficient volume with a minimum of delay. Compatibility tests for whole blood are quickly and accurately performed, so that delay or fear of reactions does not prejudice the choice between whole blood and plasma. In the year from March 1943 to March 1944, 3,618 transfusions were administered, of which 3,358 were of whole blood and 260 were of plasma. In this situation, in which only the indications for whole blood and plasma were considered and availability was not a factor in the choice, 92.8 per cent of the transfusions were given with whole blood and only 7.1 per cent were made with plasma. A majority of the transfusions were given to surgical patients. Transfusions of whole blood were employed chiefly for the correction of chronic anemia, for the preoperative preparation of anemic

patients or in the treatment of hemorrhagic shock. Plasma was used for the treatment of shock from burns and for the correction of hypoproteinemia.

From this experience it is possible to predict the indications for whole blood and plasma transfusions in an active military installation where both are available in sufficient quantities. A far larger proportion of patients will be undergoing major surgical procedures, and the incidence of secondary shock will be much greater than in civil practice. We are told that in military medicine over 90 per cent of the cases of secondary shock are caused by hemorrhage. This is preferably treated by transfusions of whole blood, but plasma may be given successfully in all but the more severe cases. In the correction of preoperative anemia whole blood is indispensable. Transfusions of plasma or serum are indicated in burns, although patients with severe burns frequently develop anemia requiring whole blood transfusions after the stage of shock has been passed. If poison gas should be used in this war, a still greater demand for whole blood transfusions may arise.

But so far we have dealt with ideal situations and frequently in warfare there are many practical limitations to be faced. Consideration must be given to complicated problems of equipment and supply. The ease of administration and the stability of blood plasma and human serum albumin are now well known. These products may be prepared in the home country in vast quantities on a production schedule. They will remain stable for years at the temperature of the natural environment. They may be administered with simple equipment in a foxhole, an ambulance, a ship or an airplane without preliminary tests for compatibility. These features make them preferable for the treatment of secondary shock in many military situations. It is frequently not a question of whether to employ whole blood or plasma transfusions but of plasma or nothing.

The transfusion of fresh whole blood is not practical in many military situations. The time required for collection of blood often coincides with that when the medical personnel is most occupied in the surgical procedures demanded in emergencies. Lack of laboratory personnel and equipment may make difficult or preclude entirely the use of fresh blood. Lastly, the procurement of blood donors not only may be time consuming but may actually be limited by the circumstances. The medical personnel soon becomes "bled out," the walking wounded may not be amenable, convalescents may not be available, the ship's company may be otherwise occupied.

Employment of three procedures has made possible the application of whole blood transfusions in military medicine: (1) the accumulation of large stores of preserved blood, (2) the transportation of preserved blood and (3) the administration of group O blood to recipients belonging to any of the four blood groups.

Any one who has worked in a civilian hospital where a blood bank is established has realized the advantages of having a large supply of whole blood instantly available for the patient who develops shock from extensive hemorrhage. One, 2, or even 5 liters of blood of the proper group, previously tested by the Wassermann reaction, may be poured into the patient's veins. There is no wait while one or ten donors of the proper blood group are sought, no delay while the blood is collected. Under such conditions the potentialities for time saving and life saving are impressive in even a single case.

These advantages may be multiplied many times when a store of preserved blood is available in an advanced medical establishment where surgical operations are being performed on severely wounded men by limited personnel.

Transportation of preserved blood is limited only by the distance which can be attained by air transport in the maximum time of preservation of the blood. It is possible to preserve blood suitable for transfusion up to thirty days by some methods. In actual military practice, blood was shipped from England for use in the battle of Dunkirk. Blood was transported by airplane from Cairo and used in the battle of El Alamein. From Cairo blood followed the British Eighth Army across the desert as far as Tunis. Transfusions were given in New Guinea with blood shipped from Australia. Donors in Moscow and other cities of the Soviet Republics have given blood which was administered to Russian soldiers at the front.<sup>1</sup>

Since the principle of the "universal donor" was first proposed by Ottenberg in 1911, considerable controversy has been aroused about the safety of such a procedure. It is probably true that rarely a blood belonging to group O is encountered with agglutinins of such potency as to cause reactions in a recipient of heterologous group. This point is still debated. It is a fact, however, that thousands of transfusions of group O blood have been given to recipients of other groups in civil practice and in the various armies engaged in this war without an alarming incidence of untoward reactions. The advantages of such a procedure in military medicine are immense. The group of the blood can be carefully determined at the point of collection, where well trained technicians can perform the tests. At the point of administration the universal blood may then be employed as indiscriminately as plasma, without the delay, equipment or personnel required for laboratory tests. If the time saving feature of this procedure is ignored, it is still safer than to entrust the performance of compatibility tests to technicians of doubtful skill working under the pressure of urgency which frequently surrounds the transfusions of blood in emergencies.

In addition to the problems encountered in supplying plasma to medical installations, the military organization faces certain additional problems in handling preserved blood. Collecting depots must be established far enough in the rear to insure an adequate supply of donors. Facilities for accurate blood grouping must be located at the points of collection. Refrigeration must be provided at collecting depots, during transportation and at dispersal points. Accurately timed and frequent transportation facilities between collecting depots and dispersal points must be maintained with the necessary communications for activating them. These are not insurmountable problems for a military organization. They have been solved in the British and Russian armies and they are now being solved in the American army.

It is therefore possible to employ preserved blood of group O in the same manner as plasma, administering it in foxholes, on ambulances, aboard ship and in airplanes.

1. Since this article was written, the Army of the United States has established a blood transfusion service whereby preserved blood of group O is collected in the eastern part of the United States and shipped daily by airplane to the European theater of operations. The U. S. Navy now operates a transfusion service under which preserved universal blood is collected on the West Coast of the United States and shipped by airplane to the Pacific Ocean area.

## THE MEDICAL OFFICER RETURNS TO CIVILIAN PRACTICE

LIEUTENANT COLONEL HAROLD C. LUETH

Surgeon General's Liaison Officer

MEDICAL CORPS, ARMY OF THE UNITED STATES

Concern has been expressed about the number of men who will seek licenses to practice medicine after the war. Since this is a matter of real importance to the medical profession, the Committee on Postwar Medical Service wished to obtain reliable information about the number of men who would like to resume their former practice of medicine, the number of men who would like to begin a practice of medicine after the war in a community other than the one they left, and the number of men who for the first time would like to establish a practice of medicine in a community.

TABLE 1.—Number of Medical Officers in Each Graduation Group and Percentage of Total

Group No.	Dates of Graduation	Number of Medical Officers' Questionnaires Studied	Percentage of Total Questionnaires Studied
1.....	1941-1943	4,393	20.9
2.....	1938-1940	4,205	20.0

A study of 21,029 questionnaires returned from medical officers on duty with the Army, Navy, Public Health Service and Veterans Administration provided information concerning problems that probably will face the various state licensing boards in the future.<sup>1</sup> The Committee on Postwar Medical Service in cooperation with the Surgeons General of the Army, Navy and Public Health Service authorized the distribution of questionnaires to each medical officer on duty with the armed services. The Surgeons General assisted greatly in the addressing and distribution of the questionnaires, for which service the committee is most grateful. Relatively few requests were made to the committee for additional questionnaires, and personal inquiries by various members of the committee to medical officers on duty indicated that there was a nearly complete distribution of questionnaires. Their ability to provide so extensive a coverage of members of their corps during

Read before the Federation of State Medical Boards of the United States, Chicago, Feb. 13, 1945.

1. Lueth, H. C.: Postgraduate Wishes of Medical Officers: Final Report on 21,029 Questionnaires, J. A. M. A. 127:759 (March 31) 1945.

active warfare and amid the frequent changes of station reflects credit on the Surgeons General. The 21,029 questionnaires studied represent about 35 per cent of all medical officers on duty.

The questionnaires were divided into six groups on the basis of date of graduation from medical school. There were about the same number of men in the first five groups (table 1). Group 6, or graduates before 1920, formed a very small number. A comparison of the number of returned questionnaires with the actual number of medical officers on duty with the different branches of the armed forces indicated that the present study was a representative sample of the group.

A study of medical officers as to licensure by graduation groups and by length of service in the armed forces was made (table 2). Ninety-two per cent of all officers, or 19,391, had licenses to practice medicine, and 1,590 medical officers did not possess a license to practice (chart 1). Only 48 men failed to answer this part of the questionnaires.

The group of 1,590 medical officers who did not have licenses was studied separately. About 70 per cent, or 1,106, were graduates of group 1. They had

to practice. Also there were a small number of officers of the Regular Medical Corps in these groups, who very likely will not seek licenses in the future.

Men who graduated before 1937 and who did not possess a license were relatively few. There were 44 group 3 graduates, 37 group 4 graduates, 37 group 5 graduates and 35 group 6 graduates, or a total of 153. It is significant that more than half of this total number of officers, or 84 medical officers, had served for more than four years. Very few reserve medical officers had more than four years' service at the time the questionnaires were filled in. Nearly all the group (84) with more than four years' service were from the regular medical corps of the services. A majority of regular Army, Navy, Public Health Service and Veterans Administration officers presumably intend to remain with the services after the war, so that there need be little concern about their future licensure.

Medical officers from groups 3, 4, 5 and 6 who did not have licenses but who served less than four years formed a distinct group (69). It was quite likely that a majority of them were formerly engaged in some type of work that did not require a license to practice medicine, such as teaching, research, hospital administration and public health. They should not offer any serious problem as to licensure in the future.

It was concluded that graduates of groups 1 and 2 were of future interest to the state licensing boards. There were 1,437 medical officers in both groups, or 6.8 per cent of the entire group studied, and some of the group would remain in government service, some select types of practice that would not require a license (teaching, research, hospital administration and so on) and some were already in the regular Medical Corps of the federal services, so that they would not seek a license in the future.

Chart 1.—Number of medical officers with and without licenses to practice.

served the following length of time with the services: 736 for one year, 317 for two years, 52 for three years and 1 for four years. It is probable that this group is of major concern to the licensing boards, since they are likely to be the men who will return from military service and seek a license in order that they may establish themselves in the civilian practice of medicine.

There were 331 group 2 graduates who did not have a license, or 21 per cent of all the unlicensed medical officers studied. Most of the group 2 unlicensed medical officers had served for some time; there were about 85 per cent who had served for two or more years. Specifically, there were 28 who had served one year, 123 who had served two years, 124 who had served three years, 32 who had served four years and 24 who had served for more than four years. Nearly all the men in this group left internships and residencies and went directly to the armed services. It is believed that many of the men in this group will seek a license to practice medicine soon after release from military service so as to enable them to engage in civilian medical practice. It should be mentioned that a certain number of men without licenses will probably remain in government service; consequently they will not need licenses

#### SIZE OF COMMUNITY OF FORMER MEDICAL PRACTICE

The size of community of former medical practice of medical officers was studied. A little more than half the men (12,508) indicated the size of community in which they were engaged in practice before they entered military service. The remainder did not answer the question or were not in practice. Most of the men came from large cities. There were 4,943, or 39 per cent, of those who mentioned the size of community of previous practice who came from cities of more than 250,000 population. About 32 per cent, or 4,026 medical officers, came from cities of 25,000 to 250,000, and about 23 per cent, or 2,836 medical officers, came from communities of 2,500 to 25,000 population. Less than 6 per cent, or 703 medical officers, came from communities of less than 2,500 population.

Medical officers who were formerly in civilian practice came from different sized communities in about the same ratios from each graduation group, except group 1. The small number of replies from group 1 precluded further analysis of the group. Cities of 25,000 to 250,000 uniformly attracted 32 per cent of doctors from all graduation groups. Smaller communities seemed to have relatively more younger graduates and fewer older graduates. For example, there were 28 per cent of group 2 graduates, 24 per cent of groups 3 and 4 graduates, 19 per cent of group 5 graduates and 18

per cent of group 6 graduates who came from practice in cities of 2,500 to 25,000 population. A similar variation from 9 per cent of group 2 graduates to 4 per cent of group 6 graduates was observed in the men who formerly practiced in communities of 2,500 or fewer persons. An increasingly large proportion of older graduates were found to have come from the largest cities. There were 31 per cent of group 2 graduates from cities of 250,000 or more population, 37 per cent of group 3 graduates, 40 per cent of group 4 graduates, 46 per cent of group 5 graduates and 46 per cent of group 6 graduates.

#### FUTURE COMMUNITY MEDICAL PRACTICE OF RETURNING MEDICAL OFFICERS

There were 20,497 medical officers who indicated their desires as to future medical practice (table 3). Forty-seven per cent, or 9,649 men, signified that they desired to reengage in practice in the previous locality of practice (chart 2).

A large group of medical officers, 10,848, either did not desire to reengage in practice in their previous locality or did not answer that part of the questionnaire. They were mainly younger graduates, since there were 4,237 from group 1, 3,160 from group 2, 1,517 from group 3, 1,172 from group 4, 632 from group 5 and 130 from group 6. While these numbers seem large, it should be pointed out that there was uncertainty in the minds of many men.

The large number of medical officers who indicated that they would establish a civilian practice of medicine in a community other than the one they left to enter military service may at first seem startling. It should be remembered, however, that under normal conditions there are a certain number of civilian physicians who move from one community to another. A study of physicians who moved from one city to another during the period May 1, 1940 to April 15, 1941 showed that 19,359 physicians changed their locations of civilian medical practice. There were about 176,000 physicians in the United States in the same year, or about 1 doctor in 9 that moved from one city to another. Recent graduates from medical schools who have just established a practice after the completion of their internships, physicians removing from one building to another within the same city, or physicians who have died were not included in the previous figures.

An estimate of the normal number of changes in location of medical practice of the civilian physicians now in the Army was made. It was assumed that, in spite of the war, 1 medical officer out of 9 who served in the Army, except officers of the Regular Corps, would normally seek a new community in which to practice. There were 532 Regular Corps medical officers who returned their questionnaires in the present study. On this basis it is estimated that about 2,275 physicians among the group studied would normally have changed their practice of medicine from one city to another even if there had been no war. As there were 2,469 medical officers who indicated that they would not practice medicine in their former locality but would seek a new community in which to practice after they left the military service, it was concluded that they represented about the anticipated changes in normal migration of doctors.

Relatively few medical officers, about 9 per cent of all medical officers in this study, actually had a definite preference as to a new locality in which to practice medicine. There were 67 group 1 graduates, 362 group 2 graduates, 555 group 3 graduates, 537 group 4 graduates, 280 group 5 graduates and 40 group 6 graduates who actually named a state and/or city in which they would like to practice.

There were 628 medical officers who did not plan to return to their former localities of medical practice but who failed to mention a community in which they would like to resume civilian medical practice.

Of the small number of medical officers (67) that were group 1 graduates who named a state in which they would like to practice, 9 mentioned California, 8 Illinois, 6 Washington, 5 Georgia, 4 Texas and New York, and the remainder many other states. Most of the men indicated that they would prefer communities of 25,000 to 250,000. There were 11 who selected cities of more than 250,000 population, 31 who selected cities of 25,000 to 250,000 population, 22 who selected cities of 2,500 to 25,000 and only 1 a community of less than 2,500 population.

Chart 2.—Desires as to place of future practice.

A total of 362 group 2 graduates marked their preference for future medical practice. They represented 11 per cent of all men who did not wish to reengage in civilian medical practice in the community they left to enter military service. Questionnaires revealed that 62 wanted to practice in California, 30 in New York, 26 in Washington, 23 in Texas, 16 in Pennsylvania and Wisconsin, 15 in Illinois, 13 in Florida, 11 in Minnesota, and some from every other state except Rhode Island.

There were 51 men (14 per cent) who wanted to practice in cities of more than 250,000 population, 177 men (49 per cent) who wanted cities of 25,000 to 250,000 population, 89 men (34 per cent) who wanted cities of 2,500 to 25,000 and 10 men (3 per cent) who wanted communities of less than 2,500 population.

The largest group of medical officers (555) who specified the state and size of community in which they desired to practice in the future came from graduation group 3. There were more than 36 per cent of medical officers who expressed a desire to seek a new community in which to practice medicine after leaving the military service rather than to return to their former location of practice. California was preferred by nearly twice as many men (114) as any other group. Other states

that were selected were, in order of frequency and number of requests, New York 67, Texas and Washington 26, Pennsylvania 25, Florida 22, Michigan 20, Illinois 18, Arizona, Indiana and Wisconsin 17 and New Jersey and Ohio 16, Oregon and Virginia 13 and Colorado 12. Most of the questionnaires showed that medical officers favored larger cities. There were 100 men, or 18 per cent, who wanted to practice in cities of more than 250,000 population, 272 men, or 49 per cent, wanted cities of 25,000 to 250,000 population, 123 men, or 22 per cent, wanted cities of 2,500 to 25,000 population and 3, or 1 per cent, wanted communities of less than 2,500 population. About 10 per cent (57) of the group failed to indicate a choice of the size of city of future practice.

A group of 537 medical officers, or 46 per cent of those from graduation group 4 who showed that they

New York.....	202	112	114
Texas.....	99	55	33
Washington.....	92	51	11

would like to practice medicine in different communities than they left for military service, actually designated a definite community. The largest number chose California, or 132 men, and New York by about half that number, 68 men. Other requests came from 35 for Texas, 24 for Pennsylvania, 21 for Washington, 20 for Michigan, 18 for Ohio, 17 for Colorado, 15 for Illinois and 14 for Oregon and Wisconsin. All other states except Mississippi, Nebraska, North Dakota, Rhode Island, South Dakota and Wyoming were requested as possible locations for future practice. Cities of 2,500 to 25,000 population were the favorite choice of medical officers for future locations of medical practice. There were about 18 per cent, or 96 men, who wanted to practice in cities of more than 250,000, about 49 per cent, or 263 men, who wanted to practice in cities of 25,000 to 250,000, about 19 per cent, or 101 men, who wanted to practice in cities of 2,500 to 25,000 and about 1 per cent, or 4 men, who wanted to practice in communities of less than 2,500 population.

About 45 per cent of the medical officers from group 5 graduates (280) who did not care to reengage in practice in their former communities after the war indicated a definite place at which they would like to practice medicine after they left military service. About a third of them, or 90, wanted to practice in California. Other states were selected by the following number of men: New York 30, Washington 13, Texas 11, Oregon 10, Arizona, Colorado, Massachusetts and Pennsylvania each 9, Illinois 8, New Jersey 7 and North Carolina, Ohio and Wisconsin each 6. Again, a majority of men favored medium sized cities. There were 46 men, or 17 per cent, who indicated that they preferred cities of more than 250,000, 141 men, or 50 per cent, preferred cities of 25,000 to 250,000, 44 men, or 16 per cent, preferred cities of 2,500 to 25,000 and 3 men, or 1 per cent, who preferred communities of less than 2,500 population.

About one third of all medical officers in graduation group 6 (130) signified that they would not resume practice in their former locality. Of this number about one third, or 40 medical officers, expressed definite ideas concerning their new location of practice. There were 16 men who wanted to practice in California, 4 in New York, 3 in Illinois, 2 each in Connecticut and Florida and 1 in Colorado, Georgia, Idaho, Kentucky, Maine, Michigan, Minnesota, Nebraska, Nevada, New Jersey, Oregon, Texas and Wisconsin. Older medical officers favored larger cities, as there were 10 who wanted to practice in cities of 250,000 or more, 17 who wanted to practice in cities of 25,000 to 250,000, 7 who wanted to practice in cities of 2,500 to 25,000 and only 1 who wanted to practice in a community of less than 2,500.

An attempt was made to compare the number of removals in a few selected states as shown by the information from the questionnaires with the number of removals in the same states before the war (table 4). Five states, California, Illinois, New York, Texas and Washington, were chosen for the study. The number of medical officers, except group 6 graduates, who indicated that they would not resume practice in their former localities but who suggested new communities, was known. Graduates of group 6 were excluded, since they were men more than 55 years of age and all other data on removals was determined for men under 56 years of age. From the questionnaires 1,801 medical officers (except group 6 graduates) mentioned specific states in which they intended to establish a practice instead of their former locations of practice. A comparison of the number of men who wanted to relocate in the five states with the total relocations was made. Removals per thousand medical officers who desired relocation were 226 to California, 36 to Illinois, 112 to New York, 55 to Texas and 51 to Washington. In an earlier study of removals of physicians under 56 years of age during May 1, 1940 to April 15, 1941 the following removal rates per thousand physicians who relocated was determined. They included California 57, Illinois 42, New York 114, Texas 33 and Washington 11. It appears that medical officers want to relocate in California and Washington in about four times the normal numbers, in Texas about half again as many as normally, and in Illinois and New York in about the normal numbers.

There were 8,379 men who did not indicate a locality of future practice and who likewise left unanswered the questions of whether or not they intended to resume practice in a former locality. They were largely young

officers, as there were 4,155 who had graduated in 1941-1943 and 2,705 men who had graduated in 1938-1940. Most of these men had never been in practice but came directly from hospital training to military duty. In an earlier study (1) it was shown that 4,640 men came directly from internship to the armed services and 2,191 men came directly from residency. It appears that more than 80 per cent of the medical officers who did not indicate a locality of future practice were men who had never been in practice but who came directly from internships or residencies to the armed forces. The remainder were men from older graduation groups who were probably uncertain as to their future location of practice. They included 800 men from group 3 graduates, 425 men from group 4 graduates, 232 from group 5 graduates and 62 from group 6 graduates.

From the questionnaires it appears that half of the men who have a definite community selected for future practice chose cities of 25,000 to 250,000 population. Cities of more than 250,000 population seemed to attract about 17 per cent of medical officers who sought new locations and cities of 2,500 to 25,000 population about 20 per cent. Communities of 2,500 or less were chosen by about 1 per cent of medical officers. Younger medical officers seemed, however, to be attracted in larger numbers to communities of 25,000 population or less than older medical officers.

#### CONCLUSIONS

1. A study was made of 21,029 questionnaires returned by medical officers on duty with the armed forces.

2. Ninety-two per cent of all officers had a license to practice medicine.

3. There were 1,590 medical officers who did not have licenses. About 70 per cent of the officers without a license had graduated from medical school between 1941 and 1943. More than 20 per cent of unlicensed men were graduates of 1938-1940, and the remainder were graduated earlier. Many of the older medical graduates were formerly engaged in work that did not require a license and would be likely to return to their former activities after the war.

4. There were 12,508 medical officers who indicated the size of community in which they were engaged in practice before the war. About 39 per cent came from cities of more than 250,000, nearly 32 per cent from cities of 25,000 to 250,000, almost 23 per cent from cities of 2,500 to 25,000 and less than 6 per cent from communities of less than 2,500 population.

5. The ratio of medical officers that came from a given sized city to the total number of officers in the graduation group was about the same for all graduation groups. Smaller communities seemed, however, to have attracted a few more younger graduates and larger cities a few more older graduates.

6. Forty-seven per cent, or 9,649 medical officers, indicated that they wished to return to practice in the former community after the war.

7. More than 21 per cent, or 4,310 medical officers, signified that they did not intend to reengage in practice in their former communities. Less than half of the group, or 1,841, gave a definite locality in which they would like to practice after the war. The rest merely left the question as to location of practice unanswered.

8. There were 8,379 medical officers who gave no answer as to where they would like to practice. More than four fifths of them were graduates of groups 1 and 2 and consequently had probably never had an established practice of medicine.

## THE USE OF DIASONE FOR THE TREATMENT OF TUBERCULOSIS

H. J. CORPER, M.D., Ph.D.

AND

MAURICE L. COHN, Ph.D.

DENVER

Without becoming facetious, one could say from past evidence that tuberculosis has been the major mummer among diseases. Those who have been deceived in the past by the vagaries of this disease include such names as Brehmer by the cause of tuberculosis, Koch by tuberculin action, Virchow by the microbic origin, Behring by the source of infection, Krause by the significance of the tuberculin inflammatory reaction, and so on. The scientific investigator should be wary of the vagaries of the tubercle bacillus and tuberculosis by this time and inquire into the "whys and wherefores" of the mechanism involved before accepting mere appearances as bona fide evidence of practical actualities. In chemotherapy particularly history has recorded numerous faux pas of premature overoptimism with tuberculin, with copper, with gold, with cinnamates, with oils, with mercury, and now with the sulfonamide drugs, just to mention a few. Not that these failures should discourage the chemotherapeutic investigator in tuberculosis, but rather that he should become an expert at cautious and careful evaluation before submitting the tuberculous invalid to useless and unnecessary hazard because of his own scientific shortcomings and in support of the unjust plea that not all necessary information can be obtained from properly performed animal tests and that spontaneous human tuberculosis cannot be duplicated by animal experiments. Therefore, to fill the void of this inadequacy, human tests must be performed. To any one conversant with both spontaneous human and experimental animal tuberculosis, this unjust stand merely impresses one as a confession of the individual investigator's limitations in tubercology.

In 1940 in a review of chemotherapy<sup>1</sup> it was pointed out that there was "no specific chemotherapeutic agent of proved value in tuberculosis" and that "in the evaluation and planning for chemotherapeutic determinations in tuberculosis, theories drawn from chemical in vitro actions with nonviable bacilli are not likely to lead to conclusions in vivo. Vital biological reactions and approach appear to be the right road for this purpose. Distortional organotoxic effects of chemotherapeutic agents must also be evaluated properly to avoid deductions drawn from anatomic tuberculosis alone. In vitro culture and static tests cannot be translated directly into in vivo terms. The solution, as in medicine in general, lies in the broad evaluation of all factors concerning the tubercle bacilli as well as the disease as a whole, with careful scientific experimental checking to avoid all possible errors in the interpretation of results."

Regardless of the apparent visual experimental results with sulfanilamide<sup>2</sup> and sulfapyridine,<sup>3</sup> it was pointed

From the Research Department, National Jewish Hospital. This investigation was aided by a gift from Morton May in memory of Florence G. May.

Read before the Section on Pathology and Physiology at the Ninety-Fourth Annual Session of the American Medical Association, Chicago, June 15, 1944.

Owing to lack of space, this paper has been abbreviated for publication in *THE JOURNAL*. The complete article will appear in the reprints, a copy of which will be sent by the authors on request.

out that the effect noted is attributable to the toxicity of these compounds and that it would not appear to be justified to use them in the treatment of human tuberculosis *per se*. Yet in spite of this warning and plea for a better scientific evaluation of these compounds, cursory tests have been the usual rule and resort to human use of no possible scientific value has been common, ranging from sulfanilamide through almost all the newly prepared and related chemicals in this class of compounds.

In earlier investigations the significance of oxygen for the growth of the tubercle bacillus both *in vitro* and *in vivo* was noted, and as early as 1924 it was observed that the constriction of the rabbit's ear retarded the development of local tuberculosis in the auricle.<sup>5</sup> Then in 1927 the importance of slight changes in oxygen tension on the growth of tubercle bacilli was pointed out.<sup>6</sup> It appeared also that changes in bodily conditions which can alter the oxygen dissociation curve of the blood may exert a decided influence on the progress of the disease. In a recent publication<sup>7</sup> it was noted that the growth of submerged tubercle bacilli in nonprotein liquid mediums is usually sparse and is affected appreciably by any factors or influences which retard the ready exchange of air or oxygen into the medium. The tubercle bacillus is an aerobe primarily and therefore grows best *in vitro* with a plentiful supply of air (oxygen). It is capable of sparse growth in practically air (oxygen) exhausted surroundings on a good nutrient. Rich and Follis, who were among the first to note the apparent retarding effect of sulfanilamide on guinea pig tuberculosis,<sup>8</sup> unrelatedly observed<sup>9</sup> in 1942 that the progress of tuberculous infection was appreciably inhibited in animals infected with virulent tubercle bacilli and kept continuously in a chamber at low oxygen tension.

In 1943 Callomon<sup>11</sup> reported that, while sulfanilamide, sulfapyridine, sulfathiazole and sulfathiazoline showed no appreciable effect in guinea pigs, the sulfones promin and diasone (2398) produced favorable results, with diasone being most favorable from the standpoint of mortality and histologic change. A little later Feldman, Hinshaw and Moses<sup>12</sup> reported that while "certain of the compounds containing a sulfone nucleus have been found highly effective in influencing favorably the course of tuberculosis in guinea pigs, most of them unfortunately are objectionably hemotoxic" and "this fact, while of little consequence in dealing with guinea pigs, has definitely limited the amount of most of the drugs of this type that can be given safely to human beings." They concluded that, although less toxic, it is also less effective than the parent substance in its capacity to deter tuberculous infections in guinea pigs.

Encouraging for the effectiveness of these compounds were the reports that they were tuberculostatic *in vitro*

and *in vivo*. Smith and his associates<sup>13</sup> found partial to complete inhibition of growth of tubercle bacilli to approximate concentrations of 1 to 10 mg. per hundred cubic centimeters except for promin, which required 100 mg. per hundred cubic centimeters. Their results, however, for *in vivo* interpretation are vitiated by using glycerol bouillon, a poor nutrient medium, for test nutrient. They<sup>14</sup> also conclude that prolonged cultivation of tubercle bacilli on a promin-containing medium attenuates their virulence and that this persists after the strain is returned to control mediums. In a study of the *in vivo* effects of diasone, Feldman and his associates<sup>12</sup> made cultures of composite suspensions of portions of the livers and spleens of 8 treated animals and obtained negative results in all instances except 1, inferring a cidal effect of treatment.

Encouraged by these reports, Petter and Prenzlau<sup>16</sup> began diasone administration to patients in 1943 and noted definitely favorable changes in symptoms and objective findings after sixty days of chemotherapy.

In considering the effects of sulfonamides on the blood of man, Kracke<sup>18</sup> noted that cyanosis is often seen in patients taking sulfanilamide, infrequently in those taking sulfapyridine and extremely rarely in those taking sulfathiazole and sulfadiazine; in any event the occurrence of the cyanosis has little significance for man, and the cause remains unsettled; with sulfadiazine there appears to be no interference with oxygen carrying capacity.

In a recent volume on autonomic regulations Gellhorn<sup>19</sup> pointed out that the lower animals, compared with the higher, including man, possess a lesser susceptibility to a great many natural variations and especially to wider latitudes of depressed oxygen tensions as displayed even in internal mechanisms of regulation of such features as anoxia.

The studies reported here were concerned primarily with diasone as a representative of the sulfones and were initiated in an effort to learn the mechanism of the retarding effect of the sulfonamide and sulfone preparations in tuberculosis beyond that noted previously for sulfanilamide and sulfapyridine. The work was centered mainly about diasone because this compound offered many advantages to a better solution of the mechanism involved and because Drs. George W. Raiziss and George R. Hazel of the Abbott Laboratories expressed a willingness to cooperate in every way in an effort to elucidate this important subject.

Although attacking the problem of the treatment of animal tuberculosis in a different manner from previous observers and to obtain more speedy results, we were able essentially to verify the fact that certain sulfonamide drugs and certain sulfones did display a retarding effect on guinea pig tuberculosis. Taking advantage of our previous studies and technics, however, we used intravenous infection in the guinea pig in most cases. This produces a rapidly fatal tuberculosis with highly virulent human and bovine tubercle bacilli, becomes

graded off with less virulent strains and small infecting doses<sup>20</sup> and makes it possible to consummate results in from one to two months or less in comparison to the usual three months to a year. It is particularly valuable in obtaining leading information and, if properly performed and interpreted, can yield information equally valuable to the longer duration tests.

#### THE EFFECT OF DIASONE ON EXPERIMENTAL TUBERCULOUS INFECTION

The guinea pigs were young and weighed from 250 to 300 Gm. when the experiment was initiated. Young animals were chosen since they proved better suited for these experiments, as will be shown later, than older and larger animals. Drug controls given 4 grains (0.26 Gm.) of diasone orally daily for thirty days showed no apparent gross effects except for the dark appearance of the spleen particularly and internal organs, as was noted with sulfanilamide,<sup>21</sup> and there was a coincident splenomegaly in most cases, the weight having increased from the normal of 0.7 to 1.2 Gm. to 2.3 Gm. The infection controls, given intravenously 1 mg. of fine suspension of a virulent human strain of tubercle bacilli, number 4008, died of miliary tuberculosis especially visible in the lungs; while the diasone treated animals, given 4 grains (0.26 Gm.) daily and begun coincident with infection, showed the same miliary pulmonary disease with a cyanotic splenomegaly. An illustrative experiment in duration of life is given in table 1.

In these experiments it is noted that a definite prolongation of life of the young guinea pigs occurs, resulting apparently from the oral diasone treatment. When the same experiment is repeated with the intravenous injection of 1 mg. of a low virulent strain of human tubercle bacilli (H 37, N. J. H.), the results become

even more striking in guinea pigs. Such an experiment is reported in table 2.

It is obvious here that diasone has retarded the tuberculosis in the guinea pig infected intravenously with a low virulent strain of human tubercle bacilli and that with the natural regression of the splenic infection there has been a subsidence of the splenomegaly probably resulting from both the bacilli and the diasone. How-

ever, cultures from the organs of these animals indicate the absence of any cidal effect on the bacilli, as will be shown later.

With intravenous and subcutaneous diasone treatments, the effects were not consistent and large treatment doses were detrimental to the animal, resulting in earlier lethal effects.

#### THE EFFECT OF DIASONE IN VITRO

Although translation of in vitro static and cidal effects on tubercle bacilli into in vivo interpretation requires extreme caution, such information, properly obtained, may prove invaluable for practical purposes. It is for this reason that such tests should approximate as nearly as possible the nutrient conditions of in vivo circumstances and should also be elaborated on by in vivo studies. Since good nutrients differ widely from poor nutrients for tubercle bacilli in many respects and since graded studies are thus made possible, the following information was obtained by studying growth on a good nutrient medium—the glycerol egg yolk medium.<sup>23</sup> The results of a typical static test with different concentrations of diasone incorporated in a glycerol egg yolk medium is recorded in table 4. It is to be noted from table 4 that the lowest concentration of diasone exerting

TABLE 4—Tuberculostatic Effect of Diasone Toward Virulent Human Tubercle Bacilli (H 4008)

\* The numeral indicates the number of weeks in which growth first appeared on the medium

a perceptible effect is 50 mg. per hundred cubic centimeters with small (0.000,001 mg.) plantings, which, however, does not become evident with all plantings until the 500 mg. per hundred cubic centimeters dilution is reached.

In a further cidal time test with a very high concentration of diasone, 4.25 per cent, the contact results are recorded in table 5. It is to be noted from the results recorded in table 5 that even in high concentrations (over 4 per cent) diasone is effective in preventing positive plants with small numbers of bacilli only after six hours' contact, and it took about twenty-four hours to prevent successfully plants from all grade plantings. Since the foregoing experiments were not under actual natural conditions, they were further elaborated on by using blood from guinea pigs given large amounts of diasone by mouth and preparing a medium from this blood which was planted with human tubercle bacilli. The results of these cultures are recorded in table 6. It is to be noted that there is no retarding effect on the growth of small plantings of tubercle bacilli by the presence of 6 to 9 mg. per hundred cubic centimeters in the analyzed blood of guinea pigs fed large amounts of diasone orally.

A similar cidal time test with the blood obtained from orally diasone treated guinea pigs gave the results

\* For method used see Cohn, M. L.: *J. Bact.* **27**: 517, 1934. To 0.5 cc. of suspension is added 0.5 cc. of 4.25 per cent diasone solution, the mixture is incubated at 37.5 C. for the time indicated, then the mixture is diluted to 50 cc. to stop action, and then plants are made on glycerol egg yolk medium.

† The numeral indicates the number of weeks in which growth first appeared on the medium.

as long as ten days. The differences noted in the higher dilution plantings of tubercle bacilli are due to the fact that whole blood had to be treated with oxalic acid before planting, since whole blood itself retards growth. This accounts for the apparently irregular results recorded.

#### THE IN VITRO CELLULAR TOXICITY OF DIASONE

The effect of diasone on phagocytosis in vitro, according to the method of Welch and Hunter,<sup>24</sup> was tested using concentrations of 0.01 to 1 per cent of diasone

TABLE 6.—*Effect of Diasone in Blood Medium on the Growth of Virulent Human Tubercle Bacilli (H 4008)*

† These mediums were prepared by adding 3 per cent glycerol and 25 per cent water to the blood and inspissating.

‡ The numeral indicates the number of weeks in which growth first appeared on the mediums.

A. The blood for this medium was obtained by cardiac puncture after oral administration of 4 grains (0.26 Gm.) of diasone each hour to a 650 gram guinea pig for a total of 28 grains (1.8 Gm.). The blood was taken 25 minutes after last feeding.

B. Five grains (0.35 Gm.) each hour for a total of 35 grains (2.3 Gm.) and blood taken 30 minutes after last feeding.

C. Same as B.

with the results shown in table 8. It is to be noted from the results recorded in table 8 that phagocytosis is retarded only when a concentration of 0.5 per cent of diasone is attained. Blood taken from guinea pigs given large doses of diasone orally did not differ in

phagocytosis from the results noted in table 8 for normal blood.

In a similar way the toxicity of diasone was tested by the method of unstained cell counts of Schrek,<sup>25</sup> the results of which are recorded in table 9. It is to be noted from the results recorded in table 9 that diasone in concentration of 0.5 per cent or over is toxic to guinea pig bone marrow cells. If we compare these findings on the effect of diasone on phagocytosis and cell death with the cidal time effect of diasone on human tubercle bacilli, it would appear that the tubercle bacilli are less susceptible to the diasone than the body cells so far as this is determinable by these methods and comparisons.

#### EFFECT OF DIASONE ON BACILLI IN VIVO

When tubercle bacilli are injected intravenously into guinea pigs, two phases of the study might yield data of value: the one, and probably more important, is

TABLE 7.—*The Tuberculocidal Time Effect of Blood Containing Diasone Toward Virulent Human Tubercle Bacilli (H 4008)*

\* The blood was obtained by cardiac puncture from guinea pigs. The diasone blood was obtained from a guinea pig which weighed 1,350 Gm. and which was given orally 5 grains (0.33 Gm.) of diasone each hour for a total of 35 grains (2.3 Gm.). This blood contained 8 mg. of diasone per hundred cubic centimeters. To 9 cc. of blood was added 1 cc. of bacillary suspension and stored at 37 C. for time indicated. One cc. of blood bacillary mixture was treated with 5 per cent oxalic acid in the usual manner of sputum culture isolation for tubercle bacilli, and after incubation and neutralization it was planted on glycerol egg yolk medium.

† The numeral indicates the number of weeks in which growth first appeared on the medium, three tubes being planted.

‡ An exponent added to the numeral indicates the number of tubes which revealed a positive growth at the time indicated by the numeral.

their survival in the tissues; and the other, their persistence in the blood. Table 10 records the results of cultures from blood samples taken at various intervals after virulent infection, and in table 11 the results of culture of the important internal organs after infection with a low virulent strain of human tubercle bacilli are recorded.

The results recorded in tables 10 and 11 indicate that although diasone treatment may prolong the life of virulent infected guinea pigs it does not prevent or alter particularly the occurrence of the bacilli in the blood. Continuous daily treatment with diasone for up to one hundred and two days does not prevent their recovery in relatively large amounts, as determined by the speed of appearance of positive cultures from the lung, liver, spleen and kidney of the treated guinea pigs even though low virulent strains of human tubercle bacilli are used for infecting.

In another experiment in which avirulent human tubercle bacilli were given intravenously in 1 mg. amounts and in which case these bacilli are usually

24. Welch, H., and Hunter, A. C.: Method for Determining the Effect of Chemical Antiseptics on Phagocytosis, *Am. J. Pub. Health* **30**: 129, 1940.

destroyed naturally within about a year in the organs, diasone treatment of 16 grains (1 + Gm.) was given before infecting and continued thereafter with the results recorded in table 12. The results recorded in table 12 indicate that diasone given orally in maximum dose to guinea pigs for up to one hundred days displayed no appreciable effect on the viability of the intravenously injected avirulent human tubercle bacilli contained in the lung, liver, spleen and kidneys of these animals.

It would appear from the experiments thus far recorded that diasone exerts no cidal or static action on human tubercle bacilli *in vivo* directly, and the cause of the indirect or remote effect which acts by retarding multiplication of the bacilli in the organs of the guinea pig should be sought further.

#### EFFECT OF DIASONE TREATMENT ON THE SPREAD OF THE BACILLI

In order to study the spread of the bacilli more carefully from a remote site and affected as little as possible by the internal organic disease, a series of guinea pigs was infected intracutaneously with 0.01 mg. fine sus-

be introduced by the use of low virulent strains.<sup>28</sup> The results of such a study are recorded in table 16. The results recorded in this table appear to indicate that although diasone treatment is capable of retarding organ tuberculosis resulting from a subcutaneous infection with virulent human tubercle bacilli the retardation is not

pension of viable avirulent human tubercle bacilli in one experiment and the same amount of virulent human tubercle bacilli (number 4008) in another. One half of each set of animals was kept as controls and the other half was given orally daily 4 grains (0.26 Gm.) of diasone in solution. The injection site, about 1.5 cm. to the left of the umbilicus, the local tributary inguinal glands, the retroperitoneal glands and the important internal organs (lung, liver, spleen and kidney) were cultured; and no appreciable difference was noted between the cultural results with the treated and the untreated guinea pigs given an intracutaneous injection of avirulent or virulent tubercle bacilli in specimens obtained immediately after injection and one week, two weeks, four weeks and two months later.

#### THE EFFECT OF DIASONE ON THE RESOLUTION OF TUBERCULOSIS

Since some observers have stressed the resolving effect of diasone treatment on tuberculosis, an effort was made to gain more information on this phase of the subject using highly virulent human tubercle bacilli (H 160) subcutaneously to obviate such errors as might

particularly evident in the effect on the glandular tuberculosis in comparison. If treatment with diasone is discontinued, the tuberculosis in the guinea pig again progresses at a rate apparently commensurate with that of the original infection.

#### AN ATTEMPT TO EXPLAIN ACTION OF DIASONE

Since no evidence has been obtained that diasone is able to destroy tubercle bacilli *per se* in *vivo* or to affect the specific immune or allergic condition directly in a way that might explain its mode of action, a number of other conceptions were considered as possibilities in this mechanism. One fact, however, appears to stand out distinctly, and that is that whatever action diasone exerts on tuberculosis in the guinea pig this action is one of indirect consequence of temporary effect exerted only as long as the drug is administered to the animal. Since diasone in itself is neither sufficiently cidal nor static to exert an influence directly on the bacilli, it must be assumed that the effect in all likelihood is

TABLE 11.—*The Presence of Tubercle Bacilli in the Organs of Guinea Pigs Treated with Diasone*

\* These animals were infected by giving 1 mg. of a low virulent strain of human tubercle bacilli (H 37—N. J. H.) intravenously and were treated daily with 0.26 Gm. of diasone in solution orally.

† The untreated controls of this series died on the 32d, 35th, 45th and 49th day with tuberculosis.

‡ The numeral indicates the number of weeks after which culture was positive.

one of temporary alterations in the guinea pig body. For this reason an approach at mechanisms was tried either to resemble diasone action, to counteract it or to reinforce it. Among the substances which might

28. Corper, H. J., and Cohn, M. L.: Specific Tuberculosis Immunity During Infection, *Yale J. Biol. & Med.* 16: 333, 1944.

act like diasone, thiourea, an antioxidant and thyrotoxic agent, was tried with no appreciable beneficial effect but rather detrimental and toxic effect on tuberculosis in the guinea pig. Thyroxin when given in a dose of 0.4 mg. per day by mouth exerted a definite detrimental effect on primary guinea pig tuberculosis. Para-aminobenzoic acid, which is considered a neutralizer of sulfanilamide action, exerted no appreciable effect on the diasone action within the limits of the experimental

temperature, thus neutralizing all diasone action by this means and suggesting the possibility that reduced body temperature of the diasone guinea pigs may play a part indirectly in the diasone effect even though not directly effective in itself.

THE SIGNIFICANCE OF INTRAVITAL OXYGEN IN THE EFFECT OF DIASONE IN TUBERCULOSIS

In explanation of the action of sulfanilamide and sulfapyridine in retarding tuberculosis in the guinea pig, attention was called especially to the cyanotic splenomegaly, particularly because of the significance of the spleen in generalized guinea pig tuberculosis<sup>29</sup> as the organ of susceptibility in this animal on the assumption that this finding, being an outstanding one, might be concerned in some way with the general effect on tuberculosis noted at that time. It was then designated as the evidence of toxicity of the sulfanilamide and sulfapyridine. Now it is interesting that sulfadiazine, which does not display the cyanotic splenomegaly effect when given in large doses to guinea pigs, also displays no appreciable retarding effect on the organic tuberculosis in these animals infected intravenously with virulent human tubercle bacilli, nor does it prolong the life of intravenously infected animals such as occurs with diasone. This finding and other like findings led us to the study of the anoxemic picture under diasone and other treatments. The results of such studies in guinea pigs are recorded in table 15.

The findings recorded in table 15 indicate that diasone treatment depresses the oxygen content of the arterial blood in guinea pigs perceptibly and that this effect occurs within two hours after the primary oral administration of 4 grains (0.26 Gm.) of diasone and persists twenty-four hours after administration, and diasone also persists in the blood. If treatment continues for one week, the depression of oxygen to a low level occurs within one hour after the last oral administration to the guinea pig. In view of these findings it was interesting to note whether it concerned a direct effect of diasone on the blood, which would not conform to the fact that injection treatments were not as successful as oral administration. In *in vitro* tests it was found that concentrations of diasone of 10 to 100 mg. per hundred cubic centimeters added to venous blood had no effect on the ability of the blood to be oxygenated; as a matter of fact, diasone added to blood *in vitro* absorbed as much oxygen as did the same control blood without diasone. Likewise, diasone added to oxalated blood did not displace oxygen in the blood. It is inferred that the action is not that of diasone as such but either that a change occurs in gastrointestinal absorption or that the effect is an influence on the hemoglobin of the blood or its normal oxygenating mechanisms. Sulfadiazine given to guinea pigs orally in large amounts did not depress the oxygen content or oxygen absorption of the blood.

In like examinations of the blood of rabbits which had received diasone (10 grains [0.65 Gm.] daily orally for months) no appreciable depression of the oxygen content or oxygen absorption power was noted. This might possibly explain the unsatisfactory results obtained from the diasone treatment of tuberculosis in the rabbit. The examination of the arterial blood of human patients who had received 1 Gm. (15 grains)

\* The oxygen content and oxygen capacity of the blood were determined by the D. D. Van Slyke and J. M. Neill method (*J. Biol. Chem.* 61: 523, 1924).

tests. Likewise, attempts to counteract diasone action with 40 per cent oxygen inhalations continuously throughout the experimental period had no appreciable effect on the tuberculosis in the guinea pig, but it did prolong the life of the infection controls in the oxygen chamber as compared with those maintained at room oxygen tension. However, an increase of temperature and humidity in the oxygen chambers increased the lethal results very much and reduced the effect of diasone to such an extent that the infected guinea pigs lived only as long as the infection controls did at room

of diasone daily for four months, the routine recommended for clinical use, as compared with arterial blood from nontreated tuberculous patients, showed no appreciable depression of the oxygen content.<sup>30</sup>

#### SUMMARY AND CONCLUSIONS

1. The retarding effect previously noted for some of the sulfonamide drugs in tuberculosis in the guinea pig is noted also for diasone as a representative of certain effective sulfone compounds.

2. This retarding effect of diasone on the tuberculosis in the guinea pig does not appear to be due to

\* This figure is an arbitrary gradation of the glandular tuberculosis and can be considered only an objective approximation, the grades used being from 0 to 4:

† The organic tuberculosis of lungs, liver and spleen are also arbitrarily graded from 0 = no visible macroscopic tuberculosis to 4 = a massive involvement of the organs. In the case of the diasone treated animals, which all display a cyanotic splenomegaly after treatment has been continued in the dosage used, the tubercles are difficult to see even when present.

any direct cidal or static action of the diasone itself (a) since diasone does not exert a cidal or static effect on human tubercle bacilli in vitro in concentrations attainable in the body (b) nor does it kill avirulent human tubercle bacilli in vivo when administered for long periods (over one hundred days) in maximal effective therapeutic amounts orally as determined by their viability in the lungs, liver, spleen and kidneys after this time (c) nor does it abolish the viability of virulent human tubercle bacilli in the organs of the diasone treated guinea pig (d) nor does it retard virulent glandular progression from an intracutaneous site.

3. In experiments in which the diasone treatment has been interrupted the tuberculosis caused by virulent human tubercle bacilli appears to continue when the diasone treatment is stopped, and the treatment is not effective in other animal species such as the rabbit infected with virulent bovine bacilli.

4. Although the diasone treatment is also beneficial in guinea pigs that have been immunized with avirulent human tubercle bacilli and then are infected, pretreatment with diasone during the immunizing period and discontinuance during infection may exert either no effect or a definite detrimental effect on the tuberculosis in the guinea pig.

5. Diasone treatment of guinea pigs during specific vaccination displays no effect on the immunization against tuberculosis, nor does it exert any effect on the allergic hypersensitiveness or the tuberculin or bacillary allergic intoxication.

6. The effect of diasone treatment on the tuberculosis of guinea pigs appears to be directly related to the cyanotic effect on the internal organs and to that particularly noted in the spleen of the guinea pig as well as the liver. Sulfonamide drugs, such as sulfadiazine, which do not exert this effect are also ineffective toward the tuberculosis.

7. In guinea pigs treated orally with diasone in effective amounts against tuberculosis a definite anoxemia exists which appears to be related to the effect noted; and, although it may not be the only factor implicated, it would appear to be a significant part of this retarding mechanism possibly as an expression of a general or organic anoxia.

8. In view of the fact that patients treated orally with 1 Gm. of diasone daily for months did not display an evident anoxemia, it is doubtful whether a therapeutic effect for diasone has been attained clinically in tuberculosis in man with the sulfonamide or sulfone drugs thus far.

9. In view of the greater sensitivity of the human being to anoxic and anoxemic effects and the fact that such a mechanism appears to explain the favorable results noted on tuberculosis in the guinea pig, it would not seem warranted to continue human experimentation with these drugs at present because of the hazards of their use in the tuberculous and the fact that all the necessary information for proper evaluation can be obtained from careful animal experimentation.

**Hospital Facilities in Hawaii.**—In 1940 there were 70 institutions with beds for medical care in the Territory of Hawaii, with a total of 6,501 beds, or 15.4 beds per thousand of population (based on a total population of 423,000). Sixty-eight of these institutions were hospitals or sanatoriums, one was a nursing home of 125 beds controlled by the government and one was a nonprofit institution with an infirmary and 5 beds. Twenty-seven were located in Honolulu County, 21 in Hawaii County, 12 in Maui County, 9 in Kauai County and 1 in Kalawao County. About a fourth of the 68 hospitals mentioned were not registered; these, however, provided only about 8.6 per cent of the total number of beds. Sixty-two per cent of all beds in 1940 were provided by government controlled hospitals in spite of the fact that such hospitals constituted only 26 per cent of the total number. Most hospitals in the territory are small; 44 per cent in 1940 had less than 25 beds each. Utilization of hospital and sanatorium facilities in that year was 73 per cent of capacity.—Simmons, James S.: *Global Epidemiology*, Philadelphia, J. P. Lippincott Company, 1944.

30. These examinations of human blood were made possible through the courtesy of Dr. Charles J. Kaufman, medical director of the National Jewish Hospital.

## Clinical Notes, Suggestions and New Instruments

### BITE AND DENTAL INJURY

FRANCESCO RONCHESE, M.D., PROVIDENCE, R. I.

A distinction, it seems to me, should be made between a bite and a dental injury, either a self-inflicted bite<sup>1</sup> or a bite by another person.

Recently a clinical note<sup>2</sup> appeared in *THE JOURNAL* reporting a case of actinomycosis secondary to a "human bite." While playing volley ball "the patient sustained the human bite wound. He struck his elbow against another man's front teeth."

Fig. 1.—A heavy callus from pressure against the teeth while finger sucking. A tooth injury, not a bite.

Hitting any part of one's body against somebody's teeth and sustaining an injury should not be called a bite. Barnes and Bibby<sup>3</sup> report a case of knuckle wound incurred by striking a tooth in a fight, and it is correctly called a "human tooth wound." Boland<sup>4</sup> says that, "strictly speaking, trauma to the clenched fist is not an actual bite." Boyce<sup>5</sup> entitles his paper "Human Bites" but in the text makes a distinction between true bites and tooth wounds.

From the Department of Dermatology, Boston University.

1. Ronchese, F.: Self-Inflicted Bite, *Am. J. Surg.* 66:80, 1944.
2. Robinson, R. A.: Actinomycosis of the Subcutaneous Tissue of the Forearm Secondary to a Human Bite, *J. A. M. A.* 124:1049 (April 8) 1944.
3. Barnes, M. N., and Bibby, B. G.: A Summary of Reports and a Bacteriologic Study of Infections Caused by Human Tooth Wounds, *J. Am. Dent. A.* 26:1163, 1939.
4. Boland, F. K.: Morsus Humanus: Sixty Cases of Human Bites in Negroes, *J. A. M. A.* 116:127 (Jan. 11) 1941.
5. Boyce, F. F.: Human Bites: An Analysis of 90 (chiefly Delayed and Late) Cases from Charity Hospital of Louisiana in New Orleans, *South. M. J.* 35:631, 1942.

In my own paper<sup>1</sup> figure 4C is erroneously described as due to biting, while it is a dental injury from pressure in the process of finger sucking.

Figure 1 shows a conspicuous warty lesion at the proximal end of the left index finger and a smaller one at the distal phalanx of the same finger due to pressure of that area against the teeth while finger sucking. The habit is so strong that the

Fig. 2.—A heavy one knuckle callus from knuckle chewing. A true bite.

child will not fall asleep unless with his index finger all the way in the mouth. It is similar in appearance and consistency to the lesions due to the actual chewing of the skin (fig. 2). Both are calluses from repeated dental trauma over a long period, but only one (fig. 2) can be called a bite, like the finger and toe biting (fig. 3).

Fig. 3.—Finger and toe nail biting in a 12 year old boy. A true bite.

The lesions as illustrated in figures 1 and 2 are far from rare. Surprisingly enough, they are often not diagnosed or they are diagnosed as a wart, a keloid, a sarcoid, a mycotic growth or an epithelioma and, accordingly, unnecessary biopsy, surgery or irradiation is done.

The Dattner lumbar puncture needle<sup>1</sup> as modified by L. W. Harrison,<sup>2</sup> has been in use since 1937 primarily because of the low incidence of headaches associated with lumbar puncture. H. W. Allen,<sup>3</sup> who first reported on the use of this needle in England, stated that in 116 punctures in which the inner needle (25 British standard wire gage) penetrated the meninges only two headaches of incapacitating severity and sixteen mild headaches occurred. On the other hand, in 11 punctures in which the membranes had been punctured by the outer needle (20 British standard wire gage) severe headaches occurred in 5 cases.

The small caliber of the inner needle (25 British standard wire gage) requires that an average of one half hour elapse in order to collect 6 cc. of cerebrospinal fluid for laboratory examination. The search for a satisfactory method of holding a glass tube for collecting this fluid after lumbar puncture in our experience has gone through various stages in development. In an effort to reduce the number of assistants necessary to hold the tubes for collection of cerebrospinal fluid during the performance of lumbar punctures on several patients at one time, blocks of wood having graduated heights with holes to support the tubes were devised. These placed the mouths of the tubes near the needle openings but not as effectively as the more adjustable ring stands and buret clamps which were later adopted for the purpose. Neither method was entirely satisfactory to compensate for slight movements by the patient and required that the tube and holder be frequently adjusted.

A holder was finally devised consisting of 16 gage galvanized wire and bent as shown in figure 1. The hook, B, was formed to fit the groove, A, of the modified Dattner loosely and the

Fig. 1.—The Dattner needle, tube holder and tube.

loop, C, was designed so as to indicate the 6 centimeter level of the 15 cubic centimeter glass collecting tube.

The collecting tube and holder are sterilized in the autoclave with the other equipment to be used in lumbar puncture.

From the Chicago Intensive Treatment Center, Venereal Disease Control Program, Chicago Board of Health in cooperation with the U. S. Public Health Service.

1. Dattner, B.: *Moderne Therapie der Neurosyphilis*, Vienna, Wilhelm Maudrich, 1933, pp. 7-10.

2. Harrison, L. W.: *Note on Lumbar Puncture with Dattner Pattern Needle*, *Brit. J. Ven. Dis.* 13: 173-176 (Jul.) 1937. Burke, E. T.: *Veneral Diseases*, London, H. K. Lewis & Co. Ltd., 1940, pp. 223-225.

3. Allen, H. W.: *Headache Following Lumbar Puncture*, *Brit. M. J.* 2: 349 (Aug. 25) 1934.

The lumbar puncture is performed under 2 per cent procaine-epinephrine local anesthesia with the patient on his side in the knee-chest position. After the cerebrospinal fluid begins to flow, the first ten drops are discarded to avoid contamination of the specimen with red blood cells, the glass tube is placed in the holder and the combination is suspended from the needle.

Fig. 2.—The holder and tube in place after lumbar puncture.

If necessary, the tube may be raised or lowered and will remain in the desired position, being in the grasp of the snug-fitting holder. The combined weight of the tube and holder is sufficient to bend the needle slightly, making the opening most dependent and preventing any of the fluid from running down the needle toward the patient's back. There has been no expression of added discomfort at the puncture site.

Regardless of the movements of the patient on the table, the cerebrospinal fluid collection tube is always in position (fig. 2). The nurse who is in constant attendance of these patients is free to assist the physician in performing a series of lumbar punctures in the same room and can easily supervise the collection of the fluid after the punctures have been effected.

On removal of the needle the perforation in the meninges, being small, closes with a minimal leakage of cerebrospinal fluid. After resting in the prone position for twenty minutes the patients are again ambulatory, freeing the nursing personnel from the serving of meals and other procedures necessary to bed patients.

In our opinion this is a very satisfactory method for collecting diagnostic cerebrospinal fluid specimens from ambulatory patients and minimizes the incidence of headaches associated with lumbar puncture.

## NEISSERIA PERFLAVA ENDOCARDITIS; RECOVERY

RALPH H. MAJOR, M.D., AND EDGAR W. JOHNSON JR., M.D.,  
KANSAS CITY, KAN.

The great majority of cases of subacute infectious endocarditis are caused by *Streptococcus viridans*. In Libman's<sup>1</sup> series 95 per cent were due to this organism, and in the cases tabulated by Blumer<sup>2</sup> 70 per cent were due to the streptococcus, 80 per cent of these proving to be *S. viridans*. In the past the disease has been almost uniformly fatal. The introduction of sulfonamides and penicillin in the treatment of endocarditis has, however, unquestionably reduced the mortality rate of this disease. The following history of a patient suffering from endocarditis is interesting because of the organism producing the disease and because the patient recovered under sulfonamide therapy.

From the Department of Internal Medicine, University of Kansas School of Medicine.

1. Libman, E., and Celler, H. L. *The Etiology of Subacute Infective Endocarditis*, *Am. J. M. Sc.* 140: 516, 1910.

2. Blumer, George. *Subacute Bacterial Endocarditis*, *Medicine* 2: 105, 1923.

R. A., a man aged 45, admitted to the University of Kansas Hospital on Oct. 4, 1943, was somewhat confused mentally and had been ill for approximately three months, suffering from fever and "chilly sensations." In 1918 he had an attack of rheumatic fever and in 1828 a second attack.

On admission the patient showed a temperature of 101 F. and a pulse rate of 116. There were numerous petechiae scattered over the chest, back and abdomen, and several in the conjunctivas of both eyelids. Several splinter hemorrhages were obvious under the fingernails of both hands. The heart was slightly enlarged on percussion, and auscultation revealed a loud systolic murmur of maximum intensity over the mitral area, also well heard over the entire precordium and at the inferior angle of the left scapula. The spleen was not palpable.

Examination of the blood showed 3,130,000 red blood cells and 7,800 white blood cells. The hemoglobin (Haden-Hauser) was 53 per cent (8.3 Gm.). Blood cultures on October 5, 6 and 8 all showed growth on blood agar plates and in brain broth. The cultures on blood agar were white or grayish white, often slightly yellowish, granular in appearance and quite adherent to the culture mediums. In brain broth the growth was granular, showing a tendency to pellicle formation. Smears of the organism showed it to be a definite diplococcus, the transverse diameter being greater than the length of the axis. It was strongly gram positive. The patient's serum agglutinated the organism completely in dilutions of 1 to 5,120, 2 plus in dilutions of 1 to 10,240.

The organism was obviously an unusual etiologic agent in subacute infectious endocarditis. Further studies were carried out with the assistance of Dr. Noble P. Sherwood, professor of bacteriology in the University of Kansas. In semisolid mediums, acid was produced in dextrose, lactose, saccharose, mannite and maltose but not in inulin. No gas was produced in these mediums.

The diplococcus was strongly gram positive on isolation and for several successive generations but after cultivation for two months on artificial mediums became gram negative. It was not pathogenic for rabbits and guinea pigs and only slightly pathogenic for mice. Further study showed it to resemble *Neisseria perflava* except for the fact that it was originally gram positive.

The similarity of this organism to *Micrococcus pharyngis siccus* is obvious. Weed, Clapper and Myers<sup>3</sup> in 1943 reported a case of endocarditis caused by *Micrococcus pharyngis siccus* with recovery after treatment with heparin and sulfapyridine. They collected reports of 4 cases of endocarditis caused by this organism, beginning with the original case reported by Schultz<sup>4</sup> in 1918. Dammin<sup>5</sup> in 1941 described a fatal case of endocarditis due to an unidentified coccus which was gram negative constantly and did not ferment lactose or mannite, possibly *Micrococcus pharyngis siccus*. The differences between the organism we have isolated and *Micrococcus pharyngis siccus* are obvious. The former organism was originally gram positive and *Micrococcus pharyngis siccus* gram negative; our organism ferments lactose and mannite, *Micrococcus pharyngis siccus* does not.

The exact classification of the diplococcus found in our case of endocarditis is difficult. It has the cultural characteristics of *Neisseria perflava*, except that when first isolated it was gram positive and became gram negative only after cultivation on artificial mediums over a period of two months.

The patient was started October 8 on sulfamerazine in doses of 10 Gm. by mouth every twenty-four hours. The temperature, which for four days had ranged from 101 to 104 F., fell sharply and did not exceed 101 during the next three days. From October 21 to October 31 the temperature did not exceed 100 F. and from November 1 until the dismissal of the patient from the hospital on Feb. 24, 1944 remained normal. The patient received 10 Gm. of sulfamerazine by mouth daily for two months. It

was then reduced to 4 Gm. daily for one month and then to 2 Gm. daily. This dosage caused no digestive symptoms, no leukopenia, no anemia nor any other untoward symptoms. The blood concentration of sulfamerazine varied from 13 mg. to 24.4 mg. per hundred cubic centimeters. The average concentration during the two months the patient received 10 Gm. of sulfamerazine daily was 17.7 mg. per hundred cubic centimeters. Following the administration of sulfamerazine, a blood culture on October 15 was negative for growth and eight succeeding blood cultures were negative.

On Jan. 22, 1944 the patient had an attack of paroxysmal auricular fibrillation lasting six hours. On questioning him it was learned that he had had similar attacks before entering the hospital. He was dismissed from the hospital on February 24, his temperature having been normal for four months. The patient was readmitted to the hospital on May 15, suffering from an infected ingrown toenail, and was kept under observation for two weeks. His temperature was normal during this period. One blood culture was negative. The loud systolic mitral murmur was still audible. He was again admitted to the hospital on October 28, suffering from a mild cardiac failure. The patient showed some pitting about the ankles, and the mitral murmur was still easily heard. The patient's temperature was normal, and two blood cultures showed no growth.

## Council on Foods and Nutrition

### SPECIAL ARTICLE

*This is the second of a series of articles discussing the significance of protein nutrition in health and disease. This material was prepared by the authors at the request of the Council and has been authorized for publication.*

GEORGE K. ANDERSON, M.D., Secretary

## IMPORTANCE OF ADEQUATE PROTEIN NUTRITION IN PREGNANCY

PHILIP F. WILLIAMS, M.D.

PHILADELPHIA

It is an incontestable fact that a pregnant woman differs from other persons in her protein needs. To the basic need of the nonpregnant woman for material building and repair there are added during pregnancy the demands of an increased metabolism, the storage of nitrogen, the growth of the woman's body, the necessity for meeting needs of fetal growth and repair, the growth of the mammary tissue and the hormonal preparation for lactation. Under ordinary circumstances a desirable allowance of protein is considered to be 1 Gm. for every kilogram of body weight in an adult, but nutritional authorities agree that an increase to 1.5 Gm. per kilogram is safer to supply the demands of fetal and maternal growth and tissue repair in the latter half of pregnancy.

The increased requirements of the pregnant woman have been emphasized by the allowance of this nutrient factor recommended by the Food and Nutrition Board of the National Research Council.<sup>1</sup> Their suggested allowances provide an increase to 85 Gm. for the average pregnant woman and to 100 Gm. for the lactating woman above the 60 Gm. suggested for the nonpregnant woman of equal weight. This stepping up of the protein intake to approximately 1.5 Gm. per kilogram of body weight during pregnancy and to 2.0 Gm. per kilogram during lactation in a woman weighing 56 Kg. presupposes a previously normal protein intake and nutritional status.

Recent surveys of food intakes of various groups in widely separated areas show diets less than satisfactory with respect to protein to be common. In a group of 514 pregnant women in Philadelphia the average intake of protein in a diet was 66 Gm. per day.<sup>2</sup> Burke,<sup>3</sup> Tompkins,<sup>4</sup> Leamy,<sup>5</sup> Arnell<sup>6</sup> and others have shown similar defects. When expressed in terms of desired body weight based on height, age and month of gestation, 92.7 per cent of the group of 514 pregnant women studied in Philadelphia received less than the recommended allowance of 1.5 Gm. per kilogram daily. If in pregnancy an intake of 1.5 Gm. of protein per kilogram is regarded as an index of a diet surely adequate in protein it was found that in the group of 514 pregnant women studied in Philadelphia only 13 per cent were receiving such a diet. Burke<sup>3</sup> found that in Boston 19 per cent of a group of pregnant women were receiving a good protein diet, while Ebbs<sup>7</sup> in Toronto found only 24 per cent.

Such defects in the diet may be caused by certain factors: economy, ignorance, custom or habit, actual or supposed food idiosyncrasies and erroneous advice. All but the first of these factors could be overcome by proper education. Students of the subject of nutrition have remarked that even in low economic groups an educational campaign of effective and intelligent nutrition teaching has been absorbed readily and used well. Restrictions in protein intake or deficiencies in this factor are almost invariably accompanied by restrictions or deficiencies of other equally important factors. The minor nutritional deficiencies of a woman often become apparent only under a diet efficiency test of pregnancy,<sup>8</sup> when the physiologic strain of the condition reveals the borderline status of nutrition.

Deficiencies in the protein content of the diet of the pregnant woman lower her nitrogen level, deplete the body tissues by utilizing them for the normal protein needs, lower the serum protein level content and may lead to nutritional edema. By altering the colloid osmotic pressure of the serum protein, the dietary protein insufficiency may predispose to the toxemias of pregnancy. Anemia, poor muscle tone of the uterus, lowered resistance to infection and insufficient lactation may all result from a low plane of protein intake.

It should be borne in mind in discussing protein malnutrition in pregnancy that many such instances are occasioned by a long standing deficit. In other cases gastrointestinal disorders may hinder digestion or absorption. When early pregnancy has been characterized by excessive vomiting an acute protein deficit may be produced which will require an increased increment of protein during the remainder of the pregnancy.

Specific obstetric complications have been pointed out by Tompkins<sup>4</sup> in his study of the signs of nutritional deficiencies in pregnancy. In two groups of women, a control group on a diet of their own choosing and a study group receiving a diet well balanced and with a content of 110 Gm. of protein, it was noted that toxemia and mild hypertension were four times more frequent in the control group; edema was five times as frequent, preeclampsia eight times as frequent. Holmes<sup>9</sup> observed the clinical results in 1,400 pregnant women

patients. The protein intake in one group ranged from 60 to 70 Gm. daily; in the other group the protein intake ranged from 110 to 120 Gm. daily. He found the incidence of toxemia, using as a criterion a blood pressure of at least 140/85 irrespective of the presence of albuminuria, was twice as frequent in the low protein group as in the high protein diet group.

Proteins in the diet are derived from both animal and vegetable sources. The animal proteins of meat, milk, eggs, cheese, poultry and fish should form at least 66 per cent of the protein requirements of the pregnant woman, since they furnish all the essential amino acids and are therefore of the highest biologic values. The remaining proteins are supplied by vegetables and nuts, such as peanuts and cashews, and legumes, especially soy beans and dried peas, and other lentils, and from bread and cereals of whole grain, particularly wheat. The vegetable proteins are inadequate sources of certain amino acids and, while they cannot replace entirely the animal proteins, they should be used not only as an accessory source of protein supply but for other essential food factors which they contain.

The metabolism of protein has been the subject of many years' study by physiologists. The experiments of Macy,<sup>10</sup> Hunscher,<sup>11</sup> Coons<sup>12</sup> and others on the metabolism of pregnancy have shown that patients store up large amounts of nutritive factors by nitrogen retention in their bodies. If such storage is steady and continuous, the nitrogen balance is regarded as normal. To this storage, which should be present in pregnancy, the term "positive nitrogen balance" is applied. Wilson<sup>13</sup> has shown that this storage of nitrogen begins as early as the tenth week of gestation. The storage of nitrogen at various periods has been regarded as in excess of the normal demands of growth of the products of conception and the maternal organism. It is believed that such a storage is in preparation for lactation. Hunscher and her associates<sup>11</sup> calculated that the net gain to the maternal organism during pregnancy can be 250 Gm. of nitrogen. The gain possibly varies in different persons between 200 and 400 grams.

During the puerperium the nitrogen balance of a woman shifts to the negative side, and this is due most likely to the loss incurred in the involutional process of the uterus and pelvic tissues. Lactation makes large demands on the remaining nitrogen stores, and the food intake of a nursing mother should contain an adequate amount of protein to supply both the maternal needs and the essential amino acids to be transferred in her breast milk for the growth of the child. The daily diet of the lactating woman should therefore include 1 quart of milk, two eggs and a large serving of meat, which will furnish approximately 84 Gm. of protein. The proteins from other items in a well balanced diet will usually suffice to bring the total protein intake to 2 Gm. of protein per kilogram of body weight in the average 56 kilogram woman.

Anemias of various types and degrees are frequent during pregnancy. Bethel, Gardiner and McKinnon<sup>14</sup> have described as a dietary deficiency anemia one in which the red blood cell count is below 3.5 million per cubic millimeter and in which the volume index is above 1.1, as contrasted with an iron deficiency type of

anemia in pregnancy in which the hemoglobin falls below 10 Gm. per hundred cubic centimeters with a lowered mean corpuscular hemoglobin and a color index below 0.9. Such an anemia associated with inadequate food intake is regarded as a true macrocytic anemia, and in its more serious manifestations it is probably identical with the so-called pernicious anemia of pregnancy. Bethel and his associates found no such anemia when the daily intake of animal protein was above 50 Gm., but the incidence rose rapidly with the increasing deficiency of animal protein and reached 40 per cent of those studied when the daily animal protein intake was below 30 Gm. In the treatment of severe degrees of such anemia they suggest that the daily intake of animal protein should be adjusted to a compensatory high plane.

Arnell<sup>6</sup> broke down his series of 200 cases with regard to hemoglobin and found a progressive diminution in hemoglobin volumes as the protein intake in the diets decreased. Arnell points out that hemoglobin contains protein as well as iron and that a deficiency in either iron or protein usually means an inadequacy in the intake of the other, and probably many of these anemias were caused by long standing nutritional deficiencies in both factors. In all cases significant increases in blood values were followed by improvement in the animal protein content of the diet.

There has been a great deal of discussion on the relationship of protein in the diet to the toxemias of pregnancy. There have been two schools of thought on this subject. The first, holding the idea that a high protein intake was responsible for toxemia of pregnancy, has lost ground as the result of controlled clinical experiences. It has not been found that a high protein intake in the diet is capable of producing the specific toxemias of pregnancy. There is reason to believe, however, that where there is nitrogen retention, as in chronic renal disease, or where acute inflammatory processes, as in acute glomerulonephritis, are present, a modified protein intake is in order.

Strauss<sup>15</sup> has contended that a diet low in protein may be a cause of toxemia of pregnancy. He feels that with a dietary protein deficiency the fetus draws on the maternal organism for its dietary factors, including its protein precursors. If the mother's protein intake has been barely sufficient for her own economy, the depletion of her protein in the last trimester of pregnancy would be pronounced, using up the various protein reserves and finally the plasma protein.

When the plasma protein becomes depleted, the balance between the intracapillary hydrostatic pressure and the colloid osmotic pressure of the blood becomes disturbed. As a result an excess of extracellular tissue fluid, edema, presents itself, with a consequent disturbance in the electrolyte balance and a resulting inefficiency in the liver and kidney function, elevation of blood pressure and other signs of specific toxemias of pregnancy. Strauss feels that the development of true toxemia of pregnancy can be prevented by maintaining the pregnant woman's plasma proteins at a high level through adequate dietary protein and suggests an average of 130 Gm. of protein as an optimal amount in a balanced diet.

Dieckmann<sup>16</sup> and other observers do not believe that eclampsia or preeclampsia is due to a hypoproteinemia.

Dieckmann states that he did not find any correlation between the serum protein concentration and the amount of edema. Only 16 per cent of preeclampsia and 12 per cent of the eclamptic women whom he studied showed a serum protein concentration at the edema level or lower, indicating that the edema in the majority of toxemic women was not occasioned by hypoproteinemia.

Harden<sup>17</sup> attempted to stabilize the protein intake against the maintenance needs and the urinary loss in a large series of preeclamptic patients. He had considerable success in preventing the occurrence of convulsions in his preeclampsias by this method of treatment. Dieckmann<sup>18</sup> states that the general experience is that loss of protein in the urine cannot be prevented by increasing the dietary protein intake.

It seems reasonably sure that pregnant women with liberal intakes of protein seldom develop the specific toxemia of pregnancy, although there may be cases in which the protein dietary adequacy alone may not prevent or cure. Kooser<sup>19</sup> found a median protein intake of 45 Gm. daily in one group of women among 4,000 obstetric patients of the Frontier Nursing Services in Kentucky. This must be regarded as a very low dietary intake of protein, and yet but 3 per cent incidence of all types of toxemia and 0.2 per cent incidence of eclampsia were observed.

Arnell and Guerriero<sup>20</sup> have discussed a group of women who had extreme edema during pregnancy associated with pronounced hypoproteinemia without signs of toxemia of pregnancy. The condition was considered as being due to a long continued protein malnutrition occasioned by inadequate dietary protein, in some instances in combination with deficiency in absorption and utilization of the ingested protein. They noted a diminution in the colloid osmotic pressure in the serum protein of these women and called attention to the influence of a high intake of sodium by the group. With a high protein diet which included parenteral protein in the form of plasma or whole blood these women quickly recovered. Plasma was regarded as more suitable than whole blood because it contains more protein in proportion, but transfusion was selected for cases which presented a complicating severe anemia.

Evidently a combination of factors is operative in hypoproteinemia, namely inadequate calories, ill balanced diet, ineffective protein ration and large fluid intake.<sup>21</sup> Probably an impairment of or injury to a specific mechanism for serum protein formation forms a large factor in the production of hypoproteinemia.<sup>22</sup> For the maintenance of normal plasma protein levels and prevention of edema, animal protein has been found to be twice as effective as vegetable protein.<sup>23</sup>

The interrelationship of protein with other dietary constituents is a complex problem. It is generally agreed that dietary proteins are used more economically and stored to better purposes when their digestion and metabolism are associated with those of carbohydrates. The nitrogen sparing action of carbohydrates is con-

sidered to be superior to that of fat. A large number of small meals appears to be more effective in protein economy than the same amount of food distributed over two or three meals. It is believed that the level of dietary protein has little or no effect on the vitamin economy.

Of particular interest in the need for high supply and exceptional absorption of calcium in the reproductive processes are the recent experiments of McCance, Widdowson and Lehman.<sup>24</sup> They have shown that in the presence of a high protein intake 15 per cent of the calcium was absorbed as compared with an absorption of only 5 per cent in the case of a low protein diet. This probably means that the amino acids facilitate calcium absorption. As a result, in persons or races in which calcium intake is low or absorption poor a high protein diet may convert a calcium deficiency into sufficiency. This interrelationship should be significant in pregnancy.

Although many advances have been made in recent years in the artificial nutrition of newborn infants, the preference for breast feeding is still emphasized by pediatricians. Human milk should supply the infant with the indispensable components needed for growth.

The first step in ensuring an adequate supply of proper quality of breast milk must begin in pregnancy. An adequate intake of varied proteins is essential to provide for the growth of the breast and to permit it to withdraw sufficient amino acids for synthesis to form the particular protein characteristic of the mammary secretory elements. The specific protein whose hormonal action (prolactin) is necessary for the continued production of milk is also synthesized from amino acids.<sup>25</sup>

According to Tolley<sup>26</sup> it is improbable that milk protein arises from blood amino acids. Plasma proteins are probably utilized for the synthesis of caseinogen. The important source of milk proteins is some fraction of plasma protein which is estimated as globulin. The growth of the breast requires a storage of 17 Gm. of nitrogen.<sup>10</sup> Meigs<sup>27</sup> states that protein is the most important limiting factor for lactation in cows, the milk yield varying directly with protein intake. It is common practice in animal husbandry to feed protein in excess of maintenance requirements of pregnancy in preparation for lactation. The experiments of Richards<sup>28</sup> in experimental animals, whose basic diets were supplemented by milk ration, showed a higher proportion of young per litter reared than in a group receiving a basic diet alone. The importance of class A proteins, particularly milk proteins, in the diet of the nursing mother has been emphasized frequently.

The human infant in its early weeks consumes from 1 to 1.5 Gm. of nitrogen daily in breast milk, according to Macy and Hunscher.<sup>10</sup> The same observers have pointed out that in order to maintain nitrogen equilibrium in the lactating mother over the nitrogen requirements for maintenance there must be a daily intake of 2 Gm. of nitrogen for every gram of nitrogen in the milk. This high withdrawal rate usually leads to a negative nitrogen balance in the maternal organism. The deduction follows that 100 Gm. of protein in the diet of the lactating mother would be a sufficient intake.

Others have recommended even higher allowances. Clinical observations on mammary secretion and infant weight gain with various types of diets brought the conclusion by Adair<sup>29</sup> that liberal protein feeding is of definite value in securing the maximum milk supply from nursing mothers.

Burke<sup>3</sup> recommends an intake of 2 Gm. of protein per kilogram of body weight for the lactating mother. The advantage of a high protein diet in promoting successful breast feeding has been demonstrated by Ebbs.<sup>7</sup> In a study of three groups of women with low income, dietary supplements of protein of high biologic value, milk, eggs and cheese were furnished to one group. The members of a second group were educated and encouraged to provide a good antepartum diet. These two groups were much more successful in nursing their infants than the mothers in the third group, who had been left on their poor antepartum diet. Breast feeding was considered successful in 95 per cent of those women with supplemented diet, 88 per cent in those educated to a good diet and but 81 per cent in the poor diet group. An interesting observation in connection with this study was the decrease in breast feeding when the supplemental foods were discontinued at the end of six weeks post partum. While mental attitude on the part of the mother may have had an influence in the decrease, it was felt that the sudden withdrawal of essential food factors had possibly altered the secretion and quality of the breast milk.

The history of large blood loss during menstruation or the occurrence of postpartum hemorrhage, of prolonged puerperal loss of blood from subinvolution or other obstetric complications or of a renal lesion or toxemia with pronounced albuminuria should be regarded as indicating increased protein intake if lactation is to be successful.

It should be remembered that if enough protein is not furnished in the maternal diet to supply both maintenance needs and the protein of the milk secreted a loss of maternal body tissue will occur. A high animal protein ingestion is necessary in lactation to supply liberally in the milk those proteins which cannot be synthesized in the body of the newborn.

There can be no doubt that increased intake of protein is essential for the well being of the pregnant woman and her unborn fetus. Her ability to produce suitable food efficiently for the newborn child depends greatly on the same material. Certain factors, such as economic, educational and social, are involved in her receiving an adequacy of this necessary food substance. At the present time employment of women in industry during pregnancy and the necessary governmental regulations on food rationing<sup>30</sup> may play a part in determining the quality and quantity of her protein needs and intake.

Just as the mother is instructed in the hygiene of pregnancy, so should she be individually instructed in the quantity and quality of food which she should eat. The importance of adequate protein in the diet should be explained, and sufficient instruction and financial assistance should be given to enable her to obtain it. The education of the pregnant woman in the basic principles of nutrition will redound to her own health, the well being of the baby and the benefit of her family as a whole.

## FERROUS VS. FERRIC IRON

Since the latter part of the seventeenth century it has been known that the red blood cell contains iron; this element forms part of the molecule of hemoglobin and with it is associated the remarkable ability of this pigment to carry oxygen. One of the most direct therapeutic technics is the administration of salts of iron in certain types of anemia; when the condition is due largely to low iron intake or to defective utilization of iron, and when a trace of copper is present, regeneration of hemoglobin follows such treatment. Once it was believed that iron in organic combination is superior to inorganic iron salts. Likewise the debate regarding the efficacy of ferric or trivalent iron salts like ferric ammonium citrate, as compared to that of ferrous or divalent iron such as is present in ferrous carbonate, has persisted. Part of the difficulty undoubtedly has arisen from the variation in criteria employed for judging the comparative behavior of the two types of iron salts; again certain of the experimental devices are doubtless rendered less reliable because of the difficulty in analyzing tissues for iron quantitatively.

Studies on the human being generally indicate that ferrous iron is superior to ferric iron. Thus the chloride and sulfate of ferrous iron were more effective in infantile anemia than ferric iron.<sup>1</sup> On the basis of increase in the iron of the serum, Moore and his associates<sup>2</sup> observed better absorption of ferrous iron than of the trivalent form. From the point of view of iron in nutrition, McCance and his co-workers<sup>3</sup> showed that ferrous iron was absorbed better than ferric iron and that the phytic acid in cereals interfered with the utilization of ferrous iron to a lesser extent than with ferric iron. Experiments with mice, rabbits and pigs have also been cited in favor of the superiority of ferrous

iron.<sup>4</sup> Many studies with experimental animals, however, have indicated little, if any, superiority of one form of iron over the other on the basis of absorption.<sup>5</sup>

The dilemma with respect to the preference of one form of iron over the other in therapy seems to be cleared somewhat by the recent investigation of Moore and his associates,<sup>6</sup> in which radioactive iron was used as the indicator and the speed of its appearance in the circulation erythrocytes after a test dose was the criterion of utilization. In human subjects the divalent iron (ferrous) was distinctly superior, whereas in dogs no regular distinction between the two forms was demonstrated. Although ferrous iron is likely to be tolerated better by human patients than is the more soluble ferric salts,<sup>7</sup> there appears, from the most recent evidence with labeled (radioactive) iron, to be a real difference in the utilization of the two forms of iron in man. In experimental animals, on the contrary, the distinction seems much less obvious.

## WILHELM KONRAD ROENTGEN—THE CENTENNIAL OF HIS BIRTH—SEMICENTENNIAL OF THE X-RAYS

On March 27, 1845 Wilhelm Konrad Roentgen was born in Lennep, Germany. He received his early education in the Netherlands and then studied under Clausius, teacher of Willard Gibbs, in Zurich, Switzerland. At Würzburg he became assistant to Kundt. In 1874 he became privatdozent at Strasbourg University. In 1875 Roentgen was made professor of mathematics and physics at the Agricultural Academy of Hohenheim. He returned to Strasbourg in 1876, where he became extraordinary professor. In 1879 he was appointed ordinary professor of physics and director of the Physical Institute of Giessen, and in 1885 he became professor at Würzburg. Here in 1895, at the age of 50, Roentgen discovered the x-rays.

In 1895, while experimenting with a highly exhausted vacuum tube (Crookes) on the conduction of electricity through gases, he observed the fluorescence of a barium platinocyanide screen which happened to be lying near. Further studies disclosed that this radiation could pass through various substances which are opaque to ordinary light and could also affect a photographic plate. On Dec. 28, 1895 Roentgen<sup>1</sup> communicated his discovery of the x-rays to the president of the Physica-

lisch-medicinische Gesellschaft of Würzburg. On Jan. 23, 1896 Roentgen for the first time publicly presented his discovery before the Physical Medical Society of the University of Würzburg. Kolliker suggested the name roentgen rays. For this discovery Roentgen received the Rumford medal of the Royal Society in 1896 jointly with Philip Lenard, who, with Hertz, showed that a portion of the cathode rays could pass through a thin film of a metal such as aluminum. In 1901 Roentgen received the Nobel prize for physics.

When attempts were made to credit his discovery to his assistant, Roentgen was deeply hurt and became accessible only to his students and a few friends. He died in Munich on Feb. 10, 1923.

The original discovery of the x-rays opened the way to many additional advances useful in the practice of medicine. In 1898 W. B. Cannon studied the movements of the stomach and in 1902 of the intestine in animals with bismuth. Between 1909 and 1912 Holzknecht, Haudek and Groedel popularized the use of the fluorescent screen and made the first good serial plates of the stomach in man. In 1923 and 1924 E. A. Graham and W. H. Cole devised roentgenography of the gallbladder.

William J. Morton, it is claimed by some, was the first American physician to make x-ray pictures. His book on "The X-Ray, or Photography of the Invisible, and Its Value in Surgery," in collaboration with E. W. Hammer, was published in 1896. Carl Beck published his work on "Roentgen Ray Diagnosis and Therapy" in 1904. Beck and Cannon were among the first to apply bismuth in x-ray studies. Beck was the first to use bismuth in the study of human disease, according to Arturo Castiglioni. Mention should be made of the books published by Pusey and Caldwell.<sup>2</sup>

Holzknecht and Kienböck introduced scientific dosage in 1900-1902. It was Albers-Schonberg, inventor of the compression diaphragm in 1902-1903, who devised the leaden chamber for the protection of operators from sterility. Perthes introduced high voltage therapy in 1903 and noted the effects of radiation on the growth of young animals. In 1913 Coolidge<sup>3</sup> introduced the Coolidge tube. Bucky<sup>4</sup> gave us the Potter-Bucky diaphragm.

The debt of medicine to roentgenology is vast indeed. What serious errors of omission and commission, what tragedies, have been avoided by use of the roentgen rays! How many unnecessary operations have been avoided! How many lives have been saved by prompt operations and the avoidance of delay and procrastination, because of the life saving aid in diagnosis, so

often given by the roentgen rays! The centennial anniversary of Roentgen's birth and the semicentennial anniversary of his discovery (1895) of the x-rays are fittingly made an important event through celebrations by the gastroenterologic associations all over the world during 1945.

## Current Comment

### CHRONIC TOXICITY OF ERGOT

The chief source of ergot is rye infested with ergot ascospores. A cold wet season prolongs the period of infestation but reduces the yield of grain. The most recent extensive human epidemic of ergotism occurred in Russia after the cold wet summer of 1926. A mild epidemic occurred in Manchester, England, in 1928. Epidemics have not occurred in the United States. The clinical symptoms of ergotism are correlated with the amount present in the rye. Ergotism appeared whenever as much as 1 per cent was present in the rye; 7 per cent of ergot caused fatal poisoning. In addition to ergot other factors seem to be concerned in the production of ergotism. Animal experiments, though not conclusive, indicate that vitamin A deficiency increases the severity of the convulsive form of ergotism. In spite of early and great attention to the use of ergot medicinally, there has been no thorough investigation of the chronic effects of ergot on laboratory animals. Fitzhugh and his associates<sup>1</sup> demonstrated the influence of protein on a form of ergotism. They fed small amounts of ergot in different diets for the approximate lifetime of the rat. The experiments were performed on 20 female rats, which were started at 3 weeks of age on doses of 1, 2 and 5 per cent of ground crude ergot in a diet containing relatively high quantities of protein, and on a control group of 20 female rats. A second series of animals were started with the same levels of ergot but a low protein diet. There were 18 animals in each group and they were chosen at random with regard to litter mates. Each group contained an equal number of males and females. Ergot retarded the growth rate of the rats, and this effect was more pronounced in male animals during the early growing period. With an adequate diet the 1 and 2 per cent of ergot did not retard the growth of the female animals. On a low protein diet the growth rates, except for those of the female rats on the 1 per cent ergot, were significantly different from the controls. Histologically typical neurofibromas were produced on the ears of a high percentage of rats fed 5 per cent of ergot. The tumor occurred less frequently on the level of 2 per cent of ergot, rarely on a level of 1 per cent, and did not occur in the controls. A low protein diet somewhat favored the production of ear tumors. Tumors other than neurofibroma of the ear occur spontaneously in the older rats, and the incidence of these was about doubled in the rats that were fed ergot. Two other lesions, necrosis and calcification of the lower ends of

the renal pyramids, and corpus luteum hyperplasia of the ovaries were frequently caused by feeding of the ergot. Cutaneous gangrene or vascular lesions attributable to ergot were not observed. In a fractionation study whole ergot was less toxic than defatted ergot. Ergot oil caused little or no toxicity. There is an indication that the alkaloid ergotoxine may be slightly toxic in the amount found in 5 per cent of ergot. It slightly retarded the growth rate of rats during the early period. The exact constituent of the crude ergot responsible for the tumor production is not known. The fact cannot be ignored that 1 rat on the ergotoxine did develop a typical neurofibroma of the ear.

#### HANDBOOK OF PHYSICAL MEDICINE

From the Council on Physical Medicine of the American Medical Association has just come a new Handbook of Physical Medicine, representing a series of articles published in part in *THE JOURNAL* and covering for the general practitioner a review of the uses of physical medicine. This work, formerly published as the Handbook of Physical Therapy, is essentially a new contribution. It represents, however, twenty years of work by the Council on Physical Medicine of the American Medical Association. The purpose of this handbook is to bring the use of physical therapy more directly into the practice of general medicine, surgery and various medical specialties. The chapters cover the effects of heat, massage, body mechanics, exercise, occupational therapy, water, electrical energy and radiation on the body in general, with special articles covering fractures, infantile paralysis, psychiatric practice and dermatology. The revival of interest in physical therapy now demonstrated by the grants that have become available through the Baruch Committee on Physical Medicine and through the National Foundation for Infantile Paralysis adds special value to the convenient Handbook of Physical Medicine developed by the Council on Physical Medicine.

#### INACTIVATION OF MALARIAL PARASITES BY X-RAYS

The selective sensitivity of various diseased tissue to x-rays has important medical implications. Recently Bennison and Coatney<sup>1</sup> tested the sensitivity of some species of malarial parasites to x-rays. In vitro both the sporozoite and the trophozoite forms of an avian malarial organism were found to be sensitive to x-rays. Of the two, the sporozoite form could be more easily inactivated. While doses of x-rays of less than 10,000 roentgens do not cause inactivation of the trophozoite form, there was a somewhat increased survival time of infected chicks. Also there was a noticeable increase in time after injection of infected blood before the birds showed positive blood smears. With this sensitivity in mind infected birds were irradiated, and under the conditions used there was no significant change in the survival time. *Plasmodium malariae* was irradiated in vitro and this treated blood then injected into a patient suffering from syphilis of the central nervous

system. In the following thirty-two days no symptoms of malaria developed and no parasites were found in the blood smears. It appears that the organisms had been completely inactivated under the conditions of irradiation. The subject was later treated with the unirradiated blood and developed typical malaria. The prolonged prepatent period and also the increase in survival time of the chicks receiving the irradiated organism suggests that some of the parasites were totally inactivated, thus leaving only a small number to initiate the infection. It is believed that the cells most sensitive to x-rays are those in the process of division. It may be possible to inactivate selectively the malarial organism while it is in the process of reproduction. This would be difficult with the avian strain used, since all stages of the cycle are present in the blood stream at one time. However, in the highly synchronous infections with *Plasmodium malariae* of man practically all the parasites at a given time are at the same stage of development and one of these phases may well be sensitive to x-rays.

#### METHYLENE BLUE TEST FOR URINARY BILIRUBIN

A sensitive test that would reveal the prejaundice stage of liver damage would be useful. In 1933 Fellingner and Menkes<sup>1</sup> described a method for the quantitative determination of bilirubin in the urine with methylene blue. The qualitative test as described by Myers<sup>2</sup> consists in adding two drops of Loeffler's methylene blue to 10 cc. of urine. The solution remains dark blue if negative but turns a brilliant green if positive. The test is immediate and is not changed by temperature or the acidity or alkalinity of the urine. It can be read in natural or artificial light. In determining the quantitative value of the methylene blue test a method of simple dilution of the urine was done routinely. To keep the volume at 10 cc., 1 cc. of urine was replaced by 1 cc. of water for the first dilution, 2 cc. of urine by 2 cc. of water for the second dilution, and so on until a negative test was obtained. In all cases in which positive methylene blue tests of the urine occurred, a serum bilirubin test was done immediately. Of the 59 cases of elevated serum bilirubin found among a group of employees exposed to tetrachlorethane, not one was found in which the methylene blue test of the urine was negative at the onset. The test was used on patients hospitalized for acute toxic hepatitis. Urine specimens were obtained each day on which a serum bilirubin test was done. The peak of the rise of bilirubin in the urine was present several days before the bilirubin in the serum reached its highest level. As improvement occurred, the urine became negative more promptly than the serum reached its normal level. More information is necessary to evaluate accurately the methylene blue test. Judging from the cases reported it is valuable in detecting early liver damage and thus avoiding further exposure to the toxic tetrachlorethane fumes.

# MEDICINE AND THE WAR

## ARMY

### 365,437 PRISONERS OF WAR IN THE UNITED STATES

The War Department recently announced that there were 365,437 prisoners of war held within the continental limits of the United States as of April 1: 311,630 German, 50,549 Italian and 3,258 Japanese. The prisoners are being held at 141 base camps and approximately 319 branch camps located in all sections of the United States. The branch camps are designed to place prisoners near current work projects. About 35,000 of the Italian prisoners of war were members of Italian service units directly engaged in war work. They contributed almost a million man days of work to the war effort during the month of March. Of the remaining war prisoners, an average of more than 43,000 were working on contract labor and more than 150,000 were working at Army, Navy and Air Corps posts, camps and stations. Additional prisoners were assigned to "housekeeping" duties within their own prisoner of war compounds, and the remainder of those not working were either hospitalized or officers or nonworking noncommissioned officers who cannot be forced to work under terms of the Geneva Convention.

Prisoners working on posts, camps and stations during March were employed principally in the laundries, in clothing and equipment, in warehouses, in quartermaster shops, in the maintenance of buildings, utilities, grounds and roads, in motor maintenance and repair and in bakeries and messes of American officers and enlisted men.

### MEDICAL-SURGICAL CONFERENCE AT 300TH GENERAL HOSPITAL

Probably the largest military medical meeting ever held overseas was sponsored by the 300th General Hospital January 26-27 at the hospital in Italy. More than 600 officers attended, drawn from all over the Mediterranean Theater of Operations. The General Sessions, which were presided over by Col. George W. Reyer, commanding officer of the 300th General Hospital, were featured by addresses by Major Gen. Morrison C. Stayer, surgeon Mediterranean Theater of Operations; Brig. Gen. Joseph I. Martin, surgeon Fifth Army; Col. Frank Berry, surgical consultant Seventh Army; Col. Perrin Long, medical consultant Mediterranean Theater of Operations, and Lieut. Col. Tracy B. Mallory of the 15th Medical General Laboratory. The scientific sessions were divided into a medical and a surgical section, and each of these had programs running simultaneously composed of papers, lantern slide lectures, clinical demonstrations, ward rounds and reports of cases.

### OPEN SCHOOL FOR WAC OFFICERS AT PURDUE

A school for Women's Army Corps officers assigned to administrative duties with WAC troops was recently opened at Purdue University, West Lafayette, Ind. Courses in personnel management and a study of the most successful administrative practices evolved in the various army commands to which Wacs are assigned is an important part of the school curriculum. Each class will attend the school for a two and a half week period. Ninety WAC officers, drawn from the various commands throughout the continental limits of the United States, have reported for each class.

Curriculum and training doctrine of the school will be under the supervision of the Personnel Division, War Department General Staff, and the school will be operated by the Fifth Service Command for the Commanding General of the Army Service Forces. Lieut. Col. Jessie Pearl Rice, Griffin, Ga., is commandant of the new school.

### LIFE OF WHOLE BLOOD FLOWN TO EUROPE EXTENDED

Brig. Gen. Fred W. Rankin, director of the surgical consultants division of the Army Medical Department, recently stated that whole blood, one of the greatest single factors in saving lives of wounded soldiers, is now being flown to the European Theater of Operations under a new system of refrigeration which prolongs the life of this valuable fluid by about one third. Under this system whole blood is suitable for transfusions for a period of about twenty-one days. Expendable iced containers have been developed to keep the whole blood at the right temperature: not below 39 F. or above 50 F. The new system was inaugurated at New York and Washington, D. C. The whole blood is collected at Boston, New York, Brooklyn, Baltimore and Washington. About 1,200 pints a day will be flown to Europe.

### ARMY AWARDS AND COMMENDATIONS

#### Captain Carl W. Gerardy

Capt. Carl W. Gerardy, formerly of Seagraves, Texas, was recently awarded the Bronze Star for meritorious service in connection with military operations from Jan. 1 to Dec. 31, 1944. Dr. Gerardy is a unit medical officer of the Ninth Air Force Service Command. The citation accompanying the award read, in part, "while serving with the Army of the United States, distinguished himself by operations not involving participation in aerial flight against an enemy of the United States during the period of Jan. 1, 1944 to Dec. 31, 1944. As surgeon of a service team Captain Gerardy was largely responsible for the low incidence of disease on the Air Force station. The devotion to duty, professional skill and superior achievement of Captain Gerardy as a team surgeon have been a material contribution to the service efficiency of his unit." Dr. Gerardy graduated from Baylor University College of Medicine, Dallas, in 1936 and entered the service in June 1943.

#### Captain Ernest D. Geever

The Bronze Star was recently awarded to Capt. Ernest D. Geever, formerly of Chicago. The citation read "for distinguishing himself by meritorious service in connection with military operations against an enemy of the United States from Dec. 6, 1944 to Jan. 20, 1945 in Germany and Belgium. As battalion surgeon, Lieutenant Geever performed his duties in a superior manner. Without hesitation and without an assistant, under the most adverse conditions of enemy action, weather and fatigue, he worked to provide the best medical care of the wounded. The professional skill, humanity and tireless devotion to duty displayed by this officer are in keeping with the finest traditions of the armed forces of the United States." Since the award was made, Dr. Geever has been promoted to captain. He graduated from the University of Illinois College of Medicine, Chicago, in 1943 and entered the service in January 1944.

#### Lieutenant Colonel Manuel E. Lichtenstein

Lieut. Col. Manuel E. Lichtenstein, formerly of Chicago, was recently awarded the Bronze Star. The citation indicated that "as chief of surgical service he efficiently organized the service and conspicuously directed its functions with outstanding professional skill." He also "demonstrated unusual ability as a teacher and was responsible for the superior training results attained." Dr. Lichtenstein graduated from Rush Medical College, Chicago, in 1925 and entered the service Oct. 15, 1942. He is now serving with the Michael Reese Hospital unit with the 5th Army in Italy.

**Captain Earl W. Douglas**

Capt. Earl W. Douglas, formerly of Portland, Ore., and now a flight surgeon with the Ninth Troop Carrier Command, was recently awarded the Bronze Star because of the courage and ability with which he has carried out his duties as dispatcher for the medical air evacuation of casualties from the western front to the great hospitals in England. The award was not made because of any one occasion of bravery but because, beginning with the beachheads of Normandy just after D day, Dr. Douglas has repeatedly gone into invasion fronts with attacking troops, helped set up evacuation tent hospital units at newly captured landing areas and directed evacuation of casualties under fire. Dr. Douglas graduated from the University of Oregon Medical School, Portland, in 1941 and entered the service Oct. 15, 1942.

**Captain Gordon H. Haggard**

The Legion of Merit was recently awarded to Gordon H. Haggard, formerly of Indianapolis, for "service as medical inspector of the 76th Infantry Division, Fort Meade, Maryland, from July to October 1942. His invention and original construction of models of simulated war wounds was used in the production of moulages adopted for use as a standard item of issue and has not only simplified first aid training but has

increased the efficiency of army personnel in the application of medical aid." Dr. Haggard graduated from Indiana University School of Medicine, Indianapolis, in 1933 and entered the service March 27, 1941. He has been reported missing in action since October 1942 (THE JOURNAL, January 13, p. 95).

**Lieutenant Colonel Howard A. Patterson**

Lieut. Col. Howard A. Patterson, formerly of New York, has been awarded the Bronze Star "for coolness under fire and excellent performance of his duties on the Salerno beachhead. His unit was bombed from the air at Salerno and some members were killed. The citation accompanying the award told of his going ahead with a surgical operation while the bombing was in progress. Dr. Patterson graduated from Harvard Medical School, Boston, in 1925 and entered the service July 1, 1942.

**Captain Robert S. Sherman**

The Bronze Star was recently awarded to Capt. Robert S. Sherman, formerly of New York, "for meritorious service from June 10 to Nov. 1, 1944 as chief of the x-ray department of his evacuation hospital operating in France." Dr. Sherman graduated from Harvard Medical School, Boston, in 1935 and entered the service July 15, 1942.

**NAVY****LST HOSPITAL SHIPS SAVED LIVES  
AT IWO JIMA**

Four of the big LSTs at the invasion of Iwo Jima were transformed into floating medical evacuation stations within a few minutes after their amphibious tanks were launched. Remaining close inshore throughout the operation, wounded men were on their operating tables in some instances within twenty minutes after they had been hit. The four ships had been so loaded that all of their tanks would hit the water within seconds after their arrival on the line of departure. These tanks were for the first wave. Navy Medical Corps personnel rode to the operation aboard the "hospital LSTs." Operating tables set up in the troop quarters long before the island was sighted were soon ready. As the last "water buffalo" rolled down the ramp, cleaning crews went to work and before the first wave had reached shore the huge tank decks had been transformed into 150 bed hospital wards. The work of the doctors on the four ships was under the direction of Capt. Robert M. Gillette, formerly of Altadena, Calif.

**EASTERN TUBERCULOSIS CENTER  
FOR NAVY**

The Sampson Naval Training Center Hospital, Geneva, N. Y., has been chosen by the Bureau of Medicine and Surgery as the Eastern tuberculosis center for the Navy east of the Mississippi River. A similar center for the Western half of the country has been established at Corona, Calif. The Sampson center will have 200 beds. Dr. Jacob F. Heinrich will head the new department. On the staff also are Lieut. Comdr. W. C. Jensen and Lieut. Edward Rothstein.

**NAVY AWARDS AND COMMENDATIONS****Lieutenant Stuart Clayton Knox**

Lieut. Stuart Clayton Knox, formerly of Los Angeles, was recently awarded the Gold Star in lieu of the Second Silver Star. The citation accompanying the award read "for conspicuous gallantry and intrepidity during action against enemy Japanese forces in the initial stages of the landings at Empress Augusta Bay, Bougainville, Solomon Islands, on Nov. 1, 1943. When an artillery shell hit a landing boat and inflicted numerous casualties on the troops, Lieutenant Knox courageously directed and assisted in the removal of the injured to a position of safety despite sustained hostile mortar, machine gun and rifle fire. Quickly organizing a defense around the aid station, he

skillfully ministered to the wounded, saving the lives of 2 critically injured men and alleviating the suffering of many others. Lieutenant Knox's personal valor and professional integrity, maintained at great personal risk, were in keeping with the highest traditions of the United States Naval Service." Dr. Knox graduated from the College of Medical Evangelists, Los Angeles, in 1934 and entered the service Oct. 16, 1942.

**Lieutenant Warren Griffith Parish**

The Navy Cross was awarded posthumously to Lieut. Warren Griffith Parish, formerly of Cleveland, "for extraordinary heroism while attached to the third marine division hospital at Gaum, Marianas Islands, during an attack by enemy Japanese forces on July 26, 1944. With the hospital subjected to a fierce and organized attack by hostile rifles, machine guns and mortars while he was performing a series of surgical operations on the wounded patients under his care, Lieutenant Parish calmly and deliberately carried on in the face of bullets and fragments which continually penetrated his station. Only when this vital task had been completed and his patients evacuated did Lieutenant Parish leave his post to render further service by ministering to combat casualties and was himself mortally wounded while proceeding in front of our lines to assist another wounded man. His great personal valor and high professional integrity, maintained in utter disregard of all danger to himself, reflect the highest credit on Lieutenant Parish and the United States Naval Service. He gallantly gave his life for his country." Dr. Parish graduated from the University of Pennsylvania School of Medicine in 1933 and entered the service Aug. 6, 1942.

**Lieutenant Commander James H. MacArt**

The Legion of Merit was recently awarded to Lieut. Comdr. James H. MacArt, formerly of South Orange, N. J. The citation read "for exceptionally meritorious conduct in the performance of outstanding service as acting senior medical officer of a cruiser at the moment when magazines on an aircraft carrier blew up while the cruiser was alongside fighting fires. Although the only medical officer still alive on board the ship and faced with the necessity for the immediate care of a large number of critically wounded, he immediately organized corpsmen and volunteers to care for them. With energy, judgment and proficiency he supervised and administered this care. His coolness, executive ability and professional skill in the face of adversity were an inspiration to all. At all times his conduct was in keeping with the highest traditions of the United States Naval Service." Dr. MacArt graduated from Hahnemann Medical College and Hospital of Philadelphia in 1935 and entered the service June 16, 1942.

## MISCELLANEOUS

HOSPITALS NEEDING INTERNS  
AND RESIDENTS

The following hospitals have indicated to the Council on Medical Education and Hospitals that they have not completed their house staff quota allotted by the Procurement and Assignment Service:

(Continuation of list in *THE JOURNAL*, April 14, p. 996)

## GEORGIA

Grady Memorial Hospital, Atlanta. Capacity, 720; admissions, 13,152. Mr. Frank Wilson, Superintendent (residents—medicine, surgery, urology, obstetrics-gynecology, ophthalmology-otolaryngology, discharged medical officers).

## MICHIGAN

Eloise Hospital and Infirmary (William J. Seymour Hospital), Eloise. Capacity, 6,303; admissions, 4,394. Dr. T. K. Gruber, Superintendent (residents—medicine, surgery, ophthalmology-otolaryngology, July 1, disqualified for military service).

## NEW YORK

Rochester State Hospital, Rochester. Capacity, 3,324; admissions, 657. Dr. J. L. Van De Mark, Director (residents—psychiatry, discharged medical officers and physicians disqualified for military service).

## OHIO

Glenville Hospital, Glenville. Capacity, 135; admissions, 3,411. Mr. A. B. Harris, Superintendent (resident—mixed service, July 1, disqualified for military service).

## WASHINGTON

Pierce County Hospital, Tacoma. Capacity, 239; admissions, 3,032. Mr. Burton A. Brown, Superintendent (2 interns, July 1).

RECORD ENROLMENT IN SCHOOLS  
OF NURSING

The National League of Nursing Education recently reported to the National Nursing Council for War Service that the number of students enrolled in state accredited schools of nursing in the United States had reached an all time high of 126,576 on January 1. In spite of the record total, however, the Nurse Education Division of the U. S. Public Health Service estimates—on the basis of Cadet Corps members enrolled—that 10,000 beginners must be recruited for June classes if this year's quota of 60,000 new students is to be met.

Enrolment by states and by service commands is detailed in the league report. New York, with 13,895, has the highest number of student nurses. Pennsylvania, with 13,588, is second. The third service command, made up of Pennsylvania, Maryland, Virginia and the District of Columbia, is first among the commands with 19,501 students. The second service command, which includes New York, New Jersey and Delaware, is second with 18,473.

A. M. A. MEMBER ON NURSING  
COUNCIL

The American Medical Association recently appointed Dr. F. H. Arestad, assistant secretary of the Council on Medical Education and Hospitals, to represent the Association as a member-at-large on the corporation of the National Nursing Council for War Service. Two other members-at-large were voted into the corporation. They are Major Julia G. Stimson, first chairman of the National Nursing Council, superintendent of the Army Nurse Corps during World War I, and former president of the American Nurses Association, and Miss Ruth Taylor of the Children's Bureau, U. S. Department of Labor.

193,000 PINTS OF BLOOD FLOWN  
TO WOUNDED

Combined figures on East and West Coast flights of whole blood to the war theaters reached 193,000 pints in March. Since the start of the blood flying program over the Atlantic last August 150,000 pints of whole blood has been flown from the east coast to the European theater. This service has made it possible for a wounded man to get blood within twenty-four hours after it has been drawn from a donor here. Shipments

average about 1,200 pints a day, which provides transfusions for 300 to 400 average cases. Whole blood shipments being flown from the West Coast to the Pacific Ocean area have totaled 43,000 pints since the inauguration of the service last November.

Continued donations of type O whole blood are necessary to maintain this life saving service.

## WARTIME GRADUATE MEDICAL MEETINGS

The following subjects and speakers for Wartime Graduate Medical Meetings have just been announced:

## California

Hammond General Hospital, Modesto: Uremia Following Urologic Surgery, Dr. Donald Smith, May 2; Symposium on X-Ray Diagnosis, Medical and Surgical Treatment of Peptic Ulcer, Drs. Leon Goldman, Theodore Althausen and Earl R. Miller, May 15; Laboratory Aids in the Diagnosis of Disease, Dr. Jesse Carr, May 30.

Station Hospital, Hamilton Field: Early Postoperative Ambulation of Surgical Patients, Dr. H. Glenn Bell, May 2; Peripheral Nerve Injuries, Dr. Howard A. Brown, May 9; Fractures of the Extremities, Dr. Carl Anderson, May 16; Diagnosis and Treatment of Arthritis, Dr. Stacy R. Mettler, May 30.

Station Hospital, Camp Roberts: Diagnosis and Treatment of Arthritis, Dr. Hans Waine, May 19; The Treatment of Poliomyelitis, Dr. Henry D. Brainerd, May 26.

Station Hospital, Stockton Army Air Base: The Treatment of Syphilis, Dr. Norman N. Epstein, May 16; Use and Misuse of Endocrine Preparations, Dr. Ernest W. Page, May 30.

Oakland Area Station Hospital, Oakland: Diseases of the Thyroid, Dr. Mayo H. Soley, May 9; Diagnosis and Treatment of Hemorrhagic States, Dr. Paul M. Aggeler, May 23.

## Kentucky

Station Hospital, Fort Knox: Malignancies in the Army Age Group, Dr. Danely P. Slaughter, May 2; Injuries of the Hand, Dr. Sumner Koch, May 2.

Nichols General Hospital, Louisville: Malignancies in the Army Age Group, Dr. Danely P. Slaughter, May 3; Injuries of the Hand, Dr. Sumner Koch, May 3.

## Missouri

Station Hospital, Roscrans Field: Allergy, Dr. Orval R. Withers, May 10; Disease of the Blood, Dr. C. J. Weber, May 10.

## Nebraska

A. A. F. Regional Hospital, Army Air Field, Lincoln: X-Ray of the Gallbladder and Gastrointestinal Tract, Dr. James F. Kelly, May 1; Lesions of the Chest: Surgical Management, Dr. J. Dewey Bisgard, May 1; Benign Tumors of Bone, Dr. Robert D. Schrock, May 1.

## New York

Induction Center, Grand Central Palace, New York: Common Allergic Manifestations, Dr. Joseph Harkavy, May 4; Deleterious Effects of Drug on the Hemopoietic System, Dr. Nathan Rosenthal, May 11 (to be repeated May 18); Deficiency States and Their Recognition, Dr. H. D. Kruse, May 25.

## Pennsylvania

U. S. Naval Hospital, Philadelphia: Chemical Burns of the Eye, Dr. F. H. Adler, May 4; Health Department Military Liaison in Venereal Disease, Dr. Norman Ingraham, May 18.

## West Virginia

Newton D. Baker General Hospital, Martinsburg: Neurosurgical Clinic, Dr. Charles Bagley Jr., May 7; Chemotherapy in Dysentery, Dr. Lay Martin, May 7; Narcosynthesis and Hypnosis, Dr. Addison McGuire Duval, May 21; Peripheral Vascular Diseases Due to Wartime Conditions, Dr. J. Ross Veal, May 21.

# ORGANIZATION SECTION

## Washington Letter

(From a Special Correspondent)

April 16, 1945.

### Congressmen Inspect Veterans Administration Hospitals

Every Veterans Administration hospital has been visited by one or more Congressmen since charges of maladministration were brought before Congress recently. The twenty-one members of the House Veterans Committee were asked by Chairman Rankin of Mississippi to constitute themselves individual investigating subcommittees, and other House members were urged to inspect hospitals in their jurisdictions. Inspections instigated by the Veterans Administration itself are under way by the American Legion, the Veterans of Foreign Wars and Disabled American Veterans, the three national veterans' organizations. They have sent twenty-seven questions to their posts throughout the country to be answered by visits to Veterans Administration facilities in their localities.

### "Pilot Courses" in Diagnosis of Cancer Advocated

"Pilot courses" in diagnosis of cancer at medical schools throughout the country were advocated by the National Advisory Cancer Council meeting at the National Cancer Institute here. Council members emphasized the need of educating third and fourth year medical students to recognize cancer in its earliest stages. This was described as the first line of defense in cancer control. How to increase the number of cancer specialists in the country was discussed, along with a proposal that cancer specialists be appointed in each state to serve as consultants to surgeons in rural and urban areas. Dr. Thomas Parran, Surgeon General of the U. S. Public Health Service, reported that the Army would cooperate fully in sending news of Public Health Service fellowships in cancer study to surgeons with cancer experience in the armed forces.

### Civilian Hospitals Have Million More Patients

An increase of a million in the number of patients admitted to civilian hospitals in this country was reported by Dr. Donald C. Smelzer, president of the American Hospital Association, when announcing May 12 commemoration of National Hospital Day. He reported that civilian hospitals are waging a two front war in a nation requiring their services at home and abroad, their record 54,000 hospital trained nurses and 60,000 hospital trained doctors, many thousands of technicians serving in the armed forces and admission of 12 per cent of the American population to community hospitals in 1944 for civilian hospital care. Dr. Smelzer said that despite a drop in the total number of voluntary hospitals the bed capacity in them had actually grown by several thousands. Shortages of personnel and supplies and the increased demand for hospital care had required patience and understanding from administrators and the communities. May 12 is observed as the 125th anniversary of the birth of Florence Nightingale, who initiated modern hospital practice.

### Quarantine Lowers Deaths from Psittacosis

Quarantine regulations governing importation and interstate shipment of birds of the parrot family have caused a decline in the number of human deaths from psittacosis, or parrot fever, according to Dr. G. L. Dunnahoo and Brock C. Hampton of the U. S. Public Health Service. Stressing the importance of the quarantine regulations, they point out that last June 113 mixed quarantine regulations, they point out that last June 113 mixed Amazon parrots and parakeets entered quarantine at Brownsville, Texas. All but 3 of the birds died, and the virus of parrot fever was found in some of the bodies. Its presence was suspected in the rest from appearance of the spleen and liver. In a more recent shipment of 51 birds, 48 died while in quarantine at Brownsville. Studies by the National Institute of Health and the Hooper Foundation for Medical Research indicate that parrot fever caused the death of these birds.

### Navy Segregates Physically Deformed Recruits

"Physical medicine" salvaged thirty-three recruit companies between last summer and March of 1945 at the U. S. Naval Training Center at Farragut, Idaho, according to a U. S. Navy announcement here. Medical officers reported that segregation of physically deformed recruits was a "most gratifying" experiment. During the experiment a definite decrease in the number of recruits medically discharged was reported. "We have no accurate estimate of the number of men we 'saved' but we are pleased with the results," reports Comdr. Leon O. Parker (MC), U.S.N.R., who as orthopedic consultant at Farragut worked out the segregation system with Lieut. Comdr. Joseph E. Wilson, U. S. Navy (retired), who was in charge of recruit training.

### Senator Pepper's Remarks Included in Record

Need for cooperation in planning any national health program is stressed in remarks of Senator Claude Pepper incorporated in the *Congressional Record* from his speech earlier this year before the New York Times forum on public health and doctors. He said "Mapping of broad outlines of any national medical program is the job of government in consultation with the representatives of the American Medical Association and other professional societies, the trade union, business and consumer organizations, leaders of enlightened opinion and far sighted citizens. . . . Achievement of a national health program rests, in the last analysis, with the people themselves. They must want it and they must work for it."

### Purer Forms of Penicillin Reaching Market

Purer forms of penicillin are now reaching the market, causing less pain through injection in muscle tissue, according to Food and Drug Administration doctors Henry Welch, R. P. Herwick and A. C. Hunter. They state that many laboratories are producing penicillin that is five times as powerful and thus purer than the drug obtained earlier in production. Fred J. Stock, chief of the Drugs and Cosmetics Branch of the WPB Chemical Division, says that three or four times as much penicillin will be produced this year. Controls over the sale of preparations of penicillin in pills, tablets, ointments or solutions are urged by Dr. R. P. Fischelis, secretary of the American Pharmaceutical Association.

### Public Hearings Slated on Bill to Ban Animal Experimentation

Public hearings will be held soon on the bill of Representative Lemke, Republican of North Dakota, to prevent animal experimentation in the Capital, according to Chairman Jennings Randolph of the House District Committee. In response to a petition from Mr. Lemke, Mr. Randolph said he would request that early hearings be conducted by the subcommittee headed by Representative McGehee, Democrat of Mississippi, to whom the measure has been referred.

### Nurse Draft Bill Unlikely to Be Passed

President Truman's inauguration is believed to be one factor that will bar action on the nurse draft bill. He is known to be most sympathetic to labor, and it is considered likely that he will discourage agitation for manpower legislation. The nurse draft bill measure itself, which passed the House and is now on the Senate calendar, has already been given little chance of passage because of the Senate's rejection of compulsory manpower controls.

### Capital Notes

Dr. R. H. Riley, director of the Maryland State Department of Health, announced here that public health nurses "necessary to the maintenance of minimum health services in their communities have been classified as in essential service." He lauded nurses who stay at home "to carry on a minimum public health program."

Col. William C. Menninger, director of the Neuropsychiatry Consultants Division of the Army Medical Service, addressed a forum on mental health of the Washington Metropolitan Health Council, telling of his work in connection with the mental health of the seven million men in the United States Army. District Health Officer George C. Ruhland summarized mental health plans for the district.

The role of whole blood, plasma and plasma fractions in war medicine was described by Capt. Lloyd R. Newhouser (MC), navy plasma expert, in the annual Kober Foundation lecture at Georgetown University. Formerly on the Naval Medical School staff and now awaiting secret orders, Captain Newhouser was for several years in charge of the blood substitute and penicillin program for the Navy Medical Corps.

Washington led national observances during the first week of April of National Negro Health Week, started forty-one years ago by Booker T. Washington, noted Negro educator. Sponsored by the U. S. Public Health Service with the motto "A healthy family in a healthy home," the program is assisted by the National Negro Health Movement, year round service which acts as a health information clearing house. The program emphasizes the benefits of cleanliness, hygiene and individual and community sanitation.

The first attempt to export penicillin without a license in violation of the Export Control Act was reported here to have occurred in Laredo, Texas, where a customs patrol seized 2,000,000 units of penicillin.

President Basil O'Connor of the National Foundation for Infantile Paralysis, Inc., announces that scholarships for training in physical therapy under the \$1,267,000 program of the foundation are available immediately for classes beginning in June and July.

Antepartum examinations for syphilis are required in four more states, Arizona, Montana, Oklahoma and West Virginia. This brings to thirty-four the number of states taking this step to prevent transmission of syphilis to unborn children by requiring antepartum examinations.

The National Association of Chiropractors will observe Foot Health Week, June 8-16, when it will endeavor "to focus public and military attention on proper foot care to prevent foot troubles before they happen."

The War Production Board has directed the return to production of all looms that produced bandage cloth in 1943, to provide cotton cloth for military and surgical bandages and food processing needs.

The critical situation in the staffing of Washington hospitals was the subject of newspaper headlines here. The twenty-seven metropolitan area institutions were reported to have 497 job vacancies. An appeal has been made to the War Manpower Commission for a higher employment rating.

"Epidemic breeding" conditions in restaurants caused by wartime scarcity of garbage cans, toweling, vitrified china and flatware has prompted the WPB to consider giving eating places higher priorities on these articles.

A Council of Social Agencies Committee is speeding plans for establishment of a clinic here to provide treatment instead of sentences for heavy drinkers.

Eliminating Washington slums and rehousing their occupants was described as the "key" to the Capital's health problem by Commissioner Guy Mason before the public health subcommittee of the House District Committee.

Eugene Meyer, editor and publisher of the *Washington Post*, was presented by President Truman (as Vice President) with the annual award of the Corrections Division of the Council of Social Agencies for what War Mobilizer Fred Vinson described as Mr. Meyer's interest in "the welfare of the people."

## Society Proceedings

### COMING MEETINGS

- New Hampshire Medical Society, Manchester, May 15. Dr. Carleton R. Metcalf, 5 S. State St., Concord, Secretary.
- Rhode Island Medical Society, Providence, May 16-17. Dr. William P. Buffum, 122 Waterman Street, Providence 3, Secretary.
- South Dakota State Medical Association, Watertown, June 3-5. Dr. Roland G. Mayer, 22½ S. Main St., Aberdeen, Secretary.

## Council on Medical Service and Public Relations

### NORTHWEST MEDICAL SOCIETIES MEET MEDICAL CARE PROBLEMS

How medical organizations of the Northwest have taken leadership in meeting the demand for prepayment medical care through their own medical and hospital service plans was explained at a regional conference of the Council on Medical Service and Public Relations held April 7 at the Multnomah Hotel, Portland, Ore. The day preceding the conference representatives of the Council and other members of the American Medical Association staff visited Permanente, the hospital being operated on a prepayment basis by the Kaiser Foundation to take care of the employees and their families of the Kaiser ship yards at Vancouver, Wash.

Officers and members of public policy, public relations and medical economic committees from the states of Oregon, Washington, Idaho, California, Montana and Alaska attended the conference and discussed many problems having to do with the broad question of medical care and public relations.

Unlike many other sections of the country, the problem of prepayment medical and hospital care is not a new question in the Northwest. Twenty years or so ago the first plan on the insurance principle was sponsored by physicians in the state of Washington and at the present time seventeen local groups held together by a statewide plan sponsored by the Washington State Medical Association serving 230,000 persons is in operation. The program functions a bit differently in Oregon. Whereas the groups in the state of Washington are federated through a central statewide committee and have a large degree of autonomy, Oregon Physicians Service is more like Michigan Medical Service in its overall state coverage.

Relationship with the Blue Cross differs from the situation in regard to hospital service generally existing throughout the country. In Washington and Oregon, where medical service plans were established before Blue Cross and cover the hospital as well as the medical field, the medical groups are loath to give up their control over any of the field to Blue Cross. This is a most interesting point in light of the situation in some places where conflicting views are developing as a result of aggressive movement by Blue Cross to supply medical as well as hospital service.

Permanente enters the discussion whenever any question of postwar medical care arises. In addition to serving the workers and families of the Kaiser organization, its facilities are open to any one who may desire to come to the hospital for treatment. Its staff consists of 45 physicians and about 130 nurses, all on a salary basis. It is one of the medical establishments of the Kaiser Foundation under the direction of Dr. Sidney Garfield. The usual question is What is going to happen to Permanente and to other Kaiser medical facilities when the war ends and ship building slows down or stops? Dr. J. W. Neighbor, medical director of Permanente, expressed the hope that following the war Permanente may receive the approval of the Washington State Medical Association to continue. Whatever may become of Permanente, there is no doubt that its creation and its methods will have much influence in the blue prints of plans for medical care.

Estimates of the quality of medical care actually received by Permanente patients differ greatly. Those connected with the organization naturally rate it as superior, while others do not feel that the type of medical care rendered at Permanente is up to the high standard claimed and point to the rapid turnover of the group's medical personnel as one of the reasons why such claims of superior service are exaggerated. The overhead daily cost per bed for Permanente is \$15 according to hospital officials, while it is much lower for regularly established institutions in the same locality. Permanente officials state that this relatively high figure is due to the fact that the doctors of Permanente have their equipment centralized in the hospital and that patients are transported to the hospital rather than the doctor having to go to the patient.

Dr. John Fitzgibbon, Chairman of the Council, presided at the meeting. Among those who spoke were Dr. Edward J.

McCormick, vice chairman of the Council, Toledo, Ohio; Dr. Blair Holcomb, president of the Multnomah County Medical Society, Portland, Ore.; Dr. Dwight Murray, Napa, Calif.; Dr. R. L. Zech, president of the Washington State Medical Association, Seattle; Dr. E. H. McLean, president of the Oregon State Medical Society, Oregon City, Ore.; Dr. J. C. Shields, Butte, Mont.; Dr. Leslie S. Kent, Eugene, Ore.; Dr. Homer Dudley, Lewiston, Ida.; Dr. Frank R. Mount, Portland; Dr. Gordon B. Leitch, Portland; Dr. Richard B. Adams, Portland, and Dr. Morris L. Bridgeman, Portland.

Among the representatives of the American Medical Association were Mr. J. W. Holloway Jr., Director of the Bureau of Legal Medicine and Legislation; Dr. Carl M. Peterson, Secretary of the Council on Industrial Health; Dr. Joseph S. Lawrence, Director of the Washington Office of the Council, and Mr. Thomas A. Hendricks, Secretary of the Council.

Bureau of Information

IOWA AND OHIO COUNTY REPORTS

Iowa, through Dr. Robert L. Parker, secretary of the Iowa State Medical Society, and Ohio, through Mr. Charles Nelson, executive secretary of the Ohio State Medical Society, have returned completed summary sheets for several counties.

The following table presents some of the data on the three counties from each of these states. The column giving the number of persons per telephone is used as one index of the economic status of the area. Many physicians over 65 years of age are carrying on large practices and are doing much to maintain the health of communities. They are not included in computing the physician population ratio, however, as the future needs of the communities will be largely dependent on younger physicians.

IOWA				
County 1	Principal Cities 2	Population	Physicians Under 65	Persons per Physician
Decatur.....	Leon.....	11,717	3	3,906
Keokuk.....	Sigourney....	15,487	4	3,872
Lyon.....	Rock Rapids	13,191	4	3,298
OHIO				
Clark.....	Springfield...	100,466	46	2,184
Gallia.....	Gallipolis....	21,940	6	3,657
Muskingum...	Zanesville....	64,947	30	2,165

When filled out the section on the Summary Sheets headed "Remarks" is particularly useful. For example, it was reported on a county summary sheet that at least one general practitioner was needed in Roseville (population 3,000) in Muskingum County, Ohio. The nearest practicing physician to Roseville is in Crooksville, which is not easily accessible. Information like this, which is more complete than shown with tables, is available to inquiring medical officers.

With the information available on a completely filled out summary sheet it is readily possible for an interested medical officer to make an initial selection of areas in which he might like to practice. The further investigation through the state and county medical societies is thus greatly facilitated, and much unnecessary correspondence and perhaps travel may be avoided. In many communities vacancies are being held open for physicians now in military service. The number of physicians listed may therefore be misleading and consequently direct correspondence with the county medical society will always be necessary.

Medical Legislation

MEDICAL BILLS IN CONGRESS

*Changes in Status.*—The House Committee on Rules has heard testimony from Representative O'Toole in support of his resolution authorizing an investigation into the achievements of Sister Elizabeth Kenny, H. Res. 201. It is reported that the chairman of the Committee, Representative Sabath, Illinois, will request Sister Kenny to appear before a special meeting of the committee. H. R. 2348 has been reported to the Senate, a bill to bring within the purview of federal narcotic laws certain drugs found to have an addiction-forming or addiction-sustaining liability similar to morphine or cocaine.

*Bills Introduced.*—S. 852, introduced by Representative Johnson, Colorado, proposes to increase from \$100 a month to \$125 a month the rate of pension for veterans of the Civil War and of the war with Spain who are blind or helpless or so nearly blind or helpless as to require regular aid and attendance. S. 855, introduced by Senator Vandenberg, Michigan, proposes to extend the rehabilitation and educational benefits under Veterans' Regulations to citizens of the United States who served in the military or naval forces of any allied government. H. R. 2827, introduced by Representative McDonough, California, proposes to authorize the release of persons from active military service and the deferment of persons from military service in order to aid in making possible the education and training and utilization of scientific and technologic manpower to meet essential needs both in war and in peace. H. R. 2860, introduced by Representative Mundt, South Dakota, provides that the Veterans Administration facility under contract for construction at Sioux Falls, S. D., shall be designated as the Royal Johnson Memorial Veterans' Hospital.

DISTRICT OF COLUMBIA

*Changes in Status.*—S. 125 has been reported to the Senate providing that funds collected by the District of Columbia examining, licensing and other boards and commissions shall be paid to the Collector of Taxes and by him deposited in the United States Treasury to the credit of the District of Columbia. S. 463 has been reported to the Senate, specifically authorizing a court to commit to Gallinger Municipal Hospital for examination and observation any defendant in a criminal case where the court feels, from the prima facie evidence before it, that the defendant is of unsound mind. If after examination and observation the psychiatric staff of the hospital reports that the defendant is of unsound mind, the court may then proceed to impanel a jury to inquire into the mental condition of the defendant.

*Bills Introduced.*—H. R. 2839, introduced by Representative Randolph, West Virginia, proposes to increase the salary of the executive secretary of the Nurses' Examining Board of the District of Columbia.

Official Notes

DOCTORS LOOK AHEAD

During the next three weeks Doctors Look Ahead will present the following programs:

April 21. Cancer, with special reference to education for youth. Dr. Frank L. Rector, cancer consultant, Michigan Department of Health, will be the speaker.

April 28. Battle Fatigue. Speaker, Major Gen. George F. Lull, Deputy Surgeon General, United States Army, speaking from Washington, D. C. This program only will be broadcast from 1 to 1:30 p. m. Eastern War Time instead of at the regularly scheduled time.

May 5. Child Health. Speaker, Dr. George K. Anderson, Secretary, American Medical Association Council on Foods and Nutrition.

Doctors Look Ahead is heard on one hundred and twenty-three stations of the National Broadcasting Company network each Saturday at 4 p. m. Eastern War Time (3 p. m. Central War Time, 2 p. m. Mountain War Time and 1 p. m. Pacific War Time). Some stations may record the program and broadcast it at a time which suits their schedule better. Local newspaper radio announcements should be consulted.

## Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST: SUCH AS RELATE TO SOCIETY ACTIVITIES, NEW HOSPITALS, EDUCATION AND PUBLIC HEALTH.)

### ALABAMA

**New Appointments at University of Alabama.**—Dr. Roy R. Kracke, dean of the Medical College of Alabama, Birmingham, announces the following appointments:

Dr. Ray O. Noojin Jr., instructor in dermatology and syphilology, Duke University School of Medicine, Durham, as associate professor of medicine in the department of medicine, and chief of the division of dermatology and syphilology, effective September 1.

Alan Hisey, Ph.D., associated with the department of biochemistry, George Washington University School of Medicine, Washington, D. C., as assistant professor of biologic chemistry, effective September 1.

Miss Mary Ament, formerly librarian at Bowman Gray School of Medicine of Wake Forest College, Winston-Salem, as librarian, effective April 1.

### CALIFORNIA

**City Loses in Hospital Case.**—On February 7 Municipal Judge Daniel R. Shoemaker, San Francisco, handed down an opinion to the effect that persons receiving hospitalization in San Francisco public hospitals are not liable for the cost thereof unless an investigation is made by proper authorities as to their ability to pay, according to *California and Western Medicine*. The decision was rendered in the case of the city against a Mrs. William Perry, who was treated at San Francisco Hospital and subsequently billed for services. The court rendered a verdict in favor of Mrs. Perry, including her costs in the action. "No evidence was offered of any action by the board of supervisors, as required by the welfare and institutions code, as to whether any investigation was made, or finding, or determination as to the pecuniary ability of defendant to pay, or her other family responsibilities."

**The George Dock Lecture.**—Dr. Willard Lee Marmelszadt, resident at the Queen of Angels Hospital, Los Angeles, and winner of the William Osler Medal for the best essay on a medical historical subject by a student of medicine, delivered the fourth annual George Dock Lecture April 5 under the auspices of the Barlow Society for the History of Medicine. His subject was "The Musical Sons of Aesculapius," the same theme which won him the Osler Medal (*THE JOURNAL*, February 3, p. 286). The lecture was created by the Barlow Society four years ago in celebration of Dr. Dock's eightieth birthday. This year, although Dr. Dock's eighty-fourth birthday fell on April 1, the observance was held April 5. In an announcement the *Bulletin* of the Los Angeles County Medical Association stated that, although the absence of many of the members of the Los Angeles County Medical Orchestra has led to its disbanding, many of those still remaining are active in small groups as trios and quartets.

### DISTRICT OF COLUMBIA

**Personal.**—Dr. George B. Roth has been made professor emeritus of pharmacology at the George Washington University School of Medicine, where he has been a member of the faculty since 1924.—Mr. Leo G. Schmelzer has been appointed superintendent of the new George Washington University Hospital, Washington, effective March 15. He will supervise the building and equipment of the hospital and will assist Dr. Walter A. Bloedorn, dean of the university medical school, who has been appointed medical director of the hospital. The new hospital is being built by the federal government for the use of the university to meet the needs of the wartime emergency in Washington. The 400 bed structure, which will be equipped and managed as a "teaching hospital," replaces an older building in use since 1898. The George Washington University School of Medicine, whose faculty will control the hospital, was opened in 1825 and is the eleventh medical school in the country in order of founding.

**Postgraduate Course.**—The eighth annual postgraduate course in ocular surgery, pathology and orthoptics of the George Washington University School of Medicine, Washington, will be held Monday May 28 through Saturday June 2. The registrants will perform operations on animal eyes under the direction of Drs. Ernest A. W. Sheppard, Edgar Leonard Goodman, Ronald A. Cox, Richard W. Wilkinson, Sterling Pockoven, Carmon R. Naples and Jonathan B. Peebles Jr. as instructors. Operations to be performed will be combined intracapsular cataract extraction, Elliott's sclerocorneal trephine, cyclodialysis, Lagrange iridectomy, iridotaxis, iridencleisis,

Jameson recession, Reese resection, Worth advancement and O'Connor cinch. A course in pathology embraces normal histology of the eye; inflammations, general and specific; phthisis bulbi, glaucoma; cataract; arteriosclerosis, albuminuric retinitis; intraocular and epibulbar tumors. Instructors will include Col. James E. Ash, M. C., Capt. Joyce M. S. Morris, M. C., Helenor Campbell Wilder and Lawrence Ambrogio, of the Army Institute of Pathology. Orthoptics and ocular motility will be conducted by Dr. Sheppard, Dr. Frank D. Costenbader, Louisa Wells, Mary E. Kramer, Dorothy R. Bair, Mildred Brown and Alice L. McPhail, resident staff of the department of ophthalmology.

### ILLINOIS

**Physician Wins Prize on "Never Too Old" Program.**—Dr. Charles A. Runyon, Carthage, recently received a wrist watch as a gift of the Art Baker Hollywood program "Never Too Old," which is dedicated to older professional men and women who are continuing their services to the public. Dr. Runyon, who graduated at the College of Physicians and Surgeons, Keokuk, Iowa, in 1884, has been practicing in Elvaston and Carthage nearly sixty-two years. The program which recognized him was heard over MBS February 16.

### Chicago

**Dr. Bevan's Bequests.**—An inheritance tax appraisal listing net assets of \$1,540,827 in the estate of the late Dr. Arthur Dean Bevan was submitted April 10 to County Judge Perry L. Persons of Lake County. Presbyterian Hospital, where Dr. Bevan was chief surgeon for many years, will receive \$975,247, Rush Medical College \$113,884 and Lake Forest Hospital, Lake Forest, Ill., \$25,000, it was reported.

**Lying-In Hospital to Observe Fiftieth Anniversary.**—A fiftieth anniversary campaign for Chicago Lying-In Hospital of the University of Chicago is being undertaken by its board of directors. Mrs. Kellogg Fairbank is chairman of the committee in charge of fund raising, with offices at room 718, People's Gas Building, 122 South Michigan Avenue, Chicago 3. Mrs. Josephine Patterson Reeve will handle publicity pertaining to the campaign through this office.

**Faculty Changes at Loyola.**—Dr. Louis G. Hoffman, a member of the faculty of Loyola University School of Medicine since 1934, has been appointed acting chairman of the department of ophthalmology. He succeeds the late Dr. Carl F. Schaub. Dr. Hoffman graduated at Northwestern University Medical School in 1910. Dr. Samuel Salinger, professor of otorhinolaryngology and a member of the faculty since 1917, has been named acting chairman of the department of otorhinolaryngology, succeeding Dr. George T. Jordan, who is now professor emeritus.

### IOWA

**Diamond Jubilee of State Medical School.**—The *Journal of the Iowa State Medical Society* for April was dedicated to the State University of Iowa College of Medicine, Iowa City, which this year is celebrating its seventy-fifth anniversary. The school was established in 1869 under the leadership of the late Dr. William F. Peck, Davenport, with the name Department of Medicine in the State University of Iowa. The first class was graduated in 1871. It is hoped to celebrate the anniversary September 27-28 with special clinics. The issue also commemorates the third consecutive annual number, in which all of the scientific articles have been prepared by the faculty of the college of medicine. In addition, it observes the fiftieth anniversary of the first preparation of diphtheria antitoxin in Iowa. The work was carried on in the department of pathology in the state university by Dr. Walter L. Bierring, Des Moines, now state health officer. An article entitled "The Modern Treatment of Diphtheria, with Demonstration of Method of Preparing Antitoxin," was presented at the annual meeting of the state medical society in Creston in April 1895. In the anniversary number of the state journal Dr. Bierring discusses "The Control of Diphtheria After Fifty Years."

### KANSAS

**Personal.**—Dr. William L. Speer, Osawatomie, has been named Miami county coroner to fill the term of Dr. Benjamin L. Phillips, Paola, who resigned because of ill health.—Dr. Patrick S. Brady, Hays, has been named health officer of Ellis County, succeeding Dr. Gardner A. Surface, Ellis.

**Division of Cancer Control to Be Created.**—The 1945 session of the Kansas State Legislature has appropriated funds which make possible the establishment of a division of cancer control in the Kansas State Board of Health. For the first time in the history of the state an official public health program will be instituted to reduce needless deaths from cancer.

**Paul Ensign Named Director of Maternal and Child Health.**—On March 1 Dr. Paul R. Ensign, formerly assistant director of the division of maternal and child health, Kansas State Board of Health, was appointed director of the division, according to the *News Letter* of the state board of health. Dr. Ensign, who graduated at Northwestern University Medical School, Chicago, in 1936, served for three years as assistant health officer and pediatric consultant in Hancock County, Ga., the project serving as a demonstration center. Dr. Ensign left this appointment to become assistant director of the Kansas division and after a year and a half accepted an appointment as city-county health officer, Boise, Idaho.

### KENTUCKY

**Graduate Extension Course.**—The Kentucky State Medical Association will continue its postgraduate extension course that it has been conducting for the past two years under the direction of Dr. William W. Nicholson, Louisville. Lectures will be given in Richmond, May 3 and May 10, the first group to be presented by Drs. Richard T. Hudson, Bruce B. Mitchell, Edwin Paul Scott and Marion F. Beard and the second by Drs. Russell E. Teague, Frank A. Simon, Percy S. Pelouze and Major Francis W. Hetreed, M. C. On May 17 and 24 the course will be conducted in Berea, the first day's program to be presented by Drs. Joseph Garland Sherrill, Winston U. Rutledge, Maurice G. Buckles and Morris M. Weiss and the second by Drs. Foster D. Coleman, Alice D. Chenoweth, Earl R. Gernert and Charles H. Maguire. All except Dr. Pelouze, who is from Philadelphia, are Louisville physicians.

### MISSOURI

**Robert James Named State Health Commissioner.**—Dr. Robert M. James, Joplin, on March 21 was appointed state health commissioner and secretary of the state board of health by Governor Phil M. Donnelly. Dr. James is one of the members recommended to the governor for consideration. He graduated at the St. Louis University School of Medicine in 1904 and was president of the Jasper County Medical Society in 1939.

**Personal.**—Dr. Leonard M. Folkers is now chairman of the division of health education, Stephens College, Columbia, succeeding Dr. Florence I. Mahoney, who has joined the University of Wisconsin, Madison, according to the *Journal-Lancet*.—Dr. B. Albert Lieberman Sr. on March 29 completed fifty years in the practice of medicine in Kansas City.—Dr. William V. McKnelly, Chamois, has been appointed physician to the state penitentiary at Jefferson City.—Dr. John Zahorsky, St. Louis, was made president emeritus of the Bethesda General Hospital recently when he resigned as president after having been head of the institution for twelve years.

**Medical Service Plan Launched.**—On March 11 the Missouri Medical Service announced that the medical and surgical care plan sponsored by the Missouri State Medical Association has been launched (*THE JOURNAL*, July 22, 1944, p. 859 and Oct. 14, 1944, p. 445). According to the *Journal of the Missouri State Medical Association Surgical Care, Inc.*, of Kansas City, now in its second year of operation, is caring for more than 32,000 persons in the western part of Missouri. Arrangements currently worked out by the two Blue Cross plans, which are handling the enrolment and other administrative matters for both of the plans, are such that every county in the state eventually will be covered. Missouri Medical Service, in conjunction with the St. Louis Blue Cross plan, will handle enrolment of subscribers in the section of the state now serviced by St. Louis, while Surgical Care, Inc., in conjunction with Kansas City Blue Cross, is handling enrolment in Kansas City, St. Joseph and nineteen other counties in the northwest section of the state.

### NEW YORK

**Aid to Alcoholic Addicts.**—A project is under way in Rochester to establish a center for aid to alcoholic addicts patterned after the Yale clinic on alcoholism, the Rochester *Times-Union* reported, March 2. A committee of physicians and representatives of interested citizens' groups, in charge of Dr. Edwin Fauver, Rochester, is considering the project.

**Appropriations Cover Medical Construction.**—An extensive building and expansion program is planned for the Rochester and Utica state hospitals for the mentally ill as soon as the exigencies of the war will permit. Plans call for a group of interconnected buildings at each institute. One unit will be for patients with physical ailments in addition to their mental condition, another will be for shock therapy treatments and another

will be for new patients. There will be also a medical surgical building where will be concentrated an operating suite, laboratories and diagnostic clinic. Numerous auxiliary buildings will be constructed also.

**Arthur Johnson Honored.**—The Medical Society of the County of Monroe gave a dinner at the Powers Hotel March 31 in honor of Dr. Arthur M. Johnson, retiring health officer of Rochester (*THE JOURNAL*, March 3, p. 534). In 1943 the Rochester Academy of Medicine presented to him its highest award, the Albert D. Kaiser Medal, for "outstanding service to the medical profession." In addition to Dr. Johnson the speakers at the recent dinner were:

Dr. Benjamin J. Slater, Rochester, Medical Society of the County of Monroe, chairman.

Hon. Samuel B. Dicker, mayor, city of Rochester.

Alan Valentine, L.L.D., Rochester, president, University of Rochester.

Thomas Parran, Surgeon General of the U. S. Public Health Service.

Dr. Stearns S. Bullen, Rochester, president, Medical Society of the County of Monroe.

**Clothing Workers Receive Hospital Insurance.**—Free hospitalization insurance will be extended to 11,000 clothing workers in Rochester, May 1, according to the Rochester *Times-Union*, March 28, as the result of an industry-wide agreement between the manufacturers and the Amalgamated Clothing Workers of America. Throughout the industry the insurance will cover 150,000 men and women clothing workers. The hospitalization program is an extension of the life insurance program instituted under a similar industry-labor agreement in July 1943 and a life and accident policy started last February, it was reported. Without cost to the employee, the hospitalization plan provides payment of \$5 a day up to a maximum of thirty-one days for illness in any consecutive twelve months; a separate payment of \$5 a day for a maximum of thirty-one days for hospitalization resulting from an accident, also within any twelve consecutive months; an additional payment up to \$25 for expenses incidental to hospitalization, and a flat \$50 maternity payment.

### New York City

**New Professor of Neurologic Surgery at Columbia.**—Dr. Leo M. Davidoff, Brooklyn, has been appointed professor of clinical neurologic surgery at Columbia University College of Physicians and Surgeons. He is also to become attending neurologic surgeon at the Montefiore Hospital for Chronic Diseases about September 1.

**Economic Talks for Medical Students.**—The coordinating council of the five county medical societies of greater New York is sponsoring a series of lectures on the social and economic problems of medicine for students in all medical colleges in the city. Dr. William B. Rawls, chairman of the council, opened the series February 24 with a discussion of "Organized Medicine's Effort to Meet the Changing Aspect of Medical Economics."

**First Lecture in Series Named for Menas Gregory.**—Dr. Edward A. Strecker, professor of psychiatry, University of Pennsylvania School of Medicine, Philadelphia, will deliver the first of an annual series of lectures established in memory of the late Dr. Menas S. Gregory at the New York University College of Medicine, April 27. His subject will be "Psychiatry Speaks to Democracy." Dr. Gregory was for many years professor of psychiatry at New York University College of Medicine. Under his will the medical school received a fund of \$40,000, half of which was to be used to establish an annual lectureship and the other half to establish the Menas S. Gregory Fund in support of the professorship in psychiatry.

**Proposed Pay Increase for Physicians Denounced.**—The 17 cents an hour pay increase for physicians working part time for the city health department, proposed by Mayor Fiorello La Guardia in his executive budget for the coming year, was denounced April 5 by the Medical Society of the County of New York as "completely insufficient to solve the problem and to insure a satisfactory grade of performance in these essential health services." James E. Bryan, executive secretary of the society, in a statement to the press, said that the mayor, in recommending a nominal increase of 50 cents for each three hour session, "has recognized, in principle at least, the inadequacy of the present fee rates." He is reported to have said that the mayor had failed to reply to a letter from the city requesting "a substantial increase in the rates of remuneration," together with "a system of limited tenure." The society was said to believe that wages the city is paying these doctors are "comparable to those that prevailed in 1897." About 500 physicians are said to be involved in this situation, two thirds of them in the baby health clinics and in the public schools, while the others either work in the cardiac or eye clinics or are tuberculosis clinicians, diagnosticians in the bureau of preventable diseases or clinic chiefs. For these

essential duties the physicians receive \$5 for each three hour session or, if affiliated with the health department before March 15, 1944, \$5.50. Supervisors receive \$6 for three hours, or \$6.50 if their service predated March 15, 1944. The society pointed out that industry in the city, in employing physicians to attend company workers, paid as high as \$15 for a three hour session and that the range for "other social and semi-public agencies" was from \$9 to \$15.

**Eye Bank for Sight Restoration.**—The organization of the Eye Bank for Sight Restoration, Inc., which will collect and preserve healthy corneal tissue from human eyes for transplanting to blind persons who have lost their sight from corneal defects, was announced April 13. Headquarters are at 210 East 64th Street. Stanley Resor, president of the J. Walter Thompson advertising company and the Manhattan Eye, Ear and Throat Hospital, has been elected president of the Eye Bank. Other officers are Dr. Richard Townley Paton, vice president; Cyril B. Hartman, secretary; Walter C. Baker, treasurer, and Mrs. Henry Breckinridge, executive director. The organization, national in scope, has been incorporated under the laws of New York State and twenty-two leading hospitals in New York City are now affiliated with it; in addition, twenty leading ophthalmologists throughout the country will serve in an advisory capacity. An announcement to the press indicated that between 10,000 and 15,000 blind persons with corneal defects, in the United States, may have an opportunity to see again through the activities of the eye bank. The purpose of the bank is to make available a supply of fresh or preserved corneal tissue wherever and whenever needed by hospitals and surgeons who are qualified to perform the corneal graft operation. It is also planned to extend, through scholarships and fellowships, the knowledge and skill required to perform the delicate operation, which consists in substituting a healthy cornea for a damaged one and which can restore sight in only one type of blindness, that caused solely by opacity of the cornea when the rest of the eye and optic nerve are normal. One of the most important objectives will be to discover a method for preservation of the corneal tissue over a longer period of time than is now possible. At the present time the corneal tissue taken from a living or dead person may be stored for only three days before it is transplanted. Corneas obtained from a dead person must be removed within a few hours after death. In New York State, however, it is necessary to have the legal consent of the next of kin for a postmortem removal of an eye, even though the deceased left written instructions for the use of his eye in this way. The National Society for the Prevention of Blindness and other public health and medical agencies are cooperating with the project. The New York chapter of the American Red Cross, through its motor corps division, has taken the responsibility for transporting corneas between the Eye Bank and its affiliated hospitals. Physicians who are participating in an advisory capacity are Lieut. Col. M. Elliott Randolph, M. C.; Col. Derrick Vail, M. C.; Drs. Harry S. Gradle, Chicago; Alan C. Woods, Baltimore; Theodore L. Terry, Boston; William L. Benedict, Rochester, Minn.; Lawrence T. Post, St. Louis; Dohrmann K. Pischel, San Francisco; Edmund B. Spaeth, Philadelphia; Cecil S. O'Brien, Iowa City; Purnan Dorman, Seattle; David H. Webster, Herbert B. Wilcox, John M. McLean, John H. Dunnington, E. Clifford Place, Daniel B. Kirby, Conrad Berens, Ernest L. Stebbins and Dr. Paton, all of New York. Initiation of the project was mentioned in THE JOURNAL, May 20, 1944, page 220.

## WASHINGTON

**Memorial to Physician.**—An oxygen memorial tent will be contributed to the city of Anacortes in honor of Dr. Samuel G. Brooks, who died January 16.

**Physicians in the Legislature.**—Dr. Donald Black, Port Angeles, is the one physician member of the state senate, according to *Northwest Medicine*, and Dr. Ulric S. Ford, Forks, the one physician member of the house of representatives. Both physicians are chairmen of their respective medical committees.

**Funds for Proposed Medical Dental School.**—The governor has signed a bill calling for an appropriation of \$450,000 for expansion of the premedical school in operation at the University of Washington, Seattle, and \$3,750,000 to erect a medical school and hospital as soon as building materials are available, according to *Northwest Medicine*. Immediate plans for development of the school contemplate expansion and complete equipment of the existing premedical school to make it a school of the highest quality for teaching the basic medical sciences, which comprise anatomy, physiology, chemistry, bacteriology and pathology. It is planned to begin operation of

the school in the fall of 1945, with complete physical preparations and a carefully selected teaching force to meet the demands required. It is planned to start with a freshman class and add other classes as the school progresses.

## WISCONSIN

**Spring Clinics.**—The council on scientific work of the State Medical Society of Wisconsin, in cooperation with the Eau Claire, Portage, Outagamie and Milwaukee county medical societies, has launched a program of spring clinics consisting of the following:

Dr. Clarence O. Sappington, Chicago, Industrial Medicine—Scope, Present Status, Future Possibilities.  
Dr. Hans H. F. Reese, Madison, Psychoneuroses and War.  
Dr. John A. Toomey, Cleveland, Laryngeal Emergencies in Children.  
Poliomyelitis, diagnosis from the: symptomatology in signs of acute anterior poliomyelitis, Dr. Herman W. Wirka, Madison; differential diagnosis of poliomyelitis from other neuron lesions, Dr. Toomey; poliomyelitis as seen by the neuropsychiatrist, Dr. Reese, and the immediate orthopedic treatment of anterior poliomyelitis, Dr. Wirka.

The sessions will be held at Eau Claire May 8, Stevens Point May 9, Appleton May 10 and Milwaukee May 11.

**Woman's Auxiliary Inaugurates Health Program.**—The first annual health program sponsored by the Woman's Auxiliary to the Medical Society of Milwaukee County will be presented May 2 in the Solomon Juneau Hall in the Milwaukee Auditorium. Mrs. Edward F. Barta, Milwaukee, president of the auxiliary, will preside at the session, and Dr. Josiah J. Moore, Chicago, Treasurer of the American Medical Association, will act as moderator. The mayor of Milwaukee, John L. Bohn, will open the program and speakers will include:

Dr. Edward R. Krumbiegel, Milwaukee, Can You Prove You Are a Citizen?  
Dr. William W. Bauer, Director, Bureau of Health Education, American Medical Association, Chicago, Stop Annoying Your Children.  
Dr. Clifford J. Baborka, Chicago, Too Fat—Too Thin.  
Dr. Austin E. Smith, Secretary, Council on Pharmacy and Chemistry, American Medical Association, Chicago, Miracle Drugs in Modern Warfare.

## GENERAL

**Illegal Penicillin Export Halted.**—On March 30 the Treasury announced that customs agents seized 26,000,000 units of penicillin at Laredo, Texas, in what is believed the first attempt to export the valuable drug without a license, newspapers reported. A Treasury spokesman said no further information is available in Washington. Export control is administered by the Foreign Economic Administration but is enforced by customs agents stationed at the ports and borders.

**Actions on 1945 Conventions.**—Reports received by the American Medical Association indicate the following action for the 1945 sessions of the respective organizations:

American Federation for Clinical Research, canceled; sectional meetings will be held in the fall if the Office of Defense Transportation revokes its present ruling.

American Laryngological, Rhinological and Otolological Society, canceled.  
American Orthopedic Association, canceled.

American Psychanalytic Association, canceled.

American Society of Clinical Pathologists, canceled.

Association for Research in Ophthalmology, canceled; essayists are requested to reserve their manuscripts for a possible meeting in 1946.  
Association for the Study of Internal Secretions, canceled; executive meeting of council in New York, April 17.

Western Association of Industrial Physicians and Surgeons, canceled.

**Mead Johnson and Borden Awards.**—Announcement is made by the American Institute of Nutrition that the Mead Johnson and Company prize for 1945 has been awarded to Dillworth Wayne Woolley, Ph.D., of the Rockefeller Institute for Medical Research, New York, in recognition of his studies on the inhibitors of vitamins and for his many contributions to the identification of nutritional factors of a vitamin nature. The institute also announced that Harold H. Mitchell, Ph.D., professor of animal nutrition, University of Illinois, Urbana, Ill., has been given the Borden Award in nutrition in recognition of his "outstanding contributions which have emphasized the nutritive significance of the components of milk and of dairy products."

**Narcotic Violations.**—The U. S. Bureau of Narcotics announces the following actions:

Dr. Florian A. Domalski, Trenton, N. J., and Toledo, Ohio, following his plea of guilty at the U. S. District Court at Newark, N. J., February 17, was placed on probation for a period of five years following the suspension of his sentence by Federal Judge Philip Forman on condition that he enter the U. S. Public Health Service Hospital, Lexington, Ky., and remain until discharged as cured of his addiction to narcotics.

Dr. Don D. Cornell, Picher, Okla., formerly of Boston, and recently occupying an office with Dr. George A. Hughes, Siloam Springs, Ark., was sentenced on his plea of guilty in the U. S. District Court at Tulsa, Okla., on February 20 for violation of the narcotic laws by Judge Royce Savage to serve a term of one year and one day and fined the sum of \$250.

Dr. Abijah C. Fields, Ensley, Ala., pleaded guilty in the U. S. District Court at Birmingham, Ala., February 15 and was fined \$500 and placed on probation for a period of five years for violation of the narcotic law.

**Prize Winners in Traffic Safety Contest.**—The state of Connecticut and the city of Lansing, Mich., on April 4 were named grand prize winners in the national traffic safety contest conducted by the National Safety Council. All 48 states and 1,307 cities participated in the contest, which covered the calendar year 1944, the award to go to the state and city which, in the opinion of the judges, came nearest to doing the most that could be done practically for traffic safety. Lansing reduced its traffic death toll to 4 in 1944, as compared to 7 in 1943 and a total of 26 for the three years preceding 1944. Connecticut reduced its traffic deaths to 221 in 1944 from 235 in 1943; this is the second time Connecticut has been a grand award winner.

**New Pharmacopeial Headquarters.**—The board of trustees of the United States Pharmacopeial Convention has purchased a building at 4738 Kingessing Avenue, Philadelphia, for temporary headquarters. For almost twenty years the Philadelphia College of Pharmacy and Science has provided quarters for the pharmacopeial revision chairman and his staff, but increasing work has necessitated larger accommodations. The new quarters, located a short distance from the Philadelphia College, consist of a two story, two apartment building and will be renovated and refitted for pharmacopeial purposes providing adequate storage space and fireproof facilities for the protection of records. It is announced that, with independent headquarters established now, consideration will be given, when the time comes, to obtain permanent headquarters in Washington.

**1945 Lasker Award Designated for Rehabilitation of Mentally Handicapped.**—The Lasker Award for 1945 will be given for a noteworthy contribution to the rehabilitation of the mentally handicapped. The National Committee for Mental Hygiene, which made the announcement April 1, is now receiving nominations with supporting data, to be presented to an anonymous jury selected each year for its competence to judge accomplishment in the field chosen. The award of \$1,000, established in 1944, is made annually in November by the Mary and Albert Lasker Foundation for meritorious service and significant contributions to promoting mental health and increasing public understanding of mental hygiene. Col. William C. Menninger, M. C., chief consultant in neuropsychiatry, Office of the Surgeon General of the U. S. Army, was the first recipient of the award, for his contribution to the mental health of men and women of our armed forces (*THE JOURNAL*, Dec. 2, 1944, p. 902).

**Cabinet Post Urged for Welfare Work.**—Formation of a new cabinet post for the coordination of all education, health and welfare services in one administrative agency is the goal of a committee of twenty-five experts in these fields, headed by Mrs. Eugene Meyer, wife of the publisher of the *Washington Post*, and Leonard W. Mayo, S.Sc.D., dean of the School of Applied Social Science, Western Reserve University, Cleveland. According to the *New York Times* the group is at work on detailed plans which envisage a secretary of public social services, who might alternatively be called a secretary of education, health and welfare in the President's cabinet, it was stated. The proposed department would unify administrative control over federal welfare activities, working with similar departments in the states. Ultimate localization of the plan would be in "the Community Service Center," where public and private health and welfare agencies, doctors and psychiatrists would be available to individuals.

**Essay Competition on Hospital Treatment of Psychiatric Patients.**—"A Plan for Improving Hospital Treatment of Psychiatric Patients" is the theme of an essay competition sponsored by *Modern Hospital*. Judges will be drawn from the U. S. Public Health Service, the American Psychiatric Association and the National Committee for Mental Hygiene. Hospital administrators, psychiatrists, psychologists, social workers, nurses, therapists, former patients and any other interested persons are eligible to compete. Two or more persons may write a joint essay. The judges chosen and employees of *Modern Hospital* are excluded. Essays must be received by the Managing Editor, *Modern Hospital Publishing Company*, 919 North Michigan Avenue, Chicago 11, by October 1. Essays received after this date shall be eligible for consideration only if they are mailed within the continental United States prior to midnight, September 25. Three prizes will be awarded, \$500, \$350 and \$150. Winners will be announced on or before December 31. In case of a tie, duplicate prizes will be granted.

**Birth Registration Designated for Child Health Day.**—May 1 has been designated by Presidential proclamation as Child Health Day. The proclamation requests that "each community use the day to impress upon parents the importance

of registering the birth of every baby born in the United States." The proclamation also urged the mobilization of community resources "for the better care of our children so that the growing generation will be strong to mold the peace." On the basis of a detailed study of infants reported in the 1940 census but not registered as part of the vital statistics of the states in which they were born, the bureau of census estimated, according to the *New York Times*, that 1 of every 13 children born each year is not registered, the total of unregistered births exceeding 200,000 every twelve months. This information was reported simultaneously with President Roosevelt's proclamation by Miss Katharine F. Lenroot, LL.D., chief of the Children's Bureau, and James C. Capt, director of the bureau of the census. In connection with the announcement of a joint sponsorship of the nationwide birth registration campaign, the President's proclamation mentioned "the many physical defects which handicap large numbers of adult citizens," which are evident during childhood and which could be prevented or corrected with proper care at that time. Miss Lenroot pointed out that funds under the Social Security Act for this purpose are allocated to the states on the basis of the number of registered live births, and, unless all are registered, the state receives a smaller amount than that to which it is entitled, and as a result fewer children get care. The Bureau of the Census study showed that birth registration was lower in the nonwhite population, the rate for nonwhites ranging under 50 per cent in two states, New Mexico and Arizona. New York's registration rate was 98.7 per cent, with a rate of 96.3 per cent among the nonwhite population. Both Connecticut and Minnesota had a higher than 99 per cent registration.

## LATIN AMERICA

**Health Activities in Latin America.**—*Congress of Radiology.*—The second Inter-American Congress of Radiology will be held in Havana, Jan. 19-24, 1946, under the presidency of Dr. Pedro L. Fariñas Mayo. Additional information may be obtained from the secretary-general, Dr. Ricardo L. Hernandez Begueire, Calle 23 No. 411, Velado, Havana, Cuba. According to *Radiology* the formal organization of the Inter-American College of Radiology is scheduled for this meeting.

**Dispensary for Merchant Seamen.**—Brig. Gen. Henry C. Dooling, M. C., chief health officer of the Panama Canal, opened recently a merchant marine dispensary in the port of Balboa. All shipping agents have been notified of the new service and henceforth it is expected that physicians will need to make only emergency calls aboard ships. Major Raymond H. Ralston, M. C., and Dr. Glenn Adams have been assigned as physicians to the staff, which also include a psychiatrist, two dentists and a clerical assistant. Formerly merchant seamen received medical attention at the Balboa dispensary, but inadequate facilities and the loss of time in going and coming from the pier area necessitated the installation of the new service.

**DDT.**—Production of DDT will be on a large scale in Mexico by the organization *Petróleos Mexicanos* for distribution in the states of Mexico by the department of public health.

## Deaths in Other Countries

**Denis J. Coffey**, president of Dublin University College from 1908 to 1940 and formerly professor of physiology, Catholic University School of Medicine, Dublin, and a representative of the National University of Ireland on the General Medical Council since 1921, died April 3.—**Hans Fischer**, Munich, for many years professor at the Technische Hochschule and 1930 winner of the Nobel prize in chemistry for his discovery and isolation of hematin, has died, the *New York Times* reported April 7, at the age of 63.—**Hans Sachs**, formerly professor of immunology at the University of Heidelberg Medical School and at the time of his death connected with Trinity College in Dublin, and also at one time connected with the Institute of Frankfurt on Main, died recently following a prostatectomy operation.—**Major Gen. Sir Robert Charles MacWatt**, honorary surgeon to the late King George V and formerly director general of the Indian Medical Service, died suddenly, April 14, aged 80.

## CORRECTION

**Diabetic Coma.**—The number 5 should replace 15 on the second line of table 6 on page 561 of *THE JOURNAL*, March 10.

### LONDON

(From Our Regular Correspondent)

March 17, 1945.

#### Death of Lord Dawson

Death from pneumonia, at the age of 81, has removed from the profession a prominent figure, Lord Dawson, president of the British Medical Association. He attained every possible honor and distinction, including that of physician to four British kings. Educated at University College, London, and at the London Hospital, he was appointed assistant physician to the latter in 1893. An excellent teacher, lecturer and writer, he made his reputation as a general physician of sound judgment who won the patient's confidence. As a consultant he was valued for his all round ability, but he showed special interest in diseases of the alimentary canal. In his early days he wrote many articles on diabetes mellitus, diabetes insipidus, influenza, rheumatoid arthritis and the physical examination of the stomach and intestine for the then popular Allchin's Manual of Medicine. In the war of 1914-1918 he was consulting physician to the British armies in France. He led a special investigation into the causes of infective jaundice among the troops. In association with two collaborators he showed that it was the same in clinical and pathologic features as the disease described by the Japanese as due to a spirochete in the liver.

In medical politics no one was so influential both in the profession and outside it with the government. His elevation to the House of Lords in 1920 was the first attempt by a British government to utilize medical knowledge in that chamber. An excellent speaker, his views were expressed with great force and clarity. In 1930 he addressed the Canadian Club on "Medicine and Statesmanship." He pleaded for the delegation by the state of social services each to a special body, a view which he expressed many years later in connection with the government's present proposals for a comprehensive health service. He sounded a note of caution and favored a gradual advance. He wanted the government to begin with organization of hospital and consultant services and to leave general practice at first untouched. In 1932, when the British Medical Association celebrated its centenary in London, he was president and filled the office with great distinction. It is significant that in 1943, when the association lost by death its president and the medical profession was faced with the greatest crisis in its history by the publication of the government's scheme for a health insurance service for the whole population, Lord Dawson, notwithstanding his age, was again chosen to fill the office of president. He was honored by degrees from several universities at home and abroad, including Pennsylvania and McGill.

#### The National Loaf

The national loaf has aroused much controversy in the political sphere. We seem to be only waking up to the fact that for those who depend largely on bread the extraction of so much from the wheat in order to obtain white flour is a gigantic blunder. Before the war the flour used for bread contained only 72 per cent of the wheat grain. During the war this was raised to 85 per cent as a precautionary measure against shortage. In October the percentage was reduced to 82.5 and later to 80. In the House of Lords Lord Teviot asked whether the extraction rate of wheat had been reduced below the standard of 1942 and moved that 85 per cent should be regarded as the minimum compatible with maintaining the health of the people. Lord Addison, anatomist, said that scientific evidence was in favor of the motion. More ought not to be taken out of the grain than would permit of making a good and wholesome bread. Lord Horder, physician, spoke of the value of 85 per cent extraction and recalled that when in 1942 this bread was introduced he said that no single step which the government

could have taken was so calculated as this to raise the country's nutrition. That statement after three years' experience had proved correct. The Red Army was fed on 100 per cent extraction. They took no risks in the matter, and all would agree that by their performance they were justified. Lord Geddes said that high extraction had an important bearing on tooth health as well as general health. Lord Hankey said that the reversion toward prewar white bread was a mystery. It appeared to be abandonment of inexpensive and natural means of preventing disease. Replying, Lord Woolton, minister of reconstruction, said that the reduction was made on expert advice that it could be safely done without interfering with the nation's health. Since then it had been made clear that we could go lower and get all the advantages from a health point of view without consuming so much bran. They were trying out the experiment but had not yet got the figures. If they found that they were wrong they would go back. Though the motion was by leave withdrawn, the objectors were not at all satisfied. One had information from a high medical authority that in the 80 per cent extraction about half the iron was lost. The decision of the government to reduce the extraction is condemned by the *British Medical Journal* as impairing the nutritive value of the loaf.

#### The Training of Psychiatrists

A committee on psychologic medicine of the Royal College of Physicians has made a report which points out the inadequacy of the requirements for the diploma in psychologic medicine. It recommends a five year course of study and clinical and laboratory work after one year as house physician in a general hospital. This period would allow for the diversity of experience now necessary for the psychiatrist and is intended to prevent the tendency for psychiatry to be split up into a number of specialties, the practitioners of which tend to drift apart and to have little in common in their points of view. Criticizing the report, the *British Medical Journal* regrets that not more time than three months is assigned to the study of psychology, the principles and methods of which are of value not only to the psychiatrist but to the nonmedical psychologist as well. The committee realizes that such a curriculum as it suggests can be brought into effect only gradually, and that the budding psychiatrist may have some difficulty in financing himself during the period. It therefore hopes that it may be possible to arrange for him to hold paid appointments during the greater part of the time.

#### Investigation of Estrogens in Cancer

The Royal Society of Medicine has arranged for a scientific committee to investigate the effects of estrogens in cancer. The chairman is E. C. Dodds and the members are sectional representatives: experimental medicine and therapeutics, A. L. Bacharach and K. M. A. Perry; obstetrics and gynecology, Malcolm Donaldson and James Wyatt; pathology, W. E. Gye and R. W. Scarff; radiology, Ralston Paterson and B. W. Windeyer; surgery, Rupert Corbett; urology, F. McG. Loughnan and Clifford Morson; co-opted, G. B. Stebbing and A. B. Bratton; statistical adviser, K. Mather. The advisability of forming such a committee was considered by the council of the Royal Society of Medicine after a preliminary investigation by the radiologic section at fifteen radiotherapeutic centers on the effects of diethylstilbestrol in more than 100 cases of cancer of the breast.

At the first meeting the committee decided to concentrate on carcinoma of the prostate, breast and esophagus, to confine the investigation to diethylstilbestrol at two prescribed dosage levels and to keep records on forms based on those of the National Radium Commission approved in the minister of health's scheme for cancer. Members of hospital staffs who may wish to cooperate in the investigation are invited to communicate with the honorary secretary, F. Ellis.

### A New Remedy for Leprosy

The *British Medical Journal* has received, through the courtesy of the French embassy in London, a copy of a dispatch from the colony of Madagascar giving a preliminary account of the discovery of a new remedy which has given remarkable results in the treatment of advanced lepromatous cases of leprosy. In 1937 two French physicians, Drs. Boiteau and Grimes, extracted a new glucoside from an umbelliferous plant growing in Madagascar called *Hydrocotyle asiatica*, which in doses near a toxic level gave encouraging results in leprosy. In 1938 Bontemps, working in the leprosy laboratory at Antananarivo, the capital of Madagascar, discovered a new glucoside, which he called asiaticocide and which was much less toxic. By further research Boiteau obtained a solution suitable for injection, which, he holds, acts as a solvent of the waxy coating of the bacillus of leprosy, which then becomes fragile and can be easily destroyed by the tissues or by an adjuvant drug. In this connection it may be recalled that a British investigator, Leonard Rogers, in 1923 described a defatting action of injections of chaulmoogrates and morrhuates on the bacilli of leprosy and tuberculosis, based on estimates of the lipase in the blood before and after treatment. The results now reported from the new glucoside include softening and breaking down of nodules, followed by cicatrization. Healing of whitlows and perforating ulcers and gradual improvement of anesthesia and muscular atrophy are also claimed. Still more remarkable is the claim that eye lesions are rapidly cured if treated before the posterior chamber is involved.

### The Value of Mass Miniature Radiography

The Hospitals and Medical Services Committee of the London County Council reports that the first year of miniature mass radiography shows that the method has fully justified itself in detecting unsuspected lung and heart abnormalities. Of 45,682 persons examined, 335 were referred for further clinical and pathologic investigation for lesions probably tuberculous. Of this number 112 were advised to accept hospital and sanatorium treatment. Heart abnormalities were discovered in 83 cases.

### PARIS

(From Our Regular Correspondent)

March 4, 1945.

### Lumbar Sympathectomy

Leriche analyzed before the Académie de médecine the results of removal of the lumbar ganglions for various conditions in 800 cases. There were thirteen deaths, a mortality of 1.6 per cent in these 800 cases; the deaths were generally due to the primary disease. In 601 cases of arteritis there were complete failures, in 20 per cent of which it was necessary to resort to amputation, moderate results with persistence of vague clinical signs in 30 per cent and success in 50 per cent.

Sympathectomy is advantageous in ischemia of effort and in 1 out of 2 cases of ischemia of decubitus. One cannot count on a lasting result when ulceration has occurred. The successes are more numerous and satisfactory when the obliterations are low, which is logical if one considers that sympathectomy acts in dilating the collateral vessels. In successful cases the operation causes an easier walk and the disappearance of pains. However, in thromboangiitis the results are mediocre and temporary; the disorder continues its development in another area.

It is sufficient to remove the first and second lumbar ganglions. In hypertension one will add to this the removal of the last two dorsal ganglions and the section of the splanchnic on the right. Several days later the same intervention is made on the left side and an adrenalectomy is performed. In Raynaud's disease which is localized in one lower extremity, sympathectomy will be short. In postphlebitic sequelae success is possible only before the stage of ulceration. In megacolon and doli-

chocolon the operation must be bilateral: high sympathectomy with splanchnic section. After poliomyelitis an amelioration of the sensation of cold has been observed, but the cyanosis persists. Examination of the removed sympathetic chains shows neurolysis, inflammatory infiltrations and angiomatous aspects.

To the Société médicale des hôpitaux S. de Sèze and his collaborators have reported good results obtained by infiltration of the stellate ganglion by the anterior route in diffuse and extensive pains which follow a slight traumatism and which are accompanied by functional difficulties and vasomotor disturbances. This treatment also is good for painful paresthesias of the upper extremities in women between 40 and 50 and in a number of other painful syndromes of the upper extremity. The treatment is applicable not only to pains originating in the sympathetic but even to radicular pains, which may be benefited. It is known that the stellate ganglion and the eighth cervical and first dorsal roots are contiguous.

Stellate infiltration can be helpful in phalangeal stiffness which accompanies the formation of Heberden's nodes. Its action is less constant in chronic polyarthritis; but it can be useful at the onset of Dupuytren's disease and in facial sympathetic algias. It also gives good results in Raynaud's disease and in sclerodactylia as well as in different forms of angina pectoris.

### Triple Vaccination

Ramon stated before the Académie de médecine that cases of tetanus are at present numerous and severe. Two recent improvements have been applied in antitetanic treatment: the solution of antitoxin, which does not produce serious accidents and perhaps can be employed for its prophylactic quality, and toxoid. At present the employment of combined immunization with antityphoid-paratyphoid vaccine and diphtheria and tetanus toxoids is obligatory in France. This triple "vaccine" has been still more improved by the addition of formaldehyde treated organisms in a concentration that is weaker than the primary mixture. The triple vaccine thus loses its disadvantages and keeps the same immunizing power. There have been carried out without accident 129,000 mixed (diphtheria-tetanus) and 28,000 triple (diphtheria-tetanus-typhoid-paratyphoid) vaccinations, some even in children weakened by food restrictions. The triple vaccination of nearly a million subjects in the French army in 1939 has already indicated its possibilities. Unfortunately, the vaccination has been applied only irregularly among the civil population since the invasion of France and the German occupation.

Tanon at the session of Nov. 28, 1944 reported that in 1942 and 1943 there were carried out 400,000 injections with triple vaccine without an accident.

### The Arsenicals in Syphilis

Durel at the Société médicale des hôpitaux has opened a discussion on the employment of dioxaminodichlorarsines in syphilis. These compounds are eliminated much faster than the arsenobenzenes; this permits all day intravenous injections with a fortnightly dose of 0.12 Gm. They do not cause nitritoid crises, but occasionally digestive disturbances with or without dental shock or rare serious apoplexies. Although the treatment is brief and is completed in two weeks, the patient must be hospitalized. According to other observers the treponemes disappear from the lesions more rapidly than do the lesions themselves and these lesions are not cicatrized as easily with the dioxaminodichlorarsines as with the arsenobenzenes. Slight accidents of intolerance are often observed. They can be avoided or reduced by making the injection rapidly. Flandin adheres to the Politzer method, three injections of 0.9 Gm. of neoarsphenamine every three days, after a desensitizing injection of 0.15 Gm. This treatment acts with the same rapidity as the dioxaminodichlorarsines.

## BRAZIL

(From Our Regular Correspondent)

RIO DE JANEIRO, Feb. 18, 1945.

## The Campaign Against Yellow Fever in 1944

The Ministry of Health has released for publication a report of the activities of the Division of Yellow Fever of the National Department of Health during the year 1944. According to the report the Aedes mosquito has been eradicated from the states of Maranhão, Espírito Santo, Rio de Janeiro, Minas Gerais, Goiás, Paraná, Santa Catarina and the Federal District. In the remaining thirteen states the antimosquito work is being intensively carried out, so much so that it is expected that during the current year the Aedes mosquito will be eradicated also from five or six more states of the remaining area. The territory now entirely freed of the Aedes mosquito represents an area of about 800,000 square miles, or 24 per cent of the whole country, and has a population of about 15.8 million, or 38 per cent of the total population. To achieve this result an organized anti-Aedes specific control work is being conducted in 29,529 localities, a figure to be contrasted with 6,024 in 1940, the first year of the present organization against yellow fever. The total number of inspections and reinspections of dwellings and other places where water deposits have been found reached the figure of more than 2,800 million, as against about 2,100 million in 1940.

There is a vast network of 1,274 posts of viscerotomy, throughout the entire country, to maintain a close watch on all suspicious deaths from feverish illnesses and perform the small operation that enables a central laboratory to make a pathologic examination of a small piece of liver, without the necessity of a complete necropsy. Out of these 1,274 posts, 1,205 have sent to the laboratory a total of 325,244 liver samples.

During the year 8 cases of yellow fever have been reported and confirmed, all of them having been ascertained to be of "jungle" yellow fever, in which sylvatic mosquitoes act as the medium of transmission. There has been no instance of Aedes-carried urban and suburban yellow fever. In 103 counties of 17 states a total of 210,442 persons have been inoculated with yellow fever vaccine, a large part of these persons belonging to the military services.

## Penicillin Treatment of the Bartonellosis of Splenectomized Rats

Owing to the close relations between bartonellosis and the spleen, the exact nature of this infection is interesting to endocrinologists as well as to bacteriologists. The strange fact of the appearance of bartonellosis in animals that have been subjected to splenectomy seems to point to the existence of some protective mechanism of endocrine nature. Starting from the fact that splenectomy presents a poorly defined clinical picture, Dr. Thales Martins, head of the Division of Endocrinology of the Oswaldo Cruz Institute, suggested that bartonellosis might be used as a valuable test for the study of the physiology of the spleen. For this reason Dr. F. Ubatuba and Dr. Gessy Vieira of the Division of Endocrinology decided to study this problem experimentally. In a first paper on this general subject, the authors report the results of a preliminary investigation on the effect of penicillin in the treatment of bartonellosis of splenectomized white rats. They used 80 rats, previously splenectomized, that have been carefully studied in regard to the secondary anemia consequent on the operation. They ascertained that the anemia closely coincides with the appearance of the bartonellas in the circulating blood and that it shows an earlier appearance and a more rapid and severe evolution in Brazil in comparison with the same results as published in the medical literature of other countries. The observed mortality rate, higher for the male animals, was about 50 per cent. The

authors used the opportunity to test the therapeutic effect of barium penicillin prepared at the Oswaldo Cruz Institute on the Bartonella infection. These results were completely negative, at least with the dose of 400 Oxford units that was employed.

## Penicillin in the Treatment of Brazilian Typhus

Dr. Octavio Magalhães and Dr. Adyr Rocha, who have carried out experimental studies on Brazilian typhus in the state of Minas Gerais, have published the results of their work on the treatment of the experimental disease of guinea pigs with penicillin. They found that small doses of 1,600 Oxford units inoculated during the first twenty-four to forty-eight hours of the appearance of the feverish reaction are unable to modify the course of the disease in the temperature curve or in the testicular or splenomegalic manifestations. When used in larger doses of 25,000 to 30,000 Oxford units through the peritoneal route during the first twenty-four hours penicillin causes the temperature to fall to normal and is able to attenuate the visceral manifestations of the disease. In these doses, even when injected in later stages of the disease, penicillin causes the temperature to fall, modifying to a certain degree the virulence of the virus in the animals. Direct contact of penicillin with the virus during several hours causes complete loss of the virulence of the virus. The authors then conclude that, with higher doses of the drug given intravenously to man, it would be possible perhaps to modify for the better the evolution of severe cases of Brazilian typhus, which frequently show 85 and 90 per cent of fatality.

## Brief Items

Gustavo Baz of the Ministry of Health of Mexico has arrived at Rio de Janeiro, where he will spend a few days as a guest of the Brazilian government.

Dr. José Paulo de Azevedo Sodré has been elected to membership of the National Academy of Medicine. Dr. Sodré is head of the surgical department of the Municipal Emergency Hospital of Rio de Janeiro.

A new school hospital has just been opened by the Department of Education of the Rio de Janeiro city administration. This institution will be known as the "Oscar Clark School-Hospital" in honor of Dr. Oscar Clark, to whom the city owes much in the development of school health.

Dr. J. de Moraes Grey was recently received as a new member of the National Academy of Medicine.

## Marriages

WILLIAM W. FARLEY, Richmond, Va., to Miss Rachael Gilbert Smith of Kings Mountain, N. C., January 20.

HAL PEARSON JAMES, Whitehaven, Tenn., to Miss Elizabeth "Mickey" McClure of Waynesville, N. C., recently.

JOSEPH LEO RUBEL, Columbus, Miss., to Miss Margaret Patricia Meacham of St. Louis, January 20.

SAMUEL P. NIXON, Fairport, N. Y., to Miss Elizabeth S. Hopkins of Haddonfield, N. J., February 6.

HERBERT LOUIS TREUSCH, Atlanta, Ga., to Miss Belen Maria Bernabe of San Juan, P. R., February 14.

BUELL H. VAN LEUVEN, Sault Ste. Marie, Mich., to Miss Gladys Collin of Empire, February 9.

BLANCHE O. NOBLE NICOLA to Major Lee Edgar Beakley at Glendale, Calif., January 24.

ERVIN ELLISON, Lancaster, Pa., to Miss Frances S. Haines in Brooklyn, February 3.

LEE M. GOODMAN to Sgt. Helen C. Robinson, both of Jersey Shore, Pa., February 14.

CONIE C. LOWRY to Miss Betty Jane Hamilton, both of Nashville, Tenn., February 3.

ERN C. MOONEY, San Antonio, Texas, to Miss Marie Sims of Mexia, December 27.

## Deaths

**Edward Lyman Allen**, Brookline, Mass.; L.R.C.P., London, and M.R.C.S., England, 1937; member of the Vermont State Medical Society and the American Medical Association; served on the staff of the Bangor State Hospital, Bangor, Maine; died in Boston January 22, aged 58, of pulmonary edema.

**Adolph John Baiocchi** ☉ San Jose, Calif.; Stanford University School of Medicine, San Francisco, 1919; fellow of the American College of Surgeons; past president of the Santa Clara County Medical Society; interned at the San Francisco Hospital; member of the staffs of the Santa Clara County Hospital, San Jose Hospital and the O'Connor Sanitarium, where he died February 16, aged 52, of typhoid.

**Horace Mitchell Baker** ☉ Lumberton, N. C.; Harvard Medical School, Boston, 1917; past president of the Robeson County Medical Society; served during World War I; member of the International College of Surgeons; for many years a member of the local school board; a director of the Scottish Bank; member and past president of the Rotary Club; member of the board of the State Hospital in Raleigh; surgeon, chief of staff and administrator of the Baker Sanatorium, where he died February 28, aged 57, of cerebral hemorrhage.

**Willard Doolittle Becker**, Lakeville, N. Y.; College of Physicians and Surgeons, New York, 1890; at one time president of the Rochester Pathological Society; served as mayor of the village of Livonia, where he had been a member and president of the board of education; died in the Genesee Hospital, Rochester, January 24, aged 78, of carcinoma of the prostate.

**George D. Bollard**, Jefferson, Ohio; Western Reserve University Medical Department, Cleveland, 1888; died January 3, aged 84, of coronary occlusion and Parkinson's disease.

**Charles Frederick Browne**, Racine, Wis.; Chicago Homeopathic Medical College, 1898; member of the American Medical Association; for three years secretary-treasurer of the Racine County Medical Society; for many years a member of the local board of health; died January 30, aged 69, of coronary thrombosis.

**Howard Storm Browne**, Ponca City, Okla.; University of Illinois College of Medicine, Chicago, 1919; at one time dean and professor of materia medica at the School of Pharmacy of the University of Oklahoma; past president of the Kay County Medical Society; served an internship and taught chemistry at the University Hospital in Chicago; on the staff of the Ponca City Hospital; died January 27, aged 58, of coronary heart disease.

**Louis Burckhardt** ☉ Indianapolis; Universität Zürich Medizinische Fakultät, Zurich, Switzerland, 1889; emeritus professor of obstetrics at the Indiana University School of Medicine; in April 1940, on the completion of his fiftieth year of active practice, his colleagues and friends honored him and his wife with a commemorative dinner; member of the staffs of the Methodist Hospital and St. Vincent's Hospital, where he died March 20, aged 79, of complications resulting from an injury to his hip received in a fall.

**John Laurence Callahan**, La Crosse, Wis.; Rush Medical College, Chicago, 1891; died in the La Crosse Hospital January 5, aged 85, of cardiorenal disease.

**William Austin Carr**, Merriam, Kan.; University of Oklahoma School of Medicine, Oklahoma City, 1918; member of the American Medical Association and Missouri State Medical Association; served during World War I; on the staffs of the Bethany Hospital and St. Margaret's Hospital, Kansas City, Kan., St. Mary's Hospital and Trinity Lutheran Hospital, Kansas City, Mo., where he died January 4, aged 56, of coronary occlusion.

**Caleb B. Chambers**, Oklahoma City; Meharry Medical College, Nashville, Tenn., 1909; died in the Oklahoma City General Hospital January 21, aged 69, of diabetes mellitus and gangrene of the right foot.

**Charles J. Chloupek**, Green Bay, Wis.; Milwaukee Medical College, 1901; member of the American Medical Association; past president of the Brown-Kewaunee-Door County Medical Society; served as city health officer; on the staff of St. Vincent's Hospital; died February 21, aged 70, of respiratory failure following anesthesia.

**William Peter Connor**, Youngstown, Ohio; Georgetown University School of Medicine, Washington, D. C., 1908; one of the founders of St. Elizabeth Hospital, where he died January 20, aged 65, of carcinoma of the throat.

**Donato Conte**, Newark, N. J.; Regia Università di Napoli Facoltà di Medicina e Chirurgia, Naples, Italy, 1929; died December 29, aged 62, of aortic regurgitation and aortitis.

**Maurice Stewart Doak**, Newport, Tenn.; University of Tennessee College of Medicine, Memphis, 1924; member of the American Medical Association; mayor of Newport; served during World War I; chief examining physician for the draft board; served as alderman; died January 20, aged 46, of an accidental gunshot wound received while returning from duck hunting.

**Rafe Arnett Easter**, Washington, D. C.; Howard University College of Medicine, Washington, 1914; first lieutenant, medical reserve corps, U. S. Army, not on active duty; died in the Veterans Administration Facility February 25, aged 57, of hypertensive heart disease.

**James K. Egbert**, Elgin, Ill.; Rush Medical College, Chicago, 1886; died in the Sherman Hospital February 5, aged 80, of carcinoma.

**William Ansley Grant** ☉ Bardwell, Texas; University of Nashville Medical Department, 1905; served on the staffs of the Terrell State Hospital in Terrell and the San Antonio State Hospital in San Antonio; died January 26, aged 63, of pulmonary fibrosis.

**Brose Sumerville Horne**, Gas City, Ind.; Medical College of Ohio, Cincinnati, 1895; past president of the Wells County Medical Society; at one time Indiana State Prison physician in Michigan City; served during World War I; an examiner for Spanish-American War veterans; died in the Veterans Administration Facility in Marion, February 12, aged 71, of hypertension and psychosis.

**Daniel John Horton**, Pomona, Calif.; Denver Homeopathic College, 1900; died December 16, aged 72.

**James W. Janes**, Columbus, Kan.; University of Tennessee Medical Department, Nashville, 1887; member of the American Medical Association; honorary member of the Kansas Medical Society; died January 18, aged 100, of myocardial failure.

**Howard Reynold Johnson**, Bishop Hill, Ill.; University of Illinois College of Medicine, Chicago, 1925; interned at the City Hospital in St. Louis; died February 26, aged 44, of malignant adenoma of the liver.

**James J. Kane**, Norristown, Pa.; Jefferson Medical College of Philadelphia, 1892; formerly coroner and postmaster; served two terms on the borough council; honorary chairman of the Montgomery County branch of the National Foundation for Infantile Paralysis; died in the Sacred Heart Hospital February 22, aged 85, of pyelonephritis.

**George Kessel** ☉ Cresco, Iowa; Rush Medical College, Chicago, 1885; formerly mayor; donor of park to city; fellow of the American College of Surgeons; surgeon-in-chief of St. Joseph Mercy Hospital; died January 29, aged 88, of heart block.

**Nathaniel Clark King**, Brockton, Mass.; College of Physicians and Surgeons, New York, 1884; member of the American Medical Association; died January 23, aged 83, of coronary occlusion.

**Adolph Leonard Kylo**, Superior, Wis.; University of Louisville School of Medicine, Louisville, Ky., 1911; city health officer; served during World War I; on the staffs of St. Mary's, St. Joseph's and St. Francis hospitals; died in the Veterans Administration Facility, Minneapolis, February 18, aged 57, of coronary thrombosis.

**Frank P. Lenahan**, San Diego, Calif.; University of Pennsylvania Department of Medicine, Philadelphia, 1888; a founder of the Mercy Hospital in Wilkes-Barre, Pa., and the Nesbitt Memorial Hospital in Kingston, Pa.; died in the Mercy Hospital February 7, aged 80, of bronchopneumonia, left hemiplegia and general arteriosclerosis.

**Michael Lewis Levitt** ☉ Philadelphia; Jefferson Medical College of Philadelphia, 1906; died in Atlantic City, N. J., January 1, aged 65, of coronary thrombosis.

**Arthur Luscomb**, Waterbury, Conn.; New York Homeopathic Medical College, New York, 1883; died January 22, aged 83, of myocarditis following an attack of bronchopneumonia.

**Kurt Helmer MacDuffie**, New York; Yale University Medical School, New Haven, Conn., 1942; interned at the Roosevelt Hospital; diplomate of the National Board of Medical Examiners; commissioned a first lieutenant in the medical corps, Army of the United States, on June 10, 1943; served in New Guinea; honorably discharged on Aug. 30, 1944, because of physical disqualification; died January 10, aged 29, of bronchopneumonia.

**Richard Roderick Marnell**, Cincinnati; University of Cincinnati College of Medicine, 1933; member of the American Medical Association; served as athletic physician at Xavier College; member of the staffs of the Good Samaritan, St. Mary and Our Lady of Mercy hospitals; died February 9, aged 43, of coronary thrombosis.

**Eugene Allan McCarthy**, Bedford, Mass.; Harvard Medical School, Boston, 1887; member of the American Medical Association; died in Cambridge January 1, aged 84, of intestinal obstruction and myocarditis.

**Patrick Farrell McPartland**, Hartford, Conn.; Baltimore Medical College, 1905; member of the American Medical Association; served as president of the Hartford Medical Society and as secretary of the Hartford County Medical Society; fellow of the American College of Surgeons; on the staff of St. Francis Hospital; died January 28, aged 64, of coronary thrombosis.

**Michael W. Minor**, Comorn, Va.; University of Maryland School of Medicine, Baltimore, 1891; member of the American Medical Association; chairman of the local school board and the board of directors of the Bank of Westmoreland; died January 31, aged 77, of cerebral hemorrhage.

**Gordon Baird Moffat**, Kalamazoo, Mich.; University of Toronto Faculty of Medicine, Toronto, Ont., Canada, 1923; director of the city and county health department; formerly health officer of district number 4, comprising Alpena, Cheboygan, Montmorency and Presque Island counties; on the staffs of the Borgess and Bronson Methodist hospitals; interned at the Highland Park General Hospital in Highland Park, Mich.; died January 3, aged 46, of coronary occlusion.

**Marguerite Winifred Moir**, Boston; Boston University School of Medicine, 1918; member of the American Medical Association; died December 3, aged 71, of carcinoma.

**Chalmers Hale Moore** Ⓢ Birmingham, Ala.; Johns Hopkins University School of Medicine, Baltimore, 1913; member of the Southern Surgical Association and the Southeastern Surgical Congress; died in the Jefferson Hospital January 3, aged 55, of coronary occlusion.

**Harry M. Moore**, St. Louis; Washington University School of Medicine, St. Louis, 1898; member of the American Medical Association; fellow of the American College of Surgeons; on the surgical staffs of the Frisco, Missouri Baptist, De Paul and St. Luke's hospitals; died January 16, aged 71, of heart disease.

LIEUT. MANNE P. ADAMS (MC),  
U.S.N.R., 1917-1943

LIEUT. (JG) BELTON A. BENNETT JR.  
(MC), U.S.N.R., 1913-1944

**Walter Scott Musser**, Tyrone, Pa.; Jefferson Medical College of Philadelphia, 1895; member of the American Medical Association; died December 26, aged 77, of coronary occlusion.

**Leonard Carothers Nigh** Ⓢ Mansfield, Ohio; University of Cincinnati College of Medicine, 1923; died in the Mansfield General Hospital January 26, aged 49, of coronary thrombosis.

**James Edmund Norman**, Trenton, Texas; St. Louis College of Physicians and Surgeons, 1899; member of the American Medical Association; local surgeon for the Missouri-Kansas and Texas Railroad; on the staff of St. Vincent's Hospital, Sherman; died January 10, aged 76, of injuries received when the automobile in which he was driving was struck by a train.

**Wilbur Myrland Paige**, Lynn, Mass.; Tufts College Medical School, Boston, 1919; died December 28, aged 50.

**Richard Armstrong Pearse** Ⓢ Brigham, Utah; Gross Medical College, Denver, 1900; past president of the Utah State Medical Association; fellow of the American College of Surgeons; member of the staffs of the Thomas D. Dee Hospital in Ogden and the Cooley Memorial Hospital; served as medical director of the Pearse Private Hospital; died January 21, aged 69, of coronary occlusion.

**Charles Clarence Phillips**, Hampton, Va.; Southwestern Homeopathic Medical College and Hospital, Louisville, Ky., 1901; member of the American Psychiatric Association; served during World War I;

formerly on the staffs of the Eastern State Hospital in Lexington, Ky., and the Western State Hospital in Hopkinsville, Ky.; served on the staffs of various Veterans Administration facilities; died in the Veterans Administration Facility, Ketchikan, February 13, aged 64, of coronary occlusion.

**Julius Hyman Rubin**, Kansas City, Kan.; Eclectic Medical University, Kansas City, Mo., 1914; member of the American Medical Association; served during World War I; on the staffs of the Bethany and Providence hospitals; died suddenly while en route to Alexandria, La., January 17, aged 53, of coronary occlusion.

**Roy Bulkley Roberts**, Brimfield, Ill.; Ensworth Medical College, St. Joseph, Mo., 1897; Rush Medical College, Chicago, 1899; served as mayor of Brimfield; formerly president of the Lions Club; died in St. Francis Hospital, Peoria, January 28, aged 69.

**Joseph Bernard Rockett**, Boston; Middlesex College of Medicine and Surgery, 1928; died January 4, aged 62, of coronary occlusion.

## KILLED IN ACTION

**Manne Perry Adams**, Sebring, Fla.; Emory University School of Medicine, Atlanta, Ga., 1941; interned at the University Hospitals in Iowa City; commissioned a lieutenant (jg) in the medical corps, U. S. Naval Reserve, Aug. 12, 1941; began active duty on July 14, 1942; promoted to lieutenant on April 30, 1943; was awarded the Silver Star and Purple Heart posthumously; the citation accompanying the Silver Star award read "For conspicuous gallantry and intrepidity during action against numerically superior enemy Japanese forces near Koi-ari, Bougainville, British Solomon Islands, on Nov. 29, 1943"; died in the Pacific area Nov. 29, 1943, aged 26, of a gunshot wound of the chest.

**Belton Allen Bennett Jr.**, Greer, S. C.; University of Virginia Department of Medicine, Charlottesville, 1938; served an internship and residency at St. Luke's Hospital in Bethlehem, Pa.; served a residency at the Doctors Hospital in Washington, D. C.; received the degree of master of science in surgery from the University of Pennsylvania in 1943; commissioned a lieutenant (jg) in the U. S. Naval Reserve on Sept. 7, 1943; a surgeon aboard the U. S. S. *Cooper* which was torpedoed and sunk in Ormoc Bay, off Western Leyte; at first declared missing in action; presumptive date of death, according to the Navy Department, Dec. 3, 1944, aged 30.

**Elizabeth Gregorievona Samoylenko**, Boston; Albert-Ludwigs-Universität Medizinische Fakultät, Freiburg, Baden, Germany, 1905; at one time a member of the faculty of a medical college in Kharkov, Russia; served on the staff of the Massachusetts General Hospital; died January 13, aged 63, of hypertensive heart disease.

**Herman Joseph Schlageter** ☉ San Francisco; Cooper Medical College, San Francisco, 1895; formerly an assistant in the genitourinary department at his alma mater, and associated with the city board of health as sanitary inspector for the mission district; veteran of the Spanish-American War; served in France during World War I; died in the Stanford Hospital January 19, aged 72, of cerebral hemorrhage.

**Alexander Shulman**, St. Petersburg, Fla.; College of Physicians and Surgeons, New York, 1885; at one time practiced in New York City, where he had been on the staff of St. Mark's Hospital; died January 12, aged 83, of arteriosclerosis.

**Kenneth Gilbert Smith**, Portland, Ore.; University of Oregon Medical School, Portland, 1926; member of the American Medical Association; interned at the Letterman General Hospital in San Francisco; at one time a first lieutenant in the U. S. Army; served as acting assistant surgeon in the U. S. Public Health Service; died January 18, aged 43, of bronchogenic carcinoma.

**John Joseph South** ☉ Massillon, Ohio; University of Pennsylvania School of Medicine, Philadelphia, 1914; a medical officer with the British army during World War I; chief of staff at the Massillon City Hospital; died February 3, aged 55, of heart disease.

**Thomas Richard Shannon**, St. Louis; St. Louis College of Physicians and Surgeons, 1918; member of the Illinois State Medical Association and the American Medical Association; on the staff of the Alexian Brothers Hospital; died at his home in East St. Louis, Ill., January 27, aged 58, of coronary occlusion and influenza.

**Martin Wesley Steele**, Corbin, Ky.; Kentucky School of Medicine, Louisville, 1905; in 1912 vice president of the Kentucky State Medical Association; past president of the Kiwanis Club; died February 16, aged 69.

**Ulysses B. Stone**, Buffalo; University of Buffalo School of Medicine, 1896; died in Palm Beach, Fla., January 18, aged 72.

**Wladislaus M. Struzynski**, Wilkes-Barre, Pa.; Northwestern University Medical School, Chicago, 1904; served on the staff of St. Joseph's Hospital in Joliet, Ill.; died January 15, aged 75, of congestive heart disease.

**Rufus Amery Sullivan**, Dallas, Texas; Barnes Medical College, St. Louis, 1907; member of the American Medical Association; died in St. Paul's Hospital January 14, aged 66, of carcinoma of the liver.

**Clarence Conkle Taylor** ☉ East Rochester, Ohio; Ohio Medical University, Columbus, 1898; served as a member of the Columbiana County board of health advisory council; president of the Minerva Savings and Banking Company; died in the North Side Unit of the Youngstown Hospital, Youngstown, January 21, aged 75, of prostatic hypertrophy and perirenal abscess.

**William Henry Taylor**, Irwin, Pa.; University of the City of New York Medical Department, New York, 1884; member of the American Medical Association; served on the staff of the Westmoreland Hospital in Greensburg; died January 17, aged 83.

**Percy Hamilton Terhune**, Hamden, Conn.; College of Physicians and Surgeons, New York, 1889; member of the American Medical Association and the Medical Society of New Jersey; at one time president of the board of health and city physician in Passaic, N. J., where he was on the staff of the Passaic General Hospital and on the visiting staff of St. Mary's Hospital; died in the Grace Hospital, New Haven, January 25, aged 77, of coronary heart disease.

**Charles Oscar Thompson** ☉ Boston; College of Physicians and Surgeons, New York, 1889; trustee of the Massachusetts College of Pharmacy; life member of the New England Historic Genealogical Society; died January 29, aged 82, of cerebral thrombosis.

**Edward C. Tinsley**, Indianapolis; Louisville (Ky.) Medical College, 1897; died January 26, aged 77, of cerebral hemorrhage and arteriosclerosis.

**Henry Herman Unger**, New York; Columbia University College of Physicians and Surgeons, New York, 1906; member of the American Medical Association; life insurance examiner; died January 29, aged 61, of heart disease.

**Hamilton Vreeland**, Ridgewood, N. J.; University of the City of New York Medical Department, New York, 1885; member of the American Medical Association; died January 12, aged 85, of carcinoma of the stomach.

**Charles William Wang**, Philadelphia; Jefferson Medical College of Philadelphia, 1906; served during World War I; died in the U. S. Naval Hospital December 4, aged 65, of large infarction anterior wall left ventricle of heart.

CAPT. WALTER E. BLOCK, M. C.,  
A. U. S., 1903-1944

CAPT. GORDON FREDERIC FISCHER,  
M. C., A. U. S., 1912-1944

## KILLED IN ACTION

**Walter Eugene Block**, Chicago; Chicago Medical School, 1930; member of the American Medical Association; interned at the Baptist Hospital in Houston, Texas, on the staff of St. Mary of Nazareth Hospital; commissioned a first lieutenant in the medical corps, Army of the United States, on July 10, 1942; later promoted to captain; went overseas in November 1943; with the Rangers when they landed on Normandy Beachhead at Port Du Hoc, they received the Silver Star, Presidential Unit Citation, Purple Heart and Bronze Star with Oak Leaf Cluster and the

Distinguished Service Cross; killed in action in Germany during his fourth major battle, Dec. 8, 1944, aged 40.

**Gordon Frederic Fischer**, Detroit; University of Michigan Medical School, Ann Arbor, 1942; served an internship and a residency in otology, laryngology and rhinology at the University Hospital in Ann Arbor, Mich.; commissioned a first lieutenant in the medical corps, Army of the United States, on June 29, 1942; later promoted to captain, killed in action in Belgium Sept. 16, 1944, aged 32.

## Correspondence

### WASSERMANN REVERSAL AFTER PENICILLIN

*To the Editor:*—In Queries and Minor Notes in *THE JOURNAL*, February 24, the item "Effect on Syphilis of Penicillin Treatment for Gonorrhea" ends with the statement "There is no information as to the effect of 100,000 to 200,000 units of penicillin given in one day on the blood test of a patient with an already existing positive serologic reaction."

While it concerns only one individual, the following case report is submitted in an effort to supply such information:

F. A., a Negro aged 23, was admitted to the Kansas State Sanatorium for Tuberculosis on Feb. 2, 1944 with far advanced pulmonary tuberculosis involving the right lung. At the University of Kansas outpatient clinic he had had 4 plus Wassermann and Kahn reactions on Dec. 24, 1943 and had received six injections of neocarsphenamine. On admission to the sanatorium his Kolmer reaction was doubtful and Kahn reaction positive.

On physical examination the left lung was normal; the right lung showed the usual signs of an active pneumonic tuberculous process in the upper half. Sputum was positive for tubercle bacilli. X-ray examination showed the left lung normal, the right with an infiltrative lesion in the upper half with cavitation in the first and second interspaces.

Pneumothorax was started on the right side February 29 with a good collapse, but by March 4 there was definite spread in the third interspace, left, peripherally, which was considered a focal reaction. This was absent on the x-ray film of March 2 and was quite obvious on March 4. At that time the temperature ranged as high as 102.4 F. for eight days, after which the daily range seldom went higher than 99.6 until August, when it reached 101 on several days. The patient improved clinically and the pneumothorax on the right was pushed to a 50 per cent collapse. No antisyphilitic treatment was given. On July 7 an intrapleural pneumolysis was done under negative pressure, cutting two posterolateral adhesions to the third and fifth ribs but leaving an apical adhesion because of the close proximity of a large vein. There was no appreciable elevation of temperature following the pneumolysis. On November 4 the temperature suddenly went to 102.8 F. and a couple of days later to 104 and continued high.

The x-ray reading of November 17, compared with the original of February 16, contained the statement that on the first x-ray of February 16 the fine radiating lines extending out from a presumably tuberculous process in the right hilus made one think that syphilis might be associated with this. The Wassermann reaction was positive, and the fact that there was a spread to the other side, despite the fact of a pneumothorax, made one want to try intensive antisyphilitic treatment. Accordingly on November 18 penicillin was started intramuscularly, every four hours, a total of 300,000 units being given over a period of seventy-two hours. The temperature, which had been running as high as 103 and 104 F., dropped the second day to a maximum of 99 and remained down after the discontinuance of the penicillin, rarely going above 99 at any time since.

X-ray examination on November 22, after 300,000 units of penicillin, showed that the lesion in the left chest looked better; on December 22 the right lung was down to 40 or 50 per cent of its original volume and there was atelectasis in the base, also an infiltrative lesion in the middle third of the left chest with cavity formation opposite the third interspace. In general, the picture remained about the same except that the infiltration in the middle third of the left lung looked better than it did before.

On November 28, ten days after the penicillin was given, the Kolmer and Kahn reactions were both negative. On a repeat December 12 they were still both negative.

The patient's general clinical condition has remained good and there has been no other antisyphilitic treatment than the penicillin.

ROR K. SMITH, M.D., Norton, Kan.

### REGIONAL ENTERITIS

*To the Editor:*—The papers on regional enteritis by H. L. Bockus and H. W. Cave in *THE JOURNAL*, February 24, make it clear that the last word on this condition, which Homans and Hass aptly term "a clinical, not a pathological, entity" is yet to be written. Until the etiology is resolved, the approach to treatment must continue to be largely empirical. That surgery per se is not the final solution is evident from the frequency of postoperative recurrences. When manifestations such as stenosis, ulceration, abscess or fistulous formation present themselves, surgery (whether conceived as curative or only palliative) will, of course, be indicated. Yet, as S. F. Marshall points out (*Regional Ileitis, New England J. Med.* 222:375 [March 7] 1940), "the patient with widespread involvement of the small intestine may of necessity [have to] be given medical treatment, because it is impossible to remove all the diseased bowel."

The question of the best treatment for the patient with early or mild regional enteritis is still a difficult one to answer. Cave reported 4 cases that presented at operation a typical early regional ileitis; only an appendectomy was done in each case and the patients have remained well for five years. I can testify to a similar result in a case of early or mild regional ileitis in a woman of 55. The gastrointestinal x-rays were negative save for gallstones. At operation in 1930 abdominal exploration demonstrated inflammation and thickening of the terminal ileum for a distance of about 6 inches, with edema of the mesentery and pronounced enlargement of the mesenteric glands. The gallbladder containing stones and a normal appearing appendix were removed; the postoperative course was uneventful. Gastrointestinal x-ray films taken one month after operation and again thirteen years later were negative. The patient has now been continuously free from abdominal symptoms for fifteen years.

In the early stages of regional enteritis, therefore, there is merit to Bockus's observation that "one should refrain from operating on some patients with regional enteritis in the absence of extensive infection or obstruction in order to determine whether or not the infective process will subside and some degree of resolution occur . . ."

CARL BEARSE, M.D., Boston.

## Bureau of Legal Medicine and Legislation

### MEDICOLEGAL ABSTRACTS

**Insurance: Chiropractic Treatments as "Medical or Surgical Treatment or Attention."**—The defendant insurance company issued a policy of insurance Feb. 2, 1942 on the life of Pauline Kahn in which Herman Kahn was named as beneficiary. The policy provided that

if within two years prior to the date of issue of this Policy the Insured has received institutional, hospital, medical or surgical treatment or attention, and the insured or any claimant under the Policy fails to show that the condition occasioning such treatment or attention was not of a serious nature or was not material to the risk, this Policy shall be voidable by the Company . . . unless reference to such institutional, hospital, medical or surgical treatment or attention is endorsed on this Policy by the Company. . . .

From January 1940 to January 1942 the insured submitted to more than one hundred treatments from a chiropractor for "shortness of breath, obesity, tiredness, menopause and various minor ailments such as colds and things of that sort." Admittedly, the chiropractic treatments were administered to the insured "for a serious condition or ailment." The insured died Jan. 12, 1943 and the insurance company refused to pay under the policy, contending that "within two years prior to the date of issue of the policy the insured received medical treatment or attention, and reference to such medical treatment or atten-

tion is not endorsed on the policy and the defendant (the insurance company) has declared the policy void." The beneficiary brought suit on the policy. At the close of the evidence the trial court instructed the jury that "there is no proof of any medical treatment of this woman at any time." From a verdict and judgment for the beneficiary the insurance company appealed to the supreme court of New Jersey.

The question here for determination, said the supreme court, is whether or not treatments or adjustments by a chiropractor are "medical or surgical treatment or attention" as used in the policy of life insurance involved. The word "medical" means "of, pertaining to, or dealing with, the healing art, or the science of medicine; especially in the narrower sense; as, medical profession; medical services; medical jurisprudence." The word "medicine" is defined as "the science and art dealing with the prevention, cure or alleviation of disease; in a narrower sense, that part of the science and art of restoring and preserving health which is the province of the physician as distinguished from the surgeon and obstetrician." Webster's New International Dictionary. In administering the chiropractic adjustments to the insured, continued the court, the chiropractor held himself out as attempting to prevent, cure or alleviate the conditions from which his patient suffered. The legislative history in connection with the practice of chiropractic is illuminating. By chapter 4, Laws, 1920, the New Jersey legislature enacted a statute entitled "An Act to regulate the practice of chiropractic." The following year that act was repealed and the legislature enacted a supplement to "An act to regulate the practice of medicine and surgery, to license physicians and surgeons, and to punish persons violating the provisions thereof." Laws, 1921, chapter 136. Through the revision of 1937 and as recently as Laws, 1939, chapter 115, the subject of chiropractic has been dealt with by the legislature under the general heading of "An act to regulate the practice of medicine and surgery." The effect of chapter 136, Laws, 1921, and the subsequent acts amendatory and supplemental thereof was to grant to chiropractors a limited license to practice medicine. In *State Board of Medical Examiners v. Maza*, 153 A. 259, 9 N. J. Misc. 171, the supreme court said:

The precise question therefore is whether chiropractic is a branch of medicine or surgery. Evidently the Legislature elected so to regard it, when after passing the "Act to regulate the practice of chiropractic," chapter 4 of the Laws of 1920, it repealed it the following year by chapter 136 of the Laws of 1921 (P. L., at p. 268), and provided for "limited licenses" under the Medicine and Surgery Act. . . . We consider that it was entirely within the power of the legislature to label chiropractic as a branch of medicine or surgery.

There have been a number of cases, continued the supreme court, of which *State Board of Medical Examiners v. Maza*, *supra*; *Heintze v. New Jersey, etc., Medical Examiners*, 107 N. J. L. 420, 153 A. 253, affirmed 110 N. J. L. 24, 163 A. 892; *Miller v. State Board of Medical Examiners*, 167 A. 740, 11 N. J. Misc. 653, are typical, which deal with the convictions of chiropractors for engaging in the practice of medicine. A close scrutiny of these cases will in each instance disclose that the convictions are based on the performance of acts by the chiropractors which went beyond the scope of the limited license that was issued to them, or with the practice of chiropractic by unlicensed persons. We find nothing in that line of cases incompatible with the holding that a chiropractor practicing within the limits of his license is engaged in the practice of medicine. We believe that the trial court took too narrow a view of the word "medical" as used in the policy under consideration. Considering the legislative action referred to, it seems indisputable that the adjective "medical" is used in the broad generic sense comprehended by the definition given and is inclusive of the practice of chiropractic. The undisputed evidence disclosing the treatments within the two year period and reference to such treatments not having been endorsed on the policy as required, or disclosed in the application, it was the duty of the trial court to direct a verdict in favor of the insurance company.

The judgment in favor of the beneficiary was reversed and judgment was entered in favor of the insurance company.—*Kahn v. Metropolitan Life Ins. Co.*, 41 A. (2d) 329 (N. J., 1945).

## Medical Examinations and Licensure

### COMING EXAMINATIONS AND MEETINGS

#### NATIONAL BOARD OF MEDICAL EXAMINERS EXAMINING BOARDS IN SPECIALTIES

Examinations of the National Board of Medical Examiners and Examining Boards in Specialties were published in THE JOURNAL, April 14, page 1012.

#### BOARDS OF MEDICAL EXAMINERS

ALABAMA: Montgomery, June 26-28. Sec., Dr. B. F. Austin, 519 Dexter Ave., Montgomery 4.

ALASKA: Juneau, September. Sec., Dr. W. M. Whitehead, Box 561, Juneau.

ARKANSAS: \* *Eclectic*. Little Rock, June 7. Sec., Dr. C. H. Young, 1415 Main St., Little Rock. *Medical*. Little Rock, June 7-8. Sec., Dr. D. L. Owens, 701 Main St., Little Rock.

CALIFORNIA: *Oral*. San Francisco, May 20. *Written*. San Francisco, July 9-12. Sec., Dr. Frederick N. Scatena, 1020 N St., Sacramento 14.

DELAWARE: *Examination*. Dover, July 10-12. *Reciprocity*. Dover, July 17. Sec., Medical Council of Delaware, Dr. J. S. McDaniel, 229 S. State St., Dover.

FLORIDA: \* Jacksonville, June 25-26. Sec., Dr. Harold D. Van Schaick, 2736 S. W. Seventh Ave., Miami 36.

IDAHO: Boise, July 10. Dir., Bureau of Occupational Licenses, Miss Agnes Barnhart, 355 State Capitol Bldg., Boise.

ILLINOIS: Chicago, June 26-28. Superintendent of Registration, Department of Registration and Education, Mr. Philip Harman, Springfield.

INDIANA: Indianapolis, Aug. 28-30. Sec., Board of Medical Registration & Examination, Dr. W. C. Moore, 301 State House, Indianapolis 4.

KANSAS: Kansas City, June 28-29. Sec., Board of Medical Registration & Examination, Dr. J. F. Hassig, 905 N. Seventh St., Kansas City 10.

KENTUCKY: Louisville, June 18-20. Sec., State Board of Health, Dr. Philip E. Blackerby, 620 S. Third St., Louisville 2.

LOUISIANA: June. Sec., Dr. R. B. Harrison, 1507 Hibernia Bank Bldg., New Orleans 12.

MARYLAND: *Medical*. Baltimore, June 19-22. Sec., Dr. J. T. O'Mara, 1215 Cathedral St., Baltimore. *Homeopathic*. Baltimore, June 19-20. Sec., Dr. J. A. Evans, 612 W. 40th St., Baltimore.

MINNESOTA: \* Minneapolis, June 5-6. Sec., Dr. J. F. DuBois, 230 Lowry Medical Arts Bldg., St. Paul 2.

MISSOURI: St. Louis, June 7-9. Sec., State Board of Health, Miss Erma E. Nixon, State Capitol Bldg., Jefferson City.

MONTANA: Helena, Oct. 1-3. Sec., Dr. O. G. Klein, First Nat'l. Bank Bldg., Helena.

NEVADA: Carson City, May 7. Sec., Dr. G. H. Ross, 215 N. Carson St., Carson City.

NEW JERSEY: Trenton, June 19-20. Sec., Dr. E. S. Hallinger, 28 W. State St., Trenton.

NORTH DAKOTA: Grand Forks, July 3. Sec., Dr. G. M. Williamson, 4½ S. Third St., Grand Forks.

OHIO: *Endorsement*. Columbus, April. *Examination*. Columbus, June 18-21. Sec., Dr. H. M. Platter, 21 W. Broad St., Columbus.

OKLAHOMA: \* Oklahoma City, June 14-16. Sec., Dr. J. D. Osborn, Jr., Frederick.

OREGON: \* *Reciprocity*. Portland, April 28. Sec., Dr. L. S. Besson, 608 Failing Bldg., Portland 4.

SOUTH CAROLINA: Columbia, June 25-27. Sec., Dr. N. B. Heyward, 1329 Blandina St., Columbia.

SOUTH DAKOTA: \* Pierre, July 17-18. Sec., Medical Licensure, State Board of Health, Dr. Gilbert Cottam, State Capitol, Pierre.

TEXAS: Galveston, June 4-6. Sec., Dr. T. J. Crowe, 918-20 Texas Bank Bldg., Dallas 2.

VERMONT: Burlington, June. Sec., Dr. F. J. Lawliss, Richford.

VIRGINIA: \* Richmond, June 20-23. Sec., Dr. J. W. Preston, 30½ Franklin Rd., Roanoke.

WASHINGTON: \* Seattle, July 16-18. Sec., Department of Licenses, Miss Nell Adams, Olympia.

WEST VIRGINIA: Charleston, July 5-7. Commissioner, Public Health Council, Dr. John E. Offner, State Capitol, Charleston 5.

WISCONSIN: \* Milwaukee, June 26-28. Sec., Dr. C. A. Dawson, Tremont Bldg., River Falls.

\* Basic Science Certificate required.

#### BOARDS OF EXAMINERS IN THE BASIC SCIENCES

CONNECTICUT: June 9. Address State Board of Healing Arts, 250 Church St., New Haven 10.

DISTRICT OF COLUMBIA: Washington, April 23-24. Sec., Commission on Licensure, Dr. G. C. Ruhland, 6150 E. Municipal Bldg., Washington 1.

FLORIDA: DeLand, June 1. Final date for filing application is May 17. Sec., Dr. J. F. Conn, John B. Stetson University, DeLand.

MICHIGAN: Ann Arbor and Detroit, May 11-12. Sec., Miss Eloise LeBeau, 101 N. Walnut St., Lansing.

NEBRASKA: Omaha, May 1-2. Dir., Bureau of Examining Boards, Mr. Oscar F. Humble, 1009 State Capitol Bldg., Lincoln.

NEW MEXICO: Santa Fe, May 6-7. Sec., Miss Marion M. Rhea, State Capitol, Santa Fe.

RHODE ISLAND: Providence, May 16. Chief, Division of Examiners, Mr. Thomas B. Casey, 366 State Office Bldg., Providence.

SOUTH DAKOTA: Yankton, June 19. Sec., Dr. G. M. Evans, Yankton.

## Current Medical Literature

### AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1935 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (\*) are abstracted below.

**Neurovascular Syndrome from Hyperabduction of Arms.**—Wright describes a neurovascular syndrome produced by hyperabduction of the arms. This is capable of producing gangrene secondary to occlusion of the subclavian artery and neurologic sensory complaints, probably secondary to stretching, and ischemia of the brachial plexus trunks. There are two zones of stretching, torsion and pinching which contribute to the production of this syndrome: (a) the point at which the axillary-subclavian vessels and the trunks of the brachial plexus pass posterior to the pectoralis minor muscle and beneath the coracoid process and (b) the point at which the subclavian vessels and the trunks of the plexus pass between the clavicle and the first rib. Four patients developed their symptoms as the result of prolonged sleeping in the supine position with their arms hyperabducted; in each case this resulted in arterial occlusion or stretching of the involved nerve trunks. In case 5 the symptoms were aggravated by a double injury involving the right shoulder. In other cases the syndrome has developed as the result of occupational hyperabduction. It is recommended that persons whose pulses can be occluded in the hyperabducted position refrain from sleeping or working with their arms in that position. Attention should be paid to the pulse and complaints of paresthesias and numbness from patients whose arms are in hyperabduction on operating tables, in splints or in casts, in order to avoid neurovascular complications.

**Effects of Carbon Dioxide Water Baths.**—McClellan and his co-workers report observations on changes which occur in the alveolar carbon dioxide tension, the skin temperature and the respiratory metabolism of human subjects who have been submerged in baths of either carbon dioxide water or plain water. The alveolar carbon dioxide tension showed a 5 to 10 per cent rise during baths in the carbon dioxide water and returned to the resting level about twenty minutes after the bath. There was no significant change during baths in plain water. While there was no essential differences in the skin temperatures during carbon dioxide and plain water baths, when bath temperatures were between 85 and 90 F. the skin temperature was from 0.9 to 1.8 degrees F higher in carbon dioxide

than in plain water when the baths were between 95 and 100 F. A hyperemia was noted over the immersed area of the skin when the patients emerged from the carbon dioxide water baths. This was noted at all the temperatures used and was not present when the subject emerged from the plain water baths. There was a considerable increase in the elimination of carbon dioxide in the expired air during the time the patient was in the mineral water bath. There was an increase in the respiratory minute volume during the mineral water bath which did not occur with the plain water bath. The evidence supports the theory that this extra carbon dioxide is obtained by absorption of the carbon dioxide in the water through the skin and its subsequent elimination through the lungs. The authors point out that justification for the use of mineral water baths containing carbon dioxide in the program of treating disorders of the heart and circulation has frequently been questioned by thoughtful physicians who say that the results are entirely due to mental and psychologic factors. The authors think that the data presented in this communication show that they have definite physiologic effect.

**Endocarditis Caused by Higher Bacteria and Fungi.**—Beamer and his associates describe 2 cases of vegetative endocarditis, of which 1 was caused by *Actinomyces graminis* and the other by *Histoplasma capsulatum*. Ten previously reported cases of vegetative endocarditis caused by higher bacteria, yeasts or fungi are reviewed and compared with the present cases. In the presence of signs and symptoms of vegetative endocarditis, negative blood cultures by routine procedures may suggest a less common causal agent. To detect these, a longer incubation period may have to be allowed. Certain higher bacteria, yeasts and fungi, although they can develop on ordinary blood agar or carbohydrate mediums, do not "grow out" as rapidly as the true bacteria. *Histoplasma capsulatum* may require an incubation period of twelve days or more but has also been observed as early as the fourth or sixth day. *Actinomyces* frequently requires four or five days to produce visible growth.

Salicylate Poisoning Report of 4 Cases Mary M. Troll and Maud L. Menten—p 37

**Diphtheria Toxoid for Persons Exposed to Whooping Cough.**—Muñoz Turnbull observed that 9 children who had been inoculated with alum precipitated diphtheria toxoid while exposed to siblings with pertussis were protected against whooping cough. He has observed 61 exposed children under conditions which do not warrant the doubt that opportunity for contagion existed, since all of these children lived in the same houses and many slept in the same bedrooms as 1 or more siblings who had whooping cough. He suggests synergy of

two antigens, *Bacillus pertussis* and diphtheria toxoid to explain the improved immunization response. He considers the child as protected if he had been inoculated before or just at the time his cough began and if he did not cough for more than ten days. The doses of alum precipitated diphtheria toxoid used were 0.5 cc. for infants from birth to the age of 3 months, 1 cc. for infants from 3 to 12 months old and 1.5 cc. for those above 1 year of age. The injections were made every week subcutaneously in the deltoid region, with a maximum of three injections. Most of the protected subjects who were exposed to pertussis coughed for several days after being inoculated, the maximum length of time being six to ten days. Others did not cough at all. The method failed in 4 cases, that is in 6⅓ per cent.

 Experimental Study of Mixed Infections with *Plasmodium Cathemerium* and *Plasmodium Lophurae* in Ducks. F. Wolfson.—p. 123.

**Poliomyelitis in Noncontacts During Interepidemic Period.**—Kessel and Moore investigated the incidence of poliomyelitis virus in noncontacts during interepidemic periods. Tonsils and stools were collected from 136 patients coming to the Los Angeles County Hospital for routine tonsillectomies. These patients were divided into 49 groups. A pool of tonsils and a pool of stools were prepared from the members of each group, so that there were 49 tonsil pools and 49 stool pools examined in this series, the usual number of persons contributing to a pool being 3. Virus was recovered from 3 tonsil pools and 3 stool pools. One of these tonsil pools and one stool pool were from the same group of 3 persons. At least 5 of 136 persons harbored virus either in their tonsils or in their stools. The survey was performed during an interepidemic period and all but one of the positive findings were obtained during the last three months of this period. This one positive was encountered during the first month of a major outbreak.

**Glycogen and Sterility.**—Hughes asserts that glycogen is present in abundance in all parts of the reproductive system. Glycogenesis and glycogenolysis in the endometrium involve the presence of an enzyme or enzymes. The author describes the enzyme determinations on endometrial tissues and studies on the distribution of glycogen in the endometrium, on the relationship

of glycogen and enzyme concentration to sterility and on the relationship of glycogen and enzymes to pregnancy and spontaneous abortion. Studies were made on 140 women who presented themselves because of sterility. Ovulation probably does not occur when the endometrium remains in the follicular phase, the glycogen is absent or diminished and the enzyme production is low. Opportunities for pregnancy in these women are few even after hormonal stimulation. Women in whom the endometrium proceeds to the progestational phase possess relatively larger amounts of glycogen but still have a low enzyme output. They conceive without difficulty; however, the chances of survival of the ovum are not good and spontaneous abortion results. These women were more amenable to treatment, but it should be instituted prior to pregnancy and during the early days of gestation. Ten patients in this series were given small doses of estrogen before pregnancy to improve glycogen and enzyme production. After pregnancy occurred, combined treatment of small doses of estrogen and progesterone were prescribed during the first trimester and the early part of the second trimester. These women previously had aborted before the fourth month but, after treatment, proceeded uneventfully to term. The author concludes that glycogen is an important material of the endometrium and that its metabolism is probably influenced by the ovarian hormones.

**Therapy of Eclampsia.**—In the 142 consecutive cases of eclampsia reviewed in this paper by Arnell not a single maternal fatality resulted. The management employed is neither new nor original, but the details of its application are not always carried out with the care with which they are applied in this series. The plan is based on an ultraconservative concept of management: constant observation of each eclamptic patient by an experienced staff throughout the entire treatment, which permits careful integration of the various therapeutic components into an individualized regimen rather than their application as a standard routine of treatment. Special factors of success include (a) frequent changes of posture plus the use of oxygen therapy and of aspiration during the acute phases of the disease, (b) limitation of sedation to the dosage necessary to control convulsions and hyperirritability, (c) limitation of dextrose therapy to the smallest amount necessary to insure a satisfactory urinary output, with a return to oral fluids in maximum amount as soon as the swallowing reflex returns, (d) delaying labor unless it ensues spontaneously until the optimum recovery from the acute stage has taken place, (e) induction of labor at the optimum time and by the simplest possible method and (f) limitation of operative intervention and the use of local analgesia for all forms of operative work. Neither the patients' future health nor their subsequent pregnancies are in any way jeopardized by this plan of management. Lack of adequate prophylaxis was the factor chiefly responsible for the development of eclampsia in these 142 cases.

**Mental Symptoms Following Head Injury.**—From a total of 430 patients with head injuries admitted to the Boston City Hospital between July 1942 and September 1944 a series of 200 was selected for study by Adler. Of this group 63 developed mental symptoms after head injury. Pretraumatic factors that seemed to have an influence on the incidence of post-traumatic mental symptoms were advancing age, the married status in men, nationality, occupation, the type of injury and a history of anxiety. Post-traumatic factors that seemed to be important were the traumatic amnesia accompanying injuries, a prolonged stay in the hospital and the

presence of headaches and dizziness. In particular, prolonged duration of headaches and dizziness was associated with a high incidence of mental symptoms. Other physical sequelae of the injury lasting more than six months had an equally high incidence of mental symptoms. Post-traumatic nightmares were regularly associated with additional symptoms of anxiety. Certain environmental complications, occupational difficulties in particular, and problems of litigation and compensation were correlated with a high incidence of post-traumatic mental symptoms. Of the patients with post-traumatic mental symptoms the largest group, 48 patients, had post-traumatic anxiety states. Twenty-three of these patients had previously normal personalities, whereas the remainder had preexisting psychiatric liabilities. Anxiety symptoms were the predominant mental features in the post-traumatic neuroses. Symptoms of personality change only, such as euphoria, moodiness and apathy, in addition to changes in the intellectual status, were manifested by 7 patients with severe head injuries. Mental symptoms, particularly symptoms of anxiety, are, with headaches and dizziness, the commonest symptoms in convalescence. They are also the most common symptoms and major cause of prolonged disability.

**Sulfamerazine in Pneumonia.**—Volini and his associates used sulfamerazine in the treatment of 200 patients with pneumonia at Cook County Hospital in Chicago. Blood drug levels were estimated in most cases at least once and daily when the response was delayed. A white blood cell count was made and a urine analysis for  $\text{pH}$ , specific gravity, crystalluria and blood was done. Specific gravity of the urine was taken as a guide for adequate fluid output. The aim was to keep this below 1.015 to prevent renal reactions. A daily fluid intake of 3,000 cc,

was encouraged. The authors found that sulfamerazine is more rapidly and completely absorbed and more slowly excreted than sulfadiazine. Therapeutic blood concentration is maintained on smaller doses less frequently administered. The percentage of conjugation is about the same as for sulfadiazine, averaging 11. The value is much higher in cases of toxic nephritis. Clinical results parallel those following sulfadiazine. Toxic reactions are fewer, and this is probably due to the smaller total amounts of the drug required. The average duration of treatment is no longer on the lower dosage schedule. The complications of pneumonia, particularly empyema, were observed much less frequently. Sulfamerazine offers definite advantages over sulfadiazine and possesses equal therapeutic effectiveness.

**Osteotomy of Spine for Correction of Flexion Deformity.**—Smith-Petersen and his associates report a surgical procedure for correction of the flexion deformity of the spine in rheumatoid arthritis aimed at the facets, articular processes

and adjacent laminae. Osteotomy of these structures, with excision of sufficient bone, should allow corrective leverage to be transmitted to the intervertebral disks and longitudinal ligaments, overcoming whatever resistance these may present. Through an incision in the median line at least three lumbar spinous processes are exposed. The second step consists in the incision and reflection of supraspinous and interspinous ligaments, followed by the subperiosteal reflection of muscle attachments from the spinous processes and laminae. On completion of the osteotomy, leverage in the direction of extension is applied by raising the head and foot of the operating table very slowly. This results in a gradual narrowing and final obliteration of the oblique spaces between the laminae and between the remnants of the articular processes. The obliquity of the osteotomy insures locking and prevents serious displacement. By means of delicate osteotomes, bone flaps are raised from the laminae adjacent to the osteotomy, and the bone lamellae obtained from the spinous processes are inserted by means of a bone-graft carrier. These grafts bridge the gap between the laminae and consequently hasten bony fusion in the corrected position. In closing the wound, close apposition of the split interspinous and supraspinous ligaments is important. Satisfactory results were obtained in 6 cases.

**Retardation of Bone Growth by Wire Loop.**—In a series of experiments on dogs Haas found that in every instance in which a wire loop was passed around the epiphyseal cartilaginous plate in the frontal plane there was a loss in length growth of the bone. If the wire loop became unfastened, the hindering force was not so great and growth was retarded apparently in proportion to the remaining restraint of the wire to be overcome by the growing bone. In view of this experimental evidence the author attempted to control growth in children with discrepancies in leg lengths. In only 2 of the 5 patients on whom wiring operations have been performed has a sufficient time elapsed to draw conclusions. Because growth is relatively slow in man, determination of the practicability of the method of wiring the epiphyseal plate described herein must await the results obtained after a long period. From the results obtained thus far on patients there is definite evidence of growth retardation, and a continuation of the method seems warranted. The operation should not be performed until sufficient ossification of the epiphysis has taken place; that is, after about 8 years of age.

**Primary Sarcoma of Brain.**—Globus and his associates subjected to a thorough histopathologic study 150 meningiomas collected in the Neuropathology Laboratory of the Mount Sinai Hospital in New York. This survey revealed 16 sarcomatous meningiomas, of which 8 were selected for this study. The meningiomas, of which 8 were selected for this study. The histologic character and local behavior of these tumors is not unlike that of sarcomas elsewhere. The location and distribution of some of them in the depth of the brain substance do not speak against their meningeal derivation and their true sarcomatous nature. The cells are usually undifferentiated small or oval,

aggregated along blood vessels. In general, the cells exhibit a recession in the process of differentiation. Giant cells are frequent but are not essential for the diagnosis. Connective tissue, though varying in abundance, is present. The cellular constituents are traceable to derivatives of the pial component of the leptomeninges. Brain or spinal cord alterations in the proximity of the tumor are present and usually result from interference with the blood supply. The tumors are frequently multiple and often diffuse. They may give rise to visceral metastases.

**Herpetic Meningoencephalitis.**—Hassin and Rabens report the case of a man aged 48, who was admitted to the Mount Sinai Hospital in Chicago on May 20, 1935. A herpetic eruption along the ophthalmic branch of the fifth nerve was clinically complicated by a toxic condition of the central nervous system. There were confusion, urinary disturbances and a progressive febrile course. The patient died ten days after admission to the hospital and twenty days after the onset of the illness. The necropsy revealed vascular changes and degenerative nonvascular softening in the subcortex, especially in the pons, medulla and cornu ammonis, combined with a meningitis of both the vertex and the base of the brain, including some of the basilar nerves. Nerve cell changes were generally mild, but the nucleoli exhibited tinctorial changes and occasionally appeared vacuolated. The changes differed from those seen in encephalitis of the Economo type, African sleeping sickness, cerebral forms of poliomyelitis, typhus fever and other forms but much resembled the St. Louis type of encephalitis, equine encephalomyelitis and Born disease of horses. A diagnosis of a specific form of encephalitis cannot be made from the pathologic picture without the knowledge of the history or additional laboratory studies (inoculations, immunologic observations and others). Absence of cell inclusions does not speak against the herpetic nature of encephalitis.

**Convalescent Serum Against Measles.**—Bloxson says that the epidemic of measles invading Houston, Texas, in 1944 was widespread and severe. There was high fever and a high incidence of complications. At the onset of the epidemic there was sufficient placental extract to give inoculations to all contacts desiring it, but the supply became exhausted during the last part of the epidemic. At this point serum could be obtained from 2 adults. From one the serum was withdrawn three days after the temperature was normal, and the rash was still present; from the other, one week after the temperature became normal. These serums were used intradermally on 38 children and 2 adults. The serum was given in 0.4 cc. amounts intradermally on successive days until 2 cc. was given. Thirty-four children and 2 adults remained free from measles. Two children developed uncomplicated measles before the course was completed. Two children developed attenuated measles fourteen days after the inoculations. It is believed that recent convalescent measles serum has enough measles antigen available to produce an active immunity when this serum is given intradermally in at least the amounts suggested. The intradermal employment provides an economical use of this product.

**Tendovaginitis at Radial Styloid Process.**—Stenosing tendovaginitis at the styloid process of the radius is also designated as de Quervain's disease. It occurs chiefly in women, and with the great increase in the employment of women in industry it is more frequently encountered than formerly. Unless properly diagnosed and treated, its victims are subjected to a prolonged and painful period of disability. Stenosing tendovaginitis is due to a thickening of the fibrous sheath that covers the tendons and the synovial sheaths of the abductor pollicis longus and the extensor pollicis brevis as they pass through the bony groove in the radial styloid. In the acute stage of the disease there is severe pain over the radial side of the wrist joint, especially on motion of the thumb. The pain is localized directly over the styloid of the radius, with radiation into both the thumb and forearm. Most patients when first seen have had pain for several weeks. Immobilization makes most patients comfortable, but when work is resumed the symptoms usually recur. Rest may allow edema to subside, but it does not cause the fibrous thickening to disappear. The treatment of choice is surgical. The sheath is split with a sharp knife throughout its length and its edges are retracted, exposing the underlying tendons and synovial sheaths. If adhesions are present between the sheaths and tendons, they are excised. Aitken also excises the edges of the fibrous sheath. No attempt is made to close the sheath over the tendons, the only closure required being that of the skin. A compression dressing is applied. Motion is started on the day after operation. Ordinarily work can be resumed two weeks after operation.

**Tinea Capitis.**—Baer states that tinea capitis, the fungous infection of the hair usually occurring in children before the age of puberty, is caused either by *Microsporon audouinii* or by *Microsporon lanosum*. In the present epidemic all patients have been infected with *M. audouinii*. This type of infection will be observed as scattered, large and small, semibald patches in the occipital and parietal regions of the scalp. These patches are scaly and the infected hairs are dull, lusterless and broken off. Wood's light, which consists of ultraviolet rays which are filtered through a special type of Corning glass, is not generally available. The author has used an inexpensive substitute, the Westinghouse Purplex lamp, which will fit into a standard light socket. The examination is made in a darkened room. With the lamp held close to the patient's scalp the infected hairs

appear as bright, clear, bluish green stubs. With this simple examination one can make a provisional diagnosis of tinea capitis and rule out such possible confusing entities as alopecia areata, seborrhea, pediculosis, folliculitis decalvans and alopecia cicatrizzata. If the species of fungus is to be identified, fluorescent hairs are plucked and planted on the surface of Sabouraud's agar medium in a test tube. The author used the trichophyton test in 70 cases of tinea capitis, but he regards it of no value. *Microsporon audouinii* infection persists for a long time unless it is treated by x-ray epilation of the scalp. This therapeutic procedure should be done only by an experienced person with a carefully calibrated therapeutic x-ray apparatus. Chemical therapy for *M. audouinii* infections is in the experimental stage.

**Thoracic Manifestations of Sarcoidosis.**—According to Bernstein and Sussman pulmonary lesions occur with great frequency in sarcoidosis. This report is based on a series of 12 cases, of which 8 are studied roentgenologically. The first group includes cases of bilateral, frequently symmetrical, enlargement of the hilar and bronchial lymph nodes without evident pulmonary infiltration. A second group, probably the largest, includes cases of mediastinal adenopathy and variable degrees of infiltration into the pulmonary parenchyma. The infiltration ordinarily is strandlike and extends out more or less symmetrically from the hilus. A third form presents lesions easily simulating and roentgenologically indistinguishable from chronic miliary tuberculosis. A fourth type of the disease shows a discrete nodular infiltration with or without hilar adenopathy. A fifth type of x-ray appearance is that of diffuse and confluent infiltrations which may represent a transition from other forms of sarcoidosis and may easily simulate if not actually develop into tuberculosis. Bronchiectasis and other chronic pulmonary conditions are not easily excluded. The resemblance roentgenologically between pulmonary sarcoidosis and other conditions, particularly tuberculosis, may be so close that a diagnosis from the chest roentgenogram alone is not justified. Biopsy, when possible, is the only satisfactory basis for diagnosis.

**Penicillin in Bronchiectasis.**—Stookey and his collaborators made daily bacteriologic studies on the sputums of 21 patients with bronchiectasis. One or more pathogens were present in each culture. Staphylococci were the most consistent and persistent of the pathogens. In the 21 cases under discussion 1,000,000 units of penicillin on the average was given in divided doses by intramuscular injection in some cases and by continuous intravenous drip in other cases. It was administered over a period of from eight to ten days. There were no side effects. The only significant change from the bacteriologic standpoint was a decrease in the number of colonies of hemolytic streptococci and staphylococci. There was slight reduction in the growth of the nonhemolytic organisms. In spite of this reduced growth the volume of sputum was not influenced. There was evidence of great clinical improvement. Approximately 20 per cent of persons with chronic cough responded to penicillin. In those who did respond the result was immediate. The morning sputum disappeared along with the cough in as short a period as ninety hours. The true bronchiectatic patient shows little or no response to the administration of penicillin. The chronic bronchitis associated with periods of activity and remission offers the best hope of a therapeutic response. Penicillin does not establish immunity, and recurrence is to be expected.

**Two Types of Burn Shock.**—Prinzmetal and his associates produced two types of burns. They found that rats who were mildly burned at 167 F. for ten seconds on a single hind limb developed visible edema with considerable local fluid loss but did not develop shock. Rats whose single hind limbs were severely burned at 212 F. for from two to three minutes died in shock without visible edema and exhibited insufficient local fluid loss to account for death. Similar results have been obtained when larger areas of the body were severely burned for ten seconds. The authors conclude that there are at least two mechanisms capable of producing shock; one due to local fluid loss and the other due to some unknown factor. This difference in the mechanism of production of burn shock may explain some of the differences of opinion regarding therapeutic agents in burns.

**Local Administration of Penicillin.**—Cutler and Sandusky have used dehydrated human plasma as a vehicle for penicillin. The sodium salt of penicillin is mixed under sterile conditions with dehydrated plasma. From 10,000 to 20,000 units of penicillin to 0.2 Gm. of plasma is a desirable proportion. The plasma tends to be lumpy, but gentle stirring reduces it to a light fluffy powder. Penicillin is added, and after gentle stirring a homogeneous mixture is obtained. Uniform distribution of this mixture is accomplished by means of a powder insufflator. When sprayed on a wound surface, the penicillin-plasma mixture immediately goes into solution and the tissues become yellow. Complete hemostasis must be attained before insufflation; otherwise the mixture will be washed off. It has been observed that 0.2 Gm. of plasma is sufficient for fine frosting of a surface 100 sq. cm. in area. This method of local penicillin therapy has demonstrated its superiority over previous methods used.

 Bronchial Obstruction by Benign Tumor B. G. Begin—p. 156

**Gastric Cancer with Febrile Onset.**—It is not unusual for fever to accompany a known gastric cancer, but in the 4 cases reported by Cantero fever was the first and only manifestation. The first 2 cases are examples of latent cancer in which influenza preceded the appearance of the first symptoms. In the other 2 cases progressive fever was present without discoverable cause until the cancer was quite advanced. Cases of

this type demonstrate that the early diagnosis of gastric cancer requires considerable perspicacity. The polymorphism of gastric neoplasm with its latent form poses numerous diagnostic problems. Roentgenoscopy and gastroscopy should be employed systematically on all persons of a certain age whether or not they present characteristic signs. Three of the patients were between 50 and 54 years of age. The other patient was a woman aged 23. Latent gastric cancers are comparatively frequent. They are often quite advanced before they exhibit the slightest general sign. The appearance of fever indicates in the majority of cases an ulcerated adenocarcinoma. Infiltrating gastric cancers rarely ulcerate. The phlegmonous and edematous gastritides which appear after an infection may simulate a gastric cancer with febrile onset. Therapeutic tests and repeated roentgenologic and gastroscopic controls will determine the nature of the lesion.

**The Patient's Language.**—Redlich presents data obtained from 25 patients to whom 60 medical terms were presented for definition. All patients were literate, but none had had more than a high school education. The impression was gained that patients get most of their medical knowledge from observation of other patients and discussions among themselves. Twelve of the 25 patients thought they obtained some information from their physicians. Thirteen thought the information about their own disease was not adequate. Highly technical terms and medical jargon expressions were virtually unknown. A more important group were definitions of terms which gave rise to "semantic confusion." Such confusion might lead to maladjustment of the patient. A third group consisted of terms which led to a more or less outspoken fear response. Some of these terms were comparatively well known, as infection, cancer, paralysis, fit, tumor, syphilis, mental disease. Others were only vaguely known, often ill defined, as degeneration, psychopathic, moron, schizophrenia, hypnosis. Most patients could be helped considerably in their attitude by a rational discussion, with elimination of certain fears and doubts and other irrational attitudes arising from ignorance and misunderstanding of medical terms. Two thirds of the 25 patients knew too little about medical matters, their illnesses and the implications of their illnesses. A small group possibly knew "too much," but their knowledge was rather erratic, poorly integrated and often quite irrational. Both groups might be helped considerably by sensible information.

**Etiology of Erythema Nodosum.**—In view of the diversity of conditions which apparently may cause erythema nodosum, Perry studied a series of cases in an attempt to determine the causation in each. Of 112 persons examined, 38 were males and 74 females. This confirms the well known preponderance of females. The patients were tuberculin tested by the Mantoux reaction. Sixty-one gave a strongly positive Mantoux reaction and 51 a negative reaction to 0.01 mg. of tuberculin. Evaluating the patients with the positive Mantoux reaction, the author suggests that 32 were certainly tuberculous and 28 were probably tuberculous. The 51 with the negative Mantoux reaction he regards as definitely not tuberculous. Analyzing the patients with regard to age groups, the author states that in those under the age of 15 tuberculosis was definite or probable in 72 per cent, whereas in those over 15 tuberculosis was definite or probable in only 23 per cent. The material reviewed offers little support to the theory that erythema nodosum is a manifestation of acute rheumatism. The author agrees with those who have held that erythema nodosum must be regarded as the result of a nonspecific reaction to a variety of infections or toxic agents and that it is not a specific disease. However, it is clear that these agents can and do give rise to the syndrome only in patients constitutionally predisposed. The frequency with which other members of the family suffer from erythema nodosum probably offers the clue to this part of the problem and shows that the diathesis is partly inherited. The sex difference in the postpuberal incidence of the eruption suggests that endocrine factors also contribute to this predisposition.

**Bismuth Therapy in Jaundice During Antisyphilitic Treatment.**—Until the question of etiology is settled, the further question of whether or not to continue antisyphilitic therapy during jaundice cannot be satisfactorily answered. One method of approaching the problem seemed to be to determine whether the continuance of bismuth injections materially delayed recovery of hepatic function in cases of therapy jaundice. Forbes in the present experiment compared two groups of patients. One group received intramuscular injections of bismuth preparations, the other did not. Arsenotherapy was not given to either group while jaundiced. Care was taken that in all other respects the groups were strictly comparable. The Quick hippuric acid excretion test was employed in order to determine the recovery of liver function in the two groups of patients. The result of the experiment strongly suggests that bismuth does not significantly retard recovery of liver function in such patients. Such a result supports the view that bismuth therapy should be continued in the presence of jaundice of this nature.

**Penicillin in Early Syphilis.**—Ross and his associates treated with penicillin patients with early secondary syphilitic lesions. This paper records preliminary results in the first 5 of these cases. The treatment courses were as follows: (a) 30,000 units intramuscularly every three hours for eighty injections (i. e., 2,400,000 units in ten days) or (b) 30,000 units intramuscularly every hour for forty injections (i. e., 1,200,000 units in forty hours). The immediate response in all cases was excellent. Spirochetes and lesions disappeared at least as rapidly as is usual under adequate treatment with arsenicals and bismuth. Judged by the later effects it is doubtful whether the penicillin was as beneficial as arsenicals and bismuth might have been. (a) Of the 4 patients receiving 2,400,000 units in ten days, only 1 was an unequivocal success in an observation period of nine months. Another was probably but not certainly cured. The verdict remains open on the remaining 2, since the blood Wassermann reaction in 1 became negative very tardily and is still not consistently negative nine months after treatment, while there was a serologic relapse in the other some three and one-half months after treatment. (b) Of the 2 patients (these include the patient referred to as probably cured, treated again on becoming reinfected) receiving 1,200,000 units in forty hours, 1 is still free from evidence of syphilis four and one-half months after treatment, but the other relapsed in about two months. The freedom of penicillin from toxic properties will enable trials to be undertaken at even higher dosage levels and with longer courses of treatment. Penicillin treatment for syphilis will not become suitable for routine civilian practice until frequently repeated injections day and night can be avoided.

**Pain from Herniation of Cervical Intervertebral Disk.**—Elliott and Kremer point out that in the cervical region the spinal cord is large and fills the canal completely. Protrusion of an intervertebral disk may, if centrally placed, produce cord compression. Ruptures of the disk which do not produce cord symptoms are laterally placed and therefore project into the intervertebral foramen, where quite small protrusions can produce pressure on nerve roots. This result of laterally placed herniations in the cervical region has only recently been recognized. The authors give the histories of 8 patients with brachial pain. There was a uniform distribution of pain in the posterior aspect of the shoulder and upper arm and the radial border of the forearm and sometimes in the upper pectoral region. There were paresthesias in the thumb, index and middle fingers. In some cases there was a history of acute stiff neck. The signs included limitation of movement of the neck, pain produced in the arm by movements of the neck and by downward pressure on the head, and tenderness, weakness and wasting of the upper fibers of the pectoralis major, triceps and extensors of the wrist and fingers. The triceps jerk was reduced or absent, and there was usually hypoaesthesia of the thumb and index finger. The clinical picture was that of a lesion of the seventh cervical root. Contrast myelography in 3 cases showed a filling defect opposite the sixth intervertebral disk involving the seventh cervical root on the affected side. The clinical and radiologic evidence suggested that the brachial pain was caused by a herniation of the sixth cervical intervertebral disk.

**Neostigmine in Amyosthenic Diseases.**—Neostigmine in doses of 0.5 to 1 mg., occasionally combined with 0.00025 or 0.0005 Gm. of atropine, was administered by subcutaneous or intramuscular route half an hour before the noon meal in 17 cases of disturbances of deglutition of central nervous origin. Deglutition was restored to normal or was much improved. Administration of the drug must be repeated every four to six hours, since its effect is only temporary. This effect on deglutition, although not regularly obtainable, was important in preventing aspiration of food into the air passages in bulbar syndrome. The drug acts almost electively on the muscles of deglutition. It is not as pronounced here as in myasthenia. The effect obtained in 2 of Pichler's cases suggests that neostigmine cannot be utilized for differential diagnosis of myasthenic disorders from amyosthenic disorders of deglutition. The effect of neostigmine on pareses and paralyses of various types was studied in an additional series of cases. Improvement in motor power occurred temporarily only in diseases of the motor system, but the effect of the drug never approached that seen in myasthenia. The effect of the drug on pareses was either weak or absent. The denervated muscle is hypersensitive to acetylcholine and the acetylcholine content of a degenerating nerve is reduced slowly. Under these conditions the effect of the change in the acetylcholine-esterase balance on the degenerating neuromuscular elements caused by neostigmine is pronounced. Chronaximetric studies of the effect of neostigmine on 3 normal persons, on a patient with evulsion of the brachial plexus and on frog's muscles revealed a decided lowering of the rheobase (stimulus threshold). Spontaneous fibrillary and fascicular contractions in systemic diseases of the anterior horn cells may be increased by the administration of neostigmine. Irregular muscular contractions in healthy persons may be produced occasionally by the administration of larger doses of neostigmine. Contractions of this type after the administration of neostigmine were not observed in cases of total peripheral paralysis. The fibrillary muscular contractions in systemic diseases of the anterior horn cells are manifestations of the disturbed synchronizing activity of the anterior horn cells. A certain synchronization results from the administration of neostigmine in the last mentioned diseases. It is suggested that neostigmine in addition to its chief effect on the terminal plates exerts an effect on the synapses of the spinal cord.

## Book Notices

**Women and Men.** By Abram Scheinfeld. Cloth. Price, \$3.50. Pp. 453, with illustrations by the author. New York: Harcourt, Brace & Company, 1944.

This is an intensely interesting and extremely valuable book. It seems to establish conclusively the fact that the male sex is the weaker, no matter how one approaches the subject. Prenatally the rate of miscarriages is higher for boy babies than for girl babies. Throughout life the male death rate is higher. Women exhibit evidences of fortitude greater than that of the male. Entirely aside, however, from this controversial conclusion, the book is full of well documented scientific facts indicating the numerous detailed ways in which women differ from men, entirely aside from the question of environment and training. The author holds in general that environment and training tend to emphasize, rather than create, the differences between the sexes, particularly with respect to temperamental traits, aptitudes, strength, endurance and other qualities ordinarily regarded as nonsexual. The author has some interesting views relating to the marriage of tomorrow, which, whether one agrees or not, are worth reading. One of the most important features of the book is its extensive bibliography. It is also intensively indexed. Like the same author's "You and Heredity," it is a book worth having in the library of any home or school where there is an interest in science. It should also be interesting and valuable reading for physicians, especially to those who deal to any extent with emotional and personal problems and with the relations between the sexes.

**The Influence of Parental Attitudes and Social Environment on the Personality Development of the Adolescent Blind.** By Vita Stein Sommers, Ph.D. Cloth. Price, \$2. Pp. 124. New York: American Foundation for the Blind, Inc., 1944.

This interesting book was presented in order to study the factors conditioning the behavior and personality of the adolescent blind. The blind children studied, 143 in all, were carefully selected so as to include only those totally or practically blind, those either born blind or who became blind before the age of 6, of normal or superior intelligence, with 1 or more seeing siblings, and 14 to 21 years of age. They were given the California Personality Test, and special questionnaires were answered by them and their parents. In addition, complete case studies were done on 50 of these children and their families. Results were evaluated numerically by several different "judges" and were analyzed statistically. The personality test showed that blind adolescents as a group fall below the norms of the seeing with respect to personal and social adjustment. However, it was felt that the adjustments of the blind could not be adequately measured and compared with those of the seeing by such a test. The special questionnaires revealed that blind persons do not exhibit the same type of behavior reactions; on the contrary, they develop a wide variety of attitudes and feelings as a natural outgrowth of a social environment which rarely gives them the understanding essential for development of a wholesome personality. Also this study suggests that frustrations or maladjustments result more frequently from the social attitudes and conditions surrounding the blind person and brought about by the presence of the handicap than from the sensory disability itself. Most of the parents studied experienced frustrations or feelings of conflict because of having a blind child, and the child's personality was conditioned more by his parents' attitudes and practices than by the lack of sight. The final conclusion was that a definite relationship exists between the blind child's behavior and adjustment and the parental environmental and attitudes to which the child has been exposed in early life. The physical defect does not seem to be the primary cause of personality maladjustment or even neurotic or psychotic behavior; these behavior patterns could be attributed either to insecurity and instability in the home or to extreme overprotection or overt rejection. This study clearly indicates that the feelings which the individual has with regard to his own inferiority, incompetence, uncertainty and the realization of his physical defect seem to be conditioned principally by the attitude of those around him, especially his parents.

**Practical Anesthetics for Students, Hospital Residents and Practitioners.** By J. Ross Mackenzie, M.D., D.A., Senior Anesthetist, Royal Infirmary, Aberdeen. With a foreword by W. C. Wilson, M.B., Ch.B., F.R.C.S.E., Regius Professor of Surgery, University of Aberdeen. Cloth. Price, \$3. Pp. 136, with 63 illustrations. Baltimore: William Wood & Company, 1944.

The long experience of the author eminently qualifies him for the task of producing a small "guide to the practitioner or the occasional anesthetist," and his book is a valuable contribution. Within its covers a great deal of useful information is compressed into a few pages, which make interesting reading to the specialist in anesthesia as well as to the readers to whom it is specifically addressed. In every such work the author must occasionally state his own views even if these will rouse some disagreement between experts. For instance, many anesthetists would disagree with him on the desirability of using carbon dioxide during induction and in the treatment of overdose of depressant drugs or asphyxia neonatorum; and others will feel that hypercarbia is a greater danger during anesthesia than hypocarbia. The definition of "vital capacity" on page 14 suggests that it is usually measured by inspiration. The author does not seem to distinguish between "artificial" and "controlled" respiration, and he apparently believes in passing a laryngoscope with the right hand and then "changing hands" to pass the tube. His description of the signs of anesthesia could be made more complete with advantage to the beginner; for instance, no mention is made of intercostal paralysis as a valuable sign. A curious omission is that there is no mention of the importance of endotracheal anesthesia in cerebral interventions. Moreover, no details are given as to how a catheter for oxygen therapy should be placed in the oropharynx or of how a needle should be inserted into the caudal canal. The author evidently feels that trichlorethylene is a safer agent than chloroform, and he advocates the use of a concentrated solution of nupercaine for low spinal blocks. To this reviewer the chapters on "the choice of anesthetic agent" and on "anesthetics today and tomorrow" made a special appeal, as did the inclusion of the last page entitled "medicolegal notes." The chapter on anesthesia in children is the outcome of many years of specialized experience and can be read with pleasure and profit by the expert as well as the novice.

**Manual of Clinical Mycology.** Prepared Under the Auspices of the Division of Medical Sciences of the National Research Council. By Norman F. Conant, Ph.D., Assistant Professor of Bacteriology, Duke University School of Medicine, and Mycologist to Duke Hospital, Durham, North Carolina, and others. [Military Medical Manual.] Cloth. Price, \$3.50. Pp. 348, with 149 illustrations. Philadelphia & London: W. B. Saunders Company, 1944.

This is the second of the series of Military Medical Manuals prepared under the auspices of the Division of Medical Sciences of the National Research Council. Like its predecessor it possesses a handy format, sturdy pliable cover and excellent typography and is nicely endowed with splendid illustrations.

The purpose of the manual is to sketch the fundamentals of the science of mycology, as well as the clinical and laboratory findings, diagnosis, prognosis and treatment of the majority of fungous infections affecting man. This ambitious purpose is remarkably well fulfilled. There are also the valuable features of eleven world maps giving the geographic distribution of various fungous infections and a short chapter depicting and describing "fungus contaminants to which pathogenicity sometimes is erroneously attributed."

Because of the wide scope of this small book, the superficial fungous infections of the skin commonly encountered in this country could obviously be allotted relatively little space. Thus only about fifteen pages of text have been devoted to the "Symptomatology, Prognosis and Treatment of the Dermatomycoses." It is quite apparent that the author's principal objective was to give 'thumbnail' sketches of the known human fungous diseases rather than complete details on the common fungous infections of the feet, groins and scalp. In this way the present manual forms a logical addition to available dermatologic textbooks, which omit the visceral and systemic mycoses and generally skim over the rare and exotic forms but include more detailed information on the practical measures for prevention, recognition and management of the common fungous infections of the skin and hair.

A physician who anywhere in the world encounters a disease of suspected fungous origin in any organ or system will find in the present small handy book sufficient information to help him confirm or refute his suspicions and to aid him in his management.

**Foster Home Care for Mental Patients.** By Hester B. Crutcher, Director of Social Work, State of New York, Department of Mental Hygiene. Cloth. Price, \$2. Pp. 199. New York: Commonwealth Fund, 1944.

This is an exceptionally interesting and valuable report on a method of caring for mentally ill patients outside of institutions. These patients, carefully selected, are placed in foster homes, preferably in a small town or a rural environment. The method is valuable in some types of cases as a therapeutic procedure. Many of these patients have improved considerably when placed in family care. They have responded in a highly satisfactory manner to the home environment and to the personal relationships which have been built up. Aside from the therapeutic values, this method helps to release crowding in institutions and costs less than hospital care, even when the cost of careful supervision is added.

Patients regarded as suitable for family care fall into the following classes, according to the report:

1. Those completely absorbed with their own psychotic ideas; comfortable anywhere. This includes many dementia precox patients.
2. Senile, degenerative patients, irritable and difficult, who respond to individual attention and kindness.
3. Those whose dissatisfactions with hospital treatment decrease with family care.
4. Those unable to adjust outside the hospital.
5. Those with paranoid trends impossible to adjust among former associates.
6. Those whose recovery will be hastened by family care as a result of having emotional needs met and security somewhat restored by family care.

The book is in nine chapters, of which the first outlines the method of family care, its meaning and its values; succeeding chapters discuss administration and results of family care, family care as a therapeutic procedure, the selection of patients, the selection of homes, the supervision of the patient and the methods of organizing family care, namely the colony plan, in which patients are grouped, and the district plan, in which they are scattered. A large number of case histories makes up the lengthy eighth chapter, which covers fifty pages. The ninth chapter gives suggested record forms and procedures and is followed by an appendix listing family care programs in the United States; such programs exist in California, Illinois, Maryland, Massachusetts, Michigan, Nebraska, New York, Pennsylvania and Rhode Island. Prospective programs are under development or consideration in Connecticut, Minnesota and Utah.

This is a valuable report, well prepared and documented.

**Technical Methods for the Technician.** By Anson Lee Brown, A.B., M.D., Director of Dr. Brown's Clinical Laboratory and Dr. Brown's School for Technicians, Columbus, Ohio. Third edition. Fabrikoid. Price, \$10. Pp. 706, with 229 illustrations. Columbus: The Author, 1944.

This book originally started with a few directions for medical students and doctor's assistants who were called on to perform urinalysis and blood counts. It was found that the brief manner of presentation of the methods was quite convenient. The present edition is an outgrowth of an abundance of new material and new experiences which have accumulated since the appearance of the second edition. The entire style of the book embodies brevity. The directions are outlined and concise. The book should be useful to technicians who wish to brush up on the various standard methods of laboratory procedure. On pages 673 to 675 is given a list of one hundred and five laboratory reference books. The index is quite clear. The illustrations are simple and somewhat schematic. At the end of each chapter are assembled questions covering the preceding text.

**Cosmetology in the Negro: A Guide to Its Problems.** By Gerald A. Spencer, M.D. Cloth. Price, \$2.50. Pp. 127, with 35 illustrations. New York: The Author, 1944.

The author had an intriguing idea, and his well written preface and introduction gave promise of an unusual book, but he failed in his assignment largely through negligence. Errors in spelling, that are obviously printer's errors, appear all too

frequently for so small a book, and the discussions of the various diseases are much too sketchy and not always accurate. There are the surprising statements that vitiligo, if not treated early, extends to the hands and other parts of the body and that disturbances in the baby's diet may cause the hair to drop out. Listed among the common systemic conditions observed to affect the hands are the rarely encountered tuberculosis, vitamin deficiencies and glandular disturbances; and wart, or verruca, is defined as a term used to cover a group of diseases of the skin. The illustrations in black and white, though numerous, are not all clear and, though the book contains much useful information, all in all there is little about it to merit recommendation.

**Soldier to Civilian: Problems of Readjustment.** By George K. Pratt, M.D., Psychiatric Examiner, U. S. Armed Forces, Induction Center, New Haven, Connecticut. Foreword by George S. Stevenson, M.D., Medical Director, The National Committee for Mental Hygiene. Cloth. Price, \$2.50. Pp. 233. New York & London: Whittlesey House, McGraw-Hill Book Company, Inc., 1944.

Current interest in the problems of reconversion from war to peace is given sound directional guidance by the recent availability of books on the subject, such as "Soldier to Civilian." Admittedly a discussion of one of the many phases of the returning veteran, this is an exceptionally carefully reasoned and scientifically accurate approach to the subject. From previous experience in psychiatric work and a review of a few of the problems that confront the discharged service man and woman the author focuses attention on the main conflicts that are likely to arise with demobilization. In an orderly fashion the whole effect of the war on the average soldier is discussed. A brief summary of the mental equipment the average citizen took with him to induction is given at the beginning of the book. The effect of the military services is described next.

The second half of the book is devoted to the readjustments to civilian life after discharge from the armed forces. Proper stress is given to the importance of the initial week at home after discharge. Many helpful suggestions are given for the easier transition from military life to civilian industry. Getting reacquainted with the family is deftly treated. While there are brief case reports, it is regrettable that more are not included. This is an excellent handbook for the average physician, and it will give him a better insight into the problems of the future.

**Introduction to Parasitology with Special Reference to the Parasites of Man.** By Asa C. Chandler, M.S., Ph.D., Professor of Biology, Rice Institute, Houston, Texas. Seventh edition. Cloth. Price, \$5. Pp. 716, with 309 illustrations. New York: John Wiley & Sons, Inc.; London: Chapman & Hall, Ltd., 1944.

As in the previous edition, this book presents in a readable form a comprehensive account of the wide field of parasitology, with particular reference to the protozoan, helminth and arthropod parasites of medical importance. The biologic aspects of the parasites of man, such as life cycle, epidemiology, pathogenicity and prevention of infection, are stressed. Detail on morphology and taxonomy is restricted to a minimum. Many of the advances in parasitology which have occurred during the last four years are incorporated in this edition. Because of the interesting style in which the book is written, it offers a pleasant, as well as reliable, introduction to a knowledge of parasites and insect vectors of disease, essential for an understanding of parasitic and insect borne infections. The book should continue to receive the wide acceptance as a textbook for collegiate instruction in the subject which its predecessors enjoyed.

**The Practice of Medicine.** By Jonathan Campbell Meakins, M.D., LL.D., Brigadier, Deputy Director General of Medical Services, Royal Canadian Army Medical Corps. Fourth edition. Cloth. Price, \$10. Pp. 1,444, with 517 illustrations. St. Louis: C. V. Mosby Company, 1944.

This is one of the standard, excellent textbooks of medicine, considerably revised not only by extensive clarification of many subjects but also by the inclusion of new portions which are timely. Among the latter are chemotherapy, including penicillin, and certain wartime pathologic states, such as crush syndrome and blast injuries. Moreover, new stress has been laid on the importance of preventive medicine and some recent concepts of psychosomatic aspects of medicine. Altogether the book is well arranged, well written and easy to read.

## Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

### COMBINED IMMUNIZATION AGAINST WHOOPING COUGH AND DIPHTHERIA

To the Editor:—I wish to have an opinion on the combined method of immunization against diphtheria and whooping cough. Is it as effective as separate immunizations? If so, what is the best preparation to use and by whom is it made? S. L. Burdeshaw, M.D., Headlands, Ala.

ANSWER.—In a Report of the Council on Pharmacy and Chemistry (THE JOURNAL, Sept. 30, 1944, p. 294) Felton and Willard state that "the combination of pertussis vaccine with diphtheria toxoid and/or tetanus toxoid has been suggested by a number of workers. This would be a convenient means of reducing the number of routine immunization injections generally recommended for infants and children. . . . Sauer and Tucker obtained development of complement fixing antibodies in response to mixed Hemophilus pertussis vaccine and diphtheria toxoid in three doses at three week intervals equal to that obtained with H. pertussis vaccine alone. Daughtry-Denmark obtained like results with three doses at one week intervals."

In a five year report "Immunity Responses to Mixtures of Diphtheria Toxoid and Pertussis Vaccine" Sauer, Tucker and Markley (THE JOURNAL, Aug. 5, 1944, p. 949) concluded that "infants can be immunized successfully against the two diseases at the same time." These investigators, Daughtry-Denmark (Am. J. Dis. Child. 63:453 [March] 1942) and Kendrick (Am. J. Pub. Health 32:615 [June] 1942) used different methods to prove conferred active immunity. All found that alum precipitated mixtures yielded the best results. Alum abscess has been virtually eliminated by deeper subcutaneous injections, lateral and distal to the deltoid muscle, with the needle pointed distally and the site of injection promptly massaged by several firm distal strokes. To prevent abscess, Sako, Treuting, Witt and Nichamin (THE JOURNAL, Feb. 17, 1944, p. 379) recently advised that the needle for alum precipitate injections be dry.

Northwestern University Medical School has granted rights to Parke, Davis & Company to prepare Combined Diphtheria Toxoid, Alum Precipitated, and Pertussis Vaccine (Sauer). The bacilli are grown on Bordet-Gengou medium made with human blood. In a similar product of Eli Lilly & Co. the bacilli are grown on Bordet-Gengou medium made with bovine blood and are "washed" before they are alum precipitated with diphtheria toxoid. There are also several other brands of combined pertussis-diphtheria antigens.

### CONGENITAL ABSENCE OF GALLBLADDER AND BILE DUCTS

To the Editor:—A baby aged 4 months has been jaundiced since the fifth day after birth. A diagnosis of hemolytic anemia was made. Injections of crude liver and a liver-stomach concentrate with iron and vitamin B were administered, resulting in a definite increase in hemoglobin and red cells, yet the jaundice persisted. The infant was then hospitalized for observation; the consensus was obstructive jaundice. An exploratory operation was undertaken, and it was discovered that the child had no gallbladder and no hepatic duct. The infant has recovered from the operation and the general condition is good. During all this time the infant has gained weight and has been as active and alert as any child that age. The urine is a deep yellow or golden; the stools have always been yellowish; bile has shown up in the stools since the jaundice was first noticed. What is the prognosis in this case?

Siegfried Baruch, M.D., Brooklyn.

ANSWER.—If the findings as a result of the exploratory operation are correct it is apparent that the infant has a congenital absence of the gallbladder and of the extrahepatic biliary ducts. The clinical symptoms found in this patient are not unusual; the bile found in the stools is doubtless due to the diffusion of bile pigment into the intestine along with the intestinal secretions made possible by the exceptionally large amount of pigment in the circulating blood. It does not necessarily mean that there is any connection between the biliary tract and the duodenum. It is unlikely that the child will survive beyond two years. Progressive enlargement of the liver with increasing cirrhosis and ascites will probably develop. A great many varieties of

congenital abnormalities in the development of the extrahepatic biliary ducts occur. In only 16 per cent of 200 cases in one series reported were the cystic and hepatic ducts patent. When the atresia involves only the distal portion of the common duct and the gallbladder is present and contains bile, the obstruction may be relieved by making an anastomosis between the gallbladder and the stomach or duodenum. A few such operations have been performed successfully and the patients have survived in good health for a number of years. The oldest patient operated on by Ladd was 13 in 1940 and had been asymptomatic since the time of operation. When the gallbladder is absent or the cystic duct not patent, but a remnant of the hepatic duct can be found, the anastomosis may be attempted but the outlook is not promising. A small catheter may be introduced into such a remnant of hepatic duct and led through the stomach or duodenum by the method described by Dragstedt and his associates. A fine T tube also could be used, but in either case it is imperative that the tube be left in place for six months to a year in an attempt to prevent subsequent stenosis.

The preoperative preparation of these patients is exceedingly important and involves the administration of adequate amounts of vitamin K together with blood transfusion. It is usually wise to wait for one or two months after birth to make certain of the diagnosis. Hicken and Crellin suggest that at operation the extrahepatic biliary system, if any is present, may be filled with saline solution under pressure or may be visualized by injecting contrast mediums into any available part of the system and subsequently taking x-ray films. They remark that occasionally low obstruction in the duct system is due to plugs of mucus, bile or cellular detritus and that this can be removed by irrigation. Disruption of the abdominal wall is a special hazard after operation on these patients, and for this reason a transverse incision in the upper abdomen is indicated. Needless to say, surgery of this type is exceedingly difficult and should be undertaken only by those experienced in the surgery of children and properly equipped with fine needles, thread and suitable instruments. Even under optimum conditions the outlook is not good.

### MECHANISM OF NORMAL AND FALSETTO VOICE SOUNDS

To the Editor:—From a purely anatomic or physiologic point of view what is a falsetto voice? Is it produced without the vocal cords? If not, how can they, after straining to reach a top note, attain suddenly by relaxation a new and easier top range? Are different structures involved or are the same structures used by a different method? Is a node produced in the middle of the cord, thus doubling the vibration frequency? Several teachers of voice express views widely diverging.

Theodore M. Frank, M.D., Texas City, Texas.

ANSWER.—The most authoritative information on the mechanism of the production of the normal and the falsetto voice has been obtained by direct vision of the vocal cords by means of stroboscopy and by the ultra high speed motion picture camera. Information obtained with the aid of stroboscopy is reviewed in "The Mechanism of the Larynx" by V. E. Nagus (St. Louis, C. V. Mosby Company). Motion pictures taken at 4,000 exposures per second have been made by the Bell Telephone Laboratories. Observations by both methods show that both the normal and the falsetto voice are produced by the true vocal cords, which are set into vibration by the air stream. In each case the cords vibrate throughout their whole length without the production of nodes.

The ultra high speed camera demonstrates that in the production of the normal voice the free margins of the cords approximate throughout an appreciable vertical distance. Each cord shows a wavelike motion from below upward. The crest of the wave on each side appears well below the upper margin and moves upward and outward. The crest of the wave on one side approximates or contacts the crest of that on the other side to different degrees, with variations in the pitch and character of the tone produced. As the trough of the wave reaches the upper margin of the cord the crest of the next wave appears below. As the pitch rises, the length and tension of the cords increase and the configuration changes.

The theoretical explanation given for the falsetto voice is that the lateral bundles of the thyroarytenoides internus muscles relax, thereby relaxing the body of each cord, while tension on the free margin is maintained mainly by the opposing action of

the cricothyroides and the cricoarytenoides muscles. The result is a loss of elasticity, the margins become thinned, a smaller area of the margin of each cord comes in contact with its fellow during vibration, and the movement occurs more in an up and down direction than during the normal voice. This explanation seems to be supported by the ultra high speed motion picture demonstration by the Bell Telephone Laboratory.

### EPISODES OF RECURRENT DEPRESSION

**To the Editor:**—A white woman aged 53, a housewife, first consulted me two and a half years ago. Her complaints were (1) fatigue, not the result of physical exertion, so extreme that it required "every bit of nervous energy she could muster even to move" and (2) emotional instability manifest by uncontrollable crying when extremely tired. She recognized no reason for this but at times could not control the crying. At the age of 25, while teaching school, she had a similar condition for several months. Again in the middle thirties, when she was a secretary, a second attack occurred lasting about six months. A third attack, more severe and of longer duration than the others, occurred during her early forties. At that time a complete examination revealed nothing of significance except a basal metabolic rate of minus 18, for which thyroid was administered. At that time she and her husband were living in New Mexico. She has had no pregnancies. The menopause occurred at the age of 47. Her tonsils were removed years ago. Other medical and surgical history is of no import. For the last seven years she has lived in southern California. The patient is well developed and well nourished, is 5 feet 6 inches (168 cm.) tall, weighs about 145 pounds (66 Kg.), the blood pressure is 130/85 and the pulse rate is 90. Other physical examination, blood and urine are normal. Thyroid orally and estrogen by injection failed to aid, and various other medications were used, including neostigmine, amphetamine, adrenal cortex extract and salt, diethylstilbestrol, vitamin E and finally aqueous extract of whole pituitary. The first injection of the pituitary produced results, and two days later the patient appeared and acted completely normal; she exclaimed "I did more work yesterday than in all the three months previous put together." This was continued every few days, then gradually increasing the interval, and it was found that nine days was the longest period between injections before depression occurred. Thus complete relief continued until May of this year, when the treatment rapidly failed. After several weeks, about six, it was again tried, but without results. Reexamination reveals nothing; the basal metabolic rate is normal using thyroid  $\frac{1}{2}$  grain (0.032 Gm.). Blood and urine are normal, as is the blood nonprotein nitrogen and blood sugar. Roentgen examination of the sella is normal.

M.D., California.

**ANSWER.**—The patient appears to have been going through episodes of recurrent depression. It would be important to know whether the good interval periods were characterized by overactivity or elation.

Careful psychiatric study is indicated to determine what psychologic or environmental stresses precipitated these attacks. However, in some such cases it is difficult to find any clearly related causative psychogenic factors.

Treatment should include psychotherapy and socialization. The patient should be safeguarded if the physician suspects that she has any intention of injuring herself. In serious depressions hospitalization is indicated. The food intake should be increased if the patient is losing weight. Occasionally small doses of amphetamine sulfate, 5 mg. twice a day, are helpful. In severe depressions electric shock treatment is indicated.

### ABSCESS OF INJURED DECIDUOUS TOOTH

**To the Editor:**—A boy aged 4 years broke one of his incisor teeth some time ago. Since then the tooth has developed an abscess which periodically drains through the gum. Is there any contraindication to extraction of the tooth at this age? Will the abscess be likely to affect the normal development of his second tooth? What is the best way of handling this situation?

M.D., Connecticut.

**ANSWER.**—The only possible contraindication for extraction of the tooth is the possible effect on lip function, and this is negligible in the face of the hazard provided by harboring the focus of low grade infection. As a rule the infection does not penetrate the membrane of the crypt of the permanent incisor. Occasionally in case of extensive osteomyelitis of the jaw such infections produce hypoplasia of the permanent teeth which are forming at the time of the infection, but in these instances the severity and extent of the infection are greater than in the condition described.

While it is possible in some instances to fill the root canal of the injured deciduous tooth, thereby permitting its retention, the

incidence of a continued low grade infection or reinfection in the injured area is so great that this procedure is not followed commonly. As the direction and extent of growth of the premaxillary portion of the upper jaw tend to increase the width of the alveolar process in this area and the response in alveolar bone to the eruption of the permanent teeth contributes to the same end, there is no necessity for placing a mechanical device to maintain the space of the extracted tooth, as is often necessary in lateral segments of the dental arch. The procedure of choice, unless complications not stated in this problem arise, is extraction of the deciduous tooth.

### STERILIZING SPINAL PUNCTURE NEEDLES IN OIL

**To the Editor:**—In our hospital the spinal puncture needles are boiled and sterilized in oil. Before being used they are cleaned in a basin of sterile water by the operating room nurse. Often, as the spinal fluid is withdrawn after spinal puncture, droplets of oil are seen in the spinal fluid collected. 1. What are the advantages of sterilizing these needles in boiling oil? 2. What complications are likely to occur if some of these oil droplets are injected into the spinal canal when giving spinal anesthesia? 3. Do you think that the severe headaches and signs of meningismus are directly traceable to droplets of oil getting into the spinal canal?

M.D., New York.

**ANSWER.**—1. The advantage of sterilizing needles in boiling oil is that a higher temperature can be attained by heating oil than by heating water, and therefore the sterilization of the needles may be more complete than when they are sterilized in the usual way, which is to place the needles in a pan with just enough water to cover them well and then to boil the water for ten or fifteen minutes.

2. Because the oil droplets that came from needles sterilized in boiling oil were considered to be undesirable, that method has been largely given up.

3. Severe headaches and signs of meningismus might possibly be associated with droplets of oil getting into the spinal fluid, depending on the kind of oil that was used, and the probabilities are that there might be a slightly higher percentage of headaches under these circumstances than when oil was not used; nevertheless there are a certain number of headaches that are usually associated with lumbar punctures under almost any circumstances.

### SULAMYD AND DISEASE OF COLON AND URINARY TRACT

**To the Editor:**—Has the value of sulamyd (Schering) been proved in disease of the colon, kidney or urinary tract? What risk of toxicity is involved? Three children in my family have cystinuria; two have also lithiasis and kidney infection. They are unable to take mandelic acid, since they must be alkalinized and may not take other sulfonamides because of the propensity to stone formation. What are the favorable and unfavorable aspects of the use of this drug for such patients?

Byron S. Bruce, M.D., Opelika, Ala.

**ANSWER.**—Sulamyd, or sulfacetimide, is a derivative of sulfanilamide. It differs from sulfanilamide chemically in that acetylation has been carried out at the  $\text{SO}_2\text{NH}_2$  group. Sulamyd has been recommended especially for the treatment of bacillary infections of the urinary tract. As far as toxicity is concerned, one may anticipate essentially the same degree of toxicity as obtained with sulfanilamide. The advantages of sulamyd in the treatment of patients with lithiasis and urinary tract infections are that kidney complications rarely are associated with its use and alkalization of the urine is not essential. The disadvantage of sulamyd is that its antibacterial action against micro-organisms commonly associated with urinary tract infections is relatively less than that of sulfathiazole and sulfadiazine. Sulfacetimide has not found wide application in the treatment of diseases of the colon. It should be pointed out that, in general, the sulfonamides have been associated with disappointing clinical results in urinary infections complicated by renal lithiasis. This preparation is not accepted by the Council on Pharmacy and Chemistry.

### TUBAL INSUFFLATION TECHNIC

**To the Editor:**—In The Journal Jan. 20, 1945 there is an inquiry from Dr. A. E. Drexel of Alexandria, Va., about using air for tubal insufflation, and there is a brief answer to the effect that it is absolutely safe. I have in the process of preparation a paper which reports two deaths as the result of such technic. These patients both died of proved air embolism. Naturally, therefore, I do not think that the advice given is correct. The pros and cons of air embolism are outlined in my paper. I feel that there are probably a considerable number of these accidents in the country which have not been reported. At best it is a haphazard way of performing tubal insufflation.

## MYASTHENIA GRAVIS

HENRY R. VIETS, M.D.  
BOSTON

In the last eight years there has been considerable advance in our knowledge of myasthenia gravis. This somewhat rare disease is characterized by easy fatigability of the voluntary muscles. A growing interest in the disease is based on a number of recent developments: the formulation of the chemical mediation theory of the transmission of nerve impulses across a synapse by the peripheral release of a specific agent, first suggested by Otto Loewi<sup>1</sup> in 1921 to explain the actions of the autonomic nerves on their effector organs and later expanded by Dale, Feldberg and Vogt<sup>2</sup> to account for a similar reaction at the end plates of motor nerves to voluntary muscles; the discovery in 1934-1935 by Walker<sup>3</sup> of the therapeutic effects of physostigmine and prostigmine (neostigmine) in alleviating the symptoms of myasthenia gravis, and the stimulation given by Blalock,<sup>4</sup> whose removal of the thymus in 1941 in cases of myasthenia gravis reopened the whole controversial subject of the relation of the thymus to this disease. In spite of these three important contributions, a complete conception of the cause of myasthenia gravis still eludes us and many clinical features are not understandable. The present paper attempts to evaluate our knowledge based on nine years of experience in seeing 125 cases at the Massachusetts General Hospital, plus a summary of our investigations undertaken, the results found and a review of the most important literature.

Although the syndrome of muscular fatigability now known as myasthenia gravis was first described by Willis<sup>5</sup> in the seventeenth century, it was not until the close of the nineteenth century that the disease was fully recognized by Erb<sup>6</sup> in 1878 and five years later by Goldflam<sup>7</sup> in 1893. Jolly<sup>8</sup> gave the name to the

disease in 1895. By 1900 the disease was fully recognized and reports of cases were issued from many centers, both in Europe and in America. The first cases in the records of the Massachusetts General Hospital occurred in 1905, and 31 patients received this diagnosis between then and 1934 after investigations in the wards.<sup>9</sup> This figure covering a period of thirty years may be contrasted with over 100 cases seen at the same hospital in the last nine years, illustrating the growing interest in the disease now that a more exact and early diagnosis is possible and neostigmine therapy is available.

To study the clinical aspects of the disease, an outpatient clinic was established in 1935. Since that date patients have been seen at intervals of two weeks, to six months, depending on the severity and stage of the disease. About 60 cases are constantly followed in the clinic, thus giving an important source for study of such problems as the age of onset, the first symptoms, remissions and relapses, deaths, the effects of various forms of treatment and the symptoms as shown in special organs of the body. Constant watchfulness over patients, moreover, insures a prompt change in treatment schedule, a not unimportant matter in a disease with rapid and often unexpected variations in symptomatology. Not infrequently, quick action in increasing the neostigmine intake means the saving of a life.

### DIAGNOSIS

The diagnosis of myasthenia gravis is often not difficult. Even prior to the recent tests made available for this purpose, the older neurologist had no difficulty describing the disease and making an unmistakable diagnosis in well defined cases. In reading the case records written before 1935, most give a clear and certain history. Some records may be used to contrast with the material collected since 1935.

The year 1935 is a turning point in the historical development of our knowledge of the disease, for in that year Mary Walker showed the dramatic effects of neostigmine, when given by injection, on the muscular weakness of patients with myasthenia gravis. Neostigmine was first used by us in March 1935, and before the end of that year Viets and Schwab<sup>10</sup> had described a diagnostic test using neostigmine as the basis for the improvement in symptoms. This test was later modified from its original form in 1936<sup>11</sup> and made more definitive in a report in 1938.<sup>12</sup> The test has been used extensively in our clinic and elsewhere since that date

and has proved to be of value in confirming the usual diagnostic impression made from the clinical history. The correct amount of the drug, namely, 1.5 mg. of neostigmine methylsulfate with 0.6 mg. of atropine sulfate, is now supplied in a single diagnostic ampule. This is the dose for an ordinary adult and it is important to use as much neostigmine methylsulfate as this ampule contains, for a false report of "no improvement" may occur in some patients with a smaller amount. There is no definite rule in regard to this, but the dosage provided by the diagnostic ampule has been found to be satisfactory. Occasionally even more neostigmine is needed to make the diagnosis certain. Atropine is useful to prevent the muscarine-like effect on the smooth muscles and ordinarily 0.6 mg. is sufficient for this purpose. Sometimes a further injection of an equal amount of atropine sulfate is useful if the patient has many disagreeable symptoms, such as pallor, sweating, a feeling of constriction of the chest, gaseous eructations, rumbling, diarrhea or even general collapse.<sup>13</sup> Fortunately, such a response rarely occurs and seldom takes place in a patient with myasthenia gravis. The very fact that a patient can take this amount of drug without smooth muscle stimulation is suggestive of the diagnosis of myasthenia. The principal results, however, are the rapid removal of the weakness of the voluntary muscles, with a return of the ability to move the eyes and the facial muscles and normal resumption of the functions of chewing, talking and swallowing. In addition, the musculature of the neck, back and extremities may improve, if they are involved, the patient being able to hold the head up without difficulty and lift the arms above the shoulders, with the arms and fingers fully outstretched, and cross the legs, three functions due to specific involvement of muscle groups commonly affected in myasthenia gravis.

Many hundred tests with the diagnostic ampule have only confirmed the original observations that neostigmine is a specific antidote for the curare-like symptomatology of myasthenia gravis. A few other diseases respond slightly to parenteral neostigmine, such as amyotrophic lateral sclerosis, bulbar palsy, some of the muscle dystrophies and syndromes of a similar nature. The response, however, is minimal, ordinarily less than 5 per cent and never over 10 per cent of the effect seen in myasthenia gravis patients.

It is possible to make patients with myasthenia gravis worse by the use of curare or quinine. Rarely in my opinion is this necessary, as the disease is usually distinctive enough by history to make the diagnosis certain before injection of neostigmine is used. In none of the series have I felt justified in using either quinine or curare, but I have no objection to using curare under due precautions as outlined by Bennett and Cash<sup>14</sup> or quinine as advocated by Harvey and Whitehill<sup>15</sup> and by Eaton<sup>16</sup> if I felt that they were needed in order to make the diagnosis certain. The response to neostigmine injection, however, is usually so free from disagreeable symptoms and the results are so striking that preliminary medication with curare or quinine does not seem to be justified except in a most unusual case.

The use of the fluoroscope to study the swallowing reflex before and after neostigmine injection, as described by Schwab and Viets,<sup>17</sup> is one of the most important of the various maneuvers used in diagnosis. Under these circumstances all question of voluntary control is eliminated and the actual retention of barium in the pharynx and pyriform sinuses is unmistakable evidence of a structural disease affecting the swallowing mechanism. If, after the neostigmine methylsulfate is given, the patient is able to swallow normally, without retention of barium in the throat, the diagnosis of myasthenia gravis cannot be questioned. Such a result does not occur in bulbar palsy. A small amount of a thin mixture of barium should be used in a suspected case of bulbar palsy. No increase in the release of the barium on the sides of the pharynx is observed when neostigmine is injected, but the retention of it may cause considerable difficulty and patients have been known to choke and even have stopped breathing under these conditions. A careful examination of the posterior pharynx usually reveals widespread weakness and atrophy of the muscles, with fibrillations in patients suffering from bulbar palsy. These aspects, however, are not present in cases of pseudo-bulbar palsy and here the diagnosis is greatly facilitated if the patient does not respond to the neostigmine test.

#### THEORIES OF CHEMICAL MEDIATION AS APPLIED TO MYASTHENIA GRAVIS

That there might be a chemical mediation in the transmission of a nerve impulse across a synapse was first suggested by the work of Otto Loewi in 1921. The fundamental facts established by him in his report are now an integral part of physiology and they have led to great progress in this and other fields of investigation. His work dealt with the autonomic system, but it was not long before Dale, Feldberg and Vogt and others applied the same findings to the neuromuscular junction of the striated muscle system. The "vagus stuff" first suggested by Loewi was thought to be acetylcholine by Feldberg and Kraye.<sup>18</sup> This was indeed proved to be the case by Dale,<sup>19</sup> and we know that acetylcholine is a necessary constituent at the synapse for the passage of the nervous impulse.<sup>20</sup> Continued development showed that an enzyme also was present, cholinesterase, whose specific function it was to split acetylcholine by hydrolysis and thus prevent the continued transmission of a nerve impulse to an individual muscle. Cholinesterase, moreover, was found widely disseminated in the blood and body tissue. It is this enzyme that is temporarily inactivated by physostigmine and its closely related drug, neostigmine. So widespread is the release of acetylcholine at the end plates of nerves that this whole system of nerves which release this substance at their end-plates are now referred to as cholinergic nerves. It has been shown, moreover, that acetylcholine has a nicotinic-like effect on striated muscles and a muscarine-like effect on smooth muscles. The muscarine-like action may be overcome by the use of atropine sulfate, thus removing from the effect of the drug one of the symptoms that would be most undesirable in the treatment of myasthenia gravis. the chemical mediation is still a field of intensive investigation. Only recently Nachmansohn<sup>21</sup> has described another enzyme, choline-acetylase, which synthesizes acetylcholine, and gradually a whole chain of reactions is being established in which the release of acetylcholine is only one of the steps. Nachmansohn has referred to this as the "acetylcholine cycle." When the whole cycle is understood, it is quite possible that the explanation of myasthenia gravis may be revealed and that a more specific treatment aimed at elimination of the etiologic factor will be evolved.

#### TREATMENT

On the assumption that the health of the patient with myasthenia gravis depends on an adequate amount of neostigmine being maintained to inhibit the cholinesterase at all times, taken in consideration with the amount of muscle work of any kind that the patient is doing during the course of twenty-four hours, an attempt is made to give the drug so that a neostigmine level will be maintained during the entire period. The variations in the amount that are necessary to accomplish this purpose are considerable. Some patients are maintained on a minimal amount of neostigmine. In a few cases as little as 15 mg. divided in two doses taken by mouth are sufficient to relieve mild symptoms. General weakness or more specific symptoms, such as ptosis, diplopia, dysarthria or dysphagia, usually require larger amounts. The average intake of 45 ambulatory patients seen during 1943 and 1944 was 10.9 tablets of neostigmine bromide, 15 mg. each, spaced during the twenty-four hours, or a total of 163.5 mg. The highest dosage was 25 tablets a day for a patient who has been maintained on this intake for a number of years.

CASE 1.—J. B., a man aged 28, had experienced spells of generalized muscle weakness since the age of about 15 years. The chief symptom at the onset was weakness in his legs, with difficulty in running and climbing upstairs. He fell down frequently and could not compete in games with other boys. Subsequently he developed difficulty in chewing, ptosis and diplopia. At first the patient was aided by taking ephedrine sulfate. In November 1935 he was given neostigmine bromide by mouth. The diagnostic test was strongly positive, and it was soon discovered that he needed as many as 15 tablets of neostigmine bromide, 15 mg. each, in twenty-four hours. In addition he took potassium chloride and continued the ephedrine sulfate. The dosage established in 1937 has been continued, with slight variation, for the last seven years. During most of this period it was found that 15 tablets of neostigmine a day was not sufficient to maintain him, and the dose was increased to between 20 and 25 in about 1939. There it has remained for five years, the patient showing no tendency toward remissions or relapses. During this period he has been able to work intermittently in a garage and as a foreman in a defense plant, and he appears to be well adjusted on his present intake. Any variation from it, however, causes pronounced muscle weakness and disability. On numerous occasions he has been taken off this large dosage only to reveal excessive weakness with inability to turn over in bed, talk or swallow. At the present time, in 1944, he is taking the following drugs at spaced intervals during the day and night: neostigmine bromide 20 tablets, 15 mg. each; ephedrine sulfate, 5 capsules, 24 mg. each; potassium chloride, 25 per cent solution, 60 cc. a day.

In addition to the total amount given in twenty-four hours, the spacing of the drug during this period is of considerable importance. Information in regard to the hourly needs can be obtained from the patient by the

use of a chart on which the patient records his state of health four times a day (fig. 1). This is based on a simple score used by Schwab and Skogland<sup>22</sup> and has proved efficient for the purpose outlined here. The patient estimates his condition at four periods during the day, usually at 8 a. m., 12 noon, 4 p. m. and 8 p. m. After two or three weeks of observation the physician is able to space the drugs to suit the patient's needs. If his worst periods, for instance, occur consistently early in the morning, neostigmine is added during the night. A number of patients wake themselves up at 2 a. m. and take 1 or 2 tablets under these circumstances. Attempts should not be made to change the schedule in the average case without an observation period of at least two weeks. A trial daily schedule is followed for the first fortnight, adjusted at the end of that period, the average patient being seen again in two weeks and then at varying times thereafter, depending on the patient's adjustment to the drugs taken. A copy of the daily dosage is given to the patient at each interview with a carbon copy retained by the physician. It is useful to have an hourly schedule for this purpose such as the one used at the Massachusetts General Hospital. Various dosage schedules under this system have been reported by Viets and Schwab.<sup>23</sup>

Fig. 1.—Top, slightly reduced, of patient's daily report of symptomatic improvement under treatment for myasthenia gravis. There are six rows of these daily reports on each side of the blank, the actual size of which measures 7½ by 11½ inches. The patient records the state of his health four times a day, usually at 8 a. m., 12 noon, 4 p. m. and 8 p. m. in the appropriate squares. A study of the chart at intervals of two weeks often enables the physician to rearrange the hourly intake schedule so that the patient is more effectively maintained.

When the patient is more seriously ill than the average occurring in an ambulatory clinic, neostigmine is of necessity given in the form of neostigmine methylsulfate by subcutaneous or intramuscular injection. The subcutaneous dosage is satisfactory with a hypodermic syringe, and because of this patients may be trained to give the injections themselves, similar to the procedure adopted in the treatment of diabetes. Now all patients, no matter how mild their disease, are given ampules of neostigmine methylsulfate, with instructions for injections in case an emergency arises in the course of their disease. As respiratory embarrassment due to weakness of the diaphragm and chest muscles may be of rapid onset, it is well to have all patients prepared for this possibility. The patients keep a small supply of the drug in this form at home, with a letter of instruction as outlined by Viets,<sup>24</sup> so that any physician or nurse called in the emergency, even if unfamiliar

with the disease and its treatment, will be able to follow the specific instructions. A patient, moreover, who is fairly well maintained on neostigmine bromide by mouth may need the rapid and complete effect of an injection in order to swallow an adequate meal. Patients with dysphagia tend to eat less and less, lose weight and sometimes develop intestinal disturbances. If they can

Fig. 2 (case 2).—Thymus as removed at operation. Weight 11.5 Gm.

take one full meal in the course of twenty-four hours, enough calories and vitamins can be taken to prevent nutritional disability. An injection, therefore, half an hour before this meal often enables the patient to take the meal without difficulty and therefore maintain his weight.

For some patients seriously ill it is necessary to give neostigmine entirely by parenteral methods. The drug under these circumstances may be increased to a dosage as high as 31 mg. in the course of twenty-four hours, given in hourly doses. Such a patient under a large dosage was recently the subject of a report by Viets.<sup>25</sup> This patient showed serious symptoms of respiratory difficulty on smaller doses, and it was not until 1 or 1.5 mg. of neostigmine methylsulfate was given every hour through the night and day that the patient responded and became well adjusted. It is now known that, to inhibit cholinesterase, large doses of neostigmine are needed. Krayer, Ellis and Root<sup>26</sup> have indicated this in their experiments on dogs, using a continuous intravenous infusion of neostigmine methylsulfate to inhibit the normal cholinesterase activity. More neostigmine methylsulfate is needed in proportion to the amount of cholinesterase activity inhibited in a patient who is very sick compared with one who has few symptoms. At least in 1 patient, it was not until the dosage was raised to a large amount that the patient became well

adjusted and was able at a future date to reduce the total intake without having more severe symptoms.

A principle of treatment, therefore, seems to be that adequate amounts of neostigmine bromide must be given by mouth to ambulatory patients, properly spaced through the day and night. When this is not sufficient because of excessive need or because the patient has difficulty in swallowing, neostigmine methylsulfate may be used by injection to replace the oral medication. Under ordinary circumstances 0.5 mg. of neostigmine methylsulfate equals 15 mg. of neostigmine bromide taken by mouth.

#### THE USE OF OTHER DRUGS

Three other drugs are commonly used in the treatment of myasthenia gravis: ephedrine sulfate, potassium chloride and guanidine hydrochloride. Ephedrine sulfate, known for many years as a valuable form of treatment, is a useful adjunct to neostigmine. Its effectiveness is about 10 or 15 per cent of that of neostigmine. It is possible to maintain a few patients entirely on this drug if their symptoms are not very severe or if they are in a prolonged partial remission. Ordinarily ephedrine sulfate is added in doses of 24 mg. two or three times a day to the regular neostigmine schedule. About half of the patients under observation have found the drug useful for this purpose and have continued to take it over long periods of time. As most patients with myasthenia gravis are sensitive to the changes in intake of their medication, we have come to depend on them to evaluate the various drugs taken in addition to neostigmine. The only caution ordinarily needed with regard to ephedrine sulfate is in relation to its possibility as a cause of insomnia. For this reason the drug is ordinarily not taken after 12 o'clock noon; with this spacing, sleeplessness in most cases does not occur. Rarely do patients take more than 3 to 5 tablets of ephedrine sulfate, and no patient at the present time (1944) is being maintained on this drug alone.

Potassium chloride has a mild effect on the symptoms of myasthenia gravis in a small percentage of the patients. The chief difficulties in using potassium are the disagreeable symptoms arising from its intake by

Fig. 3 (case 2).—Low power section, reduced, of thymus showing fatty infiltration about 50 per cent.

mouth. Most patients find it difficult to take the drug and gradually give it up over the course of months after thorough trial, partly because it is so disagreeable to take and partly because its effectiveness is so slight. A few patients, such as patient 1, continue to take it in a 25 per cent solution disguised in orange or tomato juice, without much difficulty. Less than 10 per cent of the patients, however, in the clinic use potassium chloride.

25 Viets, H. R.: Myasthenia Gravis Treated with Large Doses of Neostigmine Methylsulfate Intramuscularly and Intravenously and with Neostigmine Bromide Orally. *Am. J. M. Sc.* 208:701 (Dec) 1944.  
26 Krayer, Ellis and Root. Personal communication to the author.

Guanidine hydrochloride has a considerable effect on the symptoms of myasthenia gravis.<sup>27</sup> One patient has taken 9 tablets of 125 mg. a day for many years with complete relief from her disability. She did so, however, only after a rather disagreeable year of paresthesia around the mouth and at the fingertips when the drug was first started. This has been the experience with

Fig. 4 (case 4).—Gross appearance of thymus as removed at operation. Weight 11.3 Gm.

nearly all of the other patients who have taken this guanidine, and because of this annoying symptom, except in a few instances, they have given it up. Although the drug is useful and over long periods the paresthesia may be overcome, this feature precludes its widespread use as far as our patients are concerned. The more effective drug neostigmine has a tendency, moreover, to overcome the less effective drugs in the mind of a patient and gradually most patients drop guanidine, feeling that the usefulness of the drug in improving their symptoms is not sufficient to justify the annoyance of the oral and digital paresthesia.

When neostigmine bromide is taken by mouth, part of the smooth muscle stimulation may be overcome by the taking of a small amount of food with each dosage. The rapid absorption of neostigmine when the stomach is empty seems to account for most of the disagreeable symptoms. Slight retardation of absorption by food in the stomach has proved to be especially useful and has now become a routine in the clinic for the first few months for all patients taking the drug.

#### THYMUS AND THYMECTOMY

Following the work of Blalock, 15 patients have been subjected to thymectomy from the clinic in the last four years. One was operated on at the Massachusetts Memorial Hospital in Boston and another at the Johns

Hopkins Hospital, the other 13 all being operated on at the Massachusetts General Hospital by Edward G. Churchill and Oliver Cope. There have been four operative deaths, or 26.6 per cent. Thymomas have been found in 4 patients. Hyperplasia of the thymus was found in 3, and the thymus appeared normal, although persistent, in 8 other cases. Of the total group of 15 having thymectomy, some are now in their second and third year following operation. Two are considered at the present time (June 1944) as in complete remission, 2 more are distinctly improved, 3 are moderately improved, 1 slightly improved, and 3 have been operated on too recently to be evaluated. None of these patients have relapsed. The patient showing the best improvement gave the following history:

CASE 2.—Mrs. E. A. H., aged 35, was first seen in 1932, at the age of 22, with dysarthria, diplopia and dysphagia. Six months after leaving the hospital she had a complete remission beginning at about the third month of a pregnancy. The remission continued through the last six months of pregnancy and for three months after parturition, at which time a relapse occurred. Her early symptoms were moderately well controlled on ephedrine sulfate, but she was greatly improved after 1936 on neostigmine bromide 10 tablets a day. A neostigmine test was strongly positive. A second pregnancy occurred in 1940. For the first five and one-half months her symptoms were increased and she required 20 tablets of neostigmine a day. About the end of the sixth month of pregnancy she began to have a rapid remission, which went on to completeness and lasted for a number of months after delivery. During the remission she required only 1 neostigmine bromide tablet a day. Reverting to her regular intake of 10 to 12 tablets in 1941, she did not respond to irradiation of the thymus. Direct transfusion from a normal person four and one-half months pregnant made no change in her symptoms.

Thymectomy was done March 18, 1942 after a preoperative observation period of ten years, during which time, except for the intervals of pregnancy, she had been nearly entirely free from remissions or relapses. The thymus gland as removed at operation weighed 11.5 Gm. (fig. 2). On section the gland appeared normal, although there was 50 per cent fat infiltration (fig. 3).

Fig. 5 (case 4) —Low power section, reduced, of tumor showing slight fat infiltration with hyperplastic thymus tissue

The patient began to improve almost immediately after the operation, and by the time she left the hospital, a month later, she was not taking any neostigmine and had not done so for ten days. The remission therefore occurred about three weeks after the operation. During the entire period of over a year since operation the patient has continued to remain comparatively well without medication. She retains a partial ophthalmoplegia of one eye, not improved by neostigmine.

27. Dodd, Katharine, Riven, S. S., and Minor, A. S.: Further Experience with the Use of Guanidine Hydrochloride in the Treatment of Myasthenia Gravis, *Am. J. M. Sc.* 202:702 (Nov.) 1941.

The remission since operation has not been quite complete. On at least two occasions there were attacks of generalized weakness lasting a week at a time, one in December 1942 and another in January 1943. During these periods there was no change in the condition of her eyes but there was weakness in the arms, legs and back, so that she could not do all her housework. Between periods of mild relapse she had no difficulty in

Fig. 6 (case 5).—Gross appearance of tumor as removed at operation. Weight 40 Gm. Thymoma at base of right half specimen.

crocheting but during them could not carry out this rapid motion without fatigue. The patient thinks she is better in May 1944 than at any time, except for the periods during her pregnancy, since the beginning of her symptoms in August 1931.

A troublesome complication of the operation has been a mild osteomyelitis of the sternum which has required a number of minor surgical operations. In May 1944 it is estimated that she is 90 per cent better than before operation.

There are a number of unusual features about this history. The patient was under observation for a long period prior to operation. Although she had periods of remission during pregnancy, otherwise her course was practically a steady one. Her condition following the operation, with the rapid onset of the remission and its continuation, afford a striking example of what may happen to a patient after thymectomy.

We must be conservative, however, about drawing too many conclusions from a case of this type, particularly in view of the fact that a normal thymus partly infiltrated with fat was found at operation. Her remission, moreover, might be spontaneous in character, such as not infrequently occurs, as is illustrated by the following case report:

CASE 3.—B. C., a man aged 60, began to have symptoms of general fatigue about the middle of July 1943. Within a few weeks he developed dysphagia and dysarthria. He rapidly lost nearly 30 pounds (13.6 Kg.) in weight. On examination the patient showed bilateral ptosis, nasal voice, great difficulty in

swallowing, weakness in holding up the jaw and some general weakness in his arms and legs, with a partial foot drop on the right. He responded rapidly on neostigmine by injection, and the swallowing reflex was almost normal after the test with a diagnostic ampule.

From October 1943 to January 1944 he was maintained on 12 to 14 tablets of neostigmine bromide a day, augmented with one or more injections of neostigmine methylsulfate taken prior to eating. He slowly gained back the weight that he had lost and developed a complete spontaneous remission about April 1, 1944. When last seen, May 23, 1944, the patient showed no signs of his disease and was not taking any medicine. He had put on 35 pounds (16 Kg.) and was doing full time work as a clerk in a store.

It is thus possible to have spontaneous remissions occur rapidly and completely. Many other examples could be cited from the experience in our clinic. These remissions may last a matter of months or even years. Some are known to have lasted twenty or more years. Many of them last four or five years. Their character is in no way different from the remission noted in case 2 following thymectomy. In cases that have been under observation, however, for many years, prior to thymectomy, as case 2, it would seem unlikely that a spontaneous remission would occur so promptly after operation.

Other patients, following operation, have not done so well. One, with a history similar to that of patient 2, who had been under observation for two and one-half years, had a normal thymus weighing 15.5 Gm. removed. About 30 per cent of the thymus was replaced with fat. This patient remains practically unchanged three years and five months after the operation. So far as we can

Fig. 7 (case 5).—Low power section, reduced, of tumor, showing compact character.

see there is no reason why he should not have done as well as patient 2.

The fact that the thymus shows hyperplasia when removed does not necessarily mean that the patient will show improvement as a result of the operation. The following case may be cited as an example:

CASE 4.—E. T., a woman aged 24, first seen in 1933 at the age of 13 with ptosis and fatigue, could walk and run but tired quickly, more so than other children of her age. There was some weakness in chewing, and examination showed a

complete bilateral ophthalmoplegia, with the pupils reacting normally to light and in accommodation. The facial muscles also were involved. She did not improve on ephedrine sulfate, but in 1935 a neostigmine test was strongly positive and subsequently she took 5 or 6 tablets of neostigmine bromide a day by mouth. She was considerably improved as far as her general symptoms were concerned, but her eyes were not much better. Between 1935 and 1942 she was tried on various schedules of neostigmine bromide, guanidine hydrochloride, ephedrine sulfate and potassium chloride. Neostigmine helped her more than any other drug and she finally reverted to this entirely, after long periods of experimentation with the other forms of medication. She was fairly well during this period and in 1939 was able to go by automobile to California from Boston and return.

Because her symptoms were relatively unchanged and she had been under observation a long time, she seemed to us a suitable case for thymectomy. This was done Jan. 14, 1942. The thymus weighed 11.3 Gm. (fig. 4). It showed very little fatty replacement but was hyperplastic (fig. 5). Two years and four months after the operation the patient shows slight general improvement and she is being maintained on about half the amount of neostigmine needed before the operation. The condition of her eyes is practically unchanged. After the operation the patient had a mild remission, which has continued, but she does not feel that the benefit quite justified going through the operative procedure. Her improvement cannot be scored as more than 20 to 25 per cent, but that some improvement is present is unmistakable.

Four of the patients in the series had thymomas, but it is not clear at the present time that they have done better than some of the patients with hyperplasia of the thymus or indeed those whose thymus was normal. An example of a patient with a thymoma is as follows:

CASE 5.—L. F. F., a man aged 28, first experienced difficulty in chewing in the spring of 1942, when he was 26 years of age. About a month after the first symptoms he noted weakness of the upper arms, so that he had difficulty in raising his hands above the level of his shoulders; within a week or two this weakness was followed by dysphasia, dysarthria and ptosis. His voice became nasal in character and he had regurgitation of liquids through his nose. For a few months after the onset the symptoms tended to come and go, but by June 1942 he had to change the character of his work from a molder in a factory to a less arduous occupation. In September 1942 he had to give up work altogether. He responded rapidly to neostigmine injection and was maintained on an intake of about 10 tablets of neostigmine bromide a day. On numerous occasions his intake had to be increased to double the amount prior to his thymectomy. Although the course of the disease had not been entirely steady, in general he did not have serious remissions or relapses. At operation, Sept. 27, 1943, about one and one-half years after the onset of his symptoms, a thymoma was disclosed in the lower pole of the right side of the thymus (fig. 6). The tumor had not definitely been disclosed by x-ray prior to the operation. The thymus weighed 40 grams and the tumor on microscopic section showed compact masses of thymic tissue (fig. 7). The patient was not improved immediately by the operation, for he required between 18 and 22 tablets of neostigmine bromide a day. About a month after operation, however, he was able to shave himself and could hold his hands straight in front of him with the fingers extended, a test that he could not perform before operation. His schedule of neostigmine bromide was gradually reduced to 14 tablets a day, but he was never able in the eight months following operation to maintain himself on a smaller intake. In June 1944 he found it difficult to hold his arms above his head, his voice was nasal in character and he was unable to work. His condition was possibly 25 per cent better than before operation.

Tumors of the thymus may show by x-ray. We have a number of examples in our series in which the tumor disclosed itself in both the anteroposterior and the lateral views. It is often particularly well visualized in lateral views of the anterior mediastinum. Not

all tumors, however, in this area are thymomas, and it is known that some patients have had thymomas removed who have not had a definite history of myasthenia gravis. An examination of one or two records of patients thought to be of this type may reveal signs of muscular weakness, overlooked as symptoms of myasthenia gravis.

We are not in a position, as suggested by some, to advocate thymectomy in every case of myasthenia gravis. There is, for instance, a fairly large group of patients, about 25 per cent of the entire series, who do remarkably well on a moderate amount of neostigmine medication or who have prolonged and even complete remissions. This group should not be subjected to thymectomy, particularly in view of the fact that the operative mortality is at the present time between 20 and 25 per cent. Secondly, we now make a diagnosis of myasthenia gravis, as a result of the refined technic of the diagnostic test with neostigmine, in patients in the older age groups, particularly above 50 years of age. In my clinic 30 per cent of the 125 patients under observation were over 50 years of age at the time of their initial symptoms. This group also in most instances should not be treated by thymectomy.

The difficulties in evaluating the results of thymectomy are many. The progress of the disease is often punctuated by rapid remissions, in many cases complete in character. The thymus, moreover, is not known to have a specific function, at least in the adult. Even the presence of thymomas does not mean that there is any effect on the body from this neoplastic tissue. Finally one must wait for many years before a critical decision can be made with regard to the thymectomy problem. At the present time we are still in the experimental stage, with slight but definite indications, however, that there is some relation between the thymus and myasthenia gravis.

#### SUMMARY

In the course of the last eight years 125 cases of myasthenia gravis have been studied at the Massachusetts General Hospital. A separate outpatient clinic was established in 1935 and about 60 cases are followed in this clinic constantly.

Neostigmine was first used by us in March 1935 and has continued to be the principal drug used in the treatment of myasthenia gravis. Neostigmine is useful also as a means of diagnosis, and the diagnostic test, first described in 1935 and made more definitive in 1938, has proved to be of value.

The study of the swallowing reflex before and after neostigmine injection is the most reliable diagnostic test.

The development of the theory of chemical mediation in the transmission of nerve impulses across a synapse has led to the assumption that the inhibition of cholinesterase by neostigmine allows the acetylcholine to remain at the myoneural junction and form the chemical connecting link between the nerve impulses and the muscle. Treatment is therefore based essentially on the giving of neostigmine in sufficient amounts to make the transmission of the impulse efficient. The exact amount of neostigmine needed for this varies greatly. Patients are maintained on doses of a few milligrams of neostigmine taken by mouth in twenty-four hours up to an intake as high as 31 mg. of neostigmine methylsulfate, given in hourly doses, throughout the day and night.

Neostigmine methylsulfate may be given intravenously.

Large amounts of neostigmine are needed by patients seriously ill; the neostigmine requirement rises in increasing ratios in relation to the severity of the illness.

Three other drugs have a place in the treatment of myasthenia gravis: ephedrine sulfate, potassium chloride and guanidine hydrochloride.

Removal of the thymus may relieve some of the symptoms of myasthenia gravis. A few of the patients studied have shown complete remission after operation; others are unchanged. Patients with thymomas do not do better after operation than patients whose thymus appears normal on section.

Progress is being made along many fields in the study of myasthenia gravis. The greatest advances are pharmacologic, although an increase in our knowledge of the disease, both from the clinical and from the surgical point of view, is evident.

262 Beacon Street.

### ABSTRACT OF DISCUSSION

DR. F. G. LINDEMULDER, San Diego, Calif.: I should like to ask Dr. Viets what his experience has been with high voltage x-ray therapy on the thymus.

DR. HENRY R. VIETS, Boston: Our experience with high voltage x-ray therapy is limited to 15 cases. We have tried to treat the region of the thymus. Some have had five or six applications of 500 or 600 roentgens on two or more occasions. In no case have I seen evidence of any effect from this treatment on the symptoms of myasthenia gravis. This is contrary to some reports in the literature, but I can simply speak for our experience. We have given up x-ray treatment.

## THE TRANSFUSION OF CENTRIFUGED HUMAN TYPE O CELLS

RESUSPENDED AND STORED IN 10 PER CENT  
CORN SYRUP

WILLIAM THALHIMER, M.D.

Associate Technical Director, Blood Donor Service,  
American Red Cross

NEW YORK  
AND

MAJOR EARL S. TAYLOR

Technical Director, Blood Donor Service, American Red Cross  
MEDICAL CORPS, ARMY OF THE UNITED STATES

WITH THE TECHNICAL ASSISTANCE OF MRS.  
THELMA S. SHaub

In the past few years there has been a growing use of suspensions of red blood cells for transfusion of selected patients. With the preparation of plasma in many hospital blood banks and the extensive American Red Cross blood procurement program for the armed forces, huge amounts of centrifuged cells remain after the plasma has been withdrawn from the whole citrated blood. Until the comparatively recent and more extensive use of some of these cells for transfusion of patients suffering mainly from anemia, most of these cells have been discarded.

It is now recognized that the transfusion of red blood cells can serve as well as whole blood for many patients. The main problem has been to find a solution for resuspension which will preserve the cells for a long enough time to make their use practical. Isotonic solution of sodium chloride has been used extensively but is far from ideal, in that it is necessary to administer the saline-suspended cells not later than five days after

the blood is obtained from the donor. Various citrate-dextrose solutions, which are excellent for storing whole blood, are not as satisfactory when used for resuspending centrifuged cells.

Since it was evident that a better solution was needed, this study was undertaken in an attempt to find one. The background has been an extensive experience with the transfusion of cells resuspended in isotonic solution of sodium chloride. Cooksey<sup>1</sup> in Detroit has followed 18,000 such transfusions in fourteen hospitals, and in New York we have reports on 2,000 out of 5,000 such transfusions administered in eight hospitals.

The value of any method for storing resuspended cells for transfusion must be estimated according to a number of criteria:

1. The solution used and its mixture with cells must be harmless.
2. The clinical response, which is the ultimate criterion, must be comparable to that from transfusions of fresh whole blood
3. The survival in recipients of the transfused cells must compare favorably with survival of transfused fresh blood.

It was found that 10 per cent corn syrup in distilled water gave better preservation of cells for a longer time than any of the other solutions tried, i. e. Alsever's, Denstedt's and various mixtures of different proportions of dextrose, sodium citrate, sodium chloride and phosphate buffer. The freezing point of the 10 per cent corn syrup solution is the same as that of 0.85 per cent sodium chloride, and in behavior it appears to be isotonic or very slightly hypertonic for blood cells.

The corn syrup solution was investigated with the idea that the dextrans contained might, because of their larger molecular size, function somewhat as the original plasma in maintaining the stability of the stored, resuspended cells.

This report is based on 761 transfusions of centrifuged type O cells resuspended and stored in 10 per cent corn syrup up to sixty days and administered to 437 patients, many of whom received repeated transfusions, some daily and some several times a week.<sup>2</sup> These patients had a variety of chronic diseases, such as arthritis, Hodgkin's disease, various types of leukemia, nephritis, pulmonary tuberculosis, inoperable cancers and neurologic conditions. A number of the aforementioned patients had demonstrable anemia, and 1 patient had an acute and massive blood loss from a bleeding gastric ulcer; also some patients with various acute conditions received cells.

The clinical improvement has been what could be expected from the administration of the same amounts of whole blood of the same age, and the same increase in the patients' total red blood cell count and nonagglutinable (transfused type O cells) red blood cells occurred. Careful observation revealed no unusual or deleterious effects, a low fever-chill reaction rate and the absence of hemoglobinemia, hemoglobinuria or jaundice in any of the patients.

Unfortunately, no one has published an in vitro test of the stability of blood cells which can be correlated with the ability of these cells to survive in the circulation after they have been transfused. If such a test could be found it would be of extreme value.

<sup>1</sup> Cooksey, W. B., and Horwitz, W. H. Use of Salvaged Red Cells. J. A. M. A. 124: 961-964 (April 1) 1944. Taylor, E. S.; Thalheimer, W., and Cooksey, W. B. The Organization of a Red Blood Cell Transfusion Service, *ibid.* 124: 958-960 (April 1) 1944.

<sup>2</sup> Up to Dec. 31, 1944 3,400 cell transfusions had been given.

## METHOD OF PREPARING THE CELL SUSPENSIONS

The cells have been obtained from the blood of voluntary donors enrolled at the Blood Donor Center of the American Red Cross in New York City. Five hundred cc. of blood is taken by gravity into bottles containing 50 cc. of 4 per cent trisodium citrate solution. The blood types are determined from samples obtained from the pilot tubes. Only type O blood is selected.

The typing is carried out on large glass plates, using two sets of high titered, quick acting typing serums. The tests are read independently by two experienced technicians.

The bottles are then delivered to the processing laboratory, where serologic tests are made, the bottles centrifuged for about one hour at 2,500 revolutions, and the plasma withdrawn for processing into dried plasma. Sterile, solid rubber stoppers are placed in the bottles containing the cells and the bottles are then refrigerated until they are ready for resuspension of the cells, thirty-six to forty-eight hours after the blood was obtained. Only blood that is serologically negative and of a low fat content is used. Two hundred and fifty cc. of pre-chilled (5 C.) 10 per cent corn syrup in sterile, pyrogen free distilled water is introduced into each bottle with a careful bacteriologic technic, the work being done in a dust free cubicle. The volume is restored to approximately that of the original blood. The composition of the corn syrup<sup>3</sup> before it is diluted is dextrose 17.7 per cent, maltose 16.8 per cent, higher sugars 16.2 per cent, dextrans (prosugars) 29.6 per cent and moisture 19.7 per cent.

The bottles are placed in small wooden refrigerator boxes for delivery to the hospitals. The cells are not administered to patients until at least three days have elapsed after withdrawal of the blood. No pilot tube is sent with the bottle, and the hospitals are required to retype the cells from the original bottle and perform cross matching tests with the recipient's blood. The suspended cells must be transfused within five hours after the sample for testing has been taken from the bottle.

Before administration the bottles must be sufficiently agitated to make an even suspension of the cells and free those that might be adhering to the bottom and sides of the bottle.

The mixture is then filtered, immediately before use, through four to eight thicknesses of sterile 40 by 40 bandage gauze or through a 100 to 200 mesh filter inserted into the infusion set. It is unusual to find more than a few small clots on either filter; as many as six bottles of cells have passed through a single steel mesh filter. The cell suspension is not warmed before use.

The type O cells have been administered to recipients of all four blood groups, and no incompatibility reactions have occurred. The hospitals have been cautioned not to use these cells for transfusing women who are either pregnant or in the postpartum period without making certain that there is no incompatibility because of the Rh factor. In case of doubt only Rh negative cells should be administered. The same caution should be observed with all patients who receive repeated cell transfusions.

Before the clinical use of either saline solution or 10 per cent corn syrup suspended cells was begun, careful tests were made to determine the sterility of

the bottles of cells. Negative cultures were first secured on fifty bottles, and then on the first three hundred which were transfused. Since then cultures have been taken each week of several bottles selected by chance; no contaminations have been found.

## CLINICAL RESULTS AND SURVIVAL OF THE TRANSFUSED CELLS

A review of the literature<sup>4</sup> indicates that fresh blood transfused into persons who do not destroy blood at a rate greater than normal disappears from the circulation in about one hundred days at the approximate rate of 1 per cent daily. It seems obvious that the oldest cells die first.

Blood kept outside the body under equally good conditions can be expected to age at the same rate. If kept under less favorable conditions (as with citrate alone) the cells should die and disappear after transfusion at a greater rate. It is conceivable that favorable resting conditions might be found to conserve the viability of the cells.

The length of survival of transfused cells has been followed by the well known method of Winifred Ashby.<sup>5</sup> This method is based on the principle that when type O blood or cells are transfused into a recipient belonging to type A or B one can differentiate the nonagglutinable O cells from the A and B cells by means of the proper agglutinating serum.<sup>6</sup> We adhered closely to Ashby's original technic, after trying other modifications of this and not securing consistent results and accurate checks. We have found, in addition, that we secure closer checks with finger stick blood than with venous blood in which clotting is prevented by a mixture of ammonium and potassium oxalate.

Blood is taken into a red cell blood diluting pipet up to the 0.5 mark and the pipet is then filled to the upper mark with the proper high titered agglutinating serum, which also has great avidity. The counts are always done in duplicate, two blood pipets being used. The filled pipets are shaken for five minutes on a shaking machine and then allowed to stand for at least one hour at room temperature. They are again shaken on the shaking machine for five minutes, and, when taken off, samples are quickly placed in the blood counting chambers. Time is allowed for the cells to settle. The unagglutinated cells which occur singly are then counted in two large squares, each a millimeter square, so as to count a large area and reduce the error of counting to a minimum. Unless the counts of the individual squares are sufficiently close together, the whole procedure is repeated.

With this technic we have made counts of a number of mixtures in vitro with different proportions of fresh citrated A blood and fresh suspended O cells. Total red cell counts, as well as nonagglutinable cell counts, were done on each of these separately and on the mixtures. These results show an unavoidable error in counting the nonagglutinable cells of not more than 10 per cent. There is, of course, an unavoidable error in regular red blood cell counting. The best technicians cannot avoid an error of about 200,000 per cubic millimeter in counting total red blood cells, which would be

5. Ashby, Winifred: Determination of the Length of Life of Transfused Blood Corpuscles in Man, J. Exper. Med. 20: 267-282, 1919.

6. M or N cells and anti M or anti N agglutinating serums can be used just as satisfactorily, as carried out by Schaefer and Wiener.

3. The corn syrup was furnished by the Corn Products Refining Company, and Dr. Haldane Gee of the Sterisol Company prepared the 10 per cent solution.

4 per cent when the total is 5,000,000, and 10 per cent when it is 2,000,000.

It must be remembered that with this technic every individual belonging to type A or B will show a small number of cells which are not agglutinated by the agglutinating serum. These will vary in different individuals from about 10,000 to not more than 100,000 per cubic millimeter. Therefore these initial nonagglutinable cell counts must be taken into consideration and subtracted from the nonagglutinable cell count in the mixtures and after the transfusion of type O cells. Total red blood cell and nonagglutinable cell counts were made before transfusion, immediately after and then at intervals. The percentage of survival was calculated on the basis of the net nonagglutinable cell count immediately after transfusion.

Two hundred and fifty-three consecutive nonagglutinable cell counts which have been done in duplicate on type A and B patients who were transfused with

Chart 1.—The straight line indicates the expected survival of transfused whole blood after refrigerator storage in an accepted dextrose citrate mixture for seven days. The survival is given in percentage of the transfused cells in the recipient's circulation immediately after transfusion and at intervals in days. Number of days' storage, before transfusion, given in the circles.

type O cells have been analyzed. The average difference between these duplicate counts has been 14,000 nonagglutinable cells per cubic millimeter. The average of the duplicate counts was the figure recorded.

Before transfusing cells suspended in 10 per cent corn syrup into human beings a long series of *in vitro* and animal experiments was carried out. It was demonstrated repeatedly that cells in 10 per cent corn syrup were more stable and less fragile at the end of three weeks' storage at 5 C. than were cells suspended in isotonic solution of sodium chloride after five days, and more stable than cells kept in Alsever's or Denstedt's solutions for the same periods of time. The amount of hemoglobin in the supernatant fluid averaged 100 mg. per hundred cubic centimeters at the end of five days' storage in saline solution and from 30 to 40 mg. per hundred cubic centimeters at the end of three weeks in 10 per cent corn syrup.

Rabbits received repeated injections intravenously of large amounts of 10 per cent corn syrup, as many as twenty in forty days, and also of rabbit cells which had been preserved in corn syrup for from one to four weeks. These injections did not cause any detectable deleterious effects in the animals. Microscopic examination of their tissues later by Dr. Jean Oliver showed no pathologic changes and no deposits of iron pigment.

Several years ago Dr. Francis D. Murphy of Milwaukee administered from 200 to 300 cc. of 50 per cent corn syrup solution intravenously to patients with increased intracranial pressure resulting from hypertension. This solution sent to him was prepared from the same brand of syrup. Some reduction of the intracranial pressure followed, and there were no deleterious or harmful effects from these large quantities of corn syrup.

Dr. R. E. Shaw of King Edward VII Memorial Hospital, Bermuda, in a personal communication states that although they formerly used a 10 per cent dextrose solution for intravenous infusion, for the past five years they have been using 10 per cent corn syrup instead and have had identical beneficial results. He also writes that "there has never been any untoward reaction from this solution."

In the beginning only small amounts, 50 to 75 cc., of fresh corn syrup suspended cells were administered intravenously, to make certain that the corn syrup or the mixture would not produce any harmful effects. The amounts were gradually increased up to 500 cc. per injection. Later a number of patients received 1,000 cc. in one injection, and several patients have received 3 liters in three days' time. One patient, with a bleeding gastric ulcer, received 3.5 liters in seven days.

Three hundred and eighty-two transfusions of type O cells resuspended in 10 per cent corn syrup have been administered to 125 different patients at Montefiore Hospital in the medical service of Dr. Louis Leiter. Some of these transfusions have been with fresh cells, 3 days old, but many of them were with cells 7, 14, 22 and 24 days old; two were with 31 day, one with 38 day, one with 41 day and one with both 50 and 60 day old cells.

The administration of these cells to these patients can be considered a severe and practical test. In the main the recipients were those who needed cells and hemoglobin, many of them with diseases causing anemia and increased blood destruction. Some patients, i. e. those with arthritis and neurologic conditions, had normal blood counts, and the transfused cells created a luxur which these recipients could be expected to remove from their blood stream, yet the survival of the cells was remarkably good in most individuals. Survival studies are recorded in charts 1 and 2.

It has been found that the survival of transfused cells drops off sharply when they have been stored for longer than twenty-four days. Cells in 500 cc. amounts which have been stored for thirty, forty, fifty and sixty days have been transfused to compare their survival with published results of survival of transfused whole blood stored for the same intervals. The survival was essentially the same, and, in addition, these old cells caused no deleterious effects, no jaundice and no hemoglobinuria. Although from 20 to 40 per cent survived in the patients' circulation for from two to ten days, it would hardly be advisable or necessary to transfuse cells stored thirty days or longer, except for an emergency or if fresher material was not available.

Although the results with transfusion of 21 day old cells have been just as satisfactory as those we and others have obtained with whole blood stored in dextrose-citrate solution for the same interval, nevertheless for the present a fourteen day expiration date has been established.

Four cases which show clinical benefit and absence of jaundice, after very large volumes of transfused cells, are reported:

B., a man with type A blood, who had aleukemic leukemia, in eighty-six days received 21 transfusions, a total of 14 liters, 14 of 500 cc. each and 7 of 1,000 cc. amounts. Most of this had been stored for from eighteen to twenty-two days. In one eighteen day period he received 9.5 liters of 18 to 22 day old cells. His red blood cell count was raised from  $1\frac{1}{2}$  to 3 million. Obviously he was destroying cells rapidly, yet he never showed any jaundice. For over a month, though he belongs to type A, his blood mixed with potent B serum showed no clumping, and both total red blood cell count and nonagglutinable count were practically identical, differing by 100,000 to 200,000. Therefore he produced very few, if any, red blood cells of his own and has been living on transfused cells.

P., a man with type AB blood, who had myeloid leukemia, in thirty-seven days received 21 transfusions, a total of 13.5 liters, 6 transfusions of 1,000 cc. amounts and the others of 500 cc. One 500 cc. transfusion was of 38 day old cells, and the next day he received 1,000 cc. of 39 day old cells. The age of the other transfusions varied from 4 to 24 day old cells. The last 12 transfusions were of 4 to 5 day old cells, and yet his red blood cell count could not be raised above 2,000,000 per cubic millimeter. Total and nonagglutinable cell counts were practically identical. Although he has been destroying large amounts of the blood he received he never has had jaundice.

L., a man with type A blood, who had aleukemic lymphatic leukemia, received 14 transfusions of cells from 4 to 38 days old, a total of 9.5 liters in thirty-five days. He has never had any jaundice. His total red blood cell count was raised to almost 4,000,000 and his nonagglutinable count to about half of this. Therefore he has been producing some red blood cells of his own.

W., a man with type B blood, entered the hospital with an actively bleeding gastric ulcer, a hemoglobin of 4 Gm. per hundred cubic centimeters and red blood cell count of 1,140,000. In twenty-one days he received 11 cell transfusions, 3 of them (2,500 cc.) of saline suspended cells and the remainder of corn syrup suspended cells, the last 3 transfusions being of cells 7, 14 and 20 days old. His ulcer stopped bleeding, the hemoglobin rose to 14 Gm. per hundred cubic centimeters, and red blood cells to 4,840,000. He left the hospital three weeks after the last transfusion with a hemoglobin of 14 Gm. and red blood cells 4,540,000. Seventy-one days after his last transfusion he returned to the hospital for observation. The red blood cell count was 4,840,000 and his nonagglutinable cell count was 790,000. The calculated survival of only the corn syrup suspended cells which he received was 604,000. This did not include any of the saline suspended cells which might have survived. These two figures are reasonably close. This case report also demonstrates that a patient suffering from massive blood loss benefits from transfusions of resuspended cells and his blood count can be brought to normal and, after the bleeding has ceased, remain normal.

Dr. Nathan Rosenthal has administered 192 red cell transfusions to 150 patients at Mount Sinai Hospital. His experience has paralleled that just reported. None of his patients developed jaundice. In addition he carried out quantitative studies of urobilin output in 3 patients before and after transfusion of cells. Two patients received 500 cc. and 1,000 cc. respectively of cells that were 8 days old, and one 500 cc. of cells that were 13 days old. There was no increase in the rate

of urobilin output (stools and urine) in any of these 3 patients.

About 20 bottles of cells in cardboard cartons and without refrigeration were sent by airplane to Bermuda and were administered there by Dr. R. E. Shaw when the cells were from 5 to 10 days old. The usual benefit resulted, and these patients developed no reactions or jaundice.

Cells suspended in 10 per cent corn syrup were next substituted for saline suspended cells at New York Hospital, with similar good results. These four hospitals have previously had a long experience with cells suspended in isotonic solution of sodium chloride and now prefer to use cells suspended in 10 per cent corn syrup. Because of the longer keeping qualities of the cells a supply can always be maintained. Since Sept. 1, 1944 from 150 to 200 bottles of cells in corn syrup have been delivered every week to eight hospitals in New York City, instead of saline suspended cells which were distributed previously.

Chart 2.—The straight line indicates the expected survival of transfused whole blood after refrigeration storage in an accepted dextrose citrate mixture for twenty-two days. The survival is given in percentage of the transfused cells in the recipient's circulation immediately after transfusion and at intervals in days.

Our counts show that the average net increase in nonagglutinable cells immediately after transfusions of 500 cc. of type O cells suspended in corn syrup in 14 patients is 418,500 cells per cubic millimeter. Clinical experience has shown that a transfusion of 500 cc. of blood into an anemic adult of average size causes an increase in the individual's red blood cell count of about 400,000 per cubic millimeter. Therefore our nonagglutinable cell counts check very well with regular red blood cell counts.

On two occasions high nonagglutinable cell counts were found in patients (1 type A and 1 type B) who were believed not to have had a previous transfusion of type O cells. Each showed, before our transfusion, a nonagglutinable cell count of about 350,000 per cubic millimeter. It was then discovered by investigating the histories of the patients that each had received transfu-

sions of O cells suspended in saline solution about two weeks previously.

On another occasion the accuracy of our counting was tested with an in vitro mixture of two samples of citrated A blood and some O cells, as already described. A mixture was made of equal parts of the citrated blood from each of these two type A patients, and the total red cell and nonagglutinable cell counts made. The nonagglutinable cell count was 340,000 per cubic

Chart 3—The survival is given in percentage of the transfused cells in the recipient's circulation immediately after transfusion and at intervals in days

millimeter. This high count caused us to recall the source of these two bloods. They were from patients who had been transfused recently with type O cells and on each of which we had just completed nonagglutinable cell counts. The average of these two separate counts was 335,000 per cubic millimeter. Therefore we have demonstrated that we are not missing nonagglutinable cells in our counts, that our counts correspond to the expected number and that our error in counting is not more than 10 per cent.

Mollison has demonstrated that when fresh whole blood preserved in dextrose-citrate mixtures is transfused into individuals who do not destroy blood at a greater than normal rate, some of the cells will survive approximately one hundred days. He has found that the rate of destruction is about 1 per cent a day; when charted as percentage of survival against number of days after transfusion, a straight line will result. If blood is preserved in the refrigerator for a number of days before it is transfused, the percentage of cells which disappear in the first twenty-four to forty-eight hours will correspond approximately to the number of days the blood has been stored. For example, if blood has been stored for fourteen days one can expect that only about 86 per cent will survive during the first one or two days after transfusion. From then on the rate of disappearance will be about 1 per cent a day.<sup>7</sup> This information has been gathered from the

7. At times, however, although survival of transfused cells in the recipient's circulation will be at the expected level for one or two days, after this the cells will disappear at a greater than expected rate

figures and curves in Mollison's<sup>8</sup> and Denstedt's<sup>9</sup> publications. This has been confirmed also in this study by survival studies after transfusion of blood collected in Alsever's solution and stored up to twenty-one days before administration. Apparently this has not been recognized, as one not infrequently finds the statement that blood preserved in certain solutions for fourteen days will survive as well as fresh blood. The curves of survival which we have obtained demonstrate that centrifuged cells that have been resuspended in 10 per cent corn syrup survived at least as well after transfusion as whole blood which we collected in Alsever's solution and stored for similar periods (chart 3), and as reported by Denstedt and Mollison for blood collected in other dextrose-citrate mixtures. Survival was found to be considerably longer than whole blood collected in citrate alone and stored for the same or even shorter periods.

The survival of transfused cells that had been stored in isotonic solution of sodium chloride for from three to eight days was also followed (chart 4). It can be seen that the survival in most instances was much less than with corn syrup suspended cells, although several times the survival was very good. These results do not indicate that the transfusion of saline suspended cells has no value but merely that they are not as efficient as cells stored in 10 per cent corn syrup. Also wide clinical use has demonstrated a real benefit to patients who have received saline suspended cells intravenously. All transfused cells, regardless of the preparation used for suspension, have a double value: first, while the cells remain intact, they supply oxygen-

Chart 4—The straight line indicates the expected survival of transfused whole blood after refrigerator storage in an accepted dextrose citrate mixture for five days. The survival is given in percentage of the transfused cells in the recipient's circulation immediately after transfusion and at intervals in days. Number of days' storage, before transfusion, given in the circles

carrying capacity to the blood, and, second, when they break down, they supply to the patients' hemopoietic

9. Denstedt, O. F.; Osborne, D. E.; Stansfield, H., and Rochlin, I.: The Survival of Preserved Erythrocytes After Transfusion, Canad. M. A. J. 48: 477-486, 1943.

system degradation products which can be rapidly utilized in the elaboration of new hemoglobin.

We have also found, as have Denstedt and Mollison, that some whole bloods do not survive as long as expected after transfusion, whereas others survive longer than expected. Therefore the results with a single transfusion of blood or resuspended cells may be misleading. Only when a sufficiently large number of transfusions are followed in a series of patients will these differences of survival balance and a true average survival rate be determined.

#### SUMMARY

1. After citrated blood has been centrifuged and the plasma withdrawn, the cells which remain have been resuspended in isotonic solution of sodium chloride and have proved useful for transfusing selected patients, especially those with anemia from a variety of causes.

2. A 10 per cent solution of corn syrup in distilled water has been found to be an excellent medium for resuspending centrifuged cells. Cells stored in it remain in good physical condition longer than in isotonic solution of sodium chloride and other solutions which were tried. They remain less fragile to hypotonic saline solution and much less hemoglobin is found in the supernatant fluid.

3. Single and repeated intravenous injections of large amounts of 10 per cent corn syrup solution have proved innocuous to rabbits and to human beings.

4. Seven hundred and sixty-one transfusions of centrifuged cells resuspended in 10 per cent corn syrup have been administered with satisfactory results to 437 patients and have not produced jaundice or other deleterious effects. The nonspecific fever-chill reaction rate has corresponded in the different hospitals to that from their own bank blood.

5. These resuspended cells have been used for transfusion after storage at 5 C. for as long as twenty-one days, but for routine use an expiration interval of fourteen days has been established.

6. Using Ashby's agglutinating technic, observations have been made on the survival of these cells in a variety of patients. Similar comparative observations have been made on whole blood in citrate-dextrose mixtures and on cells suspended in isotonic solution of sodium chloride.

7. Centrifuged cells resuspended in 10 per cent corn syrup survived as well and as long in the recipient's circulation as whole blood in a dextrose-citrate mixture stored for the same length of time and longer than cells in isotonic solution of sodium chloride. When only cells are needed, the clinical results also indicate that a transfusion of centrifuged cells resuspended in 10 per cent corn syrup is as satisfactory as a transfusion of whole blood.

111 East Eightieth Street.

**Medical Lore.**—The works of two Arab or, rather, Persian physicians of the Eastern Caliphate were the fountainhead of medical lore. Al Rhazi, better known as Rhazes (860-932), was the first very great physician, and the canon of Iban Sinna, or Avicenna (980-1036), dominated European medicine for five centuries. The writings of both were available in Arabic, of course, and there were Hebrew translations. Ali al-Tabari, a Moslem convert and court physician to the Caliphs, was the teacher of Al Rhazi; the father of the convert, also a court physician, was the first to translate the *Almagest* into Arabic.—Wechsler, I. S.: *The Neurologist's Point of View*, New York, L. B. Fischer, 1945.

## PROTEIN DEFICIENCIES IN PREGNANCY

RUPERT E. ARNELL, M.D.

DANIEL W. GOLDMAN, M.D.

AND

FRANK J. BERTUCCI, M.D.

NEW ORLEANS

The term protein deficiency, the definition of which is obvious, is to be preferred to the more commonly used term hypoproteinemia for at least two reasons. In the first place the term hypoproteinemia makes no provision for the degrees of protein depletion, which are of importance even when they are not sufficiently pronounced to lower the circulating proteins to the level of hypoproteinemia. In the second place hypoproteinemia, from the standpoint of etymology, concerns only the circulating protein of the blood, which is now believed to be less important in the body economy than the protein depots in the tissues, and the reparation of which is fully as important as the reparation of the circulating protein.

The Food and Nutrition Board of the National Research Council recommends a daily allowance of at least 85 Gm. of protein during the latter half of pregnancy and regards two thirds of the optimum level as a minimum subsistence level. For the purposes of this discussion, diets which fail to meet 50 per cent of the recommended optimum daily allowance, that is, diets containing less than 42.5 Gm., are arbitrarily considered as deficient in protein content.

Two questions invariably arise whenever protein deficiencies in pregnancy are discussed. The first has to do with the incidence of such deficiencies as the result of dietary inadequacies. The second has to do with the possible effect of such deficiencies on mother and child. The present communication is chiefly an attempt to answer those two questions.

#### INCIDENCE OF PROTEIN DEFICIENCIES IN PREGNANCY

The average daily antepartum protein intake of 400 unselected patients (225 of whom have previously been the subject of report <sup>1</sup>) was estimated, and it was determined how many patients ingested diets grossly deficient in protein content. By this method a reasonably accurate determination was obtained of the incidence of protein deficiencies due to dietary inadequacies during pregnancy.

Fifty of the 400 subjects were private (white) patients; 350 were clinic patients, of whom 150 were white and 200 Negro. The distribution of material afforded the opportunity for comparative studies of diet in groups of patients who were representative from the standpoint of race, economic status and intelligence but who were otherwise unselected except that none of them presented any obvious complications of pregnancy.

The dietary data were secured, analyzed and calculated by trained nutritionists, who employed a standard

This study was made possible by the cooperation and technical assistance of the Dietary Department of the New Orleans Charity Hospital. Read before the Section on Obstetrics and Gynecology at the Ninety-Fourth Annual Session of the American Medical Association, Chicago, June 14, 1944.

From the Department of Obstetrics and Gynecology of the School of Medicine of Louisiana State University and of Charity Hospital of Louisiana at New Orleans.

1. Arnell, E. E.; Guerriero, W. F.; Goldman, D. W.; Huckleby, Eleanor, and Lutz, A. M.: Protein Malnutrition in Pregnancy, *New Orleans M. & S. J.* 95: 114-127 (Sept.) 1942.

method of procedure based on each patient's estimate of the protein included in her diet. Since data based on the intelligence, truthfulness and cooperation of patients are naturally subject to human error, the results of these estimates were checked in a control group of 20 patients who were hospitalized and were fed diets having a known protein content. When the actual was compared with the estimated intake, the mean error was found to be only  $4.1 \pm 4.0$  Gm.

As a matter of fact, no high percentage of error was expected, for protein, of all nutrients, is most readily studied by evaluation of the intake. Its metabolism is unique, and no other element of the diet can be utilized to supply it; it must be ingested as such. The sources of protein are limited and well known, so that even unintelligent patients can estimate with relative ease and accuracy the quantities ingested of the more important protein foods, such as meat, eggs and milk. The use of ration coupons for the purchase of certain protein foods has further emphasized what these foods are. Finally, computations are relatively simple because the composition of protein in the same food source varies so little.

Fig. 1.—Protein intake of 400 pregnant women compared with National Research Council standards.

When the average daily protein content of the diet of each of the 400 patients studied was estimated in grams (fig. 1), it was found that 72 patients, 18.0 per cent, had an intake of less than half of the optimum amount recommended for the latter half of pregnancy. These 72 women represented 6 per cent of the private patients (3), 14 per cent of the white clinic patients (21) and 24 per cent of the Negro clinic patients (48). When calculations were based on ideal weight rather than on total protein intake in grams, the results were much the same; 74 patients fell into the deficiency group, their daily intake of protein being less than 0.75 Gm. per kilogram of body weight, as against a desirable intake of 1.50 Gm. per kilogram.

Neither a high intelligence rating nor easy financial circumstances precluded the possibility of defective diets. The lowest protein intake, 15.5 Gm. per day, occurred in a Negro subject, but so also did the highest, 122 Gm. per day. Twenty-two per cent of private patients received the recommended daily amounts of protein, as compared with 10 per cent of white clinic patients and 6 per cent of Negro clinic patients, the average for each group being respectively 72, 58 and 49 Gm.

Since a qualitative as well as a quantitative deficiency may affect the nitrogen equilibrium of the body, it is recommended that proteins derived from animal sources constitute at least 65 per cent of the total protein intake. In this series the average for the whole group of patients was 69 per cent, which is somewhat above the recommended proportion, but for the group whose diet was deficient in proteins the average was only 57 per cent.

TABLE 1.—Dietary Rating of 400 Pregnant Women in Relation to the Average Daily Protein Intake in the Latter Half of Pregnancy

Rating	Protein, Gm.	Cases	Per Cent
Excellent.....	85 or more	38	9.5
Good.....	70 to 84	46	11.5
Fair.....	55 to 69	149	37.3
Poor.....	42.5 to 54	95	23.7
Very poor.....	Under 42.5	72	18.0

On the basis of the protein content, estimated in grams, the diets of these 400 women were classified, according to the usual arbitrary standards, as excellent, good, fair, poor and very poor. Less than 10 per cent of the 400 patients (table 1) had diets which could be classified as excellent, and almost four fifths consumed diets which were fair or less than fair in this important nutritional essential. The group described as very poor, whose daily intake was less than 42.5 Gm., which is half the recommended amount, will hereafter be termed the deficiency group.

THE RELATIONSHIP OF PROTEIN INTAKE TO CERTAIN LABORATORY AND CLINICAL DATA

It was a fairly simple matter to determine, by the methods stated, the incidence of protein deficiencies in pregnancy as the result of inadequate protein intake. To determine the possible effect of such deficiencies on mother and child was more difficult. Balance studies, the only exact method, are not practical in most cases, and two other methods were used, namely a study of the relationship of various levels of protein intake to certain laboratory and clinical data and a study of the protein consumption of a small group of selected patients who manifested evidences of protein deficiency.

Before proceeding to the results of these studies, certain facts should be emphasized:

1. While a pronounced deficiency in the protein intake can in itself readily produce a state of protein malnutrition, such a deficiency is often accelerated and amplified by other causes, all of which may be operative in pregnancy, and which include the increased requirements of the body during the latter part of pregnancy, at which period the protein requirement is from a sixth to a third more than under other circumstances; impairment of digestion, absorption or utilization of ingested protein and excessive loss of ingested protein because of vomiting, catharsis, diarrhea or proteinuria. In evaluating the results presented, it should be borne in mind that our studies have to do only with dietary factors and that an analysis of other factors might reveal deficiencies more numerous and of greater degree.
2. The processes of absorption and utilization of ingested protein vary in different individuals. Furthermore, as we and others have demonstrated, the utilization of protein within the body tends to be more complete when the intake is low than when it is normal or high.
3. The response of the protein reserve in the tissues to the increased demands of pregnancy is variable. A

high reserve can compensate for a deficient intake, but a depleted reserve cannot. At present there is no method of determining the protein content of the tissues, and we must depend on such indirect evidence as is supplied by the fate of the protein ingested. Protein which does not enter the circulation and is not excreted is presumed to be utilized in the building up of protein depots in the tissues. On the basis of such evidence the ratio of tissue proteins to circulating proteins has been estimated as approximately 30:1. If this estimate is correct, any decrease of plasma proteins implies a depletion of tissue proteins many times greater.

4. Racial differences play a part, the Negro, generally speaking, being more resistant to dietary deficiencies than is the white subject.

5. It does not necessarily follow that abnormalities which may be present in patients with deficiencies in their protein intake are due to those deficiencies.

6. The results which follow inadequate protein nutrition are neither so characteristic nor so dramatic as those which follow other types of malnutrition. Subclinical protein malnutrition, although exceedingly common, usually causes little more than a slow and insidious wasting away of all the tissues, with associated weakness and general ill health. A demonstrable hypoproteinemia may develop and edema may ensue, but subclinical effects are far more common. The proper evaluation of these various considerations will make clear that close correlation between the protein content of the diet and alterations in the composition of the blood cannot be expected and that a close correlation also cannot be expected between the protein factor and obstetric complications and conditions. The warning should also be given that, regardless of the implications of the results of these studies, the number of cases in each category is too small to warrant definite conclusions.

**Laboratory Data.**—A significant relationship (table 2) was usually found to exist between the serum protein concentration of the blood at term and the protein content of the diet during the latter half of pregnancy. The average concentration was lowest in the deficiency group of patients. Direct correlation of individual diets and individual serum protein concentrations was, how-

ever, impossible, and several high individual levels, including the highest concentration found (8.8 Gm. per hundred cubic centimeters) occurred in the deficiency group. The albumin-globulin ratios remained practically the same for all groups. It was interesting to observe that so-called idiopathic edema of demonstrable degree occurred in the deficiency group with a frequency (40 per cent) approximately four times greater than in the group whose daily protein intake was 70 Gm. or more.

Although the total amount of circulating protein can be estimated by the determination of plasma volume by the dye method, the technic is difficult and it is not practical to repeat the test frequently in the same patient. Trends, however, can be determined by serial serum protein and cell volume determinations, the latter of which reveal the effects of hydremia and hemoconcentration.

The mean hemoglobin of the deficiency group, 8.3 Gm. per hundred cubic centimeters, was 26 per cent lower than that of the group whose protein intake was excellent (11.1 Gm. per hundred cubic centimeters). A direct correlation between individual diets and individual hemoglobin values was not possible, but it is of interest that 6 patients in the deficiency group had hemoglobin values of more than 12 Gm. per hundred cubic centimeters.

We are prone to forget that hemoglobin contains protein as well as iron and that deficiencies in either or both can cause anemia. It is true that the principal food sources of iron and protein are similar, but the components vary considerably in different foods. If a protein deficiency exists, the administration of iron will be without effect on the anemia until the protein deficiency also is corrected.

**Clinical Data.**—There was neither group nor individual correlation (table 3) between the various levels of protein intake in the last half of pregnancy and the duration of pregnancy. Women with average intakes of less than 55 Gm. daily actually carried their babies slightly longer than those with intakes above 69 Gm.

There was neither group nor individual correlation (table 3) between the dietary intake of protein and the duration of labor, though patients whose intake was excellent had on the average the shortest labors. Protein deficiency is known to lead to poor muscular tone, but this was not evident in our series.

The storage of nitrogen in the latter half of pregnancy, which depends on a sufficient intake of protein, is considered essential for adequate lactation. The onset of lactation in these 400 patients averaged 2.5 days after labor, but no correlation was evident between the protein intake of the various groups and the percentage of women nursing their children when observations were made at periods varying from five weeks to six months. In fact, willingness rather than any inherent ability or lack of ability on the part of the mother seemed the factor which determined whether or not the babies were breast fed. For obvious reasons the incidence of breast fed children was highest in the free services.

Considerable evidence points to a close relationship between protein metabolism and the specific toxemias of pregnancy, and our own experience is to the effect that

the patient who consumes adequate protein is not only less likely to develop toxemia but is also far more amenable to therapy if it should develop. These statements of course should not be interpreted as meaning that we consider protein malnutrition as the primary or the only factor in the causation of preeclampsia and eclampsia or that we believe that a diet adequate in protein content will of itself prevent or cure that condition. Our own evidence, however, proves the unwisdom of the habit, formerly general and still practiced in some quarters, of restricting meat and eggs in the diet of the pregnant woman in the belief that protein foods are one of the causes of toxemia. There was no instance of eclampsia in this series, but it is significant (table 3) that the highest incidence of preeclampsia was in the deficiency group.

A dietary investigation which we carried out in 62 cases of eclampsia suggests that protein deficiencies may be of etiologic significance in this condition and still further discredits the concept that high protein consumption is a cause of eclampsia and that limitation of protein intake may prevent it. Not 1 of the 62 patients had an optimum protein intake, and only 3 had a daily intake for the last trimester of pregnancy above the actual deficiency level, the range being 14 to 64 Gm. per day. In many instances dietary inadequacies which had existed over long periods of time were further aggravated during pregnancy by restriction of meat, eggs and milk, either self imposed or carried out on medical advice. Protein deficits were also increased by such obvious causes as proteinuria, vomiting and catharsis.

Serum protein determinations in 47 cases during the eclamptic stage showed, in spite of hemoconcentration at the time, an average concentration of  $5.1 \pm 1.10$  Gm. per hundred cubic centimeters, which is definitely lower than the normal average. A rough correlation existed between the degree of edema and the serum albumin concentration, but otherwise it was not possible to correlate the protein intake with either the serum protein concentration or the degree of edema.

Subclinical nutritional deficiencies are of importance during pregnancy not only because they may culminate in actual deficiency disease but also because they lower the general as well as the specific resistance of the patient. Pregnancy and parturition, even when normal, place heavy strains on a woman, and the strain is many times increased by the development of complications and abnormalities and by the traumatic effects of operative delivery. The prognosis in such circumstances is often largely dependent on the nutritional status of the patient.

The proteins are of great importance in the chemical defense of the body against bacterial invasion. Recent investigations in acquired immunity suggest that antibody production is a phase of protein metabolism and that a protein deficiency will in time impair the maturation or preservation of the antibody mechanism, leading to loss of acquired immunity and increased susceptibility to infection. The same reasoning seems to hold for the production of toxins, antitoxins and antigens.

Our figures support the assumption that, in the past, too much attention has been focused on obstetric complications and abnormalities as causes of maternal and fetal mortality, and too little attention paid to the general nutrition of the patient. There was no maternal mortality in this series (table 3), but a significant relationship was found to exist between the maternal

morbidity and the protein content of the maternal diet, the morbidity in the deficiency group being five times that in the excellent group. While factors other than protein deficiency may perhaps furnish part of the explanation for these phenomena, it should be emphasized that the background, so to speak, was the same for all groups, in that they were managed by the same general plan, by the same physicians and with a similar incidence of operative delivery.

Fetal mortality, including stillbirths and neonatal deaths, also bore a significant relationship to the maternal protein intake, though among babies who survived the general pediatric rating was essentially the same for all groups.

The average maternal gain in weight during pregnancy was greatest in the deficiency group (table 3). Some of the added weight can perhaps be explained by edema, but an analysis of the patients' food charts revealed a tendency, when the protein intake was low, toward high ingestion of carbohydrate and fat. It is reasonable to assume that protein foods satisfy appetites earlier than other varieties and therefore make one content with fewer calories. In this respect we have found diets high in protein of value for the restriction and reduction of weight during pregnancy.

The average fetal weight at birth was approximately the same in all groups, which supports the assumption that the fetus in utero is a true parasite, drawing nutrients from the mother, even to her detriment when this is necessary in the fetal interest. It also supports the assumption that at present no method is known by which the child's birth weight can be controlled by dietary means.

#### MASSIVE NUTRITIONAL EDEMA IN PREGNANCY: ANALYSIS OF CASES

Because subclinical protein deficiency is common but clinical deficiency unusual, we are presenting herewith a detailed study of 11 patients admitted to the hospital in the last trimester of pregnancy (8 of whom have already been the subject of report<sup>2</sup>) because of massive edema of obscure etiology. The tentative diagnoses on admission included toxemia in 6 cases, heart disease in 3 and nephrosis and anemia in 1 each. Further investigation showed the edema in all 11 cases to be due to a basic protein deficiency.

In order to exclude questionable or borderline cases from this category, the criteria by which these cases were selected were made deliberately high. They included:

1. Absence of the usual conditions responsible for edema in pregnancy, such as cardiac or renal disease, toxemias of pregnancy and mechanical or inflammatory factors.
2. The presence of an obvious deeply pitting edema of the lower extremities and the vulva.
3. A minimum loss of weight of 7 Kg. (15 pounds) from the beginning of treatment to the date of delivery. This loss, although selected arbitrarily, was made deliberately high to avoid the criticism that it might have been due to other factors than the loss of water. It should be noted that no allowance was made in our calculations for the gain in weight normally expected late in pregnancy and that the loss of weight was therefore always greater than it seemed.

*Age, Race, Parity and Stage of Gestation.*—The age range of these 11 patients, 8 of whom were white and 3 Negro, was from 25 to 42 years, and the average was 34 years. All were multiparas, the parity ranging from three to eleven pregnancies. Observations on this and

2. Arnell, R. E., and Guerriero, W. F.: Nutritional Edema in Pregnancy, with an Analysis of 8 Severe Cases, *Am. J. Obst. & Gynec.* 43: 467-483 (March) 1942.

other groups of patients leave no doubt that the tendency to protein malnutrition is more likely to develop in older women and that it is increased by the strain of repeated pregnancies in rapid succession.

All 11 patients were in the last trimester of pregnancy when the edema was first observed, the duration ranging from twenty-nine to thirty-eight weeks and

averaging thirty-four weeks. It is logical that nutritional disturbances should appear at this time, since both maternal and fetal requirements are highest in the final trimester of pregnancy.

**Clinical Data.**—Edema was the only subjective or objective finding common to all cases. It had been present in mild degree for several weeks in all the patients, but the massive degree appeared suddenly. Although it involved the lower extremities and trunk and in some instances the upper extremities and face also, it was usually the edema about the vulva of which the patients chiefly complained. None of them, contrary to the experience of others who have studied hypoproteinemia, developed either ascites or pulmonary edema, though some consider the lungs to be the site of predilection in this type of edema.

\* In grams per hundred cubic centimeters, 14.7 Gm. per cent hemo globin = 100%

† In millions

‡ In grams per kilogram of body weight daily

Weakness and dyspnea, although frequently observed, were not present uniformly, their appearance seeming to depend on the degree of edema. In 2 instances the blood pressure was slightly elevated, to 150/90 and 148/85 respectively, and all the patients had rapid pulse rates when they were first seen. Both the hypertension and the elevation of the pulse rate promptly disappeared after several hours of rest in bed and could reasonably be attributed to the effects of depen-

dency and physical activity as well as to the increased effort required to move the swollen extremities.

**Laboratory Data.**—All laboratory investigations except those which concerned certain elements of the blood were essentially negative. In 2 instances there was a transient heavy trace of albumin, but otherwise all urinalyses were negative. Hypoacidity was noted in 2 of the 6 cases in which gastric analyses were made. The Quick hippuric acid test, carried out in 4 cases, revealed no evidence of hepatic dysfunction. Roentgenologic examination of the chest and heart, and electrocardiographic examinations revealed no significant findings, and examinations of the eyegrounds were uniformly negative. The results of determinations of the urea nitrogen, nonprotein nitrogen, sugar, chlorides, cholesterol, pyruvates and carbon dioxide combining power of the blood were all within normal range for the stage of pregnancy.

Fig. 2.—Massive edema of the vulva in a case of nutritional edema in pregnancy before treatment

Anemia was present in 10 instances, being of the hyperchromic variety in 2 and of the hypochromic variety in the remainder. We have demonstrated by therapeutic test that the anemia per se was not responsible for the edema.

The serum protein concentration of the blood was low in all 11 cases (table 4), the principal decrease being in the albumin fraction. Calculations of the colloid osmotic pressure of the serum protein gave values in all cases well below the levels at which edema would be expected to appear, that is, whenever the colloid osmotic pressure of the serum proteins is less than 20 cm. of water. At this level the serum protein concentration is usually less than 5.5 Gm. per hundred cubic centimeters and the serum albumin concentration is usually less than 2.5 Gm. per hundred cubic centimeters.

**Dietary Deficiencies.**—Investigation of the diets of these 11 patients revealed pronounced deficiencies in

protein content (table 5). Not 1 had an optimum intake of protein, and only 1 had an intake above the minimum subsistence level for the last trimester of pregnancy. The highest daily intake was 0.9 Gm., the lowest 0.24, and the mean 0.48 Gm. per kilogram of body weight daily. Approximately a third of the total protein intake was derived from cereal and vegetable

Fig. 3—Same case after treatment

sources, which are of low biologic value, and in every instance the protein deficit had existed over a long period. In addition to the dietary protein deficiency, the hypoproteinemia was aggravated in 7 of the 11 cases (table 5) by conditions which resulted in either inadequate utilization or actual loss of the protein ingested.

**Diagnosis.**—Diagnostic difficulties are to be expected in a condition in which symptomatology and gross findings, as well as certain laboratory findings, simulate those of other diseases. The errors in diagnosis on admission of these patients, which have already been listed, are proof of the possible confusion.

It is perfectly possible, furthermore, for nutritional edema to coexist with other diseases and conditions, such as vomiting or diarrhea from any cause, hookworm disease, amebiasis, cardiac or cardiorenal disease, and even the various toxemias of pregnancy. Edema is a clinical manifestation of many of these states, but it may be aggravated or made intractable by an associated nutritional factor, which should always be considered as a possibility in pregnancy, particularly when there is an inadequate response or no response to the therapy of the special disease. In our experience swelling of the vulva, such as was apparent in these 11 cases, is unusual in obstetric patients unless it is associated with acute nephritis or the nephrotic syndrome, both of which can readily be excluded. This observation may be of diagnostic aid (figs. 2 and 3).

**Therapy and Results.**—All 11 patients were treated according to the following plan:

1. Complete bed rest was instituted at once, with, as already noted, general improvement within a few hours.
2. Intravenous infusions of dextrose solution were given for their nutritive value, their diuretic effect and their effect on the liver.
3. Vitamins B<sub>1</sub> and C were administered parenterally, on the empiric basis of possible deficiencies in these accessory dietary factors, although such deficiencies have not been demonstrated in nutritional edema.
4. Puncture of the swollen labia, under strict aseptic precautions, was carried out in several cases in which swelling about the vulva was a source of great discomfort.
5. A high protein diet was instituted for all patients who did not have digestive disturbances which contraindicated oral feeding.
6. Since such extreme deficiencies as were present in this group of cases cannot be corrected entirely, or even chiefly, by oral feeding, supplemental measures were instituted to repair the protein deficiency.

The most important of these supplemental measures was transfusion of whole blood or of plasma. Whole blood is more desirable when treatment is first instituted, because of the anemia frequently associated with hypoproteinemia. After the anemia is corrected, plasma is more desirable, partly because there is no purpose to overloading the circulation with unneeded red blood cells and partly because a given amount of plasma contains a much larger quantity of protein than does a similar amount of whole blood. Each of the 11 patients received an average of four transfusions given in large quantities, at fairly close intervals and totaling 2,000 cc.

Amino acids were used in 3 cases in this series, and the good results duplicated the results we have achieved with the same preparation in 12 other cases, not included in this series, chiefly instances of toxemia. We have had no experience with serum albumin transfusion.

Fig. 4—Typical response in weight loss, polyuria, increased serum protein concentration and hemoglobin value, following repeated whole blood transfusions in nutritional edema. The loss of weight represents a loss of edema fluid

In our experience the serum protein of the blood is best raised:

1. By repeated blood transfusion.
2. By blood transfusion supplemented by amino acids.
3. By plasma transfusion supplemented by amino acids.
4. By plasma transfusion.
5. By amino acids.

Elevations of as much as 0.5 Gm. of plasma protein were observed following a single transfusion of 500 cc.

of whole blood, but the improvement was not maintained unless additional transfusions were given with reasonable promptness (fig. 4). The effectiveness of amino acids in increasing the plasma protein concentration of the blood is evidence that the mechanism of the synthesis of protein is not at fault, as these acids must be converted to plasma protein within the body. When blood or plasma is used, naturally no proof of the integrity of this mechanism exists, since these fluids furnish direct substitutes for the deficient elements.

The clinical improvement which followed even small elevations of the serum protein concentration in these cases is added proof that there is no critical level at which edema appears or disappears. Clinical observation suggests that when the vicious cycle which produces edema is interrupted by raising the plasma protein concentration and thus increasing the plasma colloid osmotic pressure, a polyuria is produced, which usually continues until the water balance is restored and edema has completely disappeared.

The average duration of treatment in these 11 cases was fifteen days, and the average loss of weight 9 Kg. (20 pounds), the range being from 7.4 to 19 Kg. The average serum protein concentration at delivery was 6.9 Gm. per hundred cubic centimeters as compared with 4.01 Gm. per hundred cubic centimeter on admission; the range was from 5.8 to 7.5 Gm. per hundred cubic centimeters. The average hemoglobin at delivery was 10.4 Gm. per hundred cubic centimeters as compared with 7.9 Gm. per hundred cubic centimeters on admission, and the average red blood cell count was 3,700,000 per cubic millimeter as compared with 2,840,000 per cubic millimeter on admission. Pitting edema had disappeared in all cases prior to delivery.

There were no maternal or fetal deaths, and the children did not present abnormalities of any sort. The fetal values for serum protein and other blood elements were within normal range, and the average weight at birth was 3,674 Gm. ( $8\frac{1}{10}$  pounds), which seems, incidentally, to dispose of the idea that a low protein intake results in small babies.

*Follow-Up.*—The edema which brought these 11 patients to the hospital has not reappeared in the periods from six months to five years during which they have been followed up. Two of the group have been observed in subsequent pregnancies, both of which were normal in all respects.

#### SUMMARY

1. Although demonstrable degrees of protein deficiency are not common, subclinical deficiency is frequent.

2. A study of the incidence of this deficiency, based on the dietary intake of 400 unselected pregnant women, showed that 18 per cent had a protein intake less than half of the optimum recommended for the latter half of pregnancy and that almost 80 per cent consumed diets which were classified as fair or less than fair.

3. A study of the possible relationship of deficiencies in protein intake to certain laboratory and clinical data resulted in much less exact conclusions than a study of the incidence of protein deficiencies. In general, a significant relationship was found to exist between the protein content of the diet and the serum protein concentration and hemoglobin content of the blood, the average values being lowest in the deficiency group. These studies suggest that protein deficiencies may be of etiologic significance in eclampsia and preeclampsia and may increase the maternal morbidity and the fetal mortality. The birth weight is apparently not affected.

4. In 11 cases of massive nutritional edema in pregnancy complete recovery ensued on a regimen the basic principle of which was reparation of the protein deficiency.

#### ABSTRACT OF DISCUSSION

DR. PHILIP F. WILLIAMS, Philadelphia: Some years ago I made a survey of the food intakes of 514 pregnant women in the antepartum clinics of different hospitals and from private practice in Philadelphia. The large proportion of the women were ingesting lower than the commonly accepted standards of the National Research Council on the amount of protein which a pregnant woman should take per day, namely 85 Gm. We worked out the percentage distribution of protein intake by gram of protein per kilogram of body weight, which is presumably the proper way to figure out the protein intake for a person, and in the group in which 86 per cent of the patients received less than 85 Gm. of protein per day we found that 92 per cent of the series received less than the estimated requirement of 1.5 Gm. of protein per kilogram. No woman in the group received anything like the figure Dr. White suggested for a diabetic woman, namely 2 Gm. We found that almost 50 per cent of the women were eating less than 1 Gm. of protein per kilogram of body weight. At the time I made this survey of the food intakes we watched the women carefully for evidences of toxemia, labeling such cases as toxemic if they had any degree of albuminuria, hypertension or edema. Consequently I was interested in Dr. Arnell's and Dr. Goldman's presentation sometime ago in their original paper on this subject of the universal pitting edema that the women in their series had on this low protein intake. I found no such case of that nature in this series. There were 60 cases of toxemia of late pregnancy, but I was unable to make any positive correlation at all between the intake of protein and the incidence or the degree of severity of the toxemias, because the majority of women in the toxemic group were receiving on an average just the same protein intake as the women in the control or normal group were receiving. There is no time in the life of a person when we can get more good educational work over than in the period of a woman's pregnancy, and it is important then because not only does it influence her pregnancy and health and that of her unborn child but the educational features remain with her for the benefit of her family and others all her life.

DR. WILFRED N. SISK, Asheville, N. C.: Some people, particularly those in the lower economic groups, have a peculiar idea as to what constitutes a satisfactory diet. Their diet is extremely poor in protein and extremely high in salt; their diet is also poor in vitamins. I think that the poor vitamins and protein in their diet are made worse by the commercial preparation of foods. In public health departments such as I run we are interested in diet not only during pregnancy but during all times of life, but, as Dr. Williams just stated, pregnancy is a time when there is a considerable strain on the body of the patient, and this is the best time to give instruction in diet. There is one practical point in the instruction of the patient which I feel many of us overlook. It is important to consider what the patient can or will buy and consume. Many of my colleagues in Asheville have a tendency to give a patient instructions and sometimes don't know enough about his home life to realize that he is not likely to follow them. Particularly is this true of the Negro patients. They will listen and give you "Yassah, yassah, Ah'll be glad to do that" and then go home and do absolutely nothing that you have told them.

DR. RUPERT E. ARNELL, New Orleans: Adequate antepartum care should include a careful dietary survey early in pregnancy, with particular attention to protein, minerals and vitamins and prompt correction of any defect or deficiency which might exist. At the Charity Hospital in New Orleans the efforts of the dietary department in giving diet instruction by means of mothers' classes and individual consultations to some 5,000 pregnant women each year have proved of inestimable value. By bearing a few basic facts in mind any competent physician can give effective instruction and advice on diet and nutrition. The physician, the dietitian, the scientist must accept the responsibility for disseminating the gospel of good nutrition; it must not be relinquished to the politician or the business concern.

# THE CLINICAL USE OF PENICILLIN

IN THE TREATMENT OF INTRINSIC  
BRONCHIAL ASTHMA

MAJOR STANLEY F. HAMPTON

Since penicillin was originally advocated as a chemotherapeutic agent by Chain and his associates,<sup>1</sup> reports have appeared in the literature on its efficacy in certain infectious diseases. Its clinical use has been reviewed by Lyons,<sup>2</sup> and more recently by Dawson and Hobby,<sup>3</sup> Herrell<sup>4</sup> and Bloomfield, Rantz and Kirby,<sup>5</sup> although no report has previously been made on its use in the treatment of bronchial asthma.

The high incidence of intrinsic bronchial asthma, occurring in the young age group at this A. A. F. Regional Hospital,<sup>6</sup> led to a search for newer methods of treatment.

Nine patients with intrinsic bronchial asthma were treated with penicillin. All cases were observed a minimum of four weeks before and four weeks after treatment. All cases were considered to be of moderate or severe degree in that they required emergency therapeutic measures daily (epinephrine subcutaneously or aminophylline intravenously). Seven of the patients were "lifelong asthmatics," whereas 2 were cases of short duration, approximately three months. All cases showed physical signs (sibilant and sonorous sounds on auscultation) constantly day and night. Eight of the patients were between 19 and 26 years of age; one patient was 43.

6. Hampton, S. F., and Rand, Harold: The Problem of Allergy at an A. A. F. Regional Hospital: I. Respiratory Allergy (Hay Fever, Vasomotor Rhinitis, and Bronchial Asthma), *J. Allergy* 15: 355 (Sept.) 1944.

All 9 patients were tested intracutaneously with extracts of common pollens, inhalants and foods. Eight of the 9 reacted positively with wheal and pseudopod formation to tests with extracts of pollen, house dust or air borne molds. One patient was entirely negative by skin tests. There was no evidence of food sensitivity in any case. Elimination and injection therapy with skin reacting inhalant allergens had previously failed to alter the asthmatic state of any of the patients.

It was assumed that the etiology in these cases was probably a primary bronchial infection (bacterial allergy) and for that reason treatment with penicillin was instituted.

## THERAPY

Five patients received continuous therapy of a total of 500,000, 1 patient 800,000 and 1 patient 1,300,000 Oxford units intramuscularly. Eighty thousand to 100,000 units was administered each twenty-four hour period at four hour intervals.

At a later date the 7 patients having previously received intramuscular penicillin and 2 additional patients (duration of asthma being three months) were treated with penicillin intratracheally by means of a pressure spray and a curved cannula extending to the base of the protruded tongue. Eight of these patients

received a total of 500,000 units, 1 receiving only 180,000 units because of the precipitation of asthma at the time of each administration of penicillin.

## BACTERIOLOGY

Bacteriologic studies of sputums and of throat and nasal secretions were carried out in all 9 cases. There was no noticeable difference in the cultural growths from any of the three sources of material. Two to 6 sputum specimens from each patient were cultured before and after treatment. The patients exhibited a predominance of four types of organisms: non group A beta hemolytic streptococcus, alpha streptococcus, gamma streptococcus and pneumococcus. There was no attempt made to group the beta hemolytic streptococci other than to classify them with group A serum. The serum for the other eight groups not being available. The method used in attempting to group them was the capillary precipitation technic as described by Swift, Wilson and Lancefield.<sup>7</sup> Pneumococcus was established by the bile solubility test.

Four of the 9 patients presented non group A beta hemolytic streptococcus before administration of penicillin. Only 1 presented this organism after administration. All 9 presented alpha streptococcus before

7. Swift, H. F.; Wilson, A. T., and Lancefield, R. G.: Typing Group A Hemolytic Streptococci by M Precipitation Reactions in Capillary Pipets.

treatment and 8 of them presented the same picture after treatment. Six presented gamma streptococcus before treatment and 5 after treatment. Pneumococcus was found in 8 patients prior to their treatment and could be identified in 4 after treatment.

The normal incidence of beta hemolytic streptococcus at the time this study was started was somewhat higher than at the conclusion. This may account for the decreased incidence of beta hemolytic streptococcus in subsequent cultures.

#### VITAL CAPACITY STUDIES

Spirographic tracings and vital capacity determinations were performed on each patient by means of a spirometer and kymograph before and after penicillin therapy. Recordings were made before and thirty minutes after epinephrine was administered subcutaneously. An increase of 500 cc. or more in the average vital capacity was noted in 4 of the 9 cases. There were no specific observations to be made in the vital capacity studies before and after epinephrine except that the vital capacity after epinephrine was greater in 5 of the 9 cases following penicillin therapy, as shown in the table.

#### BRONCHOSCOPIC STUDIES

Bronchoscopies were performed on 6 of the 9 patients and all 6 showed signs of bronchitis, subacute or chronic, as manifested by a reddened bronchial mucosa and a significant amount of mucus that contained numerous polymorphonuclear leukocytes as well as eosinophils. Bronchoscopies were repeated on 2 of the 6 patients approximately two weeks after penicillin intramuscularly and intratracheally and the findings were essentially unchanged.

#### PENICILLIN ALLERGY

All patients were given cutaneous tests with the freshly dissolved penicillin before and after treatment. Whereas the concentrated solution was slightly irritating to the skin of some patients, all reacted negatively with 1:100 and 1:10 dilutions. One patient in whom an exacerbation of asthma occurred during the course of intramuscular penicillin had a transitory positive skin reaction in a 1:100 dilution after treatment. This patient reacted positively to test with an extract of *Penicillium* mold as well. A specific skin sensitivity to penicillin could not be demonstrated by passive transfer tests (Prausnitz-Küstner reaction<sup>8</sup>).

#### CONCLUSIONS

There was slight clinical improvement in 4 of the 9 cases of intrinsic bronchial asthma treated with penicillin, as evidenced by the occurrence of fewer and less intense symptoms and physical signs requiring emergency measures and by the vital capacity studies. It was our opinion, however, that penicillin administered intramuscularly or intratracheally in the dosages used in this study was of little or no value and that penicillin offers no advantage over other types of therapy in the treatment of intrinsic bronchial asthma.

**Fiji Island Hospital Facilities.**—All the hospitals in Fiji are owned or controlled by the government. In 1938 there were four well equipped general hospitals, sixteen provincial hospitals and a chain of thirty-one dispensaries throughout the islands. The medical services in Fiji are almost exclusively rendered by government physicians. Valuable medical service is rendered to the native population by the native Fiji medical practitioners.—Simmons, James S.: *Global Epidemiology*, Philadelphia, J. P. Lippincott Company, 1944.

## THE MECHANISM AND MANAGEMENT OF SURGICAL SHOCK

DALLAS B. PHEMISTER, M.D.  
CHICAGO

Surgical shock is the term commonly used to denote the acute embarrassment or failure of the circulation which arises as a result of bodily injury, whether produced intentionally, in combat and in surgical operations, or unintentionally in accidents of civil life.

There has been a great deal of debate about the mechanism of production of shock and about the relative role of various factors which may help in bringing it about, but in recent years it has been established primarily by the surgeons that the overwhelmingly important cause of surgical shock in man in good general condition prior to injury or operation is local loss of whole blood or plasma, or a combination of the two, from the circulation, thereby reducing the circulatory blood volume. If this reduction is sufficiently pronounced and prolonged, the blood pressure drops to a low level, anoxia develops, the tissues are damaged, there is generalized impairment of body function, and a continuation of such a state results in complete failure of the circulation and death.

The loss of whole blood is by far of the greatest importance, since it is the main cause of shock in operations and in most injuries which open blood vessels. The loss may be to the outside, into the body cavities or into the tissues. Plasma may be lost both to the outside and into the tissues in burns, into the tissues only after prolonged use of tourniquet and into the peritoneal cavity, as in case of strangulation of a loop of intestine by an adhesive band or of mesenteric thrombosis. Blood and plasma in varied proportions may be lost into traumatized tissue, as in limbs hammered for the production of experimental shock or limbs crushed and compressed by falling objects in air raid casualties or in accidents of civil life.

It is still a very common error in both operations and injuries to overlook the local fluid loss or to underestimate the amount of it and to neglect transfusion while groping about in the dark in search of another cause for shock. It should be remembered in blood examinations made for the detection of shock that the loss of whole blood most frequently causes blood dilution, although concentration is common, especially in the later stages. Plasma loss causes blood concentration. Loss of a mixture of blood and plasma may cause little or no change in red count, hemoglobin or hematocrit findings.

Proof that the big cause of shock is local loss of fluid is furnished by the outstanding success obtained by its treatment with transfusions. What is said here deals more specifically with civil practice than with military practice, but the rules for the two are pretty much the same. Wherever possible the treatment should be by transfusion of whatever substance has been lost from the circulation and in approximately the amount that has been lost. When blood has been lost give blood, when plasma has been lost give plasma, and when both have been lost give blood and plasma.

In emergencies when plasma is available give it while provisions are being made for giving blood. If neither blood nor plasma is available, use the next

Read in a panel discussion on "Plasma and Blood Substitutes" in the General Scientific Meetings at the Ninety-Fourth Annual Session of the American Medical Association, Chicago, June 13, 1944.

best available solution such as gelatin, saline solution or glucose.

As a rule, no operation should be done in injury cases or in internal hemorrhage from disease, as bleeding ulcers or ruptured tubal pregnancy, until the shock has responded, at least to a considerable extent, to transfusion treatment. In nonemergent surgical operations it is possible today to use blood and to a lesser extent plasma along with good hemostasis and good operative technic in such a way that shock is almost eliminated from the list of complications. For this purpose a blood bank is an extremely desirable requirement, although it is not an absolute one.

Preoperatively the correction of anemia and hypoproteinemia by transfusion will reduce the tendency to shock. During operation blood should be given as blood is lost and in amounts equal to the blood loss, whether it be 500 cc. or 5,000 cc. Hence a close track should be kept of the amount of blood lost, and the weighing of the used blood-soaked sponges at intervals during the operation may be helpful for this purpose. With adequate transfusion before, during and after operation and with modern anesthesia, operations of great magnitude, such as pneumonectomy, partial pancreatectomy and duodenectomy for cancer of the head of the pancreas, complicated and multiple abdominal reactions, transthoracic resection of esophagus and stomach and massive resection and transplantation of bone are now being done successfully which were impossible before, and persons severely injured and burned are being saved who almost invariably died before. Adams and his associates<sup>1</sup> have shown that the danger of poisoning from massive transfusion of citrated blood is extremely slight with the usual method of administration clinically, since the 'citrate concentration almost never reaches toxic levels.

Plasma finds its main fields of usefulness as a substitute for blood in cases of shock due to hemorrhage when blood is not available and in the treatment of burns. It seems only reasonable to give blood instead of plasma when blood is being lost, as during an operation.

The theory that toxins form in the crushed tissues which cause shock arose during the first world war mainly because the investigators of that day either missed or underestimated the importance of the fact that both clinically and experimentally there is a local loss of blood externally or of blood and plasma at the seat of trauma which is usually sufficient to account for the picture; also that plasma in amounts sufficient to cause shock is lost into a limb after release of a tourniquet that has been on too long, as first demonstrated experimentally by Wilson and Roome.<sup>2</sup>

Since the observation of these facts the toxic theory has enjoyed less favor, but the crush syndrome observed in this war has presented evidence that a toxic factor may play some role in shock production, although some investigators, both English and American, stress the fact that the fall in blood pressure following release of the crushed extremity is due principally to the loss of plasma and blood into the field. A very serious objection to the toxic theory is that, since blood and plasma have been used in such very large amounts, enormously traumatizing operations have been performed which according to the theory

should create toxins, but the patients have tolerated them without developing shock.

There has always been a tendency to regard shock as a nervous reaction or as brought about somehow through the nervous system. This is due in part to the fact that a purely psychic reaction, as one resulting from the sight of blood or from pain, may cause the passage of depressor impulses from the brain to the cardiac and vasomotor centers in the medulla and lower the blood pressure so much that fainting occurs. But the fainting or syncope reaction is short lived and never lasts long enough to cause shock per se. Unless there is an associated blood loss which also lowers the blood pressure, the reaction wears off in the course of a few minutes to a half hour, without consequence, and the effect is rather to alarm the friends or the doctor than to harm the patient. No one with an otherwise intact circulation ever dies or is seriously affected from syncope.

The view has been prevalent that so-called nociceptive nerve impulses may come from the damaged field and cause shock by acting on the cerebrum and vasomotor centers in the medulla in such fashion as to induce circulatory embarrassment or failure. Those who have supported the theory of nociceptive impulses have variously explained the method of action. Cannon advanced the theory that they cause overactivity of the sympathoadrenal system and vasoconstriction, but it has failed to find any support clinically. Freeman,<sup>3</sup> who reported experimental evidence in favor of the theory, has recently disavowed it clinically, and Schafer<sup>4</sup> has been unable to substantiate it either clinically or experimentally.

Swingle and his associates<sup>5</sup> in a recent article claimed that in limb trauma experiments on dogs nociceptive impulses produce shock because it could be prevented by prolonged spinal anesthesia, thereby blocking the impulses. No statement was made as to whether the impulses have a pressor or a depressor effect on the vasomotor system. But they did not estimate the amount of fluid lost into the hammered limbs, and they hammered the limbs after giving spinal anesthesia, at a time when it had lowered the blood pressure to an average of 75 mm. of mercury, which in itself materially reduces the amount of blood lost into the limb. If a limb is hammered with the blood pressure at 150 mm. of mercury and vessels are torn, there should be more blood lost into the tissues than if the blood pressure is 60 or 75 mm. of mercury from spinal anesthesia at the time of the hammering, as shown by comparing its weight with that of the opposite limb; also closure of bleeding points occurs more rapidly while the pressure is low, which lessens the amount of hemorrhage from the damaged vessels after the spinal anesthetic wears off and the blood pressure rises.

Two months later the same authors<sup>6</sup> reported that section of the spinal cord at the level of the last thoracic vertebra, or of all the nerves to the hammered limbs, did not eliminate shock, which by the same token should also eliminate the nociceptive theory from consideration in shock due to extremity wound.

Laestar and I recently made comparative limb volume studies after traumatization under ether anesthesia of the right hind limb (1) of normal dogs, (2) of dogs

under spinal anesthesia which lowered the blood pressure to 50-80 mm. of mercury and (3) of dogs whose right iliac and profunda arteries were first ligated, lowering the blood pressure of the limb to shock levels but leaving its nervous pathways intact.

In group 1 twenty hammer blows per kilogram of body weight produced shock and death in an average

Fig. 1.—Strong stimulation of sciatic nerve of anesthetized dog for six hours without production of fall in blood pressure and shock.

of three hours, and the blood and plasma loss into the traumatized side was equal to 47 per cent of the estimated blood volume. In group 2 twenty-two to twenty-five similar blows per kilogram of body weight failed to produce shock, and the animals that were not killed until the following day had recovered except for the traumatized limb. Animals which were kept under spinal anesthesia from one to four hours after the hammering and then killed within the next one and one-half hours showed a local loss of fluid in the limb equal to about one half of that found in group 1.

In group 3 twenty-five similar blows per kilogram of body weight also failed to produce shock, and the animals which were not killed until the following day had recovered likewise. Others which were killed one to two hours after the hammering showed local fluid loss into the limb of less than 50 per cent of the estimated blood volume.

From these experiments it may be concluded that the animals in group 2 were protected from shock by the spinal anesthetic, not by virtue of blockage of nerve impulses but by the low blood pressure, which greatly reduced the amount of hemorrhage in the limb. The animals in group 3 were similarly protected by the arterial ligation, as further witnessed by the fact that the nervous pathways were not blocked.

If the nociceptive theory were of great importance, it would be expected that intense continuous stimulation of the central end of the divided sciatic nerve of an animal with a tetanizing current, thereby sending in vastly more impulses than would come from a wound except perhaps at the time of its production or of very rough handling, might cause shock. However, such nerve stimulation has been carried out for as long as six or seven hours on the anesthetized dog without the production of any fall in blood pressure or other evidence of shock.

Figure 1 shows the kymographic tracing of the blood pressure of a 10.8 Kg. dog for six hours, anesthetized with 2.7 Gm. of sodium barbital intravenously. The left sciatic nerve was divided, and an electrode connected with a Harvard inductorium was applied to the proximal end. The blood pressure registered 124 mm. of mercury when stimulation of the nerve was begun (a) with 0.8 volt of alternating current in the primary coil and the secondary coil at 0 cm. This produced a slight rise of pressure, which at the end of seventy-two minutes had returned to the previous level. The stimulus was then changed by increasing the voltage in the primary to 1.6 volts. (b) The pressure rose promptly to 140 mm. of mercury and remained at

approximately that level while the stimulus was continued for the next 4.8 hours, except for a two minute release at three and one-third hours. The respirations were deep and slow, being 3 per minute at three and one-third hours and 7 in three minutes at five and two-thirds hours, and the pulse rate remained in the vicinity of 70 per minute. The argument that in case of a wound a large percentage of the impulses passing from affector organs would act more powerfully than those passing from the point of stimulation of a nerve trunk does not seem valid, since the foregoing type of sciatic nerve stimulation is so extreme that if, while it is being carried out under ether, the degree of anesthesia were not maintained at an advanced level, the animal would soon begin to display evidence of extreme pain.

My associates and I<sup>7</sup> have produced prolonged and severe lowering of the blood pressure by a more purely neurogenic mechanism than has been reported before, through stimulation of the aortic depressor and carotid sinus nerves. While it has been possible to lower the blood pressure decidedly from vasodilatation and bradycardia and produce anoxia, tissue damage and shock in this way, it usually requires several hours to do so. Also removal of the stimulus before shock is well established is followed by prompt return of the blood pressure to the vicinity of the previous level, and disappearance of alterations of the blood that may have been brought about.

This is illustrated by figure 2, which shows the blood pressure tracing of a rabbit during periods of stimulation of both aortic depressor nerves, which act by inhibiting principally the vasoconstrictor center and to a lesser extent the cardiac center in the medulla, causing a fall in blood pressure. Stimulation was kept up continuously for seven hours except for five rest periods of three to nine minutes each, totaling thirty-one minutes. The pressure ranged between 30 and 50, averaging 40 mm. of mercury for the period, and returned to

Fig. 2.—Rabbit weighing 4 Kg. Urethane anesthesia 2 Gm. intraperitoneally. Pronounced vasodepression during periods of stimulation of both aortic depressor nerves with very little impairment of the circulation, as shown by prompt recovery with each release.

the vicinity of normal with each release. Nothing approaching this prompt fall and rise of pressure and sustained vasodepression has been reported from direct stimulation of either somatic or sympathetic nerves in experimental animals. A patient with a blood pressure at this low level during similar periods due to injury or operation would occasion the greatest anxiety,

7. Pheemister, D. B.; Laestor, C. H.; Eichelberger, L., and Schachter, R. J.: *Ann. Surg.* 119:26 (Jan.) 1944.

and experience has shown that were it due to blood loss the anxiety would be justified. But the return to the original pressure after the final release was evidence of the relatively slight damage that had been produced.

The experiment suggests that if such a period of vaso-depression in man is ever produced by a purely nervous mechanism (which has never been accurately recorded) it could probably be faced with equanimity. This makes it very improbable that primary shock is ever the result solely of the much more temporary reflex lowering of blood pressure caused by psychic activity or sometimes by intra-abdominal manipulations. When there has been no blood loss and when the arterioles and capillaries are dilated with blood accessible to the tissues as in reflex vasodilatation, the blood pressure may be reduced to a low level for a remarkably long time before there is sufficient anoxia and tissue damage for the creation of shock. This is in decided contrast with the situation in which there has been lowering of blood pressure from hemorrhage which causes constriction of the arteries and anoxia with early onset of shock.

In cases of abdominal manipulations the recent clinical experience with very extensive intra-abdominal resections and excisions has definitely established the fact that the massive blood and plasma transfusions which are necessary to replace the circulating fluid lost during operation effectively prevent the development of shock even though the conditions for reflex stimulation are maximum. Brunschwig<sup>8</sup> has reported the largest series of complicated massive resections of this type for carcinomas of the stomach, colon and pancreas without shock, and the general surgical experience with total gastrectomy for cancer has been similar.

However, experimentally, when severe blood loss has preceded or accompanies a reflex vasodilatation and lowering of the blood pressure from aortic depressor nerve stimulation, and clinically, when hemorrhage is combined with a neurogenic fall in blood pressure from the fainting reaction or from abdominal manipulation, the neurogenic fall may be a contributing factor, usually of minor importance, in shock production.

#### CONCLUSIONS

1. There is a mounting tide of clinical evidence that the overwhelmingly important cause of shock produced by operation and by injury is the local loss of fluid from the circulation and that toxins formed in the damaged tissues and the activity of the nervous system are factors of only minor importance.

2. The irrefutable evidence in support of this view is furnished by the almost complete control or elimination of shock as a complication of operations and injuries where prompt care is rendered in hospitals in which operative technic is excellent and blood and plasma transfusions are given in amounts equivalent to and either simultaneously with or soon after the blood and plasma loss.

3. A full appreciation of these facts will lessen the fear of nervous and toxic factors and lead to a great increase in the frequency of transfusions given in amounts equivalent to the blood and plasma lost, with corresponding improvement in the results of surgical therapy.

950 East Fifty-Ninth Street.

## THE SURGICAL ASPECTS OF CYSTIC DISEASE OF THE KIDNEY

OSWALD S. LOWSLEY, M.D.

NEW YORK

AND

LIEUTENANT COMMANDER MARK S. CURTIS  
(MC), U.S.N.

Our purpose in this paper is to discuss the various forms of cystic disease of the kidney, with particular emphasis on their surgical aspects, and to review 74 cases of renal cystic disease admitted to the Department of Urology (James Buchanan Brady Foundation) of the New York Hospital during the period January 1924 to April 1944. Of these, 19 were cases of simple renal cysts, 53 polycystic disease and 2 echinococcus cysts.

#### SIMPLE RENAL CYSTS

*Etiology.*—The exact cause of these lesions is unknown, but the bulk of evidence points to their being acquired and not congenital. The etiologic theories are numerous. Albarran thought they were a form of localized polycystic disease. Another and widely held belief is that they form as a result of the failure of the uriniferous tubules to unite with the collecting ducts. Hepler<sup>1</sup> believes that they are the result of localized tubular blockage and concomitant renal ischemia.

*Pathology.*—Simple cysts of the kidney are usually unilateral and single. Not infrequently, however, several do occur simultaneously in the same kidney; these are probably the so-called cases of "unilateral polycystic disease." For this reason we feel that the term "solitary" renal cyst is a misnomer and should not be used in describing these cysts.

Grossly, simple renal cysts present the appearance of tense, translucent, thin walled sacs somewhat resembling simple cysts of the ovary. They may occur at either pole of the kidney or in its midportion, as well as on the anterior, posterior, lateral or medial surface. Infrequently the cyst wall will be calcified. While monolocular cavities are the rule, multilocular cavities do occur. The cysts are generally filled with a clear, straw colored fluid not unlike urine; this contains water, albumin, chlorides, phosphates, sulfates, serum globulin, fats, cholesterol crystals and urea in minute quantities. Occasionally the contents are hemorrhagic, and rarely a cyst will contain purulent material.

Of great importance is the fact that about 25 per cent of the cysts containing hemorrhagic material have been proved malignant. Malignancy is rare, however, in the serous cysts or those containing clear fluid.

Involvement of the renal parenchyma by the cyst is usually minimal. The cysts tend to grow out from, rather than into, the kidney substance.

The expenses of this research were defrayed by the Alfred Busiel Research Fund.

From the Department of Urology (James Buchanan Brady Foundation) of the New York Hospital.

Owing to lack of space, this paper has been abbreviated. The complete paper is available in the authors' reprints, a copy of which they will be pleased to supply on request.

This article has been released for publication by the Division of Publications of the Bureau of Medicine and Surgery of the U. S. Navy. The opinions and views set forth in this article are those of the writers and are not to be considered as reflecting the policies of the Navy Department.

1. Hepler, A. B.: Solitary Cysts of the Kidney, Surg., Gynec. & Obst. 50: 668, 1930.

**Symptomatology.**—Small cysts are quite often symptomless and are discovered only at operation or autopsy. Again, a renal cyst may cause pressure on intra-abdominal organs and produce severe gastrointestinal symptoms *simulating* those caused by peptic ulcer, cholecystitis or partial intestinal obstruction. A large cyst at the upper pole of a kidney may cause pressure

differentiated from the cyst outline. 3. There may be deformity of the renal pelvis and calices. This usually consists of flattening, blunting or obliteration of a calix or flattening of the pelvis, the extent of the deformity depending on the position and size of the cyst. 4. There may be deformity and compression of the ureter. This is most common with cysts occurring at the lower pole. The ureter may be displaced or its compression may cause hydronephrosis, sometimes of considerable degree. 5. There may be x-ray evidence of changes in the axis and position of the kidney due to displacement by the cyst (ptosis, rotation, deviation of the long axis). 6. Calcification of the cyst wall may be evident. 7. There may be x-ray changes in other organs. A cyst may be so large, or so located, as to cause filling defects in a hollow organ such as the stomach and the intestine.

**Treatment.**—With cysts of small or moderate size, discovered during routine examination or investigation for unrelated disease and causing no deformity or interference with renal drainage, a policy of watchful waiting may be pursued. Frequent x-ray studies of the kidney should be made and, if progression occurs, immediate surgical exploration should be done. With moderate or larger sized cysts, however, we feel that surgical

Fig 1—Removal of simple cysts of kidney, using fat and ribbon gut for repair of defects. A woman aged 58 had pain in the right upper quadrant radiating to the scapula for six months. A nontender, firm mass was palpated in the right kidney area. The preoperative diagnosis was neoplasm of the right kidney. At operation there was found a large cyst at the upper pole, a still larger one on the lateral margin, a small cyst between the two, and numerous smaller cysts scattered over the kidney surface, as shown above in 2 and 3. In 3 the cyst at the upper pole is being exposed by blunt dissection (See also figs 2, 3 and 4)

on the diaphragm, thus producing dyspnea, cough and pain referred to the shoulders. In cysts of large size, pain in the kidney region of the affected side is common and is due to pressure from the cyst

Urinary tract symptoms are present in a majority of the cases.

**Diagnosis.**—Depending on the size and position of the cyst, a mass may or may not be palpable in the renal region of the affected side. Cysts of the upper pole and posterior surface are generally not palpable. When palpable, the cyst is felt as a smooth, round, tense, generally nontender mass in the kidney area.

In the x-ray diagnosis, retrograde pyelograms and pyeloureterograms, as well as intravenous urograms, are of great importance. The following points require emphasis: 1. The x-rays may be entirely negative. 2. They may show changes in the renal outline. Intravenous urograms may be of help in delineating the kidney from the cyst shadow, particularly in cysts of the upper pole. An important point is that in neoplasms of the kidney the renal outline is often enlarged, whereas in simple cysts it is of normal size and can be

Fig 2—1, removing cyst from upper pole in toto 2, result after removal of cyst from upper pole, bleeding points are clamped 3, ribbon gut sutures are used to close the defect at the upper pole, fat is used for hemostasis 4, method of placing ribbon gut sutures 5, repair completed

exploration and treatment should be employed when at all feasible.

We have found that surgical removal of only the free portion of the cyst will give gratifying results in most cases. Removal of the cyst in toto is likely to result in undesirable, if not dangerous, hemorrhage. This is because the cyst wall in contact with the renal parenchyma is usually firmly adherent and dissects

2; chest pain, 1; no symptoms referable to the cysts, 2. The most common genitourinary symptoms were urinary frequency, hematuria, renal pain and dysuria. Two patients passed renal calculi. The average duration of symptoms was forty-eight months, the shortest being twelve hours and the longest twenty-seven years.

X-ray examinations showed a definite cystic outline in 8 cases, caliceal distortion in 5, caliceal displacement in 2, a calcified mass in 2, hydronephrosis in 1 and a mass in the kidney in 1.

The preoperative diagnosis was renal cyst in 11 cases, renal cancer in 6, hypoplastic kidney in 1 and nephrop-tosis in 1.

Five patients had more than one cyst in the affected kidney. One of these (fig. 1) had at least 20 cysts of varying sizes scattered throughout the kidney.

The average size of the cysts was 8.5 cm. in diameter, the largest being 40 cm. and the smallest 0.5 cm.

The right kidney was affected in 10 cases and the left in 9. There was a uniform distribution of the cysts in the inferior pole, superior pole and midportion

the residual cavity with fat which is held in place by mattress sutures of chromic ribbon gut placed through the renal capsule (figs. 3 and 4), is, we feel, the procedure of choice in most of these cases.

While the foregoing procedure will suffice in the majority of cases, in a small number nephrectomy will be found necessary.

A careful examination of the cyst wall, particularly that portion adjacent to the renal parenchyma, should always be made for evidence of malignancy. If doubtful tissue is found, a frozen section should be done if possible; otherwise nephrectomy should be performed immediately.

When a cyst has destroyed the greater part of a kidney, its removal will usually lead to destruction of the remainder of the organ resulting from disruption of the renal blood supply. Therefore, in cases in which more than half of the kidney has been destroyed and the function of the contralateral kidney is adequate, nephrectomy is indicated.

Occasionally a patient with a symptom-producing simple cyst of the kidney may refuse operation, in which event aspiration of the fluid content and injection of 50 per cent glucose solution may be done. This procedure reportedly gives symptomatic relief and in a few cases has even produced cures.

*Review of Cases.*—Nineteen cases of simple cyst of the kidney are included in this review. Ten of the patients were men and 9 were women. Their average age was 50.2 years, the oldest being 67 years, the youngest 26 years. Fifteen (78.9 per cent) were over the age of 40 years.

The chief complaints were genitourinary tract symptoms, 11; gastrointestinal symptoms, 3; abdominal pain,

of the kidney. Only 1 small cyst was found (fig. 1) which connected with the renal pelvis or calices.

The operative procedures employed in these cases were nephrectomy in 6, total excision of the cyst with the application of a fat pad to control bleeding in 7, resection of the free portion of the cyst wall with

phenolization and repair by the fat and ribbon gut method in 3, incision of the cyst in 1 and a combination of total excision and resection of the free portion, phenolization or some other method (figs. 1 to 4) in 1. Operation was refused by 1 patient.

Of the 6 nephrectomies, 2 were done because of malignancy in the cysts, 3 because the cysts had destroyed over half of the renal substance, and 1 because the cyst—a calcified one—was found in a hypoplastic kidney with little, if any, function.

It is only during the past two years that we have employed resection of the free portion of the cyst, with phenolization and repair by a fat pad and ribbon gut; therefore there are only 4 cases thus treated included in the series. In these 4 cases, however, this method has demonstrated its superiority over other methods of removal, and we intend to employ it in the future whenever possible. In a case of the senior author's, in which 3 cysts were removed (figs. 1 to 4), one was removed by total excision, during the course of which severe bleeding occurred, which was controlled with difficulty. The other 2 cysts were removed by resection of their free portions followed by phenolization of their bases and subsequent closure of the residual cavity with fat pads and ribbon-gut mattress sutures. In neither of these was bleeding encountered, and the time spent on resecting the 2 was less than that spent in totally excising the first cyst.

Two cysts in this series were found to be malignant. One, a hypernephroma 15 cm. in diameter, contained old blood; the other, a papillary carcinoma 40 cm. in diameter, contained a necrotic material the nature of which was not identifiable. The first patient is alive and well ten years after nephrectomy; the second died of pulmonary metastases one year after nephrectomy.

Pathologic examination of the benign cysts that were removed showed that they practically all had thin fibrous walls, generally consisting of only two layers (not having lining epithelium) and generally showing hyalinized tubular and glomerular remnants. One cyst wall was composed of a porcelain-like material. Another showed calcification and true bone formation.

There were concomitant urinary tract pathologic changes in 7 of the 19 cases. Ureteral calculi were found in 2, and there was 1 instance each of nephropathy with hydronephrosis, hydronephrosis with chronic pyelitis and ureteritis, pronounced hypoplasia of the kidney, ptosis and chronic pyelonephritis and stone.

The results following operation in the 17 cases of benign cysts were excellent in 14 and good in 1. One patient died of bronchopneumonia six days following nephrectomy, and 1 patient was operated on too recently for proper evaluation. As may be noted from figure 5, there is a definite tendency for the pelves and calices to return to normal shape following the removal of these cysts, even though there has been considerable deformity preoperatively.

#### POLYCYSTIC DISEASE OF THE KIDNEY

Polycystic disease of the kidney is congenital, probably always bilateral, and progressive in nature.

*Symptomatology and Diagnosis.*—Painless hematuria is frequently seen in this condition. Dull, aching pain in the kidney regions is also common. Ureteral colic may occur during an attack of hematuria, owing to the passage of blood clots. Urinary infection and its associated symptomatology is often encountered. The

onset of symptoms generally occurs during the fourth decade of life.

The results of renal function tests are quite often within normal limits unless the patient is seen in the end stages of the disease, when uremia dominates the picture. Palpable enlargement of one or both kidneys is the rule except in the earlier stages.

The destruction of renal tissue in uncomplicated cases is due solely to mechanical compression by the cysts. However, in many cases infection and hydronephrosis, due to pressure on the ureter or renal plexis, augment this destruction.

The characteristic x-ray picture is that of bilateral "dragon" deformity of the kidney. This may vary considerably in degree in the two kidneys.

*Treatment.*—Because of the congenital, bilateral and progressive nature of renal polycystic disease, surgical therapy is pretty much limited to the complications arising from it. Even though the disease is progressive, much can be done by careful medical management to prolong and make comfortable the lives of these patients. Destruction of renal tissue, unless augmented by infection, back pressure of urine or calculus formation,

Fig. 5.—Simple renal cyst; preoperative and postoperative pyelograms. A man aged 57 complained chiefly of gastrointestinal burning of fifteen years' duration. The lower pole of his left kidney was palpable but not tender. The preoperative diagnosis was cyst of the right kidney. At operation the free portion of the cyst wall was resected, followed by phenolization and closure with fat and ribbon gut. A, preoperative pyelogram. B, pyelogram taken three weeks postoperatively. Note tendency for pelvis and calices to return to normal shape following removal of cyst.

usually progresses at a slow rate. The avoidance of infection in any form is of extreme importance. Rest, both physical and mental, avoidance of extremes in temperature due to seasonal changes, particularly cold, and the use of a low protein diet are measures which we have found of value in these cases.

The indications for surgery may be grouped as follows: (1) infection of the kidney and surrounding structures, (2) hemorrhage both in and about the kidneys, (3) pain unrelieved by medical measures, (4) calculus formation, (5) renal neoplasm and (6) rapidly progressing destruction of relatively normal kidneys.

Infection of the kidney (including tuberculosis) which does not yield to medical management and urinary antiseptics demands surgical intervention both to preserve kidney tissue and to prevent general sepsis. Nephrostomy, with adequate drainage, may serve to control this; but if the kidney is found to be functionally dead or is the seat of infection which threatens the life of the patient, nephrectomy must be considered.

In polycystic disease complicated by perinephric abscess, incision and drainage should be employed at the earliest possible moment.

Hematuria, in polycystic disease, is sometimes severe enough to endanger life. Exposure of the kidney, with rupture of the cysts, will control this in some cases. If not, and if the hematuria is unilateral, nephrectomy will have to be resorted to. However, it should be done only as a last resort because, even though the hematuria

destruction is progressing slowly, over a long period, this procedure, in our opinion, is not justified.

*Review of Cases.*—From January 1924 to May 1944 there were 53 admissions of 30 different patients to the James Buchanan Brady Foundation of the New York Hospital because of polycystic renal disease and its complications. The reasons for these admissions were diagnosis alone, 29 admissions; operative procedures, 12; medical treatment of complications (uremia, infection, and the like), 11; renal calculus, 1.

There were 12 operations performed on 11 different patients. The average age of these patients was 45 years, the youngest being 27 years and the oldest 67 years at the time of operation. The preoperative diagnoses in these cases were polycystic kidney with infection, 2; neoplasm of the kidney, 6; perinephric abscess, 2; calculus in polycystic kidney, 1; urinary extravasation (ureteral, postcystoscopic), 1.

Only 2 of the 6 patients with preoperative diagnoses of neoplasm were found to have such a lesion. One of these had an exploratory operation; but, no evidence of neoplasm being found, a nephrostomy and incision and drainage of the cysts were done. Grossly the kidney had the appearance of uncomplicated polycystic disease. The patient died twenty-eight days post-

Fig 6—Polycystic kidney nephrostomy and rupture of cysts 1, skin incision for exposure of left kidney 2, exposing kidney 3, incising kidney along lateral border for introduction of finger and rupture of cysts below surface of kidney

is unilateral at the time of nephrectomy, bleeding from the other side may occur at any time.

Intractable pain sometimes occurs in polycystic disease. This can usually be abolished, or greatly lessened, by exposure of the kidney and rupture of the cysts.

Attempts at cystoscopic removal of renal or ureteral calculi in patients with polycystic disease should be made only in the absence of urinary tract infection. Nephrolithotomy and ureterolithotomy are often more conservative in persons afflicted with this disease than procedures entailing transvesical ureteral instrumentation.

The presence, or suspected presence, of a neoplasm in a polycystic kidney is another indication for surgical intervention, provided the functional capacity of the contralateral kidney is adequate to maintain life.

Very fine surgical judgment is needed in deciding whether or not to intervene surgically in cases of polycystic kidneys with relatively normal function but showing evidence of rapid progression of renal destruction despite a suitable medical regimen. If such progression is occurring at a rapid rate in the absence of infection or calculous disease, incision and drainage of the cysts (Rovsing's operation) may do much to prolong the patient's life. If periodic checkups reveal that renal

Fig 7—Polycystic kidney 1, rupture of deep cysts through incision along lateral border of kidney. 2, sagittal section showing method of rupturing cysts within kidney

operatively of uremia, and postmortem microscopic section of the kidney showed the presence of an angiosarcoma. No definite gross evidence of neoplasm was seen either at operation or at autopsy. The other patient had a fibrosarcoma arising in a polycystic kidney. She did quite well for five years following nephrectomy but at present (six years postoperatively) is going rapidly downhill as the result of widespread

metastases. This patient had a large cyst of her liver removed seven years prior to the nephrectomy.

There was 1 case in which nephrectomy was performed because of an erroneous diagnosis of neoplasm. The removed kidney showed only polycystic disease, with no evidence of neoplasm. The patient developed pain in the region of the remaining kidney and died eighteen months later of uremia. His death was undoubtedly hastened by the nephrectomy.

Of the remaining 3 patients with preoperative diagnoses of renal neoplasm, 2 were found to have uncomplicated polycystic disease, and incision and drainage of their cysts was done. The third had polycystic kidneys and bilateral perinephric abscesses, which were incised and drained.

There was 1 case diagnosed preoperatively as perinephric abscess that is of considerable interest. This patient, who was known to have polycystic kidneys, entered the hospital complaining of pain in his right flank. Following his admission he underwent a septic course, and a mass rapidly developed in his right lumbar region. This was thought to be a perinephric abscess and an exploratory operation was done, which disclosed a large, almost totally destroyed polycystic kidney. Nephrostomy and incision and drainage of the cysts were done, but the patient died one week later of uremia. The rapidly developing mass was undoubtedly due to rapid increase in the size of the cysts.

The following operative procedures were performed in this series of cases: incision and drainage of the cysts, 2; nephrostomy for drainage, 2; nephrostomy, with incision and drainage of the cysts, 2 (figs. 6, 7 and 8); nephrectomy, 2; incision and drainage of perinephric abscess, 1; incision and drainage of both perinephric abscess and cysts, 1; nephrolithotomy and incision and drainage of cysts, 1; drainage of extravasation from rupture of ureter during pyelography, 1.

Of the 6 patients whose cysts were incised and drained, 1 died twenty-eight days postoperatively of cardiac failure and another seven days postoperatively of uremia. Two others had entirely uneventful postoperative courses but have not been heard from since. The remaining 2 are alive and in good general condition at present, one twenty years and the other eight years following operation. However, both of these have had subsequent admissions to the hospital because of complications. One had an incision and drainage of a perinephric abscess involving the kidney that had been operated on previously; the other was readmitted because of urinary tract infection which developed subsequent to his becoming chilled and catching "cold." Both have normal blood urea nitrogen levels, and their blood pressures are normal for their ages.

There were 2 patients who had nephrostomy for the drainage of infected polycystic kidneys. One died one day postoperatively of uremia. Her blood urea nitrogen was 84 mg. per hundred cubic centimeters on entry to the hospital. Autopsy revealed extensive polycystic disease of both kidneys and cysts of the liver, pancreas, fallopian tubes and peritoneum. The other had an uneventful postoperative course and, when last heard from, several years later, was in excellent general health.

#### ECHINOCOCCUS CYSTS OF THE KIDNEY

Echinococcus infestation, or hydatid disease, in the human being is common in the wool growing countries,

viz. Argentina, Australia, Iceland, New Zealand, northern Africa and southern Europe.

Man is an accidental host in this infestation. The larval worms develop in sheep. Ordinarily the adult worms develop in members of the canine family (dog, wolf, fox, jackal). Man is usually infested from dogs harboring the parasites.

The liver is the most common site of these cysts. Renal involvement occurs in about 2 per cent of infested human beings.

*Pathology.*—Echinococcal renal cysts are generally unilateral and single. The function of the affected kidney is not as a rule significantly decreased. While the primary site of these cysts is in the parenchyma, they may rupture into the calices, pelvis, or both.

Fig. 8.—Polycystic kidney. 1, incising cysts on surface of kidney. 2, condition after collapse of cysts, and method of placing drains.

Grossly, such cysts present a thick, opalescent wall, which serves to differentiate them from simple renal cysts. Within the larger cysts are numerous smaller, or daughter, cysts, giving a grapelike appearance.

Renal echinococcus cysts are classified as (1) closed and (2) open. The former have no communication with the renal pelvis or calices. Open cysts connect with the pelvis and calices and may be further subdivided into calcified and noncalcified forms.

*Symptomatology and Diagnosis.*—The x-ray appearance and symptomatology of these cysts usually show nothing to differentiate them from simple renal cysts. However, if the cyst is of the open type, scolices and portions of the cyst wall may be passed in the urine.

Hematuria occurs in some cases of renal hydatid disease and may be due to inflammation of the mucosa of the renal pelvis or calices by an adjoining cyst or by rupture of such a cyst into these spaces. Urteral

colic may occur as a result of the passage of blood clots due to such hematuria or, in the open type of cyst, by the passage of scolices or portions of cyst wall.

About 50 per cent of patients with hydatid renal disease will have a definite eosinophilia. This may go as high as 20 per cent of the total leukocyte count. Complement fixation tests (Chedini-Weinberg test) will be positive in 80 per cent of the cases. Ninety per cent of these patients will show a positive reaction to the Casoni test.

*Treatment.*—If not removed surgically, these cysts will eventually lead to death in almost all cases. Exceptions to this are cysts of the closed type which have become calcified. Unless these cause repeated attacks of hematuria they need not be removed surgically.

During operation great care must be exercised in preventing spillage of the cystic contents, since severe anaphylaxis, which is often fatal, may result from such spillage. Also implantation of parasites is likely to occur throughout tissues thus contaminated.

Craig and Lee-Brown,<sup>2</sup> who have had wide experience with the surgical treatment of this lesion in Australia, feel that the following is the operation of choice in cases of noncalcified cysts of the closed type: The kidney is exposed through the lumbar approach and as much of the cystic contents as possible is evacuated through a trocar. The cyst cavity is then filled with alcohol or solution of formaldehyde U. S. P. diluted 1:10. This is allowed to remain in the cavity for three or four minutes and is then, with the remaining cystic contents, evacuated through the trocar, great care being taken to prevent spillage. The cyst wall is then sutured to the abdominal wall with fourteen day chromic catgut. The incision in the cyst wall is left open. A small drain is placed to, but not into, the cyst; this is removed in three or four days. If the cyst is found to connect with other organs, such as the liver or spleen, large drains should be employed.

Nephrectomy is usually the procedure of choice in cysts of the open type. If nephrectomy is technically impossible or is contraindicated because of disease of the opposite kidney, marsupialization of the cyst cavity should be employed. In certain cases of open cysts situated at the poles of the kidney, heminephrectomy may be indicated.

*Review of Cases.*—During the period covered in this paper, 2 patients were admitted to the Brady Foundation of the New York Hospital with echinococcus cysts of the kidney.

The first (1925) was a man aged 30 who was born and raised in Sardinia, a country where sheep raising is common. Fourteen years prior to his admission to the hospital he on one occasion passed some "grapes" and pieces of membranes in his urine. There was no recurrence of this until the day before his admission. For two years prior to his entry he had had intermittent pain in the right side of his abdomen, for which an appendectomy had been performed. Physical examination revealed a firm mass in his right kidney region. X-rays showed tremendous distortion of the right renal pelvis. A preoperative diagnosis of echinococcus cyst of the right kidney was made. Exposure of the kidney through the usual lumbar incision disclosed a large cyst at its upper pole. This was opened and found to con-

tain numerous smaller cysts 0.5 to 1.0 cm. in diameter. The wall of the cyst contained many hooklets. The cyst connected with the renal pelvis. A right nephrectomy was performed. Shortly after the operation the patient went into shock, which progressively became worse in spite of all efforts to combat it. He died seventy-two hours postoperatively, with a terminal temperature of 106.4 F. Even though no spillage of the cystic contents was observed at operation, it is possible that a small amount may have occurred, and the patient's death may have been due to anaphylaxis.

The other patient (1936) was a woman aged 24 who had been born and raised in Greece, where she lived on a dairy farm and had a dog for a pet. For several months prior to her entry to the hospital she had had a dull ache in her left flank and one week prior to admission had developed pain in the left flank, frequency, nocturia and hematuria. Physical examination revealed a hard mass the size of an orange in her left kidney region. The x-ray findings were suggestive of a tumor of the left kidney. Exposure of the left kidney through the usual lumbar incision showed its lower pole to be enlarged and covered with an inflamed capsule. It was thought that this was a neoplasm so a nephrectomy was performed. Gross examination of the removed kidney revealed 2 cysts in the lower pole, the larger of which was 6 cm. in diameter. They did not communicate with each other or with the renal pelvis or calices. They contained a clear fluid in which there was a grayish white flocculant and numerous small cysts 1 to 3 cm. in diameter. No free hooklets were seen. Microscopically, numerous scolices were found in the cyst walls and there was an eosinophilic infiltration of the surrounding kidney parenchyma. The postoperative result in this case was excellent.

It is of interest that neither of these patients exhibited an eosinophilia prior to operation. It is regrettable that neither the complement fixation nor the Casoni test was employed in either case.

#### SUMMARY AND CONCLUSIONS

*Simple Renal Cyst.*—1. The term "solitary" renal cyst is erroneous and should be replaced by the term "simple" renal cyst.

2. Satisfactory results will be obtained in the great majority of cases of simple renal cyst by resection of the free portion of the cyst wall, with subsequent phenolization of the base of the cyst and closure of the resultant defect with a fat pad and chromic ribbon gut. Nephrectomy is indicated in only a small percentage of cases.

3. Malignancy should be strongly suspected in all renal cysts containing hemorrhagic material; and, unless malignancy can be definitely ruled out, nephrectomy should be done, as approximately 25 per cent of hemorrhagic cysts have been found to be malignant.

*Polycystic Renal Disease.*—1. Polycystic renal disease is a congenital, probably always bilateral, and progressive pathologic entity.

2. Surgery in this condition is pretty much limited to the complications arising from it.

3. Much can be done in prolonging and making comfortable the lives of patients with polycystic disease by the employment of a judicious medical regimen.

4. Nephrectomy should be done only as a life saving measure in patients who have polycystic kidneys.

2. Craig, G., and Lee-Brown, R. K.: Hydatid Disease of the Kidney, *Surg., Gynec. & Obst.* 46: 668, 1928.

**Echinococcus Cyst of the Kidney.**—1. Renal surgery is indicated for the great majority of patients with this disease.

2. At operation great care must be exercised in preventing spillage of the cystic contents, since severe anaphylaxis, which is often fatal, may result, or parasites may be implanted in the contaminated tissues.

### ABSTRACT OF DISCUSSION

DR. WILLIAM F. BRAASCH, Rochester, Minn.: Let me call attention to the desirability of using the term simple cyst rather than solitary cyst. There may be one large simple cyst present in the kidney, but other smaller cysts usually accompany it and often they occur in both kidneys. The term "solitary cyst" therefore is a misnomer in most cases. Multiple large simple cysts frequently are found in the kidney. These cysts may cause urographic deformity which is suggestive of polycystic disease, and they have also been so regarded on surgical exploration. In reviewing the surgical records of patients with simple renal cysts observed during the last five years at the clinic, I found that in 20 per cent of the cases multiple renal cysts of appreciable size were found at operation. In the early days of urography it was thought that the presence of simple renal cysts could always be recognized by the crescentic outline and the other well known deformities of the calices and renal pelvis that usually accompany renal cysts. We were bold to make a positive diagnosis of renal cysts and thought we could differentiate them from renal neoplasm or polycystic disease. We hesitate now to make an exact diagnosis even with the most typical urographic data. Surgical exploration is necessary in practically every case, since the possibility of renal neoplasm must be excluded. Aspiration of renal cysts is not a good surgical procedure and from the therapeutic results often is unsatisfactory. Surgical exploration is preferable in these cases except for a few elderly or very sick patients. In regard to polycystic kidney, although the diagnosis is usually made without too great difficulty from the clinical and urographic data, nevertheless the lesion is often overlooked. Not infrequently only one kidney is enlarged on examination and the other cannot be felt. Urography may show a deformity in the enlarged kidney which is very suggestive of polycystic disease, but the other may have little or no deformity and its function may be normal. It would be easy to infer from this that we are dealing with a unilateral renal condition, possibly neoplasm or one or more simple cysts. As the authors have stated, many complications may occur with renal polycystic disease. The Rössing operation for polycystic disease would seem theoretically to be a logical procedure. Every now and then somebody reports 2 or 3 cases that have been treated by this method. However, several of the patients on whom this operation was performed at the clinic did not have very satisfactory results. In 2 patients postoperative complications occurred necessitating nephrectomy. The other patients observed did not seem to be greatly benefited by the operation.

DR. GEORGE R. LIVERMORE, Memphis, Tenn.: Solitary cysts of the kidney usually occur at the lower or upper pole. Sometimes, as the authors showed, we find them on the convex border. I had a type once in which the cyst covered the whole anterior surface of the kidney. It was so firmly attached to the kidney that the question was how to get it out. We dissected as much of the sac out as we could and then treated the remainder with an escharotic solution, just as Drs. Lowsley and Curtis have done. Recently some one suggested Zenker's solution, which is an escharotic. I have always been of the opinion that polycystic kidneys should not be operated on unless some definite reason calls for the operation, such as repeated hemorrhage, infection or, as Dr. Braasch suggested, stone. I have operated on quite a number of them for hemorrhage or infection when the hemorrhage had been so severe that the patients were anemic. In such cases we benefit the patient by breaking up as many cysts as possible and ligating all bleeding areas.

## Clinical Notes, Suggestions and New Instruments

### ANASTOMOSIS OF VAS DEFERENS

RESTORATION OF FERTILITY FIVE YEARS AFTER BILATERAL VASECTOMY

LIEUTENANT COMMANDER CHARLES S. CAMERON (MC), U.S.N.R.

It is the consensus that vasectomy, performed for the purpose of sterilization of the male, is irrevocable. This belief is not without advantage in that it undoubtedly deters physicians from advising and laymen from requesting the operation, otherwise so inviting because of its simplicity and effectiveness. Bickham<sup>1</sup> states that vasorrhaphy is occasionally performed in consequence of accidental cutting of the ductus deferens in the course of such operations as herniorrhaphy, a mishap which led Parla-vecchio to attempt the first vas deferens anastomosis, according to Thorek.<sup>2</sup>

Reestablishment of continuity and patency of the vas deferens with restoration of fertility in patients previously vasectomized as a measure of contraception has been reported by Strode,<sup>3</sup> Twyman and Nelson,<sup>4</sup> Freiberg and Lepsky,<sup>5</sup> Barker<sup>6</sup> and

A, exposure and preparation of spermatic duct for anastomosis; B, insertion of tube; C, stainless steel tube showing beveled ends and transverse grooves; D and E, completed anastomosis.

Nelsen.<sup>7</sup> These cases are of special interest because of the elapsed interval between the time of ligation and cutting of the ducts and the time of anastomosis: seven years in 3 instances and four years in 2.

The technic most frequently employed is that of end to end anastomosis. After the cicatrized end of each segment of the duct has been freshened a suture of catgut or dermal carried on a straight round needle is threaded through the lumen from each end and brought out through the wall of the duct 1 or 2 centimeters from the level of section, and the upper

and lower limbs of the vas are brought together over it. Interrupted sutures reinforce the line of union. The lumen suture either is tied over the vas or brought outside the scrotum and removed in seven to ten days. The method of Davis adapts the telescoping technic familiar to urologists as a means of ureteral anastomosis, the proximal portion of the vas being cut obliquely to form an acute angle, which is then drawn into the distal lumen. Bickham describes a maneuver in which a straight round needle is passed into the lumen of the proximal and distal segments to serve as a splint while the anastomosis is effected with interrupted sutures, after which the needle is made to pierce the vas and removed.

## REPORT OF CASE

*History.*—J. D. H., an enlisted man aged 26 in the U. S. Navy, was admitted to the dispensary on April 10, 1944 complaining of a mass in the scrotum. The veins on the left side of the scrotum had been enlarged as long as he could remember. He was uncertain as to the duration of the large soft tumor in the right side of the scrotum but believed that it developed shortly after ligation and cutting of the spermatic ducts in January 1939. This operation was performed just after the patient's marriage and following the decision of himself and his wife to remain childless. Although burdened by a sensation of weight and embarrassed by the size of the scrotum, the patient regarded these of less importance than his sterility. He stated that what he most wanted was to "have the tubes put together again." From the time of the vasectomy until he left the United States, an interval of five years, the patient and his wife had indulged in coitus about three times a week; she had never been pregnant. Before enlisting, he and his wife agreed that the operation had been a mistake. Both had come to desire parenthood ardently.

*Examination.*—The patient was tall, spare and healthy looking. The examination showed him to be normal in all respects excepting the genitalia. The scrotum was the size of a baseball. Minute scars were noted in the skin bilaterally. On the right, a resilient translucent mass surrounded the testis. Numerous dilated tortuous veins formed a bulky mass on the left. The testes appeared to be of normal size and consistency. Hydrocele of the right tunica vaginalis and left varicocele were diagnosed. Freshly ejaculated semen, examined preoperatively, contained no spermatozoa.

*Operation and Result.*—On April 15 left varicolectomy was performed under local procaine hydrochloride infiltration anesthesia. Following excision of the greater portion of the scrotal segments of the spermatic veins a search for the site of division of the left vas deferens was made. This was found at approximately the mid level of the scrotal course of the vas. The club shaped ends, separated by an interval of 8 mm., were cut back until the patent lumen appeared. Microscopic examination of opalescent fluid which oozed from the freshly cut distal portion disclosed no spermatozoa. A hollow stainless steel tube<sup>8</sup> 5 mm. long and of number 21 gage was inserted into the lumen of the proximal and distal segments; this was held in place by means of fine black silk ligatures tied around the vas at the levels of grooves previously cut in the tube. Interrupted sutures were placed at the line of anastomosis. On April 27 a right hydrocelectomy, according to the method of Andrews, was performed under local infiltration anesthesia. This was followed immediately by vasorrhaphy by the technic just described with the single exception that the steel tube used measured 9 mm. in length. This change was made because of the difficulty encountered during the first operation in keeping the smaller tube in place during the anastomosis. No spermatozoa could be found in fluid obtained from the distal vas at the second operation.

On June 29 freshly ejaculated semen contained 15 to 20 vigorously motile spermatozoa per high power field. A spermatozoon count on July 22 was 2,500,000 per cubic centimeter of semen.

8. The tube was made from an ordinary B-D intravenous needle; the ends were beveled and transverse grooves cut near each end with a dental emery wheel.

## Council on Foods and Nutrition

## SPECIAL ARTICLE

*This is the third of a series of articles discussing the significance of protein nutrition in health and disease. This material was prepared by the authors at the request of the Council and has been authorized for publication.*

GEORGE K. ANDERSON, M.D., Secretary.

## PROTEIN NUTRITION IN PROBLEMS OF MEDICAL INTEREST

FREDRICK J. STARE, M.D.

AND

GEORGE W. THORN, M.D.

BOSTON

There are many problems of medical interest in which protein nutrition is an important consideration.<sup>1</sup> Some of the more important of these have been listed in table 1.

In this paper we shall limit discussion to (a) some of the causes of protein deficiency, (b) protein defi-

ciency in some of the more common diseases, and (c) the use of food, protein concentrates, tube feeding and parenteral administration of nutrients as they apply to medical disorders.

## CAUSES OF PROTEIN DEFICIENCY

The simplest, most obvious and commonest cause of protein deficiency is lack of sufficient protein in the diet. This may be due to inadequate knowledge of what constitutes a sufficient protein intake, to poor economic status, to misinformation or to the existence of some local or generalized disease with resultant anorexia and dietary inadequacy. Such dietary insufficiency may not be limited to protein but may also include many other nutrients; in fact, uncomplicated protein deficiency

From the Department of Nutrition, Harvard School of Public Health, the Departments of Biological Chemistry and Medicine, Harvard Medical School, and the Medical Clinic, Peter Bent Brigham Hospital.

The products of plasma fractionation employed in this work were developed from blood collected by the American Red Cross, by the Department of Physical Chemistry, Harvard Medical School, Boston, under a contract, recommended by the Committee on Medical Research, between the Office of Scientific Research and Development and Harvard University. Albumin will not be available for general clinical use during the war because of the needs of the armed forces.

1. Stare, F. J., and Thorn, G. W.: Some Medical Aspects of Protein Foods. *Am. J. Pub. Health* 33: 1444, 1943.

rarely occurs in man. In addition to lack of an adequate quantity of dietary protein, the possibility that protein deficiency may result from the ingestion of poor quality protein must also be considered. Protein to be adequate for body needs must furnish all of the essential amino acids.<sup>2</sup>

With protein intake adequate as to quantity and quality, there still exist many other important factors which may interfere with the ultimate delivery of adequate protein to the tissues. Digestion may be impaired in the presence of deficient gastrointestinal secretions (stomach, small intestine, pancreas and liver). Impaired absorption may be present in patients with edema, inflammation or tumors of the bowel, in conditions causing hypermotility of the bowel or diarrhea, and as a result of any "short circuiting" process such as a fistula. Protein deficiency is frequently initiated or accentuated, even to the extent of precipitating a deficiency syndrome, by loss of gastrointestinal contents through repeated vomiting or diarrhea, by hemorrhage or by increased demand of protein as a result of fever and increased catabolism. Deficiency in protein may also result from destruction of protein in diseases accompanied by chronic exudation. Excessive loss of protein in the urine of patients with kidney disease and into serous cavities in other diseases may lead to protein deficiency. Furthermore, a negative nitrogen balance, with consequent loss of body protein, may be present for days to weeks following trauma such as burns, wounds or fractures. In certain disorders of the liver, insufficient regeneration of plasma protein may be a cause of protein deficiency. The more general causes of protein deficiency have been summarized in table 2.

#### SPECIFIC DISEASES IN WHICH PROTEIN NUTRITION IS OF PARTICULAR INTEREST

I. *Kidney Disease.*—Regulation of the protein content of the diet is important in the treatment of patients with kidney disease. The particular aspects of kidney disease which merit dietary consideration may be summarized as follows:

1. Poor appetite, nausea and vomiting, usually associated with azotemia, dehydration and acidosis.

TABLE 2—Causes of Protein Deficiency

1. Insufficient intake of protein, quantitatively or qualitatively
2. Impaired digestion or absorption of protein foods—chronic diarrhea, fistula and so on
3. Inadequate synthesis of plasma protein—liver disease
4. Increased breakdown of body protein stores, febrile states, elevated basal metabolic rate and the like
5. Excessive loss of protein, such as nephrotic syndrome, ascites or hemorrhage

2. Proteinuria with its ensuing hypoalbuminemia, edema and signs of protein deficiency.

3. The diuretic effect of dietary protein in patients with edema of renal origin.

1. *Poor Appetite, Nausea and Vomiting:* Kidney disease is a chronic ailment of considerable severity in many patients, and it may be expected to impair appetite and hence result in a decreased food intake, particularly of protein foods. Furthermore, such factors as

edema, uremia, dehydration, acidosis, hypertension and heart failure greatly enhance this tendency. Among lay people there is also the popular fancy that "protein foods are bad for patients with kidney disease," and hence the intake of this particular dietary requirement may be further restricted. It is evident that considerable effort on the part of physician, dietitian and

TABLE 3.—Protein Recommendations for Patients with Kidney Disease

		Rx Diet: Daily Intake			
Type of Renal Disorder		Protein, Gm / Kg	Fluids, Cc.	NaCl	Ash
Edema	I Hypoalbuminemia	2.3	1,500	Salt poor	Acid
	II Hypoalbuminemia, hypertension	1.2	1,500	Salt poor	Acid
	III Hypoalbuminemia, hypertension, heart failure	1,000-1,500 cc. milk for 2-5 days; no additional fluid or food			
Azotemia					
IV	Azotemia	0.5-1	4,000	No restriction 1-3 Gm. supplement	Alkaline
V	Acidosis	0.5-1	4,000	No restriction 1-3 Gm. supplement	Alkaline 3-6 Gm. NaHCO <sub>3</sub>
VI	Acidosis, hypertension	0.5-1	3,000	No restriction	Alkaline 3-6 Gm. NaHCO <sub>3</sub>
Edema and Azotemia					
VII	Acidosis, hypertension	1	2,000	Salt free	Alkaline
VIII	Hypoalbuminemia, hypertension	1	2,000	Salt free	Alkaline
IX	Acidosis, heart failure	1,000 cc. milk with aluminum hydroxide added (10-20 cc. to be added to each glass of milk)			

patient must be expended if optimum protein intake is to be maintained. In some cases an optimum protein intake may be attained by increasing total calories, especially carbohydrate foods, and thus "sparing" protein. In other instances it will be possible to increase the total protein intake to a reasonable quantity. If limited protein intake and a high caloric diet are advocated, it is obvious that the protein so used must be of high biologic value. Unfortunately the protein requirements of patients with kidney disease cannot be stated generally, since different forms of the disease may require different management. In table 3 a summary of protein recommendations for the more common forms of kidney disorder is presented.

2. *Proteinuria and Hypoalbuminemia:* The loss of large quantities of protein in the urine, with the consequent reduction of serum albumin level, is a major factor in the production of protein deficiency in patients with kidney disease. It would appear logical that patients with kidney disease and proteinuria would require at least the optimum protein intake of normal individuals of similar age and stature and, in addition, a quantity of protein equivalent to that lost in the urine. Such amounts would of course not provide for any accumulated protein deficit which antedated the onset of treatment and which in many patients may have reached a considerable magnitude because of the insidious nature and long duration of the illness. The need for a high protein intake in patients with proteinuria, hypoalbuminemia and edema appears obvious (table 3, types I, II, III). When uremia and hypertension

<sup>2</sup> Stare, F. J., and Davidson, C. S.: Protein: Its Role in Human Nutrition, J. A. M. A. 127: 985 (April 14) 1945.

complicate kidney disease, the dietary protein requirements may be modified significantly (table 3, types IV, V, VI), and this is particularly true in the absence of proteinuria, hypoalbuminemia and edema.

Under certain circumstances, particularly in the presence of pronounced anorexia, nausea or vomiting, it may not be possible to correct protein deficits by oral protein administration. Under these circumstances protein hydrolysates diluted to 5 per cent concentration with 5 per cent glucose solution, concentrated human plasma or human albumin solution may be employed with great advantage. A concentrated albumin solution, low in salt content and fortified with tryptophan and isoleucine, would appear to be particularly indicated for patients with hypoalbuminemia and edema. It should be emphasized that the best results in the use of parenteral protein solutions occur in conjunction with an adequate caloric intake, under which circumstance the probability of protein so administered being used to replace depleted protein reserves is greatly increased. Solutions of protein which contain appreciable quantities of salt, i. e., concentrated human plasma, while available as sources of protein, may be almost useless as diuretic agents. Protein hydrolysates are excellent sources of protein building material but have little value as diuretic agents other than the additional urea which is thereby provided.

It is apparent that protein deficiency induced by proteinuria will require long continued and intelligent cooperation by patient, dietitian and physician if a significant change in clinical status is to be effected. An intake of large quantities of diet protein of high biologic value is a sine qua non in patients with hypoalbuminemia without excessive nitrogen retention.

3. Protein as a Diuretic Agent: Dietary protein. It is not generally appreciated that in patients with edema without azotemia a high protein diet not only aids in correcting a negative nitrogen balance but also may serve a useful function as a diuretic agent. Dietary protein may be expected to improve urine output as a consequence of (1) an increase in urea available for excretion, (2) an increased sodium excretion with the fixed acid of the protein diet or (3) increased potassium content of protein diet. With many patients, however, even a large daily intake of protein does not result in the disappearance of edema, and by some of these patients additional urea may not be well tolerated. Under these circumstances protein solutions, given intravenously, may act very successfully.<sup>3</sup> Concentrated human plasma solutions have the distinct disadvantage of containing rather large quantities of sodium chloride, and hence the diuretic property of the protein solution may be greatly offset. Recently considerable success has attended the use of "salt poor" concentrated human albumin solutions.<sup>4</sup> The accompanying chart presents a typical experiment in which concentrated human albumin solution was employed as a diuretic agent for a patient with nephrotic syndrome.

Patients who are to receive "salt poor" albumin should be maintained on a protein intake of at least

70 to 80 Gm. daily with a diet of low salt content if maximum benefit is to be derived from albumin treatment. In most instances the optimum daily dose of albumin appears to be 50 Gm. intravenously. It is well not to exceed a rate of administration of 10 Gm. per hour, and it is recommended that 50 Gm. of albumin be made up to 500 cc. volume with 5 per cent glucose and administered at the rate of 100 cc. of solution per hour. The addition of glucose in this concentration to "salt poor" albumin yields a solution which, being isotonic, does not lyse red cells in vitro or, in our experience, in vivo. Albumin may be given advantageously from 1 p. m. to 6 p. m. following an early lunch or in the evening from 7 o'clock to 12 midnight. In this way the intravenous administration of albumin does not interfere with the patient's daily food intake.

Concentrated human albumin solution as a diuretic agent.

The administration of albumin intravenously is not recommended for patients with pronounced hypertension and cardiac failure.

II. Diseases of the Liver.—Cirrhosis: Cirrhosis of the liver, through its impairment of liver function by the replacement of liver tissue with fibrous or fatty tissue and with its attendant portal obstruction and consequent interference with normal gastrointestinal function, frequently is responsible for serious undernutrition. Particularly is protein deficiency likely to be present because it is probable that most of the components of the plasma are synthesized in the liver. The specific manner in which liver damage involves protein metabolism is not known precisely, but the difficulty with which the serum albumin level is maintained in patients with advanced cirrhosis of the liver is common knowledge. On the basis of the observations of

3. Janeway, C. A.; Gibson, S. T.; Woodruff, L. M.; Heyl, J. T.; Bailey, O. T., and Newhouser, L. R.: Chemical, Clinical and Immunological Studies on the Products of Human Plasma Fractionation: VII. Concentrated Human Serum Albumin, *J. Clin. Investigation* 23: 465, 1944.

4. Thorn, G. W.; Armstrong, S. H., Jr.; Dickerson, V. C.; Woodruff, L. M., and Tyler, F. H.: The Use of "Salt Poor" Concentrated Human Albumin Solution in the Treatment of Chronic Bright's Disease, to be published.

Patek and Post<sup>5</sup> the advantages of a diet high in protein and vitamin B complex, as well as carbohydrate, have been demonstrated in patients with cirrhosis of the liver and ascites. Practical difficulties are frequently encountered, however, in administering such a diet.

Tube feeding is contraindicated for patients with cirrhosis of the liver unless the absence of esophageal varices has been established. In patients with cirrhosis the serum albumin level may be improved by the administration of concentrated protein solutions (human plasma and albumin) intravenously.<sup>6</sup>

Recent studies indicate that "salt poor" concentrated human albumin solutions administered intravenously may be particularly effective in increasing serum albumin levels and in promoting a diuresis in patients with generalized edema and ascites.<sup>6</sup> The use of "salt poor" concentrated human albumin is a particularly effective form of parenteral protein therapy because of its high colloid osmotic activity and its low sodium chloride content.

Hepatitis: In the past considerable attention has been given to providing a high carbohydrate intake for patients with hepatitis. Therapy was obviously directed toward increasing liver glycogen in the hope that hepatic damage would thus be decreased. More recent experiments and clinical studies indicate the value of protein in protecting liver cells against noxious agents, and hence diets of higher protein content are now being advocated in the treatment of patients with catarrhal jaundice, toxic hepatitis and subacute yellow atrophy of the liver. During the acute phase of the illness it may be necessary to supply protein parenterally (see section on parenteral fluids). Because of the impairment in deamination which these patients exhibit, protein hydrolysates, if given, must be administered very slowly. Protein solutions such as concentrated human plasma and albumin are to be preferred.

The sulfur-containing amino acids methionine and cystine have been emphasized as the particular protein components of importance in protecting the liver from toxic hepatitis. There are experimental and clinical studies to support their value, particularly in arsphenamine injury and in liver damage from carbon tetrachloride.

Specific suggestions in the management of patients with cirrhosis and hepatitis follow:

1. A daily intake of 75 to 150 Gm. of protein, 300 Gm. or more of carbohydrate and 50 Gm. of fat is recommended. In general it is possible to consume 100 Gm. of protein with three daily meals. The remainder of the protein may be provided in supplementary high protein feedings. (See section on protein therapy.)

2. In the absence of esophageal varices, tube feeding with high protein mixtures may be undertaken. (See section on protein therapy.)

3. Approximately 10 mg. of thiamine, 10 mg. of riboflavin, 250 mg. of niacin amide and 500 mg. of ascorbic acid are given daily during the first three or four days. Later the dosage of all these vitamins may

be reduced to approximately one fifth of these quantities. Choline chloride or methionine may be given in enteric capsules 1.0 Gm. twice a day.

4. Intravenous administration of protein, carbohydrate and water soluble vitamins may be indicated, depending on the condition of the patient. Recent studies suggest that a concentrated solution of "salt poor" human albumin administered intravenously may result in a striking rise in serum albumin level and in the replenishment of depleted protein stores.<sup>6</sup>

III. *Diseases of the Gastrointestinal Tract.*—In the Northern section of the United States it is fair to state that most instances of protein deficiency develop secondarily to diseases or malfunction of the gastrointestinal tract. Such illnesses as chronic peptic ulcer with repeated bleeding, chronic pancreatitis, enteritis and ulcerative colitis rank high in the diseases responsible for protein deficiency. The mechanisms by which these illnesses induce deficiency states are decreased appetite or food idiosyncrasies, restricted diets, intestinal hypermotility with diarrhea, draining fistulas and excessive putrefaction. The important role which hypoalbuminemia and consequent edema of the bowel exert on the maintenance and aggravation of abnormal gastrointestinal function is especially appreciated by surgeons in the preoperative preparation of such patients.

Because most of the diseases considered in this group are likely to be chronic and result in more or less permanent structural or functional changes, their seriousness from a nutritional point of view is at once apparent. It is obvious that, although special measures may be introduced from time to time to correct particular deficiencies, it is the adequacy of the daily diet continued over long periods of time which is of prime importance. In this respect the protein content of the diet becomes very important, since in many instances the diet contains only a minimum number of calories and there is little opportunity to effect "protein sparing" with carbohydrate and fat. The desirability and at the same time the difficulty of restoring nitrogen balance in these individuals is evident. Repeated feedings of small quantities of food, the use of protein hydrolysates and concentrates by mouth and intravenously and the administration of blood, concentrated plasma and albumin intravenously may all be required. Increasing the blood protein and hemoglobin level may exert a striking effect on the underlying disturbance in gastrointestinal function. The following is an example:

J. A. S., a man aged 63, entered the hospital with the chief complaint of swelling of the legs of six months' duration. He had been in good health until about ten years prior to admission. At that time he began to be troubled by ulcer symptoms and periods of diarrhea. Subsequently the bouts of diarrhea increased, lasting for months at a time. Secondary anemia had been treated successfully with iron and liver injections. Six months prior to admission he began to have swelling of the legs and scrotum. He rapidly lost strength and some 60 pounds (27 Kg.) in weight. On admission to the hospital he was edematous up to the costal margins. Otherwise there was definite wasting. The skin was dry and scaly, the tongue not smooth, and there were no fissures of the lips. Abdominal examination was unsatisfactory because of the edema, but no enlargement of the liver could be detected. The plasma proteins were 1.5 Gm. per hundred cubic centimeters for albumin and 2.6 for globulin. X-ray studies revealed a duodenal-colic fistula. Whole blood and plasma were administered, but with little effect on the plasma protein level. A nasal tube was inserted and

5. Patek, A. J., Jr., and Post, J.: Treatment of Cirrhosis of the Liver by Nutritious Diet and Supplements Rich in Vitamin B Complex, *J. Clin. Investigation* 20: 481, 1941.

6. Thorn, G. W.; Armstrong, S. H., Jr., and Dickerson, V. C.: The Use of "Salt Poor" Concentrated Human Albumin Solution in the Treatment of Cirrhosis of the Liver, to be published.

manipulated under the fluoroscope so that it emerged through the opening of the fistula into the remaining portion of the duodenum. Thus food could be introduced so that it would traverse most of the bowel. By this means the patient was given daily 2,500 calories of a highly nutritious diet containing 100 Gm. of protein as described in table 4. The response of the patient was good, edema decreased, and three weeks after tube feeding the plasma proteins had increased to 2.1 Gm. per hundred cubic centimeters of albumin and 3.3 of globulin.

**IV. Convalescence and Overwhelming Infection.**—Little is known about the alterations in protein metabolism in the presence of severe infections. That rapid wasting of serum and tissue proteins may be an important factor in the death of patients in whom bacterial infection has been well controlled by sulfonamide or penicillin therapy is suggested by the recent reports of Tillett<sup>7</sup> and of Armstrong and his associates.<sup>8</sup> The report of the latter authors mentions 2 patients, 1 a

animals. It is known that an acute dietary protein deficiency superimposed on previously well nourished or chronically protein deficient rats will cause acute contraction in the blood volume.<sup>9</sup> In patients with overwhelming infections, such a factor added to the already disturbed circulatory dynamics may well be a part of the little understood "medical shock" which may persist despite efforts to hydrate the acutely ill patient. A more subtle result of severe protein loss may be failure of proper antibody responses to a disseminated infection. Cannon<sup>10</sup> has shown that rabbits following plasmapheresis fail to develop adequate antibodies. Since we know that penicillin is bacteriostatic in vitro and is bactericidal in vivo by virtue of body immunologic and phagocytic activity, the importance of maintaining adequate protein reserves in the body is evident. Knowledge of these antibody relations is fragmentary

TABLE 4.—Formula of High Nutritive Value for Tube Feeding

Total volume about 1,500 cc. Should be made up fresh daily and kept in a closed container in refrigerator. Mixing in good mechanical mixer is necessary in preparation. Give feedings of approximately 100 cc. conveniently spaced throughout the day and/or night. Material is most readily given with a 50 or 100 cc. syringe through a small nasal tube, which may be left down for three to four weeks. Use alternate nostrils at weekly intervals. The mixture may be given just as it comes from the refrigerator—it is not necessary to warm it.

young man with pneumococcal pneumonia involving four lobes and the other a man aged 85 with pneumonia due to the staphylococcus, which complicated prostatic surgery. In both patients the infection was brought under control promptly with penicillin, but because of the serious debility which accompanied the disease the patients had a very prolonged and stormy convalescence. It was apparent in reviewing these cases that massive plasma and whole blood therapy administered during the convalescent period played an important part in combating the hypoproteinemia and anemia which was present in both of these patients, and it is probable that correction of the striking nutritional deficiencies contributed significantly to the eventual recovery.

The role of rapidly developing hypoproteinemia in overwhelming infections needs much study. The direction of possible investigation may be inferred from the large literature on experimental protein deficiency in

at present. There are nonspecific antibodies<sup>11</sup> which appear within the first few hours to days of infection, to be followed in one to two weeks by more specific antibodies. Among the early types of nonspecific antibodies are the anti C substance<sup>12</sup> and the leukocyte promoting factors,<sup>13</sup> both of which have been shown to be globulins. Among the specific antibodies which have to do with crises in pneumonia and convalescence in other infections are the precipitins, complement fixing and protective antibodies of classic immunology. Whether these defense mechanisms are also interfered with by acute protein starvation, as seems likely from Cannon's work, needs investigation.

Recently the Committee on Convalescence and Rehabilitation of the National Research Council has

published a report<sup>14</sup> in which the large losses of nitrogen and general weight loss following serious trauma and various diseases are stressed. As much as 50 Gm. of protein may be lost per day from exudates or discharges in peritonitis or open wounds. Furthermore, if there are insufficient calories in the diet, protein must be used as a source of calories. The report emphasizes the necessity of high protein intake as part of the general therapy and of beginning it promptly. The importance of good nutrition from the point of view of preventive medicine is emphasized, and optimum nutrition appears to be one of the most important aspects in the general treatment of convalescence and rehabilitation.

**V. Diabetes Mellitus.**—It is well established that in untreated or poorly regulated diabetes large quantities of nitrogen are excreted in the urine (increased D:N ratio) as the result of increased gluconeogenesis (conversion of protein to carbohydrate). As a consequence of this a large protein deficit may occur. Treatment with insulin reduces the rate of protein breakdown. Ample protein in the diet is required, however, if protein deficit is to be corrected. It is suggested that during the first few weeks of treatment 1.5 Gm. of protein per kilogram be allowed adult diabetic patients. Later in the course of treatment 1 Gm. per kilogram, or a minimum of 70 Gm. of protein, should prove ample.

Neuritis is often an accompanying finding in diabetes and is frequently due to a lack of sufficient thiamine. High protein diets in diabetic patients will help to prevent neuritis, since the protein foods are generally good sources of thiamine as well as other members of the vitamin B complex. In the treatment of diabetic neuritis, a diet high in protein content and vitamin B complex must be maintained for prolonged periods.

**VI. Thyrotoxicosis.**—The protein requirement of patients with thyrotoxicosis is greatly increased because of the conspicuous rise in metabolism which occurs in this disease. Weight loss may be extreme, and it is known that muscle protein and liver protein are greatly reduced. The well defined and widespread alteration in muscle function is indicated by muscular weakness, greatly reduced creatinine excretion and decidedly increased creatine excretion. During the early period of specific therapy there is an obvious retention of creatine in these patients. A high caloric, high protein diet is indicated during the early weeks of therapy in conjunction with thiouracil, iodine medication or surgical measures.

**VII. Gout and Allergy.**—Gout and allergy are included in this discussion for the particular reason that dietary restrictions (low purine and elimination diets) imposed on patients with these diseases often result in general restriction of many types of food. Under these conditions evidence of protein deficiency, as well as other nutritional deficiencies, may develop since such peculiar dietary habits may be followed for long periods of time. In table 5 it is obvious that most patients with gout may be permitted unlimited quantities of protein foods listed among the low purine or purine free items.

**VIII. Anorexia Nervosa.**—Protein deficiency frequently exists (a) because of insufficient food intake (either carbohydrate or protein) or (b) because of peculiarity in food habits. A nutritious diet particularly high in protein because of the latter's satiety value

is indicated. Tube feeding may at times be necessary and is of great assistance in correcting the more critical nutritional deficiencies. The ultimate outcome, however, rests largely with the success of a competent psychiatrist.

**IX. Anemia.**—Of the various substances known to be necessary in hemoglobin formation, protein and iron are needed in the largest amounts. A diet may be adequate in protein yet poor in iron. This is particularly true if an appreciable quantity of the protein is furnished by milk which is low in iron. The vast majority of the cases of hypochromic or nutritional anemia seen in this country are due principally to iron deficiency and not to protein deficiency. In fact, a hypochromic anemia due to protein deficiency is rare even in cachectic individuals. This is due in part, no doubt, to the fact that hemoglobin formation takes preference over other body protein needs. However, the mere fact that hemoglobin is a protein would suggest that a good protein intake be maintained in patients with anemia. In the treatment of pernicious anemia, liver has a particular role to play in that it serves as a source of the extrinsic factor, which, however, as far as is known, is not a part of the liver protein.

**X. Hypoglycemia.**—Spontaneous, idiopathic attacks of hypoglycemia occur not infrequently in individuals

TABLE 5.—Purine Content of Foods\*

of nervous temperament in the absence of demonstrable adrenal, pituitary, pancreatic or liver disease. Attempts to correct these episodes by supplementary carbohydrate feedings usually result in a vicious cycle associated with considerable weight gain. A meal high in protein may greatly decrease the wide variations in blood sugar level which occur in such persons. The use of a high protein diet in the treatment of such patients is highly recommended.<sup>15</sup>

**XI. Hypoproteinemia Primarily Dietary in Etiology.**—Occasionally patients are observed with clearcut signs of protein deficiency but with apparently adequate protein intake and no objective evidence of impaired absorption or utilization. Usually such patients are women, and careful questioning will indicate that the protein intake during the past is not as adequate as one was first led to believe. It is also probable that for some unknown reason the protein requirement is actually increased. These patients can generally be completely cured by simply seeing that high protein diets are consumed. The following history is typical:

E. J. M., a woman aged 29, single, entered the hospital with the chief complaint of intermittent swelling of the feet

and legs during the last four years. At the onset of her illness four years before she was studied by her local physician and was said to have shown only a low serum protein. On a regimen of bed rest and high protein diet, the edema gradually disappeared after three months. Since then she has been troubled with intermittent edema. Two months prior to admission, the swelling of the legs and feet increased and after a

day's work sitting in the office, her hips would be swollen. Physical and laboratory examination, including various liver and kidney function tests, were repeatedly normal except for low plasma protein values of 2.2 Gm. of albumin per hundred cubic centimeters of plasma and 2 Gm. of globulin. The patient was encouraged to consume a diet containing 125 Gm. of protein per day. Response was rapid; four weeks after starting to consume a high protein diet, all signs of edema were gone and the plasma proteins were 3.2 Gm. of albumin per hundred cubic centimeters and 2.6 Gm. of globulin.

## PROTEIN THERAPY

**Food.**—As in other types of nutritional therapy, good food by mouth is the most effective and satisfying way to administer protein. While temporary therapy with protein concentrates of various types is often valuable and even necessary, it is only a highly nutritious diet over a long period which will give satisfactory results. Increasing the amount of protein in a diet is one of the best general ways to improve a diet, for protein foods are usually good carriers of many other nutrients, such as vitamins of the B complex and minerals. Meats, fish, eggs, milk and cheese, whole grain cereals, beans and peas are all good sources of protein, and as long as a variety of these foods is eaten it is most likely that good quality protein (furnishing all essential amino acids) will be obtained.

In the presence of sufficient calories to supply energy needs, the generally recommended allowance of 1 Gm. of protein per kilogram of body weight for the normal

TABLE 7.—Protein Concentrates for Oral Administration

"Amigen".....	75 per cent protein
Casein (crude, edible variety).....	85 per cent protein

adult is most ample, probably allowing a margin of close to 100 per cent above actual protein requirements. Thus a daily intake of 70 Gm. of protein would be recommended for the average adult. Such an amount would be furnished by consuming the foods listed in table 6. Many variations in these suggested protein foods are possible with the help of food composition tables and the application of nutritional and common sense. High protein diets are obtained simply by increasing the amounts of the better protein foods.

The addition of a glass of milk, an egg, another serving of peas or beans, 1 more ounce of meat and a serving of cheese to the protein foods just listed will raise the protein quantity to 100 Gm. These foods must be consumed, not merely ordered by the physician or served on the tray by the dietitian.

## PROTEIN CONCENTRATES—ORAL ADMINISTRATION

It is frequently difficult to consume more than 100 Gm. of protein daily, and a person not feeling too well and one confined to bed may even have difficulty in consuming 60 to 70 Gm. of protein. Thus if it is desired to prescribe a good quantity of protein per day, as it frequently is, one must resort to supplementary nourishments with protein concentrates. For this purpose one may use food preparations rich in protein, or there are available various preparations of hydrolyzed protein rich foods especially prepared for oral administration. Table 7 lists some of these protein concentrates. Dietene, Aminoids and Amigen are trade preparations. The latter two consist of hydrolyzed proteins—Aminoids of a mixture of wheat, beef,

Add milk gradually  
Cook for 10 minutes

milk and yeast proteins and Amigen of an enzymatic digest of casein. In persons with normal gastric and pancreatic function we know of no reason why hydrolyzed proteins should be preferred to unhydrolyzed preparations, and in our experience crude commercial casein has given excellent results as a protein concentrate for oral administration. Aminoids does not support growth in young rats<sup>15a</sup> when it is fed as the sole source of protein.

On the other hand, Mr. Robert A. Harte of the Arlington Chemical Company, producers of Aminoids, has drawn to our attention unpublished experiments conducted in Whipple's laboratory showing that Aminoids as the sole source of dietary nitrogen is capable of giving satisfactory regeneration of blood protein in anemic and hypoproteinemic dogs. Mr. Harte also informs us that unpublished studies by Co Tui on a series of patients during postoperative convalescence have shown that this product as the sole source of protein can maintain positive nitrogen balance in human beings. In the few protocols of these experiments that we have seen, the Aminoids has been fed in large amounts (34 to 70 Gm. per day in the dog experiments and 150 to 290 Gm. per day in the patients). A more critical test of the nutritional value of a protein is to

15a. Hegsted, D. M.; Hay, A. J., and Stare, F. L.: Unpublished data.

study its performance, whether in growth or in nitrogen balance, at a minimum level of intake, for proteins that are low in any of the essential amino acids become adequate if fed at a sufficiently high level. Rats receiving this preparation frequently have diarrhea. We have also observed the latter symptom in many patients given this preparation.

Protein concentrates may be incorporated into breads, cake, sandwich spreads, desserts, hot cereals and so on, or may simply be stirred up into milk, bouillon or soups. Table 8 gives the formula for a high protein tomato soup that we have found useful, economical and satisfactory as a means of giving supplementary protein. Such a preparation is appetizing and 1 cup furnishes 34 Gm. of high quality protein. If 2 cups a day are given at approximately 9 a. m. and 3 p. m. a total of 68 Gm. of protein will be furnished and the patient's appetite will not be impaired. A third supplementary feeding may easily be given at 9 p. m.

#### TUBE FEEDING

Not infrequently it is difficult for patients to consume an adequate diet and it may be temporarily impossible for certain patients to swallow food. Under these circumstances one may be forced to resort to tube feeding or parenteral administration of nutrients. Tube feeding, if carefully used, may be an extremely helpful therapeutic procedure in a wide variety of diseases. A pliable rubber tube of approximately 2 or 3 mm. bore is inserted into the stomach. Generally it is less bothersome if passed through the nose rather than through the mouth. The smaller the amount of tubing in the stomach the better. At least 1 foot of tubing should extend out of the nose, and this should be conveniently and securely taped to the cheek and brought up around the eye to the forehead. The tube may be left in position for a week and then removed and shifted to the other naris. If the tube is well supported it will not be uncomfortable. The end of the tube should be kept closed by folding over and fastening with a rubber band. In passing food down the tube, care should be taken to avoid forcing air into the stomach. It is well to withdraw 20 to 30 cc. of air from the tube with a syringe prior to the actual passing of food. Feedings are best given in small amounts of approximately 50 to 100 cc. at hourly intervals. These may be continued throughout the night with little discomfort or inconvenience to the patient. The tube feeding formula given in table 4 has been found to be very useful. It is readily seen that this formula is very nutritious and that its composition with respect to calories and protein can be easily adjusted.

Two complications frequently experienced in tube feeding are distention and diarrhea. Distention may be reduced by giving frequent small feedings and using care not to force air into the stomach with each feeding. Diarrhea may be controlled by varying the amount of applesauce (or commercial pectin preparations may be used). In occasional cases we have used paregoric temporarily. As has been previously mentioned, tube feeding may be contraindicated in the presence of esophageal and gastric varices.

#### PARENTERAL PROTEIN THERAPY

Parenteral protein therapy consists essentially in the intravenous administration of blood, plasma, albumin or various casein hydrolysates. It should be empha-

sized that protein therapy by vein does not include the many other nutrients furnished with orally administered protein foods. One should be aware of this if parenteral therapy is continued for any length of time and if this mode of administering nourishment represents the sole or major source.

Concentrated human plasma and albumin solutions are very suitable for intravenous administration. Cost and availability limit their use. If this form of therapy supplements oral ingestion of food and is combined with carbohydrate calories (glucose) a strongly positive nitrogen balance may be attained with moderate quantities of parenteral protein. When parenteral protein must supply a large proportion of caloric needs and can be given in only moderate amounts, it is obvious that protein storage or replacement will be greatly reduced. Recent investigations have shown that human plasma<sup>16</sup> and albumin<sup>17</sup> are inadequate when each is used as the sole source of protein for growth in the rat. They are satisfactory if isoleucine is added to plasma and isoleucine and tryptophan to albumin. Whether these observations apply in human subjects is not known but they deserve consideration.

Mixtures of amino acids are well utilized intravenously as well as orally. Generally these mixtures are

actually hydrolysates of casein prepared by either enzymatic hydrolysis ("Amigen") or acid hydrolysis ("Parenamine"). In the latter case tryptophan is added to the hydrolysate to compensate for that destroyed by the acid hydrolysis. The actual amount of amino acids present depends on the completeness of the hydrolysis. These preparations are generally diluted with 5 or 10 per cent dextrose solution to give a hydrolysate concentration of from 2.5 to 5 per cent. The continued use of such preparations frequently results in venous thrombosis at the site of injection, and mild pyrogenic reactions may be experienced. If given too rapidly, nausea and vomiting may result. The mixture presented in table 9 has been found useful for intravenous nutrition.

Mixtures of the purified essential amino acids have been given to man and are reported to have been very well tolerated. Recent studies of Albanese and his co-workers<sup>18</sup> suggest that the unnatural isomers of tryptophan and phenylalanine are not readily utilized by man. When purified amino acids are available in sufficient amounts they should offer an ideal solution to the problem of intravenous protein therapy.

SATURDAY, APRIL 28, 1945

STATISTICS AND PROPAGANDA

Among the major annoyances to American physicians of the last decade have been the loose statements emanating from propagandists in support of proposed changes in methods of medical practice. The death rates in the United States, although they are among the lowest if not the lowest of any great nation in the world, are always described as "shocking" or "amazing." We are told again and again that one third or more of American youths are physically unfit, but they never say physically unfit for what or by what standard. This type of viewing with alarm has now aroused the satire of a writer for the *New York Times*. He says in a recent issue that there is one indispensable rule for viewing with alarm and that is, when quoting, never to use conditional or supplementary clauses. His first example is a statement recently syndicated under a Washington dateline: "Only one American in a thousand is really well fed." Now actually Americans are today about the best fed people in the world. This does not mean to say that the modern advances in the science of nutrition are universally applied. That will no doubt involve a long process of education. No one has yet discovered a technic for overcoming completely the cultural lag between the acquisition of knowledge and its extension to the remotest individual in the population. The truth about nutrition is expressed in the following, which is the whole sentence: "Only one American in a thousand is really well fed, in the sense that no further improvement in his physical condition could be made by changes in his diet."

Innumerable Americans have been startled in the last three years by the amazing misuse of the statistics coming from the Selective Service System and repeatedly quoted by writers in the press and in the reports of various governmental committees. Even Senator Pepper's Interim Report of the Committee on Education and Labor of the U. S. Senate emphasized the

statistics although they did use also the saving statement that we are not obviously a nation of weaklings. The writer for the *New York Times* calls attention to the statement "Only one American in ten thousand can really be said to boast of a proper physique." This is a startling indictment, but the sentence, to be finished honestly, must include the clause "taking the Apollo Belvedere as a standard." Scientific writers have emphasized again and again that the examination of millions of young men was conducted for a specific purpose—to obtain an army. Moreover, the standards of induction varied from time to time, beginning with an exceedingly high standard when we were concerned with the raising of an army of a million men for training and proceeding to a somewhat lower standard, involving the acceptance of men with manifest disabilities, when it became necessary to scrape the bottom of the barrel. Under the heading "This Nation's Health" the *New York Times* commentator says:

That second example of what we may call the missing conditional clause is no doubt considerably exaggerated. But in kind if not in degree it is in the same class with so many statements about the positively frightening percentage of American school children who suffer from physical defects, said "defects" often consisting of troublesome tonsils or a couple of tooth cavities or three pounds under weight. It applies, though in less degree, to the large percentage of men disqualified for military service, where the emphasis on "military" is slighted and then entirely forgotten. We end up by speaking of the American nation as 25 per cent physically unfit.

Similarly we must analyze more scientifically all of the figures now being developed relating to what are called neuropsychiatric disabilities or defects. Many experts are convinced that a large percentage of those who are classified neuropsychiatric under military conditions are able to live efficient, satisfactory lives as civilians in the occupations to which they are adapted. A psychologist has pointed out that the age of 16 years is taken as a maximum for mental sufficiency, so that we need not be alarmed if we are called a nation of 14 year old or 12 year old mentalities. If Thomas Jefferson and Winston Churchill are classified as 16's, the rest of us can be reasonably satisfied to be called 14's.

Not every one is capable of evaluating scientifically the startling statements made by those who would strike fear as part of a propaganda to secure change. Quoting again:

... It is dynamic to say that Americans are really not well fed, if the plain duty of nutrition is to turn us all into Discus Throwers and Venus de Milos, into Johnny Weissmüllers and Babe Diedricksens.

The usual retort is that in order to get people to do things you must throw a scare into them. And yet President Roosevelt said that the only thing we have to fear is fear itself.

## MARIHUANA PROBLEMS

For many years medical scientists have considered cannabis a dangerous drug. Nevertheless, a book called "Marihuana Problems" by the New York City Mayor's Committee on Marihuana<sup>1</sup> submits an analysis by seventeen doctors of tests on 77 prisoners and, on this narrow and thoroughly unscientific foundation, draws sweeping and inadequate conclusions which minimize the harmfulness of marihuana. Already the book has done harm. One investigator has described some tearful parents who brought their 16 year old son to a physician after he had been detected in the act of smoking marihuana. A noticeable mental deterioration had been evident for some time even to their lay minds. The boy said he had read an account of the La Guardia Committee report and that this was his justification for using marihuana. He read in *Down Beat*, a musical journal, an analysis of this report under the caption "Light Up Gates, Report Finds 'Tea' a Good Kick."

A criminal lawyer for marihuana drug peddlers has already used the La Guardia report as a basis to have defendants set free by the court.

The value of the conclusions is destroyed by the fact that the experiments were conducted on 77 confined criminals. Prisoners were obliged to be content with the quantities of drug administered. Antisocial behavior could not have been noticed, as they were prisoners. At liberty some of them would have given free rein to their inclinations and would probably not have stopped at the dose producing "the pleasurable principle." A recent tragedy, the case of the hotel bell boy who killed a federal guard in Oklahoma City while under the influence of marihuana, is more eloquent testimony concerning the dangers of the drug.

The report states that the relation between marihuana and crime is unfounded. This opinion, based on tests of 77 prisoners, denies much available evidence. Kolb, nationally known addiction expert, after reading the report stated "one may say of such a drug that, if it were abused as alcohol is abused, it might be an important cause of crimes and other misdemeanors." The annual reports of the League of Nations are filled with cases on the relation between marihuana and crime. Likewise the recent article which appeared in the December 1944 issue of *War Medicine* entitled "The Marihuana Addict in the Army," by Capt. Eli Marcovitz and Capt. Henry J. Meyers, is a devastating refutation of the information contained in the La Guardia report.

The report proposes the use of marihuana in the treatment of drug addiction and chronic alcoholism.

Bouquet, the League of Nations expert, and others agree with Kolb that this proposal enters dangerous territory and that the result can only be the substitution of one addiction for another.

The book states unqualifiedly to the public that the use of this narcotic does not lead to physical, mental or moral degeneration and that permanent deleterious effects from its continued use were not observed on 77 prisoners. This statement has already done great damage to the cause of law enforcement. Public officials will do well to disregard this unscientific, uncritical study, and continue to regard marihuana as a menace wherever it is purveyed.

## ORAL PENICILLIN

Penicillin, it has been assumed, cannot be administered orally because of its rapid destruction by gastric acidity.<sup>1</sup> If this antibiotic could be protected from such destruction and still made available for absorption from the small intestine, administration by mouth would be successful. Libby<sup>2</sup> of the Stamford Research Laboratories, American Cyanamid Company, attempted to accomplish this by the use of enteric coated penicillin tablets. These gave unsatisfactory results. Consistent blood levels of penicillin could not be obtained, owing presumably to variations in the time and place of disintegration of the enteric coating.

Reasoning from the fact that little or no digestion of fats takes place in the normal stomach, Libby then tested oral administration of penicillin in the form of an oil or fat solution or suspension. Preliminary tests showed that a fine suspension or dispersion of penicillin salts in various oils can be kept at room temperature for many months without appreciable reduction in antibiotic titer. For clinical tests 150 to 300 Oxford units of sodium or calcium salts of penicillin per milligram were finely dispersed in cottonseed oil. The resulting suspensions were enclosed in gelatin capsules made up to contain from 10,000 to 50,000 Oxford units each per capsule.

Following the oral administration to an adult patient of a single dose of 90,000 units of sodium penicillin in cottonseed oil, 0.4 Oxford unit of penicillin per cubic centimeter was demonstrated in the first urine sample taken twenty-five minutes later. Blood levels of 0.05, 0.04, 0.04, 0.02 and 0.00 Oxford unit per cubic centimeter were obtained at the one, two, four, six and eight hour bleedings. The therapeutic blood level (0.03 unit per cubic centimeter) was reached within about thirty min-

utes after oral administration and maintained for nearly six hours, or nearly three times as long as the duration of the therapeutic blood level after intramuscular or intravenous injection. The therapeutic blood level apparently can be prolonged indefinitely by repeated oral doses.

A second apparently logical method of preventing destruction of penicillin by gastric acidity would be by the administration of an antacid. Although unsatisfactory results have been reported by earlier investigators,<sup>3</sup> a detailed restudy of this method was undertaken by Charney and his associates<sup>4</sup> of the Wyeth Institute of Applied Biochemistry, Philadelphia.

Rammelkamp<sup>5</sup> found that 60 per cent of intravenously injected penicillin is excreted in the urine. From this percentage the approximate amount of penicillin absorbed into the blood stream can be calculated from urinary recovery. In a control test Charney administered 32,000 units of penicillin without antacid to a fasting adult and recovered about 700 units of penicillin, or 2.2 per cent of the administered dose, from the urine. This 60 per cent excretion was complete within two hours after oral administration, the four, six, eight and ten hour urine samples being negative. From this it can be calculated that approximately 3.7 per cent of the oral dose was absorbed into the blood stream, or that in the control patients 96.3 per cent of the ingested penicillin was destroyed by gastric acidity.

A number of patients were then given approximately the same dose of penicillin dissolved in distilled water containing 3 to 5 Gm. of antacid. In all cases the urinary excretion was increased and prolonged beyond the two hour period by the antacid. The increase was least with sodium bicarbonate, with which the total urinary recovery was only 6.8 per cent of the oral dose. The recovery was greatest with trisodium citrate or with disodium phosphate. With these the average recovery was 20 per cent of the oral dose. Calculated from this recovery, only about 66 per cent of the ingested dose was destroyed by gastric acidity in the presence of these milder antacids. This figure suggests that the oral dose of penicillin should be increased at least threefold above the intravenous dose if orally administered penicillin plus antacid is to produce the same therapeutic effects.

The data were obtained from patients given penicillin orally after an overnight fast. With patients given the same penicillin-antacid mixture two hours after breakfast the average renal excretion was reduced by 30 per cent. Thus given, the calculated required oral dose would be four times the routine intravenous dose.

Similar results were reported at about the same time by McDermott and his associates<sup>6</sup> of the Cornell University Medical College. The Cornell clinician administered 315,000 Oxford units of penicillin orally to four groups of fasting patients. This dose was administered in four forms: (a) penicillin in 30 cc. of water, (b) penicillin in corn oil, (c) penicillin in water preceded by a buffer (magnesium trisilicate) and (d) penicillin in peanut oil plus 4 per cent beeswax. In each group of patients a serum concentration of from 0.312 to 1.25 Oxford units of penicillin per cubic centimeter (average 0.78 unit) was demonstrable thirty to sixty minutes later, the highest titers being with the two groups given the aqueous solutions. In these two groups the average titer fell to about 0.5 unit per cubic centimeter by the end of two hours. In patients given penicillin in oil or oil plus beeswax the serum titer continued to rise to an average of about 0.9 unit per cubic centimeter by the end of the two hour period. This continued rise suggested to McDermott that the duration of penicillin therapy might be greatly prolonged by the use of a digestible oil as the vehicle. McDermott recommends an oral dose five times the number of units used in intramuscular therapy.

Thus far McDermott has given 12 patients with pneumococcic pneumonia this recommended fivefold oral dose, and the therapeutic results have been as favorable as those following intramuscular administration of the routine dose. Equally favorable clinical results were afterward reported by György and his associates<sup>7</sup> of Philadelphia and Cleveland. These clinicians first treated 18 men for gonorrhea with 15,000 to 40,000 Oxford units of penicillin every three hours for two to three days, each dose being given in combination of 1 to 5 Gm. of trisodium citrate. In all cases a permanent cure was achieved in from one to three days. Three infants with gonorrheal conjunctivitis, 1 girl with streptococcic vaginitis and 1 boy with discharging streptococcic infection of the middle ear were also rapidly and permanently cured by the same method.

From the reported results, therefore, oral penicillin is therapeutically effective when given either as a suspension in a digestible oil or accompanied by one of the milder antacids. The most favorable vehicle, however, has not yet been determined. With either vehicle the effective oral dose is much larger than the routine therapeutic dose if given intramuscularly or intravenously. This disadvantage is offset by the fact that for oral administration relatively inexpensive crude or impure penicillin presumably would be equally satisfactory.

## Current Comment

### GOVERNOR DEWEY VETOES BILLS TO RECOGNIZE SUBSTANDARD MEDICAL SCHOOLS

The New York legislature this year passed two bills to permit the granting of a medical license to graduates of any medical school in the United States. The New York Times, in an editorial comment on one of these bills, April 10, said:

At one stroke the work of the late Dr. William Welch, Dr. Abraham Flexner and the American Medical Association is to be undone. Thanks to their efforts, our best medical schools have few equals anywhere in the world. If the governor should sign the Milmo bill, the diploma mills that withered and died would revive and physicians would have to fight again a battle which they thought they had won. The supposed justification for the Milmo bill is an undeniable shortage of physicians. But this should not be made an excuse for lowering standards of medical education. . . . Whatever our medical situation may be, it is not so low that we must accept an incompetent who has managed to obtain a degree from a second or third rate medical school. Bad medicine can be worse than no medicine.

Word has just been received that Governor Dewey has vetoed both bills. New York State and its governor merit congratulations. Again the standards of medical education and medical care have been saved by the courage and wisdom of a governor, after a legislature failed to recognize its obligation to the people.

### SENSITIVITY OF BACTERIA TO PENICILLIN

The frequency of naturally resistant and fast strains of staphylococcus in chronic suppurating wounds were determined by Gallardo<sup>1</sup> under clinical conditions. The group studied comprised 112 cases of traumatic wounds of the extremities with bone involvement in 30 per cent of the cases. All wounds were of at least two weeks' duration and had been previously treated with one or more of the sulfonamide drugs. Cultures were taken before penicillin was started, and follow-up cultures were made in the soft tissue wounds over a period of twelve days and in bone infections over a two month period. Coagulase tests were used to confirm pathogenicity of the strain. Of the 108 strains examined 24, or 22.2 per cent, were either naturally resistant to penicillin or became penicillin fast during the course of treatment. Approximately 9.4 per cent of pathogenic strains of staphylococcus acquired resistance during the course of treatment. Natural penicillin resistant strains occurred in 12.9 per cent among the pathogenic cocci, a figure almost the same as that reported by Spink and his associates.<sup>2</sup> Among the nonpathogenic staphylococci 17.4 per cent were naturally resistant. The exact period at which the organisms become penicillin fast was not determined, but this varied from five to forty days. The faculty and degree

of resistance are not correlated with pathogenicity, although the small number of nonpathogenic strains (five) prevents definite conclusions regarding them. Biologic activities were not appreciably different in the penicillin fast and penicillin sensitive cocci. Morphologic changes and a tendency to become gram negative were noted in the penicillin fast cocci, but staining characteristics returned to normal after subcultures. These penicillin fast strains in vitro seem to be more susceptible to the bactericidal power of the blood,<sup>3</sup> but clinically there was no evidence that the course of an infection is altered favorably as the result of the cocci becoming penicillin fast. The existing evidence indicates the high rate of natural and acquired resistance of pathogenic strains in infections and emphasizes the importance of assays of the sensitivity of bacteria to penicillin during the course of penicillin therapy.

### STERILIZATIONS IN THE UNITED STATES

Since 1941 Birthright, Inc., of Princeton, N. J., an organization dedicated to fostering, by educational means, a nationwide program of sterilization, has collected and tabulated reports<sup>1</sup> from the various states on the number of sterilizations performed in state institutions. Each state with a sterilization law has reported. In several instances each state institution has reported separately, and of nearly ninety addressed only one failed to reply. Information on the number of sterilization operations done under the law is therefore probably complete, but this gives little idea of the number done in hospitals by private physicians. Up to Jan. 1, 1944 thirty states with a sterilization law had reported the sterilization of a total of 20,600 insane, 20,453 feeble-minded and 1,563 other individuals. California, with over 10,000 sterilizations of the insane alone, led all other states in numbers. Virginia and Kansas were the states with the next largest number of institutional sterilizations. Several states have had their laws declared unconstitutional, and in others the law must be considered as a dead letter at present.

### MALARIA FROM BANK BLOOD TRANSFUSIONS

Two cases of malaria resulting from transfusion of blood which had been stored in a refrigerator have been recently reported by McClure and Lam.<sup>1</sup> The donors responsible for the 2 cases of malaria were related and had spent their childhood in the same small Sicilian town. Symptoms of the disease had not been recognized for twenty-five years. The possibility of transmission of malaria by transfusion of stored blood is now increased with the return of military personnel from malaria infested areas. Consequently when possible the blood from donors who have lived in malaria infested regions should be converted to plasma rather than administered as whole blood.

# MEDICINE AND THE WAR

## ARMY

### THE BATTALION SURGEON

Medical officers serve in many places and in various types of assignments. One of these assignments is that of battalion surgeon. According to the Surgeon General's office, these young medical officers are saving many lives but often receive little credit except from the men they serve. Promotions are slow and they are constantly in physical danger. They hear about the men in the rear hospitals doing professional work of a type similar to that which they expect to do in civil life, but they go on plowing through the mud or sweltering in the heat day by day.

The Surgeon General has arranged for these officers to receive "on the job" refresher courses in the large hospitals when they return to the zone of the interior.

The rotation of medical personnel between front and rear elements has been tried in some places, but it has only a limited application, as green men sent forward are ineffective until they learn their jobs and most of the men in the rear elements are assigned because of peculiar medical skills, making their replacement difficult. The Surgeon General is well aware of all these things and has a sympathetic understanding of the position in which these men find themselves. The excellent results of medical teamwork are due in no small part to them.

### ESTABLISH FIELD HOSPITAL FOR CARE OF CHINESE SOLDIERS

Capt. Julius W. Pastor, formerly of Cleveland, is now assisting in the establishment of a field hospital for the care of Chinese soldiers at a field headquarters of the Chinese combat command in South-Central China. Dr. Pastor was sent to his present station to prepare a site for a field hospital to support the Chinese in the South-Central China area and to aid the Americans who are training the Chinese armies in the American technic of modern warfare and in the mechanics and employment of American supplied weapons. Dr. Pastor graduated from the University of Louisville School of Medicine in 1930. He has been in the service since August 1942.

### ARMY GENERAL HOSPITAL NO. 32

According to a press announcement made by Headquarters, Communications Zone, European Theater of Operations, Army General Hospital 32, recruited and sponsored by the Indiana University School of Medicine, Indianapolis, and largely staffed by Indiana doctors, dentists, nurses and technicians, was the first major army medical installation to be established in Germany. The unit is now established in the facilities of a former German army hospital. This was the first official word received from the Indiana hospital unit in months.

Opening in its new location with a capacity of 1,000 beds the hospital, under the command of Lieut. Col. Cyrus J. Clark, Indianapolis, added 500 beds in its first two days, a period in which the entire staff was on twenty-four hour emergency duty. In the abandoned German army hospital quarters the 32d staff members discovered a quantity of new and unused German x-ray equipment, and a fluoroscope which will permit four exposures on one film, a relatively new development, and is double the capacity of most of those made in America.

Those now assigned to the hospital as department heads are Major Russell D. Hippensteel, Indianapolis, communicable diseases; Major Brandt F. Steel, Indianapolis, neuropsychiatry; Capt. William D. Campbell, Indianapolis, gastroenterology; Capt. William B. Rossman, Indianapolis, general medicine; Capt. Charles A. Everett, Indianapolis, and Lieut. Col. Carl S. Culbertson, South Bend, dental service; Major Charles L. Mahoney, Terre Haute, eye, ear, nose and throat; Capt. John R. Haslem, Terre Haute, neurosurgery; Major Robert L. Ames,

New Castle, urology; Capt. Neil Garber, Dunkirk, orthopedic surgery, and Capt. David E. Engle, Royal Center, cardiovascular diseases.

The 32d General Hospital was activated at Camp Bowie, Texas, in January 1943, went to England in September 1943 and operated two hospitals in the Midlands section of England. On D day it sent dispensary teams to the invasion ports, where they treated many of the first casualties returned from France. The unit moved to Normandy in July 1944 and operated from tent headquarters.

### GENERAL FOSTER HONORED BY CITY

Brig. Gen. George B. Foster Jr., commanding officer of O'Reilly General Hospital, Springfield, Mo., was chosen Springfield's "outstanding citizen and man of the year" and awarded an engraved bronze plaque by the Springfield chamber of commerce for his activities in coordinating the welfare of the hospital with that of the community, giving an "unusual measure of devotion to the advancement of Springfield and the Ozarks." In paying tribute to General Foster at the award dinner, Major Gen. C. H. Danielson, commanding officer of the Seventh Service Command, said he had distinguished himself "as an administrator, as a medical man and as a leader . . . who has become a part of this community . . . and a compelling force."

### NEW PICTURE MAGAZINE FOR AMERICAN AND BRITISH SOLDIERS

A new picture magazine, *Phoenix*, for American and British soldiers fighting together under the South East Asia Command, recently made its debut in India and Burma. It is named after the device which members of the Inter-Allied headquarters staff wear on their shoulder patch. Jointly sponsored by Admiral Lord Louis Mountbatten, supreme allied commander, and Lieut. General R. A. Wheeler, U. S. Army, deputy supreme allied commander, the publication strikes a balance between the things of greatest home interest to boys from the United States and London. It also combines, in about equal parts, the heavier and lighter aspects of fighting a war.

### MAXILLOFACIAL INJURIES

A survey of the North African and Sicilian campaigns showed that of the total admissions to hospitals 0.5 per cent were maxillofacial injuries. Of these, 42 per cent were battle casualties. The incidence of maxillofacial injuries compared to total battle casualties was about 2.2 per cent. In the cases reported there were no deaths caused primarily by battle incurred maxillofacial injury.

### PROMOTIONS IN THE ARMY MEDICAL DEPARTMENT

The following promotions to the rank of brigadier general (temporary) were recently announced by the War Department:

Col. W. Lee Hart, York, S. C.  
Col. Isidor S. Ravdin, Philadelphia.  
Col. Thomas D. Hurley, Tulsa, Okla.  
Col. George R. Callender, Everett, Mass.

### AVIATION MEDICAL EXAMINERS

A class of seventy-three medical officers who recently completed the Aviation Medical Examiners' course were graduated recently from the A. A. F. School of Aviation Medicine, Randolph Field, Texas. Brig. Gen. Eugen G. Reinartz, commandant of the school, presented the diplomas.

## ARMY AWARDS AND COMMENDATIONS

## Captain George L. Maison

The Legion of Merit was recently presented to Capt. George L. Maison, formerly of Detroit, "for service from July 1942 to July 1944 as chief of the Acceleration Unit, Physiological Branch, Aero-Medical Laboratory. He designed and developed the anti-G suit now used by A. A. F. fighter pilots to prevent blackout and to increase combat efficiency. This suit has had a beneficial effect in raising the score of enemy planes shot down by A. A. F. pilots. He demonstrated courage and forceful effort in developing this suit and demonstrating and instructing its use to the Eighth and Ninth Air Forces personnel." Dr. Maison graduated from Northwestern University Medical School, Chicago, in 1935 and entered the service April 16, 1942.

## Captain David Reese

Capt. David Reese, formerly of Charleston, S. C., was recently awarded the Bronze Star. Now stationed in Belgium, Captain Reese was cited for work done in Germany, where he was sent as battalion surgeon to work on German civilians, being there for two months from the middle of October until the middle of December 1944. It was while on this mission that he was cited. He barely escaped capture as the German armies started their big push. Dr. Reese graduated from the Medical College of the State of South Carolina, Charleston, in 1941 and entered the service Aug. 1, 1942.

## Lieutenant Colonel Roger O. Egeberg

The Bronze Star was recently presented to Lieut. Col. Roger O. Egeberg, formerly of South Euclid, Ohio. The citation accompanying the award states that "with untiring efforts and with the highest devotion to duty he trained the troops in the Milne Bay, New Guinea, area from Oct. 28, 1942 to Jan. 31, 1943 in mosquito control and discipline and reduced the malarial rate in a highly malarious area. More troops were thus made

available for the services at a time when they were so urgently needed." Dr. Egeberg graduated from Northwestern University Medical School, Chicago, in 1929 and entered the service Jan. 10, 1942.

## Colonel Jarrett M. Huddleston

The Legion of Merit has been awarded posthumously to Col. Jarrett M. Huddleston, former corps surgeon of the Fifth Army. Dr. Huddleston, one of the first Regular Army Medical Corps colonels to die in action in this war, was killed in Italy on Feb. 9, 1944. He graduated from George Washington University School of Medicine, Washington, D. C., in 1916 and entered the Army as a first lieutenant the following year. During the first world war he served overseas as regimental surgeon of the first Engineers, First Division, was in six major engagements and received the Croix de Guerre for bravery. Before leaving for his last assignment overseas he was stationed at Fort Beauregard, Louisiana.

## Captain Harold A. Timreck

The Air Medal was recently awarded to Capt. Harold A. Timreck, formerly of Washington, D. C., for "meritorious achievement" while participating in aerial combat. Dr. Timreck is also the recipient of the Soldier's Medal for "heroism" in helping to remove wounded airmen from a burning plane. The citation accompanying the award stated, in part, "His courage, coolness and skill on these occasions are in keeping with the highest traditions of the Army Air Forces." Dr. Timreck graduated from Georgetown University School of Medicine, Washington, in 1938 and entered the service May 17, 1941.

## Captain Robert Fawcett

Capt. Robert Fawcett, formerly of Pittsburgh, was recently awarded the Bronze Star for valorous action in Italy. He has also been a recipient of the French Cross. Dr. Fawcett graduated from the University of Pittsburgh School of Medicine in 1937 and entered the service Sept. 3, 1942.

## NAVY

## GUAM FREE FROM MALARIA

Navy medical officers of an epidemiologic unit in Guam who have conducted a survey to determine the prevalence of diseases of military importance recently reported to Marine Major General Henry L. Larsen, island commander, that the natives of Guam are completely free from malaria and filariasis and practically free from syphilis. The unit is under the supervision of Comdr. Raymond H. Goodale, Worcester, Mass., and Lieut. Ralph F. Allen, Miami, Fla.

Carrying field laboratories and medicines to native villages and outposts, the unit has spent more than five months making exhaustive tests on a cross section of the 21,000 natives of Guam. They found a major health problem to be intestinal parasites, particularly hookworm. Examination of 1,021 individuals revealed almost 99 per cent infested with one or more species of intestinal parasites. No malaria originating on Guam has been reported among natives or military personnel. The leading cause of death among adults continues to be tuberculosis, with dysentery the principal cause of death in childhood. Dengue is a definite problem, but no cases of yellow fever or typhus have been found.

Before coming to Guam in 1943 this epidemiologic unit operated at Canton Island, Tarawa, and in the Marshalls. It has been cited by Admiral A. D. Bernhard for "Promotion of Good Feeling Between the Marshallese and Americans."

## NAVY AWARDS AND COMMENDATIONS

## Commander Harry H. Haight

The Legion of Merit was recently presented to Comdr. Harry H. Haight, formerly of San Diego, Calif. The citation accompanying the award read "for exceptionally meritorious conduct in the performance of outstanding services to the government

of the United States as a regimental surgeon attached to the 2d Marine Division, Fleet Marine Force, during action against enemy Japanese forces at Saipan, Marianas Islands, from June 15 to July 5, 1944. Landing shortly after the assault waves, Commander Haight immediately set up an aid station on the beach while under heavy enemy artillery and mortar fire. Although himself wounded on the first day of action, he continued his gallant service throughout the campaign, directing the evacuation of casualties from the beach and the care of the wounded in the face of extremely difficult and hazardous conditions. By his highly skilled supervision of this vital phase of the operations and his expeditious handling of medical supplies to lower elements of the regiment, Commander Haight maintained and enhanced the traditional integrity of his profession." Dr. Haight graduated from the University of Michigan Medical School, Ann Arbor, in 1927 and entered the service Jan. 5, 1941.

## Commander Emil E. Napp

Comdr. Emil E. Napp, formerly of New Rochelle, N. Y., was recently awarded the Bronze Star "for meritorious achievement in action against the enemy at Peleliu and Ngesbus Islands, Palau Group, during the period of Sept. 15 to Oct. 20, 1944. Commander Napp, as commanding officer of a medical battalion of a marine division, displayed exceptional zeal and initiative in the medical problems that confronted him. . . . Although his medical companies were under fire on numerous occasions, he so tirelessly supervised and so strictly coordinated the processing, treatment and evacuation of casualties that many lives were saved. His devotion to duty was in keeping with the highest traditions of the United States Naval Service." Dr. Napp graduated from the New York Medical College, Flower and Fifth Avenue Hospitals, New York, in 1933 and entered the service in June 1941. The ribbon accompanying Dr. Napp's Bronze Star will be the seventh to adorn his uniform. He has

already received the Silver Star, the Navy and Marine Corps Medal, the Purple Heart and the Presidential Unit Citation. He also wears the American Defense ribbon for service prior to Pearl Harbor, and his Asiatic-Pacific Area decoration carries four combat stars.

#### Lieutenant Commander Ernest K. Robinson

The Navy and Marine Corps medal was recently awarded to Lieut. Comdr. Ernest K. Robinson, formerly of Kansas City, for "unusual skill at the operating table" aboard an aircraft carrier in the Pacific, November 25. He is credited with saving the lives of numerous men "thought to be mortally wounded by fire and shrapnel." Dr. Robinson graduated from the University of Pennsylvania School of Medicine, Philadelphia, in 1929 and entered the service in October 1942.

#### Commander Douglas D. Martin

Comdr. Douglas D. Martin, formerly of Tampa, Fla., was recently commended by Admiral C. W. Nimitz. The citation read "for meritorious and efficient performance of duty as chief of medical service at a fleet hospital in the South Pacific area from May 21, 1943 to March 25, 1944." During this period Commander Martin displayed exceptional professional skill in handling the many medical problems which arose. Through his organizational ability and thorough indoctrination of the medical officers and nurses under his supervision he contributed materially to the efficient administration of the hospital to which he was attached. His initiative and leadership were in keeping with the highest traditions of the naval service." Dr. Martin graduated from the University College of Medicine, Richmond, Va.

## MISCELLANEOUS

### NURSES STUDY VETERANS' FACILITIES

With a view to recommending ways to better the nursing service of the Veterans Administration, the National Nursing Council for War Service named a committee of nurses to visit different types of facilities in April and report on procedures found in operation there and conditions under which nurses work. The formal study was undertaken with the full cooperation of Gen. Frank T. Hines, administrator, and Miss Gwen H. Andrew, superintendent of nurses for the Veterans Administration. The committee which made the study had as chairman Miss Anna Taylor, assistant editor of the *American Journal of Nursing*, who visited all three facilities. Miss Elizabeth Bixler, dean of the School of Nursing of Yale University, assisted Miss Taylor in the study of the neuropsychiatric hospital at Bedford, Mass. Miss Esta McNett of Lowman Pavilion, Cleveland City Hospital, cooperated in the study of tuberculosis nursing at Rutland Heights, Mass., and Miss Margene O. Faddis, associate professor of medical nursing, Western Reserve University, in the visit to the general medical and surgical facility at Aspinwall, Pa.

Mrs. Elmira B. Wickenden, secretary of the National Nursing Council, stated that the Veterans Administration needs 1,000 nurses immediately and an additional 1,000 by June 30, according to figures announced by the administration. Since the number now employed is approximately 4,000, filling the need presents greater problems than the number would seem to indicate. If the nurse draft bill now before Congress is passed, nurses employed in veterans' facilities would be exempt. However, the initial base pay of a Veterans Administration nurse is \$1,800 without maintenance, as compared with \$1,800 with full maintenance in Army and Navy Nurse Corps. While nurses in the military services are officers, Civil Service rates the veterans' nurses as "subprofessional." The latter do not receive pensions, care while ill and the various other benefits under the G. I. bill. Mrs. Wickenden declared that "one good way to assure adequate nursing service for veterans would be to review the whole problem of pay, professional status and working conditions in the service and make them conform more nearly to the best practices."

The National Nursing Council for War Service is made up of representatives from the major national nursing organizations, the American Hospital Association and the federal nursing services.

### RETURNS TO ACTIVE SERVICE

Dr. Derek Denny-Brown, professor of neurology in the Harvard Medical School, Boston, and director of the Neurological Unit, Boston City Hospital, has been granted leave of absence from these institutions. He will return to active military duty as a brigadier general with the British forces in India and Southeast Asia. In 1941, after two years of service in the field, he was temporarily released by the British army to carry on research and teaching in the United States. He plans to resume his work in Boston at some later date. Dr. Denny-Brown graduated from the University of New Zealand in 1924.

### WARTIME GRADUATE MEDICAL MEETINGS

The following subjects and speakers for Wartime Graduate Medical Meetings have just been announced:

#### California

Station Hospital, Fort Mason: Diagnosis of Atypical Anemias, Dr. Stacy R. Mettier, May 18.

U. S. Naval Hospital, Treasure Island: Surgery of the Hand, Dr. Edmond Dana Butler, May 4; Selection of Time for Ambulation of General Surgical Patients, Dr. Horace McCorkle, May 18.

Birmingham General Hospital, Van Nuys: A Comparison of Protozoal and Bacillary Dysenteries, Dr. John Kessell, May 9.

Camp Haan, Riverside: Rehabilitation, Lieut. Comdr. H. W. Craig Jr. (MC), U.S.N.R., and Lieut. Comdr. E. W. Lowman (MC), U.S.N.R., May 1.

Station Hospital, Camp Cooke: Recent Developments in Surgical and Public Health Antisepsis, Dr. Frederick Moore, May 2.

Hoff General Hospital, Santa Barbara: Recent Developments in Surgical and Public Health Antisepsis, Dr. Frederick Moore, May 2.

Torrey General Hospital, Palm Springs: Some Fundamental Considerations for the Understanding of Psychiatry, Dr. Glen Meyers and Comdr. Walter Rapaport (MC), U.S.N.R., May 1.

U. S. Naval Hospital, Camp Pendleton, Oceanside: Coccidioidomycosis—Plastic Surgery in Defects of the Head and Neck in Conjunction with Colored Surgical Movies, Dr. Edward S. Lamont, May 10.

U. S. Naval Hospital, Corona: Aviation Medicine, Dr. Fred Helmholtz, May 10.

A. A. F. Regional and Convalescent Hospital, Santa Ana: Repair of the Facial Nerve, Dr. Pierre Viole, May 1.

U. S. Naval Air Training Station, San Diego: Thoracic Surgery, Dr. John Jones and Lieut. Comdr. J. E. Dailey (MC), U.S.N.R., May 4.

#### Kansas

A. A. F. Regional Hospital, Smoky Hill Army Air Field, Salina: Orthopedic Surgery, Dr. A. E. Bence, May 10.

#### Michigan

Percy Jones General and Convalescent Hospital, Battle Creek: Cerebral Arteriography, Dr. C. F. List, May 7; Some Phases of Urology, Dr. Reed M. Nesbit, May 14; Subacute Bacterial Endocarditis Confined to the Right Side of the Heart, Dr. Paul S. Barker, May 21; The X-Ray Examination in the Diagnosis of Urinary Tract Disease, presented by staff members of X-Ray and Urology departments, Percy Jones General and Convalescent Hospital, May 28.

#### Virginia

A. A. F. Regional Hospital, Langley Field: Aviation Medicine, Dr. L. G. Lederer, May 25; Fundamentals of Plastic Surgery, Dr. Robert E. Moran, May 25.

U. S. Naval Hospital, Portsmouth: Shock, Burns and Plasma, Dr. E. I. Evans, May 11.

# ORGANIZATION SECTION

## Washington Letter

(From a Special Correspondent)

April 23, 1945.

### Better Pay Urged for Veterans Administration Doctors

Low pay of Veterans Administration doctors is blamed for the agency's inability to keep its medical and surgical staffs at desired strength. More than 400 of its doctors have entered military service; but about 300, including some of the same men, have since been assigned by the Army and Navy to Veterans' hospitals. Veterans Administration salaries for doctors are said to have become less attractive as the income opportunities of private practitioners have increased. Five salary grades are provided for veterans' doctors, ranging from \$3,200-\$3,850 a year in the lowest grade up to \$6,500-\$7,500 in the highest. Most of its doctors are in the first three grades, with maximum salaries of \$3,850, \$4,600 and \$5,400. Against these salaries are cited Department of Commerce figures on average physicians' incomes, which before the war went up and down, abreast of general business conditions. In 1929 the average income for practitioners was \$5,298; in 1935 it was \$3,629; in 1936 it was \$4,143. The average net income for specialists in 1936 was \$6,521. Through good times and bad the average physician is said to be able to make from \$3,600 to \$5,200 a year under his own management.

### Research Board for National Security Lauded

A favorable reception has been given the bill now before Congress which would make the new Research Board for National Security a direct government agency rather than a subsidy of the National Academy of Sciences. On the joint request of War Secretary Stimson and Navy Secretary Forrestal, Dr. Frank B. Jewett, National Academy president, set up the board composed of twenty leading United States scientists, including medical members. Purpose of the measure is to take over the activities of the Office of Scientific Research and Development when the war ends. This agency has coordinated efforts of leading research men in the development of war weapons and medical procedures.

### National Baby Week Announced April 29 to May 5

National Baby Week is to be celebrated from April 29 to May 5, it is revealed. Its purpose is to encourage healthy babies to assure a healthy future America. A record number of three million new wartime babies and their mothers will be the special recipient of honors. Increasing shortage of doctors and nurses is said to emphasize the need of educating mothers in the proper care of infants. The National Baby Week program is designed to give young mothers the latest scientific information. Publications, displays and lectures will stress correct feeding, fresh air, exercise, early training in good habits and cleanliness. The seventh annual National Posture Week is also announced for May 7 to 12, with emphasis on the fact that 1945 was designated "Physical Fitness Year."

### San Francisco Conference

Informed opinion here is that the San Francisco conference, bearing so importantly on health and medical problems throughout the world, will lay a solid foundation for a workable peace treaty to follow. Washington representatives of the United States delegation left the Capital in optimistic spirit about the successful outcome of the meeting.

### Congress Probe of Kenny Charge Sidetracked

Congress has sidetracked—at least temporarily—a proposal that it investigate charges that Sister Elizabeth Kenny's infantile paralysis treatment program has been subjected to organized opposition. Representative O'Toole, Democrat of New York, asked for creation of a special committee to determine whether or not there had been "organized opposition" to the

Australian nurse and her methods and whether she had been "deliberately impeded." The House Rules Committee took no action on the O'Toole proposal

### Capital Notes

District of Columbia legal officials are endeavoring to learn whether or not there is legal authority for the twelve year old practice at Gallinger Hospital of sterilizing feeble-minded persons on the authority of relatives and hospital physicians. Dr. Daniel L. Seckinger, superintendent of the hospital, believes that a special three man committee from the hospital should determine the necessity of such operations.

Sterilization of persons who "by reason of mental deficiency or viciousness are incapable of evaluating consequences of their behavior" is well recognized medical procedure says Health Officer George C. Ruhland, who told District of Columbia commissioners that there is no legislation on the subject here.

Chairman Bilbo of the Senate District Committee has asked for early and favorable action by the Senate on a bill to use federal funds for a postwar 1,500 bed hospital center in Washington. The bill, sponsored jointly by Bilbo and Senator Tydings, Democrat of Maryland, was unanimously reported out of the Senate District Committee. It authorizes a center estimated to cost between 7 and 12 million dollars, with participating hospitals required to share one third of the cost. The nucleus of the center will be Garfield, Emergency and Episcopal Eye, Ear, Nose and Throat hospitals.

## Official Notes

### DOCTORS LOOK AHEAD

When the script for Doctors Look Ahead has been given final approval it is mimeographed. A dozen or more copies are required for a broadcast, since the performance of a script for Doctors Look Ahead involves eight actors, one or two sound men, an engineer, an announcer, an orchestra conductor and at least one doctor, all of whom must have scripts.

Production is under the direction of Norman Felton, an English born actor and producer, who has been on the stage since he was 8 years old. In this country he has been director of the St. Paul Civic Theater, the Civic Theater of Saginaw, Mich., and the Cleveland Civic Theater of Allied Arts. He has taught experimental playwriting and radio script writing at the University of Iowa and is the recipient of a Rockefeller Foundation fellowship in playwriting.

Under the direction of the producer, action, sound, music, announcing and the medical summary are woven into a precisely timed piece of radio entertainment with a strong dash of instruction and a considerable potentiality for motivation.

Doctors Look Ahead will present the following programs in the next three weeks:

May 5. Child Health. Speaker, Dr. George K. Anderson, M.D., Secretary, A. M. A. Council on Foods and Nutrition.

May 12. National Hospital Day and Fiftieth Anniversary, Chicago Lying-In Hospital. Broadcast will be from De Lee Hall at the hospital.

May 19. Time relinquished to U. S. Public Health Service for National Induction of Cadet Nurse Corps.

Doctors Look Ahead is heard on one hundred and twenty-three stations of the National Broadcasting Company network each Saturday at 4 p. m. Eastern War time (3 p. m. Central War Time, 2 p. m. Mountain War Time and 1 p. m. Pacific War Time). Some stations may record the program and broadcast it at a time which suits their schedule better. Local newspaper radio announcements should be consulted.

## Bureau of Information

### ARKANSAS AND UTAH COUNTIES

Dr. W. R. Brooksher, secretary of the Arkansas State Medical Society, and Mr. W. H. Tibbals, executive secretary of the Utah State Medical Society, have recently returned completed summary sheets from each county in their respective states.

The accompanying tables present some of the data on counties from each of these states. The column listing the number of

#### Arkansas

County <sup>1</sup>	Principal Cities <sup>2</sup>	Population	Physicians Under 65	Persons per Physician	Persons per Telephone <sup>3</sup>

persons per telephone is used as one index of the economic status of the area. Many physicians over 65 years of age are carrying on large practices and are doing much to maintain the health of communities. They are not included in computing the physician population ratio, however, as the future needs of the communities will be largely dependent on younger physicians.

A current knowledge of needs of communities for doctors is essential if adequate help is to be given veteran medical officers in their problems of medical practice. These needs can be indicated on the summary sheets under "Remarks" by the state and county secretaries and are then available to inquiring medical officers.

With the information available on a completely filled out summary sheet, it is readily possible for an interested medical officer to make an initial selection of areas in which he might like to practice. The further investigation through the state and county medical societies is thus greatly facilitated, and much unnecessary correspondence and perhaps travel may be avoided. In many communities vacancies are being held open for physicians now in military service. The number of physicians listed may therefore be misleading, and consequently direct correspondence with the county medical society will always be necessary.

## Medical Legislation

### MEDICAL BILLS IN CONGRESS

*Change in Status.*—H. R. 2689, the agricultural appropriation act for 1946, has passed the Senate. When the bill was before the Senate for consideration, an amendment was submitted as follows: "Provided, That, in assisting farmers in the organization and administration of associations and groups for medical care, the Farm Security Administration shall permit the members of associations or groups to have free choice in the selection of practitioners from those available practitioners who are licensed under state laws." The amendment was rejected.

*Bills Introduced.*—H. R. 2920, introduced by Representative Rogers, Massachusetts, proposes to establish a Department of Veterans' Affairs with a Secretary of Veterans' Affairs at its head. H. R. 2939, introduced by Representative Randolph, West Virginia, proposes to prevent discrimination against blind persons and persons with impaired visual acuity in the administration of the civil service laws. H. R. 2946, introduced by Representative May, Kentucky, proposes to authorize the appropriation of such sums as may be necessary to enable the National Academy of Sciences to provide for scientific research and advancement in the interest of national security. H. R. 2969, introduced by Representative Eberharter, Pennsylvania, proposes that any individual who served as an officer in the Medical Department of the Army or Navy during the war period who was discharged or separated from service under honorable conditions and who, prior to such discharge or separation, held a license to practice medicine or dentistry under the laws of a state shall be entitled to receive a certificate which will authorize him to engage in any state in the practice of the particular class of medicine or dentistry covered by the state license held by him. The Secretary of War and the Secretary of the Navy, it is contemplated, will jointly prescribe regulations with respect to the making of application for and the issuance of such certificates, which will be issued, so far as practicable, at the time of discharge or separation from the land or naval forces.

### DISTRICT OF COLUMBIA

*Change in Status.*—S. 223 has been reported to the Senate, with an amendment, to provide for the establishment of a modern, adequate and efficient hospital center in the District of Columbia. The purpose of this bill, according to the committee report, "is to give to the city of Washington a modern, adequate and efficient hospital center, with a capacity of not more than 1,500 beds, fully equipped, and with complete facilities for diagnosis and treatment in all the specialties."

## STATE LEGISLATION

### Delaware

*Bill Introduced.*—S. Sub. for S. 24 proposes to condition the issuance of a license to marry on the presentation by each party to the proposed marriage of a physician's certificate, based on a physical examination and a standard serologic test, that the party is not infected with syphilis or, if so infected, is not in a stage of that disease which is or may become communicable to the marital partner.

### Florida

*Bills Introduced.*—S. 44 proposes to condition the issuance of a license to marry on the presentation by each party to the proposed marriage of a physician's certificate based on a physical examination and a standard serologic test that the party is not infected with syphilis or, if so infected, is not in a stage of that disease which is or may become communicable to the marital partner. S. 45 proposes to require every physician attending a pregnant woman for conditions relating to pregnancy to take or cause to be taken a sample of venous blood at the time of his first professional visit and to forward that sample to a recognized laboratory for a serologic test for syphilis. S. 144 proposes to direct the state board of health to make a survey of the location, size and character of all existing hospitals, of auxiliary diagnostic facilities and of local health unit facilities and to evaluate the sufficiency of those facilities to supply the health needs of the people. The board is to be authorized to accept on behalf of the state and to expend for the purposes indicated any funds made available by the federal government or any agency thereof. Committee Sub. for H. 26 proposes to authorize the establishment of the South Florida State Hospital to be located within the county of Highlands. The governing board of the hospital is directed to cooperate with the federal government or any agency thereof in connection with the establishment of the hospital and to accept donations of funds and property in connection therewith. H. 154 proposes to make it the duty of the state board of health to formulate a plan for the care and treatment of indigent persons suffering from cancer and to establish and designate standard requirements for the organization, equipment and conduct of cancer units or departments in general or private hospitals or private clinics in the state. H. 210 and S. 146 propose to authorize the state board of health to accept any funds or grants or supplies, equipment or goods made by the federal government.

### Illinois

*Bills Introduced.*—S. 325 proposes to require a practitioner of the healing art or a hospital on demand to deliver all x-ray photographs in his or its possession to any person whose body or any part thereof is represented by the photograph and who has paid for the photography. A violation of the act is to be punishable by a fine of not less than 50 dollars nor more than 250 dollars for each offense. S. 336 proposes to create a commission to investigate the hospitalization and medical care of residents of Illinois, to study the hospitalization and medical needs of the state and to report its findings and recommendations concerning the establishment of a state system of hospitalization and medical care. H. 407 proposes to limit the retail sale or distribution of any sulfanilamide derivatives to sale or distribution on the prescription of a licensed physician, dentist or veterinarian. H. 477 proposes that any person who has paid anything of value as consideration for the x-ray photography of any part of his body has such title to the finished photographs or plates as will enable him to maintain, after demand and refusal to surrender possession of them to him, an action of replevin for them. A judgment in any such replevin action arising out of the unlawful detention of x-ray photographs or plates shall include, in addition to the relief ordinarily provided in replevin actions, an award of punitive damages equal to five times the original cost of the x-ray photography as charged the plaintiff.

### Maine

*Bills Introduced.*—S. 428 proposes, in effect, that all laws, rules and regulations for the purpose of signing certificates for committing persons to state institutions, and to which physicians of other schools of medicine are subject, shall apply equally to

osteopathic physicians and that all reports and health certificates made by osteopathic physicians shall be accepted by the officers of the departments to which the same are made equally with the reports and health certificates of physicians of other schools of medicine. H. 1476 proposes that a person who comes in direct contact with the students of any public school shall not enter on his duties until he has filed with the appropriate school authorities a certificate from a licensed physician that he has examined the school employee and has found him free from all communicable and infectious diseases.

### Maryland

*Bill Introduced.*—H. 786 proposes to prohibit all advertising by chiropractors, osteopaths, physiotherapists or naturopaths except (1) the use of a personal professional card of not more than 3½ inches by 2 inches on which may be printed only the practitioner's name, title, address, specialty, telephone number and office hours; (2) removal notices limited in size and scope; and (3) that not more than two signs on the door or wall of the building wherein the practitioner practices on which may be placed the name and title or degree of such practitioner, the letters of which shall not exceed three inches square.

### Massachusetts

*Bills Introduced.*—H. 1792 proposes to prohibit, except on the written prescription of a licensed physician, dentist or veterinarian, the retail sale or distribution of aminopyrine, barbituric acid, cinchophen, dinitrophenol, sulfanilamide or their derivatives. H. 1774, to amend the law prohibiting the possession of a hypodermic syringe, needle or any instrument adapted for the subcutaneous injection of narcotic drugs except by a physician, dentist, nurse, veterinarian or legitimate manufacturer or dealer, proposes to permit chiropodists or podiatrists also to possess such instruments.

### Minnesota

*Bill Introduced.*—S. 1278 proposes to direct the director of social welfare to provide facilities at the state sanitarium for the treatment of tuberculous patients who refuse medical treatment or who do not abide by the rules and regulations of the state sanitarium or other county sanitarium when hospitalized or who otherwise wilfully expose others to tuberculosis.

### New Jersey

*Bills Introduced.*—A. 404 proposes to consolidate and coordinate the public health activities of the state by creating a department of health to consist of a commissioner, a public health council and such divisions as the commissioner may establish. The functions usually performed by the state department of health, the state board of health, the state director of health or the Perth Amboy Port health officer and his deputy are to be transferred to the new department of health. The acceptance by the commissioner of federal grants for public health purposes is to be subject to approval by the governor of the state and the public health council. The bill provides for the coordination of the public health activities of the state with respect to (1) maternal and child health services; (2) dental health; (3) public health nursing; (4) industrial hygiene; (5) sanitary engineering facilities; and (6) laboratory analyses. The bill also proposes to authorize the commissioner to establish state health districts to facilitate the integration and coordination of local health activities. Committee Sub. for A. 381 and A. C. R. 16 propose to authorize the department of health to establish a suitable program to collect, process, store and distribute human blood and the various human blood derivatives including special therapeutic and diagnostic serums which are deemed of value in the treatment of sick and injured persons and the prevention of certain diseases.

## Coming Medical Meetings

- New Hampshire Medical Society, Manchester, May 15. Dr. Carleton R. Metcalf, 5 S. State St., Concord, Secretary.  
Rhode Island Medical Society, Providence, May 16-17. Dr. William P. Buffum, 122 Waterman Street, Providence 3, Secretary.  
South Dakota State Medical Association, Watertown, June 3-5. Dr. Roland G. Mayer, 22½ S. Main St., Aberdeen, Secretary.

## Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST: SUCH AS RELATE TO SOCIETY ACTIVITIES, NEW HOSPITALS, EDUCATION AND PUBLIC HEALTH.)

### CALIFORNIA

**Personal.**—The sixtieth birthday of Carl L. A. Schmidt, Ph.D., professor and chairman of the department of biochemistry and dean of the college of pharmacy, University of California, Berkeley, was celebrated with a tea held on March 9. In honor of the occasion a portrait of Dr. Schmidt was unveiled, and he was presented with a bound volume of congratulatory letters from his students and associates. Dr. Schmidt retired from his administrative activities in the San Francisco campus in 1944 to devote full time to his work in Berkeley.

**Mother's Milk Bank.**—The Baby Hygiene Committee of the American Association of University Women is considering the establishment of a mother's milk bank in San Francisco. To determine whether such a project would fill the need in San Francisco, a group of 134 local physicians who might use such a facility were sent a letter asking opinions on the project. Of the 46 replies received, 40 felt that there was a need for a mother's milk bank in the city, 6 questioned the need and 3 of this 6 believed such a project unnecessary and unpractical at present. The *Bulletin* of the San Francisco County Medical Society, in reporting the project, stated that the agency through which such a facility would be developed remains to be determined; in any event a staff of interested physicians will be asked to serve in an advisory capacity in its operation. The Baby Hygiene Committee of the American Association of University Women is interested in the educational aspect of child welfare and, in the past, has pioneered several programs which are now being carried on by the child hygiene bureau of the San Francisco Department of Public Health, such as the well baby centers, supervision of private boarding homes for infants and children and cardiac diagnostic centers for school children.

### CONNECTICUT

**New Haven Hospital Sets Up Priorities on Patient Admissions.**—A priority plan for the admission of private and semiprivate patients at New Haven Hospital, New Haven, became effective March 5. Under the plan, patients are admitted in the following order: emergencies immediately; then, if space is available, group I patients, consisting of those with such diagnoses as chronic lung abscess, severe ulcerative colitis, cancer, complicated patent ductus, subacute bacterial endocarditis, toxic thyroid or obstruction of respiration caused by thyroid, spinal cord tumor and therapeutic abortion; and, finally, if space is available, other patients in chronologic order. Waiting lists are kept separately for group I and other patients. If a patient twice refuses admission when called, he goes to the bottom of the list, according to *Modern Hospital*.

### GEORGIA

**Physician Wins Gold Medal for Work on Magnet.**—Dr. Murdock S. Equen, Atlanta, has been awarded the 1944 gold medal of the Thomas A. Edison Foundation for his development of the Alnico magnet to remove metal objects from the stomach and lungs, newspapers announced March 30. Robert D. Hobday, Miami, Fla., president of the foundation, is reported to have said that Dr. Equen had been given the award for "outstanding contribution to the arts and sciences" through the development of the magnet.

### ILLINOIS

**Boards Named for New Health Departments.**—Members of the boards of health who will be in command of the new health departments in Adams and DuPage counties were recently appointed by the respective county boards of supervisors. These two counties were the first in Illinois to establish their own full time health departments by popular vote. This action having been taken in the November 1944 election (THE JOURNAL, Dec. 9, 1944, p. 970). In compliance with the Searcy-Clabaugh law under which county health departments are established, the membership of each of these county boards of health, "chosen for their special fitness for member-

ship on the board," includes two physicians, one dentist and four other persons. Members of the Adams County board of health include Drs. Walter D. Stevenson, Quincy, and Walter E. Davidson, Liberty, and for DuPage county Drs. Carl E. Schultz, Hinsdale, and Arthur S. Webb, Wheaton.

### Chicago

**Meeting of Bacteriologists.**—The Society of Illinois Bacteriologists will be addressed at the Museum of Science and Industry, May 11, by Kenneth C. Robbins, Ph.D., on "Plasma Proteins and Their Relationship to Antibodies" and by J. M. Severens, Ph.D., Urbana, Ill., "Contributions of the Electron Microscope to Bacteriology."

**Roosevelt Memorial for La Rabida.**—A memorial bed for children at the La Rabida Jackson Park Sanitarium was made possible April 14 with the gift of \$1,000 by Albert Pick Jr., Highland Park. The memorial will be named to honor Franklin Delano Roosevelt and his work in caring for stricken children. The sanitarium cares for children with rheumatic fever.

**Medical Record Librarian Institute.**—A five day institute will be held at the Knickerbocker Hotel, May 14-18, under the auspices of the American Hospital Association and the American Association of Medical Record Librarians and in cooperation with Northwestern University, the Chicago Hospital Council, the Illinois State Hospital Association and Chicago and vicinity medical record librarians.

**Warren Cole Named Associate Dean at Illinois.**—Dr. Warren H. Cole, professor and head of the department of surgery, University of Illinois College of Medicine, has been appointed to serve also as associate dean of the college of medicine. Dr. Cole, who has been with the University of Illinois since 1936, will in his new capacity assist Dr. Raymond B. Allen as dean of the college of medicine.

**First Typhus Death in Nineteen Years.**—The first death in Chicago from typhus in nineteen years was announced by the city department of health, April 17. The death had occurred on April 15. Newspapers reported that the man was stricken on March 26 while on vacation in Mexico and was brought to Chicago by airplane the following day and hospitalized. This was said to be the first report of the disease in Chicago since 1937.

**Dr. Kretschmer Lectures.**—Dr. Herman L. Kretschmer, President of the American Medical Association, addressed the house of delegates of the Tennessee State Medical Association, Nashville, April 8, on "Some Activities of the American Medical Association." The following day he addressed the students at Vanderbilt University School of Medicine on "Some Problems of the American Medical Association"; he also conducted a clinic on the prostate gland.

### KENTUCKY

**Personal.**—Dr. Don M. Griswold, Albany, N. Y., consulting epidemiologist, New York State Department of Health, is substituting for Dr. Hugh R. Leavell, professor of public health and bacteriology at the University of Louisville School of Medicine, and is on leave of absence by courtesy of Dr. Edward S. Godfrey Jr., Albany, New York State commissioner of public health. Dr. Leavell is now in the regional headquarters of the United Nations Relief and Rehabilitation Administration in London. Dr. Edwin W. Sigler, Henderson, has resigned as health officer of Henderson County, effective March 31, to enter private practice. Dr. Clement V. Hiestand, Campbellsville, vice president of the Kentucky State Medical Association, has been elected mayor of Campbellsville.

### LOUISIANA

**Personal.**—Dr. Robert H. Bryant, district superintendent of the Central Louisiana State Hospital, Pineville, has been appointed superintendent of the State Colony and Training School, Alexandria. Dr. Aristide J. Comeaux, Lafayette, has resigned as director of the Lafayette Parish Health Unit, a position he held for eleven years.

**Alfred Cohn Gives Stars and Bars Lecture.**—Dr. Alfred E. Cohn, member emeritus of the Rockefeller Institute for Medical Research, New York, delivered the annual lecture of the Stars and Bars chapter of Alpha Omega Alpha, Tulane University of Louisiana School of Medicine, New Orleans, recently. Dr. Cohn discussed various maladies of the heart. The lecture was created last year (THE JOURNAL, Sept. 30, 1944, p. 309) and is given on the initiation of new members into the chapter. The initiates this year included Thomas Gus

Baffes, Rodney Clifton Jung, John Jacob Baehr Jr., William Donald Franklin, William Henry Bland, Beverly Blood, Gerald N. Weiss, Gerald Sanders Berenson, Roy White Jr., George Warren Prather and Merrill Seymour Prows, all seniors, and Vann Shaw Taylor, Joseph Clement King and Raphael Leo Robbins, juniors.

### MASSACHUSETTS

**London Physician Gives Dunham Lectures.**—Dr. Vincent B. Wigglesworth, director, Agricultural Research Council Unit of Insect Physiology, London School of Hygiene and Tropical Medicine, London, will deliver the Edward K. Dunham lectures at the Harvard Medical School, Boston, on "The Insect as a Medium for the Study of Physiology." Individual lectures will be "The Insect Cuticle as a Living System," May 7, "Hormones and the Regulation of Insect Growth," May 9, and "Integration in the Epidermis of Insects," May 11.

**Henry Pollock Honored.**—A testimonial luncheon and a check for \$350 were recently given to Dr. and Mrs. Henry M. Pollock. The occasion marked the recent retirement of Dr. Pollock as superintendent of the Massachusetts Memorial Hospitals, Boston, after thirty years (THE JOURNAL, February 24, p. 471). Dr. James W. Manary, superintendent of Boston City Hospital, was toastmaster at the dinner and speakers included Dr. Donald C. Smelzer, Philadelphia, president of the American Hospital Association, Everett W. Jones, Chicago, technical adviser, the *Modern Hospital*, and Dr. Charles F. Wilinsky, superintendent, Beth Israel Hospital, Boston.

### NEBRASKA

**Accident to Physician.**—Dr. Oscar E. Liston, Elmwood, was injured when an automobile in which he was taking a patient to the hospital for an operation collided with another at an icy intersection.

**Case Conference on Psychosomatic Medicine.**—A weekly case conference on psychosomatic medicine has been started for the senior students in the Creighton University School of Medicine, Omaha, under the direction of Dr. Ben Slutzky of the department of medicine. Suitable cases are selected from the medical clinic of the dispensary. A particular effort is made to secure patients who have no organic disease. The case is assigned to two students. The usual history, physical and laboratory examinations are carried out to eliminate or confirm the presence of organic disease. The patient is then referred to Dr. Robert J. Streitwieser of the department of psychiatry. A thorough study is made of the patient's emotional status. A particular effort is made to ascertain the presence and cause of emotional factors and conflicts. The student in charge then makes several calls at the home of the patient, and, working under the instruction of Dr. Streitwieser, endeavors to obtain the complete picture of the patient's background, particularly with regard to cultural environment, financial status and other factors which might be responsible for the production of anxiety states. When this and a social service study are completed the case is discussed at a conference at the medical school, the student in charge presenting the medical, psychologic and social aspects and the social service worker the details of their investigation. The medical and psychiatric aspects are discussed by Dr. Slutzky and Dr. Streitwieser, the psychologic factors and psychometric studies by Mrs. C. W. Hamilton Jr. and, whenever possible, experimental work which may explain the establishment and progress of the patient's present condition by Dr. Charles M. Wilhelmj, dean of the school. After a diagnosis has been agreed on the therapeutic approach is discussed in detail.

### NEW HAMPSHIRE

**Annual Meeting.**—The next annual meeting of the New Hampshire Medical Society will be held at the Hotel Carpenter, Manchester, May 15.

### NEW JERSEY

**Physician Chosen Outstanding Citizen.**—Capt. Henry H. Kessler (MC) was honored at a luncheon given by the Newark Advertising Club April 11 and designated the city's outstanding citizen of 1944. Among the 850 persons who attended the luncheon was Rear Admiral William J. C. Agnew (MC). Captain Kessler, now in charge of amputation cases at the U. S. Naval Hospital, Mare Island, Calif., formerly served as director of the New Jersey Rehabilitation Clinic. A feature of the luncheon was a presentation to Captain Kessler of a citation of merit from the National Department of Disabled American Veterans.

### NEW YORK

**Changes in Licensure.**—The license to practice medicine of Dr. Paul H. Lichtenstein, Forest Hills, was reinstated by the commissioner of education on February 13. The license to practice medicine of Dr. Charles Victor Dukoff, New York, was recently revoked.

**New Director of Laboratories and Research.**—Dr. Gilbert Dalldorf, for fifteen years director of laboratories at Grasslands Hospital, Valhalla, has resigned, effective April 15, to become director of the division of laboratories and research of the New York State Department of Health. He succeeds Dr. Augustus B. Wadsworth (THE JOURNAL, March 17, p. 664).

**Hospital News.**—A gift of \$51,500 has been given to the building fund of the New Rochelle Hospital, New Rochelle, by two brothers, F. M. E. and Rudolph Jay Schaefer and their wives, all of Larchmont. The gift will be used to construct and equip a nursery in a seven story addition the hospital plans to build as a memorial to Larchmont men and women serving in the war.

**Personal.**—Dr. Arthur B. Van Loon, Albany, who was a member of the medical grievance committee of the University of the State of New York from 1926 until his retirement last year, was recently guest of honor at a dinner given by the committee in recognition of his service. Dr. Van Loon had served as secretary and president of the committee.—Dr. Nathaniel H. Ives, Mount Vernon, has been made an honorary life member of the board of Mount Vernon Hospital in recognition of fifty years' service to the hospital.

**Cancer Teaching Day.**—May 23 has been designated cancer teaching day in a cooperative program at the Arnot-Ogden Memorial Hospital, Elmira, by the Medical Society of the County of Chemung, the Sixth District Branch of the state medical society, the state medical society and the division of cancer control of the state department of health. Among the speakers will be:

Dr. Clyde L. Randall, Buffalo, *Hormone Therapy and the Prevention of Gynecologic Malignancies*  
Dr. Archie L. Dean, New York, *Carcinoma of the Genitourinary Tract*,  
Dr. Cushman D. Haagensen, New York, *Diagnosis and Treatment of Breast Cancer*.

### New York City

**William Henry Welch Lectures.**—Edwin J. Cohn, Ph.D., professor of biochemistry, Harvard Medical School, Boston, gave one of the William Henry Welch lectures at Mount Sinai Hospital, April 26, on "Separation, Concentration and Characterization of Blood Derivatives." The second lecture in the series will be delivered April 30 on "Natural Functions and Clinical Uses of Blood Derivatives."

**Research in Psychosomatic Problems.**—On May 11 the American Society for Research on Psychosomatic Problems will conduct a regional meeting to demonstrate to the general practitioner psychosomatic management of the patients with peptic ulcer. Dr. Carl A. L. Binger will serve as chairman of a discussion on brief psychotherapy and Dr. David P. Barr as chairman of a symposium in the afternoon on peptic ulcer.

**Antirabies Quarantine Continues.**—At a special meeting, April 13, the New York City Board of Health acted to continue the antirabies quarantine throughout the city until August 13, six months after the date when the last rabid dog was picked up. The board of health based its action on the fact that the focus of the disease continues to exist in the city. In announcing the decision of the board, Dr. Frank A. Calderone, acting commissioner of health, stated that "the action taken by the board of health last October 16 was the only possible scientifically valid means of controlling rabies in dogs." The continuance of the quarantine was taken in full cognizance of the decision of Supreme Court Justice Charles W. Froessel in Queens County, April 6, when he declared the existing quarantine unconstitutional. Dr. Calderone pointed out that before Justice Froessel's decision Supreme Court Justice Aaron J. Levy in New York County on March 5, passing on a similar case, upheld the constitutionality of the antirabies resolution of the board of health. The quarantine order required that any unleashed dog found on a highway must either be destroyed within forty-eight hours or placed in quarantine for six months at the owner's expense to determine whether the animal had rabies. The *New York Times* stated that at the board of health it was said that since the order went into effect about 7,500 dogs had been picked up under the leashing order and 7,000 destroyed. During the same period 20,300 dogs were rounded up for other causes with all but 100 destroyed. The *New York Herald Tribune* reported that on April 4 Governor Thomas E. Dewey had signed a bill permitting the seizure,

confinement or killing of muzzled as well as unmuzzled dogs that are allowed to run at large in rabies infected areas and empowers the state health commissioner to designate rabies infected areas under conditions which he may prescribe and in which he may permit dogs that have been actively immunized against rabies to be at large.

### NORTH CAROLINA

**Physician Named for Work in Philippines.**—Dr. John D. Bigger, Swannanoa, formerly a missionary to Korea, has been appointed director of medical work in the Philippines for all interdenominational agencies, according to the *Asheville Citizen-Times*, March 25, which reported also that the appointment was made by the Committee for Relief in Asia of the Federal Council of the Churches of Christ in America. It was stated that Dr. Bigger's task is to reestablish medical missions in several of the Philippine Islands as rapidly as possible. Dr. Bigger has been asked to be prepared to sail for Manila any time after May 1.

**Personal.**—Dr. Lenox D. Baker, associate professor of surgery in charge of orthopedics at the Duke University School of Medicine, Durham, has been elected president of the North Carolina League for Crippled Children.—Dr. Wayland N. McKenzie, health officer of Stanly County since July 1937, recently resigned to enter the private practice of medicine in Albemarle. Dr. Millard B. Bethel, Concord, holding a similar position in Cabarrus County, will serve in Stanly County on a part time basis.—Dr. Frank P. Hunter, Warrenton, has been chosen health officer of Warren County.—Dr. John R. Saunders, for two years superintendent of the State Hospital at Morgantown, has resigned, effective about May 1.

### PENNSYLVANIA

**Special Society Election.**—At a meeting of the Reading Eye, Ear, Nose and Throat Society, March 21, in Reading the following officers were elected: Drs. Isaac B. High, president; Claude W. Bankes and Michael J. Penta, vice presidents; Paul C. Craig, secretary, and John M. Wotring, treasurer. The society was addressed at the meeting by Dr. George M. Coates, Philadelphia, on "Osteitis and Osteomyelitis of the Frontal Bone."

**State Society Plans Insurance Program.**—On April 14 Dr. Chauncey L. Palmer, Pittsburgh, president of the Medical Service Association of Pennsylvania, announced that the organization, with the approval of forty-five county medical societies, was ready to launch a statewide program to make low cost medical insurance available to "every man, woman and child in this commonwealth." At the time 2,000 physicians, 425 from Philadelphia, were enrolled in the plan. The announcement indicated that the group tried unsuccessfully to develop a cooperative statewide program with Blue Cross but that the cooperation of the latter group was not forthcoming. It was stated that the Medical Service Association of Pennsylvania deplored the controversy that has raged around proposed legislation by which Blue Cross "seeks to invade the field of private medicine for its own selfish ends."

### SOUTH DAKOTA

**Personal.**—Dr. Daniel S. Baughman, Madison, has been appointed superintendent of the Lake County Board of Health, succeeding Dr. Clarence E. Sherwood, Madison, city health officer and member of the state board of health.

**Dr. Waller Goes to Georgia.**—William H. Waller, Ph.D., professor of anatomy, University of South Dakota School of Medical Sciences, Vermillion, recently accepted a position as associate professor of gross anatomy at the University of Georgia School of Medicine, Augusta.

### TEXAS

**Changes in Health Personnel.**—Dr. Frederick R. Lummis, Houston, was recently named chairman of the Houston Board of Health, succeeding Dr. Everett L. Goar, who resigned to devote more time to his activities as professor of ophthalmology at the Baylor University College of Medicine, Houston. The following have recently been placed in charge of the health units designated:

Dr. Wyly H. Harris, Raymondville, of Willacy County.  
Dr. Gus N. Lancaster, Granbury, of Hood County.  
Dr. Byron L. Jordan, Daisetta, reappointed, of Liberty County.  
Dr. Clifford G. Swift, Cameron, Milam County.  
Dr. Sam J. R. Aronson, Amarillo, Potter County.

**Fellowship Named for Dr. Graves.**—A research fellowship in internal medicine will be established at the University of Texas Medical Branch, Galveston, in honor of Dr. Marvin Lee Graves, emeritus professor of internal medicine. Funds

to create the new fellowship were given to the medical school by Dr. Edwin Ghent Graves, Mrs. George T. Morse and Mrs. Laura Lee Graves Steel, Houston, in honor of their father. The fellowship will be filled annually by the department of medicine through the appointment of a graduate in medicine who is considered most likely to maintain the professional standards and ideals of Dr. Graves.

**Graduate Medical Training Established.**—The creation of a postgraduate medical training program under the direction of Dr. George M. Decherd Jr., associate professor of internal medicine, University of Texas Medical Branch, Galveston, has been announced. A special faculty committee will cooperate with Dr. Decherd in the development of a broad postgraduate medical training program, which will embody three features: short postgraduate conferences and courses on special subjects, to be held at the medical branch, two day conferences to be given by members of the medical branch faculty in cooperation with county and district medical societies in various parts of this state, and residency training for specialty board certification and specialty practice. Emphasis in residency training will be placed on preclinical laboratory work in the special fields in which the resident is interested. The preclinical laboratories of the medical branch will cooperate with hospitals approved for residency training in Texas in affording appropriate facilities for fundamental training in specialties. The first conference to be held under the auspices of the new postgraduate training program is being arranged by the department of pediatrics and the child health program, under Dr. Arild E. Hansen, professor of pediatrics, for May 14-19 (*THE JOURNAL*, April 14, p. 1003). Forty physicians can be accommodated for the period.

### VIRGINIA

**Dr. Van Slyke Gives Alpha Omega Alpha Lecture.**—The annual lectureship of the Brown-Séguard chapter of the Alpha Omega Alpha is to be given May 4 in the Simon Baruch Auditorium of the Egyptian Building at the Medical College of Virginia, Richmond, by Dr. Donald D. Van Slyke, chief research chemist at the Hospital of the Rockefeller Institute for Medical Research, New York. His subject will be "The Physiology of the Kidney."

**Dr. Buerki Conducts Hospital Study in Richmond.**—Dr. Robin C. Buerki, dean of the Graduate School of Medicine and director of hospitals, University of Pennsylvania, Philadelphia, will carry on a survey under the auspices of the Richmond Community Council of hospital facilities in Richmond, according to the *Richmond Times-Dispatch* of March 22. The study, which was to begin April 14, is the result of a citywide demand last November for a survey of present and future needs of hospital facilities. At the recommendation of William T. Sangar, Ph.D., president of the Medical College of Virginia, the Richmond Community Council was selected as the agency to make the study.

### WEST VIRGINIA

**County Society Launches Prepayment Insurance Plan.**—A prepayment medical insurance plan covering surgical and obstetric fees was approved by the Ohio County Medical Society at a recent meeting held in Wheeling. The plan will give full coverage to the low income group and will operate on an indemnity basis for those with higher incomes. The board of directors will be composed of six physicians and three laymen. The society has appointed the following physicians to serve as members of the board: Drs. William P. Sammons, Howard T. Phillips, Earl S. Phillips, Edward S. Bippus, Samuel W. Tretheway and Delivan A. MacGregor, all of Wheeling.

**George Evans Named as Superintendent of New Memorial Home.**—Dr. George P. Evans, Jaeger, will become the first superintendent of the new Andrew S. Rowan Memorial Home at Old Sweet Springs. The appointment, announced by Governor Clarence W. Meadows, is effective July 1, the date for the opening of the institution for the care of aged and infirm white men and women. Old Sweet Springs, popular Monroe County resort built prior to the Civil War, was purchased by the state in 1941 for use as a tuberculosis sanatorium. No appropriation was made for the purpose by the 1943 legislature, and the buildings have not been in use for about two years. The property is now being thoroughly renovated and improved to provide adequate facilities for use as a home for aged men and women now being cared for principally in state mental institutions. The bill (S. B. 9) establishing the home, passed at the recent session of the legislature, also provides that the institution may be used as a rehabilitation center for some of the boys sentenced to the state reformatory at Pruntytown. Dr. Evans graduated at the College of Physicians and Surgeons, Baltimore, in 1908.

## GENERAL

**Therapeutic Meeting Canceled.**—The American Therapeutic Society has canceled its meeting scheduled to be held June 15 in Atlantic City, N. J.

**William Bowen Named Executive Assistant of Paralysis Foundation.**—William C. Bowen, East Orange, N. J., formerly regional director in the New England states for the American Red Cross, has been appointed executive assistant to Basil O'Connor, president of the National Foundation for Infantile Paralysis. The appointment to the newly created position is effective immediately and carries with it the chairmanship of the administrative committee of the National Foundation.

**International Conference of Arts, Sciences and Professions.**—The Independent Citizens' Committee of the Arts, Sciences and Professions is initiating an international conference to which leaders of the three groups in the principal United Nations will be invited. The announcement followed a recent meeting in New York in which leaders of more than twenty-five American professional associations participated. Among those in attendance at the recent meeting included Robert Chambers, Ph.D., president of the Union of Biological Sciences, Alonzo F. Myers, Ph.D., and Dr. Frank Fremont-Smith, all of New York, and Helen Keller, Westport, Conn.

**Sigma Xi Lectures on the Blood.**—Michael Heidelberger, Ph.D., associate professor of biochemistry, Columbia University College of Physicians and Surgeons, New York, opened a series of lectures on the blood under the auspices of Sigma Xi April 27 at the University of Vermont, Burlington. The lecture will be given at the following places to complete the schedule: Oberlin, Ohio, April 30; Minneapolis, May 2; Columbia, Mo., May 4; Boulder, Colo., May 7; University of California, Los Angeles, May 11; Stanford University, Palo Alto, Calif., May 14; Shell Development Research Club, Emeryville, Calif., May 15; Abbott Laboratory Research Club, North Chicago, Ill., May 21; Illinois Institute of Technology, Chicago, May 22, and the University of Pennsylvania, Philadelphia, May 23.

**Cancer Society Reorganized.**—On April 4 the American Cancer Society announced the general reorganization of its "Structure and Orientation" designed to provide a firm basis and expert direction in the expenditure of the five million dollars being sought in its current campaign. The reorganization comprises four major steps: election of prominent laymen to a majority of the board of directors to manage the funds of the society; creation of a board of medical men and scientists in the field of cancer to direct professional and scientific plans; cooperation with the National Research Council in the formulation of a long-term cancer research program involving recommendations of specific research projects, and authorization of a nationwide survey to establish the need for service to cancer patients in the light of the war and future conditions. In a statement to the press, Dr. Frank E. Adair, New York, president of the American Cancer Society, stated that a majority of the medical and scientific leaders on the board of directors had resigned to make way for new lay members and that the former had been reconstituted into a special board which will have control in all matters in the scientific and medical fields. Eric A. Johnston is chairman of the society's campaign to raise five million dollars (THE JOURNAL, Dec. 30, 1944, p. 1160).

**Examinations in Internal Medicine.**—The American Board of Internal Medicine announces that the closing date is May 5 for persons to take the oral examination in Philadelphia, June 6-8; this applies to persons residing in Maine, Connecticut, Vermont, Maryland, New Hampshire, New York, Massachusetts, West Virginia, Delaware, New Jersey, Rhode Island, North Carolina, Virginia, South Carolina, Pennsylvania and the District of Columbia. May 5 will be the closing date for the oral examination in New Orleans, May 21-23, for persons living in Tennessee, Mississippi, Texas, Arkansas, Georgia, Louisiana, Alabama, Oklahoma and Florida. May 12 will be the closing date for the oral examination in Chicago, June 27-29, for persons living in North and South Dakota, Iowa, Indiana, Illinois, Kansas, Minnesota, Michigan, Nebraska, Kentucky, Wisconsin, Missouri and Ohio. September 1 will be the closing date for the oral examination in San Francisco, October 15-17, for persons residing in Montana, New Mexico, Arizona, Oregon, Wyoming, Idaho, Nevada, California, Colorado, Utah and Washington. Candidates who have been notified of the approval of their application for admission to an oral examination in a subspecialty will be admitted at the time and place of the oral examination in internal medicine, pro-

vided the oral examination in internal medicine is satisfactory. Candidates with an A. P. O. address who find it possible to report, please advise the board as to the most convenient place on the schedule. The schedule must of necessity be fixed within geographic limits but will be sufficiently flexible to accommodate candidates in the armed forces if they have a change of station after the closing date for the acceptance of applications. Candidates previously certified in internal medicine will be admitted to oral examination in their subspecialty in accordance with the schedule if application has been approved and notification has been received. All communications should be addressed to Dr. William A. Werrell, assistant secretary-treasurer, American Board of Internal Medicine, 1301 University Avenue, Madison 5, Wis.

**Radiologists Not Subject to Sales Tax.**—The American College of Radiology has filed a brief contesting a ruling of the California Board of Equalization, April 7, that physicians engaged in the specialty of radiology should be subject to the payment of a state sales tax on films used. The ruling is similar to one issued by the deputy comptroller for the department of finance in New York City recently which attempted to classify radiologists as subject to the sales tax by assuming that they were engaged in the sale of merchandise when examining patients with the aid of the x-rays. A brief filed by the counsel of the American College of Radiology in protest to the ruling pointed out that radiologists made examinations of patients, in making diagnoses, but did not "furnish the same to such persons." The brief also called attention to the fact that the prevailing weight of judicial opinion held that roentgenograms were the legal property of the radiologist and that patients had no right of possession to them. Subsequent action resulted in an announcement that the ruling would not be applied to licensed physicians practicing radiology. In the New York action the following was presented as the ruling of the deputy comptroller to justify his order:

Persons operating x-ray laboratories who, upon instructions from physicians and others, take radiographs or x-ray plates of persons and furnish the same to such persons and may in addition thereto render written reports on the disclosures made by such plates, are deemed to be engaged in the sale of tangible personal property at retail to such persons. Such laboratories are not deemed to be engaged in rendering professional services, notwithstanding the fact that they are licensed by the city department of health and that, under the regulations of such department, the laboratory must at all times be in charge and under the direction of a duly licensed physician or other person licensed under the laws of the state of New York to diagnose and treat diseases. Such laboratories, even though they employ licensed physician specializing in roentgenology who may render a written report on the disclosures made by the x-ray plate, are engaged primarily to take radiographs or x-ray pictures and not to diagnose disease. As such, they are deemed to be vendors of tangible personal property at retail and must charge and collect sales tax on the price of the plate.

## CORRECTION

**Abdominal Pain in Children.**—The word "sphincter" should read "stricture" in the second last line of the closing discussion by Dr. Brennemann in THE JOURNAL, March 24, page 695.

## Government Services

## New Director of Health in Indian Affairs Office

Dr. John R. McGibony, Chicago, director of health, U. S. Office of Indian Affairs, was transferred on April 15 to the hospital facilities section of the U. S. Public Health Service, Washington, D. C., of which Dr. Vane M. Hoge is director. He will be succeeded by Dr. Ralph B. Snively, U. S. Public Health Service, whose recent assignment was district medical director of the Indian Service in San Francisco and Albuquerque, N. M.

## Triptych Symbolizing Healing at Medical Center

The Colonial Dames Society has presented to the Naval Medical Center, Bethesda, a triptych symbolizing the healing by Jesus of the impotent man at the Well of Bethesda. The presentation was made to Rear Admiral William Chambers (MC) by Mrs. Barron P. Du Bois, president of the Colonial Dames, who said that she hoped the painting, executed by Violet Oakley, American artist, would be an inspiration to members of the staff of the center as well "as give hope to all ill here that they, like the helpless man of biblical Bethesda, may take up their beds and walk."

#### Greatly Improved Results of War Surgery

In no previous war has surgery been so efficient. Surgical treatment is now available so near the field of battle and in such thorough fashion that when a British soldier is wounded, however seriously, he has more than a 9 to 1 chance of survival if picked up quickly. On the western front since D day about 40,000 major surgical operations have been performed in forward areas, in addition to the vast number in the great base hospitals. The high degree of success in the forward operations is due largely to improvements in both preoperative and postoperative treatment. The former includes transfusion of blood, plasma or serum. In the war of 1914-1918 if a man received a pint of blood before an operation at a base hospital that was thought to be good. Now a wounded man can have any quantity of blood or other fluid that is necessary transfused in a field surgical unit.

On the postoperative side there have been developments beyond anything known even earlier in this war, and the most important has been the going forward of the nursing sisters. To a man fresh from an operation after a bad wound, the sight of a woman at his bedside is deeply comforting and there are nurses who have lived for long spells in shelled areas to give this comfort. Other things available at the front which count are proper beds and bedclothes and invalid foods.

Penicillin is now taking the place of the sulfonamides, which were so much relied on earlier in the war, and the growth of knowledge of its uses has been immense.

The bugbear of war surgery is sepsis, particularly in the Middle East. On the western front wounds have been cleaner and therefore less dangerous. As to chances of recovery from the more severe wounds, it is now considered unsatisfactory if no more than 2 in 3 recover from penetrating abdominal wounds, whereas in the last war only 1 in 3 recovered. In chest wounds and even in head wounds affecting the brain 9 out of 10 who reach the surgery living survive. Far fewer amputations are necessary than in the other war, and almost invariably only one operation is needed. Of the amputated men 95 per cent survive. Gas gangrene is rarely seen and tetanus not at all, though both were a plague for the wounded a quarter of a century ago. Trench feet are seen only in enemy prisoners. In the base hospitals minor wounds heal at astonishing speed, and the death rate is under 0.5 per cent. Of the first 50,000 wounded sent from Normandy to England last year only 0.4 per cent died.

#### Educational Provision for Patients in Hospitals and Sanatoriums

A new provision for the benefit of patients in hospitals is being made. The minister of health has had under consideration, in consultation with the minister of education, the question of enabling civilian patients likely to be detained in hospitals or sanatoriums for long periods to pursue educational courses if they so desire and if suitable arrangements can be made. There is ample evidence that, in addition to its educational value, a course of study or craft work, whether general or vocational, in which the patient is interested, can help to accelerate recovery and remove that sense of frustration which prolonged enforced inactivity may entail. The minister of education has therefore asked the local authorities for higher education to do their best to provide such facilities where needed.

In a circular to the local authorities the minister of health asks them when satisfied, on the advice of the medical officer in charge of the case, that a patient should be encouraged to pursue a course of study, having regard to the likely effect on the patient's condition, to put the patient in touch with the chief education officer in the area. In applying for a course the patient should state how much of the subject he knows and what examination or purpose he has in mind, so that the officer can decide whether a beginner's or more advanced course is required. A correspondence course will often be the only one practicable in the circumstances, but the tutor may wish to visit the patient for the purpose of correcting exercises. For this the hospital authorities should grant facilities. In the provision of textbooks the local education authority may be able to help. While it would generally be inappropriate to charge the patient more than a small fee, it is thought that unless some fee is charged there may be a risk of courses being started too readily and dropped owing to waning interest. A fee, ranging from \$1 for shorter courses to \$2 for longer, would generally be appropriate. The War Office already has correspondence courses for members of the fighting forces detained in the hospital. Other educational methods may be used. Thus arrangements may be made for a number of patients suffering from injuries who have reached an ambulant stage to attend a practical course at a nearby technical institute or art school. There is also the possibility of providing for small groups of patients by means of discussion circles and informal lectures.

#### The Protective Power of Vaccination Against Smallpox

In the House of Commons Sir James Grigg, in reply to a question, stated the present official view of the protective value of vaccination against smallpox. He said that 100 per cent protection had never been claimed. The maximum degree of immunity was estimated to develop about fourteen days after vaccination; thereafter it gradually waned, but it remained effective, under normal conditions, for five years in Britain and for three years in Egypt, where the risk of infection was somewhat greater. During an epidemic the virulence of the infecting agent was such that even the maximum degree of immunity conferred by immediate vaccination was not in every individual case sufficient to resist the disease. Nevertheless experience had shown that the revaccination of all exposed to infection, coupled with the normal precautions of immediate isolation of infected persons and restriction of movement of possible contacts, was successful in giving immunity to all but a small proportion and in quelling an epidemic.

#### Native African Physicians

Laying the foundation stone of the Douglas Smut residence for African students at the Witwatersrand University, the minister of native affairs said that if the European section was sincere in its promises when the 1936 legislation was before parliament the native must be actively encouraged and assisted to supply the services his people required in their own territories. When it had been shown that a section of the African community had the ability to become fully qualified physicians, every facility should be placed at their disposal. There were 24 African students studying medicine. He was glad that the Johannesburg hospital board was to provide housemanships for non-European graduates.

#### The Army Doctor Who Went Down with His Ship

The George Cross has been posthumously awarded to Capt. J. R. O. Thompson of the Royal Army Medical Corps for conspicuous gallantry and devotion to duty on board hospital ships, which, in disregard of the Geneva Convention, were repeatedly attacked by the Germans. Under dive bombing and

shell fire he showed indifference to danger and physical exhaustion in the care of his patients. At Anzio on Jan. 24, 1944, when the *St. David* was sinking rapidly as the result of a direct bomb hit, he organized parties to carry the seriously wounded to safety in the boats and was thus instrumental in saving many lives. When the ship was obviously about to founder and all were ordered to save themselves, he returned alone in a last effort to save the one remaining helpless patient still lying trapped below. It is presumed that he went down with his ship.

## PALESTINE

(From a Special Correspondent)

JERUSALEM, March 1, 1945.

### Nutritional Economic Survey of Wartime Palestine, 1942-1943

A report just issued by Dr. Vickers on behalf of the Department of Health, Government of Palestine, attempts a survey on nutritional conditions in Palestine during the years 1942-1943. The procedure was to establish the quantities of foodstuffs consumed by 1,370 families and 1,390 persons living in four communal settlements during a period of from three to seven days. Each family or settlement was visited by a welfare nurse during that particular period. She worked under the direction of a physician, and the final checkup was made by Dr. Vickers himself. The results thus obtained were applied to the 1½ million inhabitants of Palestine. As a criterion for a comparison of nutritional conditions the author chose a food expenditure unit (amount of money spent on food per capita monthly), on the basis of which he constructed eight economic categories, the group interval not exceeding 0.250 Palestinian pound. Before embarking on a comparison of data for 1942 with those for 1943 one should bear in mind that during that period the cost of living index had risen from 175 in January 1942 to 248 in June 1943. Moreover, the introduction of food rationing in certain areas of Palestine, particularly in towns, by a points system, caused a shortage of certain food articles, which naturally found its reflection in family budgets.

The main conclusion Vickers drew from the data obtained was that the nutritional condition of the Palestine population had improved in the period 1942-1943, indeed, that in 1943 it was better than ever before judging from the increased expenditure on food. However, he neglected the fact that actually in the lower classes nutrition is far from being adequate and that in the middle classes too a lack of animal protein, calcium and vitamin A makes itself felt. In his own words this means "that food expenditure has rapidly risen over the period and that a majority of the poor have now gone into what would have been classed as the medium expenditure groups. The further corollary is also clear, however, that nutrition has improved since 1942. While a good deal more was being spent on food in 1943 than possibly at any other period in the country's history, it would appear that a good many more are receiving a better diet. It follows of course that that proportion which is still really undernourished, also a considerably reduced section, is worse off than before. Possibly some 75 per cent (375,000) of the population of the three large urban areas under review now comes into the two upper groups instead of only 25 per cent a year ago. . . ."

The objections aroused by this report in various quarters mainly concerned the fact that the basis on which it was constructed is too narrow and cannot therefore truly reflect the situation. His conclusion that in 1942-1943 30 per cent of the urban population spent more than £P.2.500 per capita per month is based "on careful consideration of various factors, including observation." Of the practical suggestions made by the author, those referring to rationalization of household work and instruction of housewives deserve a wholehearted support. He also

demands the introduction of cooking as a subject in girls' schools and emphasizes the necessity of adding vitamins A and D to the food of children as well as the addition of calcium to our bread. A wider use of vegetable fats is urged, an expansion of the school feeding scheme and an extension of the Palestine restaurant system and factory canteens.

## Malaria Problems

The December 1944 meeting of the Jewish Medical Association in Jerusalem was devoted to the problem of malaria. Dr. Aschner enumerated the various anopheles species of Palestine and the specific life habits of these transmitters and discussed the control measures successfully employed in Palestine. He stressed the great difficulties with which antimalarial field work is attended in Palestine owing to the great diversity of the population; e. g., the drainage of swamps on Jewish soil, financed by private means, is frustrated if the swamps are surrounded by Arab settlements with an inimical attitude toward the drainage scheme. He then gave a short survey of the work of the late Professor Kligler in this field, specially mentioning his studies on the flying range of the various anopheles species which he deemed as of fundamental epidemiologic significance. In memory of Professor Kligler a Central Malaria Research Institute is to be erected in the Huleh region, the only area still exposed to an important degree to malaria.

Professor Adler in his lecture took up the question of treatment. Quinine, which was introduced into the therapy of this disease about three hundred years ago, has in his opinion saved the greatest number of human lives ever rescued by a therapeutic agent. He recommended giving 2 Gm. per day for the duration of five or six days and then to continue for two months with the same dose on two days of the week. Unfortunately quinine is no *therapia magna sterilisans* either. He reported 2 interesting cases he saw himself, in 1 of which after blood transfusion the recipient developed malaria, while the donor had had his last attack twenty years ago, and the other in which after blood transfusion the donor had a malarial attack after a period of latency of eight years. The plasmodia, once acquired, cannot therefore ever be got rid of, a fact on which the amount of quinine administered has no bearing. Adler gave an account of a case in which after continuous treatment with a total of 90 Gm. of quinine relapse occurred two days after the treatment had been discontinued. Atabrine has proved equal to quinine and shows the same favorable effect on schizonts as quinine. In conclusion, Adler stressed the great importance of the laboratory search for plasmodia, since "there is no clinical diagnosis of malaria."

## Marriages

JAMES NEAL BRIEN JR., Washington, D. C., to Miss Adah Maud Hamblen of Chattanooga, Tenn., March 24.

RAYMOND WILLIAM NEMECEK to Miss Rosemary Ann Hamilton, both of Chicago, March 14.

RAYMOND N. NELSON, Elkhorn, Wis., to Miss Carolyn J. Gilden of Whitewater, March 21.

CARROLL R. OLSON, Milwaukee, to Miss Thelma Olson of Burgettstown, Pa., December 22.

JESSE HALL COLLEY, Troy, Ala., to Mrs. Virginia Lee Reid of Dallas, Texas, February 24.

MAX ROSSMAN, Allentown, Pa., to Miss Rose Markley of Homestead, Pa., March 8.

MAX BENDERSKY to Miss Dorothy Fryburg, both of Amityville, N. Y., Oct. 22, 1944.

WILLIAM KEMP WRIGHT to Miss Mary Ruth Brown, both of St. Louis, February 10.

NORBERT A. KLUCIKOWSKI to Miss Virginia Turner, both of Chicago, January 27.

## Deaths

**Henry Irwin Klopp**, Allentown, Pa.; Hahnemann Medical College of Philadelphia, 1894; member of the National Committee for Mental Hygiene, American Psychiatric Association and the American Orthopsychiatric Association; served as president of the Pennsylvania Psychiatric Society and the Pennsylvania State Homeopathic Medical Society; fellow of the American College of Physicians; specialist certified by the American Board of Psychiatry and Neurology, Inc.; professor of psychiatry at his alma mater; in October 1937 his portrait, the gift of the medical societies of Lehigh, Northampton and Bucks counties and the Lehigh Valley Homeopathic Society, was unveiled, commemorating the twenty-fifth anniversary of the Allentown State Hospital, which he had served since its inception and from which he retired July 1, 1942; at one time assistant physician and assistant superintendent of the Westboro State Hospital, Westboro, Mass.; active on the boards of the Community Chest, the Association for the Blind of Northampton County and the Lehigh Valley Child Guidance Clinic, which he helped to found; died in the Hahnemann Hospital, Philadelphia, March 7, aged 75, of tumor of the thorax.

**John Charles Vincent Fisher** ♂ Boston; Boston University School of Medicine, 1917; associate professor of obstetrics at his alma mater; member of the New England Obstetrical and Gynecological Society; past president of the Norfolk District Medical Society and the West Roxbury Medical Society; interned at St. Elizabeth's Hospital, where he served on the associate staff; visiting obstetrician at the Massachusetts Memorial Hospitals; on the associate staff of the Faulkner Hospital; a surgeon for the U. S. Merchant Marine during World War I; medical examiner for the draft board of West Roxbury; associate editor of the *Norfolk Medical News*; died February 19, aged 53, of coronary thrombosis.

**William Jephtha Calvert**, Englewood, N. J.; Johns Hopkins University School of Medicine, Baltimore, 1898; interned at the Johns Hopkins Hospital, 1898-1899; first lieutenant and assistant surgeon in the U. S. Army in 1902 and first lieutenant and assistant surgeon, reserve medical corps, U. S. Army, 1909; at one time assistant professor of internal medicine, professor of physical diagnosis and clinical pathology and professor of preventive medicine at the University of Missouri School of Medicine, Columbia; served on the faculty of the Baylor University College of Medicine, Dallas, Texas; died in Daytona Beach, Fla., March 21, aged 73, of chronic interstitial nephritis and arteriosclerosis.

**Sigmund Arthur Agatston** ♂ New York; Columbia University College of Physicians and Surgeons, New York, 1900; specialist certified by the American Board of Ophthalmology; fellow of the American College of Surgeons; formerly assistant clinical professor of ophthalmology at the New York University College of Medicine; on the staffs of the Sydenham Hospital, New York Eye and Ear Infirmary and the Montefiore Hospital; died March 5, aged 68, of heart disease.

**William Aloysius Behan** ♂ Binghamton, N. Y.; University and Bellevue Hospital Medical College, New York, 1910; fellow of the American College of Surgeons; served during World War I; member of Selective Service Board No. 449, 1943-1944; co-chairman surgical staff, City Hospital, consulting surgeon, Broome County Tuberculosis Hospital, Chenango Bridge; on the staff of Our Lady of Lourdes Memorial Hospital, where he died February 24, aged 66, of coronary thrombosis.

**Robert Kemp Brewer** ♂ Syracuse, N. Y.; Syracuse University College of Medicine, 1913; professor of physiologic chemistry at his alma mater; consulting chemist in Syracuse University Medical Center Hospitals; died March 22, aged 58, of coronary thrombosis.

**Michael Jeremiah Josephus Coluccy**, Madison, Wis.; New York Medical College and Flower Hospital, New York, 1916; member of the American Medical Association; served during World War I; member of the local board of health; on the staffs of the Madison General Hospital and St. Mary's Hospital, where he died February 28, aged 53, of cerebral hemorrhage and injuries received in a fall.

**Thomas Wilson Deachman**, Chicago; the Hahnemann Medical College and Hospital, Chicago, 1895; died in the Jackson Park Hospital March 25, aged 76, of cerebral hemorrhage.

**William Hayden Dean**, Bellevue, Wash.; Starling Medical College, Columbus, 1894; died December 30, aged 83, of carcinoma of the face.

**James Lee English**, Pittston, Pa.; Georgetown University School of Medicine, Washington, D. C., 1927; member of the

American Medical Association; interned at the Wilkes-Barre General Hospital, Wilkes-Barre; served as medical examiner for the city public schools; commissioned a captain in the medical corps, Army of the United States, on Aug. 15, 1942; relieved from active duty on March 28, 1943; on the staff of the Pittston Hospital, where he died January 17, aged 43, of gastric hemorrhage due to cirrhosis of the liver.

**John Matthew Flannery** ♂ Buffalo; University of Buffalo School of Medicine, 1905; served during World War I; chief of staff of St. Francis Hospital, where he died March 14, aged 65, of carcinoma of the rectum.

**Merton Louis Ford**, Oneonta, N. Y.; University of the City of New York Medical Department, New York, 1886; formerly a druggist; a charter director of the Aurelia Osborn Fox Memorial Hospital; died in the Huntington Memorial Hospital, Pasadena, Calif., March 10, aged 84, of fractured neck of the right femur incurred in a fall.

**Lucy Woodward Gardner**, San Antonio, Texas; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1892; died February 22, aged 76, of abdominal carcinoma.

**Robert Alonzo Hamilton**, Hillsboro, Ill.; Beaumont Hospital Medical College, St. Louis, 1901; St. Louis College of Physicians and Surgeons, 1904; member of the American Medical Association; served during World War I; county physician; died February 21, aged 77, of myocarditis.

**George Lightner Harrell** ♂ Vero Beach, Fla.; Georgia College of Eclectic Medicine and Surgery, Atlanta, 1912; formerly a member of the state legislature; died in a hospital in Miami March 4, aged 60, of heart disease.

**Thomas Ignatius Kealy**, Philadelphia; Atlantic Medical College, Baltimore, 1908; died in the Fitzgerald Mercy Hospital, Darby, Pa., January 31, aged 63, of carcinoma of the liver.

**James Albert Lynch**, Cresson, Pa.; Medico-Chirurgical College of Philadelphia, 1896; member of the American Medical Association; served in France during World War I; past president of the Cambria County Medical Society; served a four year term as Burgess of the borough and for more than thirty years secretary of the board of health and health adviser in Cresson; died February 11, aged 74, of injuries received when he accidentally fell from a window.

**William Arthur McConkey** ♂ Canton, Ohio; University of Wooster Medical Department, Cleveland, 1900; past president of the Stark County Medical Society; on the staffs of the Aultman and Mercy hospitals; died March 17, aged 74, of uremia.

**Fergus Olamh Mahony** ♂ El Dorado, Ark.; Medical Department of Tulane University of Louisiana, New Orleans, 1908; specialist certified by the American Board of Internal Medicine; fellow of the American College of Physicians; served in various offices of the Union County Medical Society; past president of the Arkansas Medical Society and for one term counselor of the Fifth District; city and county health officer; served as president of the state board of health; chief of the staff of Warner Brown Hospital; died February 6, aged 65.

**Lucius Julius Mason**, St. Petersburg, Fla.; Columbia University College of Physicians and Surgeons, New York, 1900; died February 10, aged 73, of cardiorenal disease.

**Will H. Mathews**, Nicholasville, Ky.; Hospital College of Medicine, Louisville, 1883; died in a hospital at Lexington February 3, aged 88, of senility.

**Ludwig Michaelis** ♂ Queens Village, N. Y.; Albertus-Universität Medizinische Fakultät, Königsberg, Prussia, 1920; on the staff of the Queens General Hospital, Jamaica; died in the Mount Sinai Hospital, New York, February 26, aged 50, of pericarditis.

**Mark Millikin** ♂ Hamilton, Ohio; Miami Medical College, Cincinnati, 1892; served as president of the Union District Medical Society; formerly health officer; in May 1942 was guest of honor at a dinner and presented with a gold watch by the Butler County Medical Society to observe his completion of fifty years in the practice of medicine; fellow of the American College of Surgeons; for twelve years councilman; member of the staffs of the Mercy and Fort Hamilton hospitals; died February 19, aged 76, of injuries received in a fall.

**Rocco A. Nigro**, Chicago; University of Illinois College of Medicine, Chicago, 1916; member of the American Medical Association; a member of the staff of the Mother Cabrini Hospital; died March 10, aged 50, of coronary thrombosis and mitral regurgitation.

**August Wilhelm Oestmann**, Jersey City, N. J.; Universität Leipzig Medizinische Fakultät, Leipzig, Saxony, 1891; member of the American Medical Association; died February 18, aged 77, of arteriosclerosis.

**William Henry O'Neil**, Ansonia, Conn.; Baltimore Medical College, 1911; member of the American Medical Association; interned at St. Mary's Hospital in Waterbury; school physician and surgeon of the Ansonia fire department; for many years health officer of Ansonia; served as president of the staff of the Griffin Hospital, Derby, where he died February 12, aged 61, of cardiorenal vascular disease.

**Walter Rowley Paddock**, Lockport, Ill.; Northwestern University Medical School, Chicago, 1896; for many years health officer; served on the staffs of the Silver Cross and St. Joseph's hospitals, Joliet; died January 27, aged 71, of cerebral hemorrhage.

**Andrew Jackson Perolio**, Montgomery, Ala.; Gate City Medical College, Dallas, Texas, 1907; served during World War I; for many years affiliated with the division of typhus fever control of the Alabama Department of Public Health; died in the Emory University Hospital, Atlanta, Ga., February 14, aged 57, of coronary thrombosis.

**William Nelson Pettee**, Denver; University of Buffalo School of Medicine, 1899; died January 24, aged 72, of carcinoma of the lung and rectum.

**Lloyd Cyril Pierce**, Harrisburg, Pa.; University of Pennsylvania School of Medicine, Philadelphia, 1926; member of the American Medical Association and the Harrisburg Academy of Medicine; served during World War I; died March 22, aged 48, of hypertension.

**Francis Nicolaus Pitass**, Buffalo; University of Buffalo School of Medicine, 1899; died in the Buffalo General Hospital February 2, aged 73, of arteriosclerotic heart disease with decompensation.

**Jacob C. Poling**, Ansonia, Ohio; Miami Medical College, Cincinnati, 1905; member of the American Medical Association; died in the Wayne Hospital, Greenville, February 4, aged 74, of heart disease.

**Julius Raab** \* New York; Medizinische Fakultät der Universität Wien, Vienna, Austria, 1919; member of the American Academy of Dermatology and Syphilology; specialist certified by the American Board of Dermatology and Syphilology; attending dermatologist, Beekman Hospital and associate dermatologist at the Hospital for Joint Diseases; died February 7, aged 51, of carcinoma.

**Murray Mechling Rarick**, Columbus, Ohio; Starling Medical College, Columbus, 1898; recently retired after two years on the staff of the state industrial commission; for many years on the staff of the Dayton State Hospital, Dayton, and physician for the Pennsylvania Railroad; died in the University Hospital February 15, aged 71, of coronary disease.

**Thomas Jackson Ray** \* Lexington, Ky.; Memphis (Tenn.) Hospital Medical College, 1896; on the staffs of the Good Samaritan and St. Joseph's hospitals; died February 4, aged 78, of coronary heart disease.

**Lawrence Ewing Reves**, Monette, Ark. (licensed in Arkansas in 1903); died February 11, aged 70, of heart disease.

**Charles Wright Reynolds** \* Holton, Kan.; Keokuk (Iowa) Medical College, 1897; died January 31, aged 74, of cerebral hemorrhage.

**James Weldin Richards**, Le Claire, Iowa; St. Louis College of Physicians and Surgeons, 1898; died in Lake Geneva, Wis., March 7, aged 75, of coronary occlusion.

**Cheslie Alvah Clarence Richardson**, Somerville, Mass.; McGill University Faculty of Medicine, Montreal, Que., Canada, 1904; member of the American Medical Association; formerly chairman of the city board of health; a member of the executive board, chief surgeon and president of the medical staff at the Somerville Hospital; died January 30, aged 73, of coronary thrombosis.

**John Turner Robinson**, Bound Brook, N. J.; Hahnemann Medical College and Hospital of Philadelphia, 1896; for six years mayor of Bound Brook; on the staff of the Mullenberg Hospital, Plainfield; died February 18, aged 79, of cardiovascular collapse.

**Lester Daniel Rusk**, Sioux City, Iowa; Sioux City College of Medicine, 1907; member of the American Medical Association; died January 22, aged 72, of cerebral thrombosis.

**James Henry Savage**, Atlanta, Ga.; Atlanta Medical College, 1915; member of the American Medical Association; also a pharmacist; died in the Crawford W. Long Memorial Hospital February 8, aged 61, of coronary occlusion.

**Robert Burns Scott**, Philadelphia; Jefferson Medical College of Philadelphia, 1896; also a druggist; died in January, aged 77.

**Michael James Shaughnessy**, Framingham, Mass.; Harvard Medical School, Boston, 1907; member of the New England Obstetrical and Gynecological Society; fellow of the American College of Surgeons; for many years medical examiner of the eighth Middlesex district; served on the staff of the Framingham Union Hospital; died February 17, aged 63.

**William James Shoemaker**, Lock Haven, Pa.; University of Maryland School of Medicine, Baltimore, 1882; member of the American Medical Association; coroner of Clinton County; on the staff of the Lock Haven Hospital; died January 22, aged 92, of bronchitis.

**Lawrence Martin Sifrit**, Columbus, Ohio; Starling Medical College, Columbus, 1891; served on the staff of St. Francis Hospital; died January 25, aged 74.

**James Frank Sigafos**, Orting, Wash.; John A. Creighton Medical College, Omaha, 1910; member of the American Medical Association; served in the medical corps of the U. S. Army during World War I; died January 30, aged 57, of coronary thrombosis.

**Esmonde Bathgate Smith** \* Brooklyn; Cornell University Medical College, New York, 1909; member of the American Society of Clinical Pathologists; pathologist at the Methodist Hospital, where he died February 2, aged 57, of coronary thrombosis.

**Harry Boydston Smith**, Blairsville, Pa.; Medico-Chirurgical College of Philadelphia, 1902; died February 18, aged 78, of pulmonary edema and asthma.

**Charles Hugh Tate** \* Dayton, Ohio; Baltimore Medical College, 1898; member of the Clinical Orthopedic Society; past president of the Montgomery County Medical Society; on the staffs of the Good Samaritan and St. Elizabeth hospitals; died February 3, aged 69, of coronary thrombosis.

**Ernest Z. Wanous** \* Minneapolis; University of Minnesota College of Medicine and Surgery, Minneapolis, 1897; an Affiliate Fellow of the American Medical Association; at one time served as assistant superintendent of the Minneapolis General Hospital and as assistant superintendent of the State Hospital in Rochester, Minn.; died January 5, aged 69, of ascending pyelonephritis from cord bladder and decubitus ulcers.

**John P. Watkins**, Detroit; Meharry Medical College, Nashville, Tenn., 1909; associated with the Wayne Diagnostic and Parkside hospitals; died January 24, aged 61, of uremia and hypertensive heart disease.

**Joseph Robbins Wetherbee** \* Eugene, Ore.; Jefferson Medical College of Philadelphia, 1900; served during World War I, and on the staffs of the Good Samaritan and St. Vincent's hospitals, Portland, and the Sacred Heart General Hospital; died January 12, aged 73, of cardiac thrombosis.

**Ira C. Willan**, Morgantown, Ind.; Medical College of Indiana, Indianapolis, 1883; died in Martinsville January 29, aged 85, of uremia, chronic nephritis and prostatic hypertrophy.

**William Mitchell Wolf** \* San Antonio, Texas; University of Texas School of Medicine, Galveston, 1899; fellow of the American College of Surgeons; served as first vice president in 1903 and as president in 1905 of the Bexar County Medical Society; a major in the medical corps of the U. S. Army during World War I; interned at the Santa Rosa Hospital, where he also served as house physician for seven years; died while visiting on a ranch near San Antonio December 8, aged 70, of heart disease.

**Morton F. Wolfe**, New Albany, Ind.; University of Louisville School of Medicine, Louisville, Ky., 1932; served as health officer of Floyd County; began active duty as a captain in the medical corps of the Army of the United States on June 19, 1942; received a medical discharge because of physical disability; died in the University Hospital, Ann Arbor, Mich., February 6, aged 40, of coronary occlusion and hypertension.

**Henry Willis Wood**, Sheldon, Ill.; Columbus Medical College, 1891; member of the American Medical Association; past president of the school board; local surgeon for the New York Central and the Toledo, Peoria and Western railroads; member of the Illinois State Medical Society "Fifty Year Club"; died March 8, aged 82, of coronary thrombosis.

**Lewis Miller Woodson**, Gallatin, Tenn.; University of Louisville (Ky.) Medical Department, 1885; past president of the Sumner County Medical Society; a charter member of the Rotary Club and the chamber of commerce; surgeon for the Louisville and Nashville Railroad for many years; died February 22, aged 80, of uremia.

**Wilson Briggs Zimmer** \* Brooklyn; Cornell University Medical College, New York, 1905; served as president of the Flatbush Medical Society; on the staff of the Midwood Hospital; died February 5, aged 62, of coronary occlusion.

## Correspondence

### THE TREATMENT OF ERYTHROBLASTOSIS FETALIS

*To the Editor:*—The case of the recently publicized "Rh baby" suggests need for an evaluation of the current method of treatment in erythroblastosis fetalis and of its effectiveness. The procedure usually undertaken is the administration of relatively small amounts, 50 to 60 cc. once daily, of compatible blood from an Rh negative donor. The object is the replacement of the "hemolyzed" Rh positive erythrocytes of the infant with cells which will not be "hemolyzed" in order to preserve an adequate oxygen-carrying capacity of the blood. This replacement is usually the only therapeutic measure considered necessary, since "hemolysis" is conceived to be the cause of all the other abnormal symptoms and findings. The effectiveness of the current treatment can be judged by the unfavorable prognosis commonly held. Potter recently reported the production of an unaffected child by the artificial insemination of an Rh negative woman with semen from an Rh negative donor. This procedure was undertaken following the birth of twins both of whom died, the clinical diagnosis of erythroblastosis being confirmed by postmortem examination. The father of the twins was Rh positive. While this report is of the greatest scientific interest, it must be emphasized that resort to such a procedure deprives two married people of a mutually produced child and an innocent man of fatherhood of a child by his own wife. It reflects the pessimism felt by many physicians regarding the outcome in this disease. This pessimism, I believe, results from the inadequacy of the treatment usually employed.

A description of the pathogenesis of erythroblastosis fetalis will not be attempted here, but I should like to point out that "passive isosensitization" of the infant explains more completely than "isoimmunization" all the manifestations of the disease except in that form characterized only by a nonregenerative anemia. On the basis of this conception of the pathogenesis, the red cell destruction is of secondary importance while damage to the liver and lungs, the "shock organs" so obviously seen to be involved on necropsy, is of primary concern. The treatment suggested by this concept therefore includes not only intravenous administration of compatible blood but also oxygen, glucose and sometimes calcium, to reduce anoxia, support the liver, maintain capillary integrity and improve blood coagulability. The use of the mother's blood is, of course, contraindicated, as is her milk.

Compatible Rh positive blood has given uniformly good results in my experience. Its use was continued after the discovery by Levine of the role of the Rh factor in the etiology of this disease, because it was considered probable that most of the transfusions given before this discovery had been with Rh positive blood, and the improvement in the transfused infants had always been dramatic. I now use Rh positive blood by preference because of its sparing action on the infant's red cells, its greater desensitizing effect and its availability from the patient's family, a factor which may be of importance in a low-income family. No infant should die while Rh negative blood donors are being sought. Having observed the response to the use of Rh negative blood in a number of cases, I find no valid reason, either in the observed cases or in those reported in the literature, for insisting on the use of Rh negative blood in this disease. The response to the first transfusions is short lived in the severely affected infant whether he receives Rh negative or Rh positive blood. If the transfused red cells are destroyed, the infant's own cells are, and the net result is the same as far as the erythrocytes are concerned. In only 2 instances in a series of cases in which untested or Rh positive

blood was used did the jaundice last sixteen days or longer. One was an infant delivered by high forceps after a long and difficult labor. The first transfusion in this case was of Rh negative blood because an Rh negative donor had been obtained for the mother, and some of this blood was at hand. In another infant in whom the icterus index was 190 on the third day, following two administrations of plasma only, the skin began to clear with the second transfusion of Rh positive blood and the jaundice had completely disappeared by the sixteenth day. Contrary to current opinion, compatible Rh positive blood has not and should not have a detrimental effect on the baby's own blood.

The blood should be given in adequate amounts. Sanford suggests 10 to 15 cc. per pound of body weight; this would be 60 to 90 cc. for a 6 pound baby and more for a larger child. If the anemia in the cord blood is severe—and the cord blood should always be examined when a previous child of the mother has been affected—or if the nucleated red cell count is high and edema or hemorrhagic manifestations appear in any part of the body, a second transfusion should be given in twelve to twenty-four hours. The aim is to reduce the anoxia, bring the serum albumin to a safe level and improve the coagulability of the blood. Transfusions should be repeated whenever the child appears "toxic." According to the concept of pathogenesis suggested, this toxic condition is due to the damaging biochemical effects (release of histamine or histamine-like substances among others, for example) of the antigen-antibody reaction in the sensitized child. A "toxic" baby with a red cell count of 4,000,000 per cubic millimeter of blood is therefore in far greater need of an immediate transfusion than a nontoxic baby with a count of 2,000,000 red cells. Ignorance of this fact is probably responsible for some deaths in this disease. With Rh positive blood there is no danger, when a transfusion is thus indicated, of flooding the circulatory system with an excess of erythrocytes, since the Rh positive cells absorbing the isoantibodies are destroyed. In the nontoxic child it is entirely safe to delay blood replacement to the point where the erythrocyte level is 2,500,000, since anemia is not the cause of the toxic symptoms. Whole blood should be used exclusively, as plasma is ineffective, and it should always be given into the vein. The multiple syringe method of administration is to be preferred to the gravity method because of the small caliber of the veins in the newborn.

Oxygen should be given constantly, 3 to 4 liters per minute, as long as nucleated red cells are present in the blood smear, since their presence suggests an anoxic type of anoxemia. Subsequently, as long as the jaundice persists, it may be given for fifteen to thirty minute periods six to eight times daily after feedings to improve hepatic efficiency.

Venoclysis of 80 to 100 cc. of 5 per cent glucose in isotonic solution of sodium chloride may be given slowly once or twice daily if a cannula has been left in place, or subcutaneous injections of 5 per cent glucose in distilled water should be given twice daily in amounts of 30 to 40 cc. if the cannula has been removed. Glucose can thus be given in larger amounts than by mouth alone without deranging the digestive system. This therapy is likewise continued until the disappearance of the jaundice.

Calcium gluconate, 5 to 10 cc. of the 10 per cent solution, may be given intravenously at the time of a transfusion. This is especially indicated if any tendency to hemorrhage is noted, since coagulation of the blood in this disease seems to be improved by calcium more effectively than by vitamin K. It may also operate to reduce the permeability of the capillaries.

Deliberate premature delivery will not prevent or modify the disease. Birth, necessitating the separation of the infant from

the mechanisms provided within the uterus for oxygenation and the removal of toxic substances, usually precipitates the symptoms of the disease and renders the pathologic processes more fulminating. Furthermore, sensitization does not parallel the number of antibodies either in the blood or in the body tissues. It may rather be associated with the smaller titers, since one injection of an antigen may often sensitize while a larger number of injections may produce a relative immunity. Therefore there is no assurance that the sensitized child will be in any way protected by depriving him of the last few weeks of gestation. Prematurity is only a further complication.

The treatment outlined has been used for the past eight years and has given consistently good results. It permits a good prognosis in the large majority of cases. It cannot, however, restore to normalcy a child whose brain has been previously damaged. Such damage is fortunately present in only a relatively small number of those affected and seems to bear no relationship to the severity of the other symptoms. Prompt diagnosis and immediate initiation of therapy, especially the transfusions and oxygen, are of course imperative.

Early recognition of the condition is usually not difficult. Brown amniotic fluid is sometimes seen at birth. Jaundice within the first hours of life, pallor of the palms, the soles of the feet, the lips and mucous membranes of the mouth, and later of the skin in which the jaundice appears lemon yellow, enlargement of the liver and spleen and edema of the extremities or scrotum in some cases are all early signs which should not be disregarded. Soon the extremities begin to lose tone, the infant becomes less easily aroused although he may appear hyperirritable on handling, and a weak, high pitched cry may denote edema of the vocal cords; edema of the extremities may appear if not present earlier. This is the picture of the "toxic" state to which I have already referred. A blood smear showing nucleated red cells is corroborative but not pathognomonic, and they may be few or absent. The erythroblastemia usually reflects the severity of the condition, but it must not be relied on as an absolute diagnostic sign.

In the earliest American report on this disease, I. A. Abt commented on the strength, robustness and maturity of most of these children at birth. With prompt and adequate treatment ultimate complete recovery should be the rule.

RUTH RENTER DARROW, M.D., Chicago.

#### FAREWELL AND THANK YOU FROM QUEENSLAND

To the Editor:—For the past three years United States troops have been among us in this country, and among them have been medical units of both the Army and the Navy.

Now, when the tide is receding and they are leaving our shores, this committee wishes to publish through your columns our feelings of gratitude and friendship to these our colleagues.

Not only do we owe a very real debt of gratitude to those American women and men who, in our imminent danger, stood by the side of our own troops and saved this country and especially this state from Japanese invasion, but to our colleagues in the Medical Services we owe a special debt.

This body, as its name implies, is concerned with postgraduate teachings—and the call for such teaching was increased, not diminished, by the war. Owing to shortages of our own members this was a matter of the greatest difficulty, and our efforts were confined to a special week-end course once a quarter. Even this slender effort would have been impossible without the enthusiastic cooperation of your medical services. Their members were ready at any time to hold clinical meetings and to give demonstrations and lectures, and while the mental was

not forgotten the physical hospitality too was so lavish as to be almost embarrassing.

When all were so good, it is impossible to name either individual teachers or units; looking back, one feels "They were all good."

To their routine hospital meetings our members were always welcome—it was a constant regret that, owing to the pressure of their practices, so few were able to accept their invitations.

As well as at the bases in the forward areas the U. S. Medical Services cooperated with the Australian Army Medical Services in keeping up medical teaching and research.

So in this area we are sorry to have to record the end of a period of particularly happy cooperation and friendship.

A. E. PATERSON, Brisbane, Queensland, Australia.  
Honorary Secretary, Postgraduate Medical Education  
Committee, University of Queensland Medical School.

#### MORPHINE WITH PENTOTHAL ANESTHESIA

To the Editor:—Morphine is frequently used to supplement pentothal sodium in the production of anesthesia. It is definitely synergistic with and potentiates the action of pentothal. One frequently observes that administration of morphine during the course of a pentothal anesthetic will decrease the required pentothal dose.

Occasionally it has been overlooked not only that morphine potentiates the action of pentothal but that pentothal will potentiate the action of morphine. When morphine is administered to a patient postoperatively it is important to know whether such a patient has received a pentothal anesthetic. If he has, and the fact is disregarded, the morphine administered may produce a clinical narcotic effect far greater than was desired or anticipated. Such a situation will exist when a high concentration of pentothal persists for several hours after surgery, a situation to be suspected when a patient has received several grams of pentothal or when prolonged emergence from anesthesia indicates slow destruction of the drug in the blood stream.

Two cases will illustrate:

CASE 1.—A man aged 35 received 2 Gm. of pentothal during the repair of an abdominal wall defect. Recovery from anesthesia was prolonged; after several hours the patient began to groan. One-fourth grain (0.016 Gm.) of morphine was given, and very shortly thereafter the patient sank into a deep coma from which he could not be roused. The substantial dose of morphine, reinforced by some pentothal residual in the blood stream, promptly reanesthetized the patient.

CASE 2.—A patient received a bilateral intercostal block for an emergency laparotomy. Pentothal sodium was administered to produce unconsciousness. The block wore off after ninety minutes, after which increased dosage of pentothal plus 50 per cent nitrous oxide supplemented the anesthesia. The operation lasted about three hours, and at its termination the patient was in poor condition. A total of 2 Gm. of pentothal was used. Recovery from anesthesia was slow; even six hours after the operation the patient could hardly be roused. During the evening, as a result of some moaning, the patient was given  $\frac{1}{4}$  grain of morphine by the ward attendant. The patient quieted down, and respirations were considerably slowed. After six hours more of unconsciousness the patient died. The severe postoperative shock was aggravated by the prolonged unconsciousness, the respiratory depression and a developing pulmonary edema.

The morphine-pentothal synergism is routinely considered during the preoperative and intraoperative periods. It ought not to be overlooked during the postoperative phase.

SAMUEL L. LIEBERMAN, Captain, M. C., A. U. S.

**"ABDOMINAL PAIN IN CHILDREN"**

*To the Editor:*—In going over Dr. Brennemann's article on abdominal pain in children in the March 24 issue of THE JOURNAL I note that diabetic acidosis and pyelonephritis are not mentioned as causes of acute abdominal pain often difficult to differentiate from the so-called "acute surgical abdomen." These are not infrequently met and need differentiation by urinary findings, although if the physical signs indicate a strong possibility of acute appendicitis it is safer to operate than to let it alone, the diabetes and its acidosis being possible of control despite the operation.

SAMUEL GITLOW, M.D., New York.

## Bureau of Legal Medicine and Legislation

### MEDICOLEGAL ABSTRACTS

**Hospitals Not for Profit: Applicability of National Labor Relations Act Requiring Collective Bargaining with Employees in the District of Columbia.**—The Central Dispensary and Emergency Hospital is a nonprofit, charitable corporation located in the District of Columbia, whose services are available to patients regardless of their ability to pay. Sometime prior to the decision here reported a local union attempted to organize hospital employees performing nonprofessional services, and the National Labor Relations Board held an election among such employees on the question as to whether or not that union should be their bargaining representative. Of 251 employees eligible to vote only 108 voted, of whom only 75 voted to make the union their bargaining representative. The National Labor Relations Board on the basis of that election, ordered the hospital to bargain collectively with the union and petitioned the United States court of appeals, District of Columbia, for the enforcement of that order against the hospital.

The National Labor Relations Act, which has application to employment in the District of Columbia, creates the National Labor Relations Board with specified powers, one of which is to require an employer to bargain collectively with a union chosen by the employees of a particular establishment as their bargaining agency. The act applies to employments in "commerce," which section 2(6) of the act defines as "trade, traffic, commerce, transportation or communication among the several states or between the District of Columbia or any territory of the United States and any state or other territory, or between any foreign country and any state, territory or the District of Columbia, or within the District of Columbia. . . ." The hospital contended that the National Labor Relations Act did not apply to it and that consequently the order of the National Labor Relations Board requiring it to bargain collectively with the union is void, since the hospital is a nonprofit charitable institution not engaged in trade, traffic, commerce or transportation within the meaning of the act. The activities, said the court, whose opinion was written by Associate Justice Thurman Arnold, carried on by the hospital are trade and commerce, and the fact that those activities are carried on by a charitable hospital is immaterial. In *American Medical Association v. United States*, 76 U. S. App. D. C. 70, 130 F. (2d) 233 (1942), this court held that the sale of medical and hospital services for a fee has been considered as trade by English and American common law cases going back to 1793. In *Jordan v. Tashiro*, 278 U. S. 123 (1928) the operation of a general hospital was held by the Supreme Court to be a "business undertaking," and such activity was included within the meaning of the words trade and commerce as used in a treaty with Japan.

The respondent argued, however, that the spirit or policy of the National Labor Relations Act is such that there should be

read into it an exemption in favor of charitable hospitals, relying on *Western Pennsylvania Hospital v. Lichtner*, 340 Pa. 382, 17 A. (2d) 206, J. A. M. A. 117:475 (Aug. 9) 1941, in which the Supreme Court of Pennsylvania held that even though the words of the Pennsylvania State Labor Relations Act might be broad enough to include a hospital nevertheless the legislature did not intend to apply the act to such institutions.<sup>1</sup> We are unable to follow the reasoning of the Pennsylvania court, said the district court of appeals. We cannot understand what considerations of public policy "deprive" hospital employees of the privilege granted to employees of other institutions. The court then referred to opinions of the Supreme Courts of Minnesota and Wisconsin, respectively, in *Northwestern Hospital v. Public Building Service Employees' Union Local No. 113*, 208 Minn. 389, 294 N. W. 215, J. A. M. A. 117:474 (Aug. 9) 1941 and *Wisconsin Employment Relations Board v. Evangelical Deaconess Society*, 242 Wis. 78, 7 N. W. (2d) 590 (1943), which held that charitable hospitals and their nonprofessional employees were subject to the labor relation acts of those states. These opinions, the court concluded, present what seem to it the only tenable view as to the spirit and policy of labor relation acts.

The appellate court accordingly entered a decree directing the enforcement of the order of the National Labor Relations Board, which, in effect, required the hospital to bargain collectively with the union.—*National Labor Relations Board v. Central Dispensary and Emergency Hospital*, 145 F. (2d) 852 (1944).

## Medical Examinations and Licensure

### COMING EXAMINATIONS AND MEETINGS

#### BOARDS OF MEDICAL EXAMINERS BOARDS OF EXAMINERS IN THE BASIC SCIENCES

Examinations of the boards of medical examiners and boards of examiners in the basic sciences were published in THE JOURNAL, April 21, page 1076.

#### NATIONAL BOARD OF MEDICAL EXAMINERS

NATIONAL BOARD OF MEDICAL EXAMINERS: Parts I and II, May 1-3 and July 16-18. Part III. Various centers, June. Exec. Sec., Mr. E. S. Elwood, 225 S. 15th St., Philadelphia.

#### EXAMINING BOARDS IN SPECIALTIES

AMERICAN BOARD OF INTERNAL MEDICINE: *Oral*. New Orleans, May 21-23, Philadelphia, June 6-8, Chicago, June 27-29. *Written*. San Francisco, Oct. 15-17. Final date for filing application is Aug. 1. Candidates in the armed forces may take the examination at their station with the permission of their medical commanding officer. Asst. Sec., Dr. W. A. Werrell, 1301 University Ave., Madison 5, Wis.

AMERICAN BOARD OF NEUROLOGICAL SURGERY: Chicago, May 28. Sec., Dr. Paul Bucy, 912 S. Wood St., Chicago 12.

AMERICAN BOARD OF OBSTETRICS & GYNECOLOGY. *Part II. Oral*. Atlantic City, June 13-19. Sec., Dr. Paul Titus, 1015 Highland Bldg., Pittsburgh 6.

AMERICAN BOARD OF OPHTHALMOLOGY. New York, June 13-16; Chicago, Oct. 4-6; and Los Angeles, January. Sec., Dr. S. Judd Beach, 56 Ivie Rd., Cape Cottage, Me.

AMERICAN BOARD OF ORTHOPAEDIC SURGERY. *Part I. Oral and Written*. New Orleans, Sept. 28-29, New York, Oct. 5-6, Chicago, Oct. 12-13 and San Francisco, Oct. 19-20. Final date for filing application is August 1. Sec., Dr. G. A. Caldwell, 3503 Prytania St., New Orleans 15.

AMERICAN BOARD OF OTOLARYNGOLOGY: Chicago, Oct. 3-6. Sec., Dr. Dean M. Lierle, University Hospital, Iowa City, Ia.

AMERICAN BOARD OF RADIOLOGY. *Oral*. New York, June 3. Final date for filing application is May 1. Sec., Dr. B. R. Kirklin, 102-110 Second Ave. S.W., Rochester, Minn.

AMERICAN BOARD OF SURGERY: *Written*. Various centers, October. Final date for filing application is Aug. 1. Sec., J. S. Rodman, 225 S. 15th St., Philadelphia 2.

AMERICAN BOARD OF UROLOGY. *Written*. Chicago, Dec. 9. *Oral*. Chicago, Feb. 19-22. Sec., Dr. Gilbert J. Thomas, 1409 Willow St., Minneapolis 4.

1. See special article in THE JOURNAL 117:461-463 (Aug. 9) 1941, entitled "Courts and the Unionization of Hospital Employees," discussing the legal problems involved in this field.

## Current Medical Literature

### AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1935 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (\*) are abstracted below.

**Gastric Acidity in Men and Women with Duodenal Ulcer.**—Brown and Rivers point out not only that duodenal ulcers are much more frequent in men than in women but that ulcers in women are generally more responsive to treatment and less likely to recur. They investigated the part the chemical factor plays in causing women to respond so much better than men to various conservative methods of treatment of ulcer. They believe that one can evaluate the chemical factor most effectively by a study of the gastric acidity through fractional analysis of gastric contents after injection of histamine. A study on 35 women and 35 men with duodenal ulcer revealed that male patients have much higher values than female patients for free hydrochloride acid and total acid in response to injection of histamine. The higher incidence of hyperacidity may help to explain the greater tendency to intractability of duodenal ulcer in men. Neurogenic causes, on the other hand, are usually very apparent among women who have duodenal ulcer. The utilization of this information is clinically important in determining the type and intensity of treatment of duodenal ulcer.

**Vaginal Smears in Early Cancer.**—Jones and her associates report microscopic examinations of vaginal fluid aspirated as a routine procedure from 427 gynecologic patients. The equipment necessary consists of a slightly curved glass pipet to which are attached a small rubber suction bulb, two microscopic slides, each equipped with a paper clip, and a fixative (a mixture of equal parts of 95 per cent ethyl alcohol and ether). The smear is taken before any examining lubricant is used. The labia are separated and the pipet is introduced high into the vaginal vault, with the bulb compressed. As the pipet is withdrawn the bulb is slowly decompressed. The material thus obtained is sprayed over the surface of the slide and spread evenly. The moist slides are immediately immersed in the fixing solution, where they may remain for an indefinite period. Then they are stained. In 91 of the 427 patients a diagnosis of cancer was made from the vaginal smears, of which 82 were confirmed by biopsy or curettage. The procedure is a valuable addition to the methods utilized for the early diagnosis of pelvic carcinoma. When suggestive cells are present, even though few, the patient should be investigated further. Although most are eventually proved negative, an occasional early lesion will be detected, which otherwise might have been completely overlooked.

**Cervical Pregnancy.**—Cervical pregnancy has been given scant consideration in American medical literature. Studdiford tabulates 28 cases that he found mostly in the foreign literature and reports observations on 2 patients in whom clinical evidence points to the cervix as the primary nidation site. Cervical pregnancy is a definite, though rare, entity. Many cases may be unrecognized. Such pregnancies are rarely carried beyond the twentieth week of gestation. Usually it is necessary to intervene surgically before the fifth month because of hemorrhage, rupture of the amniotic sac or perforation of the cervical wall. Profuse and violent hemorrhage accompanies the attempt to remove the placenta. Enlargement and expansion of the cervix accompanied by bleeding in the early months of pregnancy, and detection of the corpus uteri surmounting the cervical mass should be regarded as suggestive of this condition. Supravaginal rupture of the cervix should be treated by prompt and radical intervention. Intravaginal rupture of the cervix can sometimes be treated more conservatively; however, this complication may require cervical amputation or complete hysterectomy to control hemorrhage. When perforation is not present, the placenta in most instances can be evacuated partially or completely, either manually or instrumentally; the hemorrhage can be controlled by packing. Blood for transfusion should be available to combat the large blood loss which may be expected in cases treated by placental removal. With the use of large and repeated transfusions the need for radical operation can be

sharply reduced. On the rare occasion when such a pregnancy progresses beyond the fourth month, complete hysterectomy may well be the safer approach.

**Rapid Treatment of Early Syphilis During Pregnancy.**—Speiser and his co-workers administered mapharsen to 43 pregnant patients with early syphilis. One death from arsenical encephalopathy occurred in this group. Of the 30 patients with early infectious syphilis who completed treatment and were kept under observation, good results from this therapy were obtained in 76.6 per cent. Between 1936 and 1940, prior to the advent of massive arsenotherapy, there were 34 pregnant patients treated for early infectious syphilis with routine therapy. One death occurred from arsenical encephalopathy, 5 patients developed jaundice and 1 developed exfoliative dermatitis. Only 50 per cent of the offspring were free from syphilis. In the relatively small series reported here, intensive therapy proved safer and more effective than routine treatment. There remains the risk of arsenical encephalopathy, and this is probably greater with intensive mapharsen therapy than when the same drug is employed in routine treatment.

**Postirradiation Bone Changes.**—Gratzek and his associates cite the case of a child in whom retardation of bone growth resulted from roentgen irradiation of a hemangioendothelioma of the right thigh. The child was 5 months old at the onset of the roentgen treatment. At the age of 9 years the right femur was 3 cm. shorter than the left and was smaller in circumference. A year later the difference between the two femurs remained about the same. Observations made at the University of Minnesota Hospitals, where since 1940 routine roentgenograms of the pelvis of all individuals referred for high voltage roentgen therapy of malignant conditions of the pelvis have been made before treatment and at yearly intervals thereafter and observations on patients treated since 1936 and reexamined roentgenologically revealed 25 instances of bone changes in the pelvis or femurs, occurring in 19 out of 1,363 patients. Of 568 cases in which routine roentgen examinations of the pelvis were made, bone sequelae developed in 3.2 per cent.

No bone sequelae were found in 541 male patients treated for carcinoma of the bladder or prostate. Particular attention is directed to the occurrence of aseptic necrosis of the head and neck of the femur and the acetabulum, which occurred in 8 instances. There were 14 cases of fracture of the femoral neck and 3 unusual cases with multiple fractures and sclerosis of the bones of the pelvic girdle. The bone changes seemed to occur more frequently after the introduction of a more intensive type of radiation therapy. Roentgenologically demonstrable lesions in the bones appeared as early as five months and as late as sixty-two months following the radiation treatments. Repeated roentgen examination permitted the demonstration of sclerotic and necrotic changes prior to the development of fracture or frank aseptic necrosis. Irradiation may affect all the bones of the pelvis as well as the neck of the femur. The effects may be *multiform*, including fractures, sclerosis, osteoporosis and aseptic necrosis of the femoral head.

**Relation of Phantom Limb Pain to Treatment of Nerves at Amputation.**—Herrmann and Gibbs studied the phantom limb pain with the primary object of preventing irritation of the afferent pathways in the mixed nerves of the extremity at the time of amputation and during the immediate postoperative period by preventing abnormal scar tissue formation or the formation of neuromas at the site of division of the large nerve trunks. From January 1937 to January 1944 they performed 238 major amputations at the Cincinnati General Hospital and the Christian R. Holmes Hospital of the University of Cincinnati. The large nerve trunks were ligated with nonabsorbable material at a point about 1 inch above the site of amputation. The nerves were never crushed before the ligature was applied. The incidence of phantom limb pain in their series of 120 patients who were adequately studied after a major amputation was only 5.8 per cent. The analysis of the clinical data presented in this study indicates that the treatment of the large nerves at the time of amputation is of considerable importance in preventing the occurrence of phantom limb pain.

**Vitallium Replicas of Carpal Scaphoid as Replacements After Excision.**—Waugh and Reuling experimented with a replica of vitallium after excision of the fragments in cases of ununited fractures of the carpal scaphoid, in the belief that such a prosthesis would maintain normal relationship of the other bones of the wrist, would prevent radial deviation of the hand and might lessen or prevent the untoward symptoms that frequently follow the ordinary excision operation. The first replica was of solid vitallium and weighed 29 Gm. Although the patient was quite satisfied with the operation and stated that his wrist was much improved, it was believed that the prosthesis was of excessive weight and not a perfect fit. To overcome these difficulties, hollow vitallium replicas were made. The weights of these replicas varied between 12 and 17 Gm. The

average weight of a human carpal scaphoid is between 4 and 5 Gm. While the results to date are encouraging, sufficient length of time has not elapsed to determine whether or not the use of vitallium replicas will be of value in solving the problem of the ununited fracture of the carpal scaphoid.

**Curare in Anesthesia.**—In the 100 cases reviewed by Cole, relaxation of abdominal muscles was obtained by curare following anesthetization with a general anesthetic agent, cyclopropane being used in all but 2 cases. To obtain relaxation in 100 abdominal surgical procedures, 158 intravenous injections of curare were given. Single doses varied from 8 mg. to 100 mg.; the largest total dose used was 240 mg. Excellent relaxation was produced in 92 cases. Severe respiratory depression, which occurred in 12 cases, was easily treated by artificial respiration. There were no fatalities attributable to curare. The average interval between the first and second doses in cases requiring more than one dose was 74.8 minutes. In 42.4 per cent of the cases the relaxation obtained from the initial injection persisted throughout the operation and was adequate for closure. Curare can be used by a competent anesthetist in almost every case. It will produce abdominal muscle relaxation during cyclopropane anesthesia without the difficulty, delay or complications of spinal block. Cyclopropane-curare combined anesthesia may well become the method of choice for abdominal surgery.

**Hepatotoxic Action of Arsenicals.**—Annegers and his associates attempted to determine whether the intravenous administration of neoarsphenamine and mapharsen affects the synthesis of cholic acid and, if so, whether the oral administra-

tion of dehydrocholic acid for three days prior to and after the administration of the arsenicals will diminish the hepatotoxic action of these arsenicals. Dogs with a permanent biliary fistula and a duodenal fistula for the return of bile were used. Neoarsphenamine was given intravenously in a single dose of 300 mg. (60 mg. of arsenic) and mapharsen in a single dose of 60 mg. (17.4 mg. of arsenic). The dose of mapharsen used, on the basis of body weight, is about twice the daily dose used in the intensive five day treatment of syphilis. It was found that a dose of 300 mg. of neoarsphenamine does not consistently depress cholic acid output in dogs with a permanent biliary fistula. Mapharsen in a dose of 60 mg. consistently depresses cholic acid output in biliary fistula dogs deprived of bile acids. Oral administration of dehydrocholic acid may aid in counteracting the hepatotoxic action of mapharsen. It is suggested that patients scheduled to receive intensive arsenotherapy should have the function of their liver examined by one of the more sensitive tests (e. g., the 5 mg. sulfobromophthalein test) and be given a diet known to affect favorably the resistance to poisons for two or three days prior to the initiation of the therapy.

**Bronchiectasis Following Atypical Pneumonia.**—Kay reports that 20 of 45 patients with bronchiectasis developed the condition following attacks of atypical pneumonia. He thinks that this suggests a cause and effect relationship. In an attempt to determine the permanence and extent of the bronchial and bronchiolar damage in the 20 cases of bronchiectasis attributable to atypical pneumonia, bronchography was repeated over a period of two to six months. In only 3 instances did bronchiectatic bronchi resume their normal contour and show evidence of clearing. The bronchiectasis of the remaining 17 patients appeared to be permanent. Ten of these 17 patients have had lobectomies. The interval between the atypical pneumonia and the operation varied from six to thirteen months. The bronchiectatic damage in the resected lobes substantiated the permanence of the bronchial destruction. The author presents 7 of the 17 case histories in which bronchiectasis followed attacks of atypical pneumonia. Their attacks of pneumonia were prolonged. Continuance of a productive cough and x-ray evidence of pulmonary pathologic conditions led to bronchographic examination and establishment of the diagnosis of bronchiectasis. Continued rest in bed should be insisted on until all evidence of pulmonary infection has disappeared. When atypical pneumonia runs a protracted course, and particularly when it is associated with x-ray evidence of unrelieved atelectasis, measures should be taken to relieve the bronchial obstruction and atelectasis. Such agents would consist of expectorants, steam and menthol inhalations and postural drainage. If these fail, bronchoscopic aspiration should be done, at which time the edematous ulcerated membrane could be shrunk with epinephrine hydrochloride. If the productive cough persists, bronchiectasis should be suspected and bronchograms should be made. Twenty-one of the entire group of 45 patients with bronchiectasis have had lobectomies, with complete relief of symptoms. There was no operative mortality.

**Hypoglycemia in Adenoma of Islets of Langerhans.**—Walker and Boger state that small adenomas of the islets of Langerhans produce recurrent severe hypoglycemic reactions, which at first yield to progressive increases of the intake of carbohydrates but are finally cured only by the surgical removal of the adenoma. The authors report 2 cases of adenoma of the islets of Langerhans in which the tumors were removed surgically, with successful control after operation. The patients were

women aged 24 and 67. Though there are fairly frequent reports of islet tumors, the removal of an adenoma with recovery is still relatively rare. With the reported 2 cases the number of operative cures of pancreatic adenoma is raised to 56. The symptoms produced by these tumors are those of "insulin shock." Headache, weakness, dizziness, nausea, sweating, tachycardia, hypothermia, lowering of the blood pressure and diplopia are common. Neurologic signs and symptoms may be encountered alone or in any combination. The frequency of a positive Babinski sign, which disappears on the relief of hypoglycemia, is worthy of comment. Hunger has been emphasized in many reports, but both of the described cases illustrate the fact that it is not a universal symptom. Convulsions are common. The lack of correlation between the occurrence of symptoms and the level of sugar in the blood has not been explained. The authors believe that the study of this condition will be furthered if more attention is paid to the alterations produced in the other endocrine glands. Surgical removal of these tumors is the most effective therapy, and this treatment is imperative in order to prevent damage to the central nervous system as a result of long-standing hypoglycemia.

- \*Ligation of Femoral Vein for Chronic Occlusive Arterial Disease: Review of 118 Ligations. S. T. Glasser.—p. 56.

**Gelatin and Pectin Solutions as Substitutes for Plasma in Treatment of Shock.**—Popper and his associates report the results of intravenous administration of 257 liters of gelatin solution to 162 patients in 213 individual infusions. The quantity of solution administered ranged from a total of 1 to 10 liters per patient. Pectin solution was administered in the amount of 235 liters to 155 patients in 251 individual infusions for a total of from 1 to 9 liters per patient. About half of the patients were hospital control subjects; the other half were patients with various degrees of surgical, traumatic, hemorrhagic and medical shock. It was found that the two solutions produce an equal degree of hemodilution, which levels off with administration of higher doses of both solutions. This leveling off is more pronounced in patients with anemia and hypoproteinemia. A hypothesis is suggested that the hemodilution is started by the macromolecular solution but is maintained by other substances, possibly labile plasma proteins. Gelatin and pectin solutions produce an equal rise in the sedimentation rate, which is considered an index of hematologic changes. The difference between the two solutions lies in the fact that gelatin produces less change in the tissues. After administration of amounts of pectin in excess of those used for patients in shock, splenomegaly and deposition of a peculiar material in various organs may be observed. It is found in phagocytic cells, capillaries, tissue spaces and infiltrating reticulum fibers in the spleen, kidneys, liver and lungs; it resembles deposits of amyloid and causes a reaction of the reticuloendothelial cells. A similar picture was produced in animals by administration of large amounts of pectin. The clinical significance of these changes is unknown. Since the beneficial effects of gelatin and pectin appear equal on the basis of changes in the tissues, gelatin appears preferable to pectin.

**Ligation of Femoral Vein for Chronic Occlusive Arterial Disease.**—Glasser reports the results of 118 ligations of the femoral vein performed on 110 patients. The superficial femoral vein was interrupted immediately distal to its junction with the vena profunda. Transfixation of the cut ends of the

vein is a safeguard against slipping of the ligature. In order to determine indications for the procedure and a proper selection of cases, ligation of the femoral vein was performed on all patients with chronic obstructive arterial disease who consented to the operation. Eighty-eight of the 110 patients were admitted with active lesions on the toes; this showed that the greatest number of patients were treated after the phase in which ligation of the femoral vein might be considered prophylactic. At the time of the final follow-up examination, 25.4 per cent of the entire series were alive. The author concludes that his experience definitely places ligation of the femoral vein in the armamentarium for the treatment of chronic occlusive arterial disease. He considers it indicated for prophylaxis in chronic obstructive arterial disease—before such lesions as gangrene, ulceration and infection present themselves.

### Bulletin of Johns Hopkins Hospital, Baltimore

75:327-452 (Dec.) 1944

**Penicillin in Acute Syphilitic Meningitis.**—Nelson and Duncan describe the effect of sodium penicillin in cases of acute syphilitic meningitis treated at the Johns Hopkins Hospital. The route of administration was intramuscular. Dosage and duration of treatment were variable, but no other treatment was given with or after penicillin. At the time this report was written from 98 to 310 days had elapsed since the penicillin treatment. The immediate results were excellent. Although penicillin did not appear in the cerebrospinal fluid even after frequent intramuscular administration, the drug was effective. None of the 10 patients treated have thus far developed evidence of clinical relapse, though 1 has shown relapse in the spinal fluid findings. The total amount of penicillin administered varied from 600,000 to 4,000,000 units; the duration of treatment varied from seven and one-half to eleven days. The treatment schedule advised for acute syphilitic meningitis is a total dose of 2,000,000 to 3,000,000 Oxford units of penicillin administered every three to four hours day and night for from eight to sixteen days. The authors think that intravenous administration of penicillin is relatively ineffective and intrathecal administration is unnecessary. All patients with acute syphilitic meningitis treated with penicillin should be closely followed, at least as often as every three months during the first year after treatment, every six months for another two to three years, and yearly thereafter. It should not be forgotten that, although symptomatic (and often serologic) improvement can be secured in acute syphilitic meningitis with almost any form of modern chemotherapy or fever therapy, the eventual prognosis of this condition in terms of development of late neurosyphilis, especially dementia paralytica and tabes, is grave.

- Dental Study of U. S. Soldiers in the Tropics. H. B. Zeitlin.—p. 113.
- Verification Tests in Serodiagnosis of Syphilis.**—Rein and Callender point out that technical false positive reactions occur in serums containing no antibody and may be due to technical errors in collecting and labeling specimens, the use

of contaminated and hemolyzed specimens, laboratory errors in performing the tests, the use of faulty materials and reagents, or errors in recording or reporting the final results. Biologic false positive reactions may be due to the presence of antibody-like substances similar to the antibodies produced in syphilitic disease, an increase or alteration of the seroglobulin fraction, or an increase or alteration of some chemical substance or substances in the blood. Stokes has enumerated about thirty conditions which render frequent, occasional or disputed biologically false positive serologic reactions. Investigations at the Army Medical School have disclosed still other diseases and conditions which may cause false positive serologic reactions. Any metabolic disturbance or febrile episode may at times influence the reliability of serodiagnostic tests for syphilis. There is need for a method which will differentiate the false from the true reactions. Several "verification" or "confirmation" procedures have been proposed for this purpose, but none of these have been able to distinguish consistently between true and false positive serologic reactions. Until a more reliable verification test has been developed, the diagnosis of a syphilitic infection should not be made on the basis of the results obtained with the various serodiagnostic tests and verification procedure alone. The final diagnosis should depend on the ensemble of the available data, including (1) a detailed history, (2) a complete physical examination, (3) radiologic examinations of the heart and aorta, (4) a spinal fluid examination, (5) examination of contacts, marital partners, brothers, and sisters and (6) repeated serologic examinations in the same and other laboratories. Additional laboratory examinations should be made, including blood counts, blood smears, heterophil antibody tests, sedimentation rates, specific complement fixation, precipitation and agglutination tests and albumin-globulin ratio studies.

- Effect of Colchicine and X-Rays on Onion Root Tips. M. Levine.—p. 107.

**Inheritance of Cancer in Mice.**—Miller and Pybus describe investigations on the incidence of mammary carcinoma in a series of crosses and backcrosses between Simpson (high tumor) and Edinburgh (low tumor) and between Simpson and CBA (low tumor) strains of mice. The results confirm the existence of a maternal extrachromosomal factor for mammary carcinoma discovered by previous workers and also show that an important part is played by interstrain genetic differences in susceptibility. No extrachromosomal factor was observed in the inheritance of lung tumors, hepatomas or bone tumors, while the evidence was inconclusive in the case of lymphadenopathy.

**Effect of Foster Nursing on Incidence of Mammary Carcinoma in Inbred Mice.**—Miller and Pybus show that when females of the Simpson (high mammary tumor) strain were fostered by mice of Strong's CBA (low mammary tumor) strain the incidence was reduced from 69.5 per cent to 55 per cent. There was unavoidable delay in fostering some of the litters, and even some of those fostered within twenty-four hours after birth had probably been suckled by their own mothers. There were fewer mammary tumors in the offspring of the fostered Simpson mice, partly because of a greatly increased mortality from lymphadenopathy. The offspring of fostered tumorous females had a higher tumor incidence than the young of fostered nontumorous mice. The mammary tumor incidence in CBA females fostered by Simpson mice was raised from 5 per cent to an average of 44.4 per cent. The CBA fostered females were able to absorb the milk influence and transmit it to their offspring even when they themselves died nontumorous. There was a great increase in lymphadenopathy in fostered

Simpson mice and their offspring; there was also an increase in the disease in fostered CBA mice and their descendants. Fostering had no effect on the incidence either of lung adenomas or of hepatomas. When young CBA mice had spent from six to twelve days with their own mothers before being fostered to Simpson females they were no longer susceptible to the action of the milk influence, although they were able to transmit it to their young.

**Simulation of Chronic Bacillary Dysentery by Paratyphoid B Infection.**—Silverman and Leslie have observed during the past twenty years 1,000 cases of bacteriologically proved cases of bacillary dysentery. In the original series of cases the causative organism proved to be the Flexner bacillus. In subsequent reports in 1932 and 1943 numerous sporadic cases of chronic bacillary dysentery due to the lactose fermenter of Duval have been described. Others were due to many different strains of the dysentery organism. Only during the past year has bacteriologic investigation of chronic intestinal infections revealed in some instances the presence of *Salmonella* paratyphi B as the only apparent pathogen. The symptomatology and physical findings in these cases of "chronic dysentery" caused by *S. paratyphi* B have been identical with those in true chronic bacillary dysentery and totally dissimilar to the picture

of classic paratyphoid fever. This resemblance is more than superficial; there is parallelism in the roentgenographic, proctoscopic and immunologic features. The authors report 4 cases in which chronic bacillary dysentery was suspected. One of these actually was a case of chronic bacillary dysentery (Shiga). The other three proved to be caused by *S. paratyphi B*. of identical strain proved culturally and by cross agglutination. This is the first report of chronic intestinal infection simulating chronic dysentery caused by *S. paratyphi B*. The writers are at a loss to explain this apparently sudden appearance of *Salmonella paratyphi B* in the ranks of the etiologic agents of chronic intestinal infection.

- Allergic Dermatitis Due to Metallic Cobalt. L. Schwartz, S. M. Peck, K. E. Blair and K. E. Markuson.—p. 51.

**Endocrine Allergy.**—Zondek and Bromberg believe that allergic reactions may be due to endogenous allergens produced by endocrine glands. They designate this condition "endocrine allergy." In certain pathologic conditions related to the menstrual cycle or the menopause, skin reagins to the steroid hormones—estrone, estradiol, progesterone, pregnandiol, testosterone, androsterone or desoxycorticosterone acetate—can be demonstrated by cutaneous tests. Analogous conditions of sensitivity to insulin and chorionic gonadotropin may occur. Allergic endocrine hypersensitivity may also be demonstrated by the "recurrent test," i. e. by the appearance of a local reaction at the site of a first intracutaneous test, following a subcutaneous injection twenty-four hours later of the allergenic hormone at a new site. When the cutaneous reaction in cases of endocrine allergy is delayed, it often occurs in the premenstruum, viz. at a time coincident with the attainment of maximum hormone level ("retarded test reaction"). Normal subjects injected intracutaneously with serum of patients hypersensitive to estrone yielded positive cutaneous reactions when a solution of estrone was given subsequently at the site of the former serum injection (positive Prausnitz-Kuestner test). Serum of patients hypersensitive to estrone may also cause positive cutaneous reactions in normal subjects; this occurs when the concentration of hormonal allergen in the normal subject reaches high values (either physiologically or following injection). The reagins induced by hormonal allergens are similar to those of allergic reagins in general. Personal and family histories of allergy and high blood eosinophilia are frequent in persons with positive cutaneous tests. Favorable results from desensitization also prove that the disturbances are caused by endocrine allergy. Allergy to endogenous hormones has been observed in women with disorders related to menstruation or the menopause. Pruritus vulvae and various premenstrual disorders may be conditioned by allergy to endogenous hormones. This is also true of asthma, vasomotor rhinitis, angioneurotic edema and urticaria when they are related to menstruation or the menopause.

**Cellular Reactions in Sulfonamide Sensitivity.**—Randolph and Rawling studied the blood response following oral ingestion of a sulfonamide drug in 3 patients of known sulfonamide sensitivity. Total and differential leukocyte counts were made prior to and at frequent intervals for as long as ten days following the oral administration of a test dose. A white blood cell diluting fluid consisting of phloxine and methylene blue was dissolved in equal parts of propylene glycol and water was employed. This technic permits the counting chamber differentiation of eosinophils, polymorphonuclear leukocytes and mononuclear leukocytes in the same specimen on which the total leukocyte count is determined. Differential counts of 100 cells in the counting chamber and 200 cells from the Wright stained film were made at each observation. The authors observed an

initial diminution in total leukocytes and eosinophils; this was followed by an increase in leukocytes, which was due in part to the presence of young myeloid cells. After the constitutional symptoms had subsided, the eosinophils either returned to the preingestion count or showed an increase above that level. The clinical and hematologic response in these cases supports the thesis that an allergic mechanism is responsible.

**Tantalum Plating of Skull Defects.**—Hemberger and his associates point out that the strength, malleability and inertness of tantalum in tissue have recommended its use in the repair of skull defects. This report is concerned with the operative technics that have evolved during the repair of 42 skull defects. In the first 6 cases small plates were inserted in the skull defects without fixation. They were preformed and altered to fit at the operating table or formed at the operating table from sheets of 0.015 inch tantalum plate. After the defect had been exposed, its edges were smoothed and a ledge was chiseled out of the outer table of the skull. The fitted tantalum plate was laid on this ledge without further support. In the sixth case a tantalum plate was inserted with this simple technic. Fourteen days after the operation, roentgenography of the skull showed that the plate had slipped. In 6 other cases fixation of the plate was secured by wiring the plate through drill holes in the plate and skull with number 30 tantalum wire. In the remaining 30 cases of this series preformed molding and inlay fixation with tantalum points have provided an adequate restoration of skull contour.

**Nerve Grafts: Importance of Blood Supply.**—In order to test the importance of the vascular supply of nerve grafts in governing their take, Tarlov and Epstein undertook studies in dogs to determine the manner of revascularization of nerve grafts and then attempts were made to improve the vascular supply of the grafts by the application of pedicled muscle or fat-areolar tissue flaps to them. The authors conclude that very good recovery of sensory and motor function may follow the introduction of fresh homologous cadaver grafts into sciatic nerve defects in dogs. Adequate vascularization is a most important factor in a nerve graft. Necrosis of a graft may occur if blood vessels are prevented from entering it. There is no justification for the practice of interposing an impermeable membrane between the graft and the surrounding tissue. Although it is imperative that the bed for a nerve graft consist of well vascularized tissue, it has proved futile to attempt to increase the blood supply of nerve grafts by the application of fat-areolar tissue or muscle flaps to them or by tunneling the grafts through muscle. When cable grafts are used, its strands should be bound together with plasma only at their ends so that the intervening segments may be separated in the bed of the graft in order that they may more readily acquire an adequate blood supply. The use of plasma clot is essential for suturing cable grafts, since considerable damage accompanies the use of thread suture. Better unions are obtainable with the plasma clot technic.

**Negative Effect of Penicillin on Inoculation Malaria.**—Twenty-eight patients who had cerebrospinal syphilis were treated with penicillin and benign tertian malaria. Penicillin was administered intramuscularly, 50,000 Oxford units being given every four hours for ten days, a total of 3,000,000 units. Therapeutic malaria was induced by *Plasmodium vivax*. A calculated standard inoculum of 500,000 parasites, taken from an active case, was injected intravenously. It was found that penicillin does not suppress fever or the parasite count of active inoculation malaria and that when given before or at the time of the malaria inoculation it does not prevent or postpone the development of fever and parasitemia. It is reasoned that since penicillin does not have an antimalarial effect on inoculation *Plasmodium vivax* malaria it will not be effective in other types of malaria or in naturally acquired malaria.

**One Day Treatment of Syphilis with Fever and Mapharsen.**—Jones and his associates report extended observations on the original group of 280 patients for a period of eight months and include data on the treatment of an additional 141 patients observed for a minimum period of three months. Patients selected for the study are those with clinical evidence of early syphilis who deny previous antisyphilitic treatment. The diagnosis is verified by dark field and serologic examinations. Contraindications to this type of therapy are active pulmonary tuberculosis, heart disease, renal disease, peripheral

vascular disease and extreme obesity. The majority of the patients treated were in the age group from 15 to 24 years. Three different therapeutic schedules were used. With schedule A, mapharsen in the amount of 1 mg. per kilogram of body weight is administered during the induction of fever, but before the temperature reached 103 F. In schedule B, mapharsen in the amount of 1 mg. per kilogram of body weight is injected intravenously in the evening, and fever therapy is carried out the following day. A second injection of 1.5 mg. of mapharsen per kilogram of body weight is given at the termination of the fever. In schedule C, mapharsen in the amount of 2 mg. per kilogram of body weight is given at the termination of the fever. Better results have been obtained with schedules B and C, in which larger amounts of mapharsen (2.5 and 2.0 mg. respectively per kilogram of body weight) were employed than with schedule A. The authors think that this mode of therapy compares favorably with other forms of intensive therapy for early syphilis.

**Common Cold Not Caused by Virus.**—Brown points out that the striking reduction in colds following the prophylactic administration of sulfadiazine in daily small doses to hundreds of thousands of service men throws doubt on the virus origin of the common cold, because the sulfonamides admittedly are valueless in virus diseases. He thinks that the common cold is not a single entity due invariably to a virus but that by far the most common cause is the hemolytic streptococcus. Such colds are mainly acute exacerbations of chronic sinusitis and usually follow chilling. They are accompanied by dissociation of the ubiquitous *Streptococcus viridans*. The bacteriostatic action of daily doses of sulfadiazine probably prevents conversion of the viridans into the hemolytic streptococcus. Colds of virus origin and those due to allergy are much less frequent. Two strong arguments exist against the virus etiology of the frequently recurring cold: (1) the long period of immunity known to exist following virus colds and (2) the striking reduction in the incidence of colds in patients taking prophylactic daily doses of sulfonamides. If the common type of cold that follows chilling was due to a virus, the virus would have to be a resident of the upper respiratory tract of large populations who develop colds simultaneously during chilling weather. Such a virus has not been found; the streptococcus has.

**Growth Promoting Substance in Treatment of Indolent Wounds.**—Kerr and Werner obtained from the Department of Experimental Pathology of the Hebrew University, Jerusalem, a tissue extract known to possess the property of stimulating growth in tissue cultures. This extract is a powdered preparation of sheep's heart which retains indefinitely its growth stimulating property toward tissue cultures and, if kept dry, is not readily contaminated. The authors used this extract in the treatment of indolent lesions in human subjects in whom

prolonged treatment by various orthodox methods had proved unavailing. The great majority responded favorably to the new treatment, and closure of the wounds was achieved in a relatively short time. Observations suggest that preliminary treatment with the growth promoting substance improves the take of transplants in skin grafting.

**Pulmonary Acariasis.**—Soysa and Jayawardena report from a military hospital in Southeast Asia that during the past two years they have observed a heavy incidence of bronchial asthma. A number of these asthmatic patients showed eosinophilia ranging from 40 to 80 per cent but rarely gave a previous or family history of asthma. The authors review observations on 30 Ceylonese soldiers. Since their attention had been called to reports on the presence of mites in the sputum of patients with asthma, they decided to investigate the possible etiologic significance of occupation and environment in these asthmatic patients. The onset of the condition was slow and insidious, with an intermittent dry cough, particularly at night. Gradually the patients began to suffer from expiratory dyspnea with wheezing. These attacks, though mild and intermittent at first, became more frequent, causing loss of sleep with a feeling of lassitude, malaise and asthenia in the morning, leading to a gradual impairment of general health and physical fitness. Hematologic examination showed a constant eosinophilic leukocytosis with massive eosinophilia in many of the patients. Anthelmintic treatment of the few patients who required it, because of infection with *Ancylostoma duodenale*, *Ascaris lumbricoides*, *Blastocystis hominis* and so on, produced no reduction in the eosinophil count. The response to the oral administration of carbarson and acetarsone was often dramatic. Tyroglyphus and Tarsonemus mites were demonstrated in the sputum of some of the patients. The authors believe that the patients had acquired their disability after the inhalation of mite-laden air. The majority had been exposed to dust emanating from rice and other cereals, pulses, flour, sugar, tea, coffee, cheese, dried fish, dehydrated vegetables, spices and other condiments, and various other dry rations and grocery products such as are issued in bulk through ration stores. A few patients had worked in depots where military equipment and miscellaneous articles such as linen and leather goods were stored. The frequent existence of tyroglyphid and tarsonemid mites in stores and stored products being recognized, all these patients must be regarded as having been exposed to the risk of inhalation of these mites, which were later recovered from their sputum.

**Sedimentation Rate in Infective Hepatitis and in Malaria.**—Wood agrees with Witts that a major difficulty in the preicteric stage of infective hepatitis is the differentiation from clinical malaria. Wood shows that the erythrocyte sedimentation rate is a simple test for this differentiation. He found that the behavior of the erythrocyte sedimentation rate in 35 unselected cases of infective hepatitis was normal during the first week or ten days. It rose steadily during the period of biliuria, to reach a maximum commonly between 15 and 30 mm. in one hour (Wintrobe). During the stage of recovery the erythrocyte sedimentation rate returned slowly to normal. The behavior of the erythrocyte sedimentation rate in malaria is in sharp contrast. Of 72 measurements made between the tenth and twentieth days in malaria, 60 ranged between 11 and 53 mm. in one hour. The raised sedimentation rate persists for several weeks. Summarizing his observations, Wood says that in the

first ten days of infective hepatitis about 85 per cent of cases show an erythrocyte sedimentation rate below 10 mm. In the first ten days of malaria about 85 per cent of cases present an erythrocyte sedimentation rate above 10 mm. An erythrocyte sedimentation rate above 20 mm. in one hour during the first week of a person under observation practically excludes infective hepatitis. The erythrocyte sedimentation rate serves to distinguish clinical malaria from short-term fevers of uncertain etiology. In malaria the acceleration is maintained for at least two or three weeks in about 84 per cent of cases; in short-term fevers the erythrocyte sedimentation rate is commonly normal within one or two weeks of the onset.

**Vitamin E and Adipose Tissue.**—Vitamin E deficiency is said to have widespread effects, and morphologic and functional changes have been described in many different organs. Menschik gives particular attention to the connection between vitamin E and the lipid metabolism. Experiments on vitamin E deficiency and on the influence of vitamin E administration have been carried on with mice since 1941 in the Department of Anatomy, Polish School of Medicine, University of Edinburgh. Different organs were examined and fixed for microscopic examination. Observations on adipose tissue are described because its behavior was one of the striking features differentiating animals fed on stock diet, vitamin E deficient diet and vitamin E rich diet. It was found that vitamin E deficiency in female mice, after a period of sixty-five weeks, caused the disappearance of adipose subcutaneous and subperitoneal tissue, although the vitamin E deficient diet used was rich in fat. If the same diet is supplemented with vitamin E in the daily dose of 2.5 mg. of alpha tocopherol the amount of adipose tissue is increased considerably in female mice. At present nothing can be said regarding the influence of vitamin E on human fat metabolism.

**Placenta Previa.**—According to Morgan placenta previa occurs in from 1 to 2 per cent of all deliveries and has a mortality rate of from 2 to 8 per cent. The series of 130 cases of placenta previa reviewed in this paper occurred in a total of 8,000 deliveries. The placenta previa was central in 32 cases, marginal in 46 cases and lateral in 52. All but 2 of the women with central placenta previa were delivered by the cesarean operation. Of the 46 with marginal placenta previa 15 and of those with lateral placenta previa 2 were delivered by this operation. There was no maternal mortality. Of the 133 infants born (3 sets of twins) 114 were born alive and 19 were stillborn. Twenty-eight of the infants died. New methods of treatment were not used, and the favorable results as far as maternal mortality is concerned are probably due to increased use of cesarean section and blood transfusion.

**Penicillin in Pleural and Pulmonary Suppuration.**—Roberts and his co-workers report the results obtained with penicillin in chest injuries. Initially there was only sufficient for local application, and it was used in hemothorax, pyogenic empyema, tuberculous empyema with secondary pyogenic infection and extrapleural suppuration complicating thoracoplasty and extrapleural pneumothorax. Penicillin appears to lower the incidence of infection in cases of traumatic hemothorax. Twelve cases of acute pyogenic empyema have been treated locally. Sterilization is usually obtained readily, but aspiration and intrapleural injection of penicillin alone result in so much pleural thickening that operative treatment is required as soon as thick pus forms. Evacuation of all fibrin and subsequent closure of the wound may prove satisfactory in some cases, but the most uniformly good results will probably be obtained by drainage. Intrapleural penicillin will assume its most important role in cases diagnosed at an early stage when the fluid is still thin and localization has not occurred. This applies particularly to those of streptococcal origin with the pneumonic process remaining active, especially in children or the aged. Intrapleural penicillin is a valuable agent in eradicating secondary infection from tuberculous pleural effusions. Other local collections of pus in the chest—e. g. those complicating thoracoplasty—may be permanently sterilized by penicillin. The systemic administration of penicillin in cases of pulmonary suppuration requires much further investigation. The response of diffuse suppuration due to nonhemolytic microaerophilic streptococci appears to be good. The lesion in the lung improved in all 7 cases treated, but extension to the pleural cavity was not prevented in 2 nor was metastatic spread to the brain in 3 others. Improvement was obtained in only 1 of 6 cases of suppuration due to a mixed anaerobic flora. This was surprising in view of the rapid disappearance of such bacteria from 2 empyemas treated locally. A single case of localized pulmonary abscess due to *Staphylococcus aureus* and *Streptococcus hemolyticus* apparently responded well. Two patients with thoracic actinomycosis were treated. One of these showed dramatic improvement and the patient is now well. Follow-up is needed to see if the result is permanent. The other died of *Pseudomonas pyocyanea* pyemia originating from the infused vein.

**Mineral Content of Milk of Australian Women.**—The work reported by Winikoff was carried out with the object of determining the calcium, magnesium and phosphorus content of maternal milk in Australia. The existence of a low mineral level could be regarded as a factor contributing to dental caries so prevalent in Australia. In preliminary work the differences in calcium, magnesium and phosphorus content of milk taken (a) from different breasts, (b) at different times during one day and (c) at the same time on different days were studied. Milk taken at the same time from both breasts of 4 patients has shown negligible differences in mineral content. The fluctuations during one day were considerable. The differences, however, were much greater for different women than in any individual woman. The day to day variations were pronounced during the first five days after parturition. After this fluctuations were small. No differences could be shown between primiparas and multiparas. The amount of milk excreted had no effect on the mineral level. During the colostrum period the milk of 212 normal women was examined for calcium and magnesium content and that of 25 women for phosphorus content. The mean calcium values was 28.2 mg. per hundred cubic centimeters. This is lower than the value given by workers in other countries. The mean value for magnesium was 3.22 mg. and for phosphorus 15.9 mg. per hundred cubic centimeters. The magnesium level was about the same as that reported by workers in other countries. The mean values for the three minerals in the milk from 18 women with such conditions as albuminuria, postpartum hemorrhage, eclampsia and prematurity were close to normal; that is, these conditions did not seem to influence the mineral content of the milk. In the later stages of lactation 155 milk samples from 65 normal mothers were examined. The mean values were compared with the results obtained at Canberra for Australian women and with results for European, American and Japanese women. The mean value for calcium rose from the colostrum period through the first, second and third months, and then it gradually declined till the eleventh month. The Australian figures appear low. The mean magnesium value varied little during the period of lactation. The mean value for phosphorus fell steadily from the colostrum period up to the seventh month, remained at the same level for three consecutive months and then declined up to the eleventh month. The Australian results for phosphorus are low compared with those in other countries.

**Cadmium Poisoning.**—Jenner and Cunningham report an outbreak of cadmium poisoning which affected 62 airmen who had eaten of fruit juice prepared by dissolving dehydrated lemon powder and canned grapefruit juice in water and ice. The mixture had been made in a metal urn with a galvanized interior. Symptoms developed from fifteen minutes to one hour after taking the drink. Severe vomiting was associated with acute colicky abdominal pain and diarrhea. Later many complained of headache and dry throat. The majority had completely recovered in one or two days. Investigation revealed that the concentration of cadmium in the fruit drink was about 20 mg. per hundred cubic centimeters. The amount of metal ingested by each patient was estimated at 56 mg. The most probable source of the cadmium was the galvanized lining of the vessel. The use of galvanized containers for mixing and dispensing drinks which are acid is to be discouraged. Glass, crockery or pure aluminum is a suitable material for such vessels. The possibility of cadmium contamination should be considered in obscure cases of food poisoning in which the ingested material is of a low pH and has stood in a galvanized container.

**Epidemic Pleurodynia.**—Akel reports an epidemic of pleurodynia in a Royal New Zealand Air Force station. Thirty-two cases were admitted to the station hospital; milder cases were treated at the sick quarters of the various camps. The typical clinical picture seen in this outbreak consisted of pain—upper abdominal or lower thoracic—dull grip or sharp spasm, aggravated by deep breathing or movements and of moderately sudden onset, usually preceded by slight malaise or

chill. Pyrexia of 101 F. lasted not more than three days. Convalescence was uneventful provided sufficient bed rest was given. Treatment consists in the liberal use of salicylates and opiates. The splinting of the affected areas by strapping usually furnished considerable relief from the pain. Absolute rest in bed was enforced in the early stages, as this decreased the possibility of recrudescence. When not occurring in epidemics, pleurodynia is difficult to diagnose and numerous cases have been labeled influenza, pleurisy, pneumonia, acute abdominal emergency and myalgia.

**Reaction for Recognition of Vitamin C.**—Rossi and Aguirre de Celsi utilized the great reducing power of ascorbic acid for ferric cations and thus indirectly proved the presence of vitamin C. As reagents they used (1) a saturated solution of dimethylglyoxime in ethyl alcohol, (2) a 28 per cent solution of ammonia and (3) a 1 per cent solution of ferric chloride. To 1 drop of the ferric solution they add 2 drops of the substance to be tested and then a drop of dimethylglyoxime and several drops of ammonia until the reaction is alkaline. If ascorbic acid is present a reddish coloration results. In assays on the sensitivity of this reaction it was found that the limit of identification was 0.000002 Gm. of ascorbic acid. The authors used the reaction with success on various fruits and vegetables.

**Conservative Management in Severe Frostbite.**—In peacetime Luetkens had obtained good results from treatment of mild frostbite involving the hands and feet with daily baths for from twenty to forty minutes in copper sulfate (1 teaspoon

in a large basin of water at body temperature). The same good results were obtained from treatment of mild frostbite involving the face with daily applications for thirty minutes of gauze or cotton soaked with copper sulfate solution. The results suggested that copper sulfate has a specific effect on the damaged tissues; arterial blood perfusion is restored to normal, venous stasis causing edema is removed and normal tissue metabolism is stimulated. The same treatment was practiced in 24 cases of second and third degree frostbite in soldiers who presented extensive necrosis of the hands and feet and whose temperature was septic. The secondary gangrenous inflammation improved and the temperature was restored to normal. The line of demarcation appeared spontaneously. Pain was alleviated after the second or third bath and disappeared completely after the fifth or sixth bath. Erosion hemorrhage, which occurred frequently prior to the copper sulfate treatment, was not observed after this treatment was instituted. The power of regeneration was stimulated in those tissues which had retained their capacity of reproduction, and the aseptic drying of the necrotic tissues was supported at the same time. The frozen portions of the extremities were covered with linen to which ointment had been applied and loose bandages were used to avoid painful daily removal of the dressing prior to the bath. The refractory edematous swelling improved during the first week of the treatment in 20 additional cases of severe frostbite in which treatment with copper sulfate was instituted after amputation or exarticulation. Pains during walking exercises after amputation of the leg were diminished, cleansing and epithelization of the still open areas was accelerated and the temperature in the stumps was improved.

**Surgical Intervention for Disorders of Blood Perfusion.**—For several years incisions around the wound and scarifications have been practiced with good results at Sauerbruch's clinic for improving blood perfusion and nutrition of tissues. The method of the incisions around the refractory wound consists in making one or several parallel circular incisions at a distance of several millimeters around the wound or around the ulcer. The incisions are made through the epidermis and through the cutis and may reach the subcutis, but larger vessels and nerves should be spared. Circles or ellipses are the common forms of these divisions of tissues. The procedure is simple and the intervention may be performed under local ethyl chloride or ether spraying anesthesia. Epinephrine should not be added in cases in which procaine hydrochloride infiltration anesthesia may be employed. After the intervention the area operated on may be covered with a loose dressing and the extremity involved may be elevated for a short time. The scarifications may be produced in areas immediately adjacent to the focus of the disorder or at some distance from it. Numerous incisions from 2 to 3 cm. in length should be made above or below the focus and parallel to the axis of the extremities. In circumscribed disorders of nutrition in the foot the incisions should cover larger areas of the leg up to the knee joint and in advanced cases even farther up to the crest of the ilium. Downward the incisions may be extended to the dorsum of the foot and to the toes. This operation may likewise be performed under ethyl chloride spraying or on sensitive patients

under light general anesthesia. Healing of these artificial wounds takes place within eight to ten days. Flat, fine scars are the result. Definite healing of the scarification wounds without any complications occurs even in cases of severe disorders of circulation in which necrosis of the toes or of the anterior part of the foot may have developed. Incisions on the edge of the tibia may delay the process of healing and should consequently be omitted. Active vasodilatation in all the layers of the tissues is the result of the incisions around the wound as well as of the scarifications. The increase in the entire blood supply and in the blood perfusion of the extremities was demonstrated with the oscillograph. The new methods proved effective (1) in cases of obstruction of the arterial blood supply associated with edema and venous stasis, (2) in cases of disorders of nutrition resulting from senile arteritis or from arteritis in patients with diabetes mellitus (preparatory insulin treatment is required in the latter cases), (3) in cases of Winiwarter-Bürger's disease (multiple scarifications are suggested in the early stage of this disease) and (4) in frostbite. Scarifications have a definite effect in all stages; vascular spasms may be checked in the initial stage and better blood perfusion may be elicited. Threatened tissue areas recovered and necrosis did not occur. It seems advisable to extend the area in which the incisions are made, e. g. from the foot to the thigh. Repeated incisions may be required to insure definite healing.

**Sea Sand Plugging of Infected Bone Cavities.**—Hetzar reports experience gained from treatment with sea sand of large "cavernous" bone defects, particularly after gunshot injuries in which the projectile is retained in the bone cavity. Chronic osteomyelitis associated with permanent fistulization may not be prevented by the surgical removal of the foreign body from parts of the skeleton, particularly from the bones of the extremities. The main problem is the callous closing of the inflammatory bone cavity. Conservative treatment with sea sand may be practiced only when the acute florid osteomyelitic process has subsided to a chronic stage. At this stage the external opening of the bone defect must be slightly enlarged, the necrotic osseous decomposition products scooped out with a spoon and sequestrums removed. The cavity is filled with sterilized sea sand; the filling of the cavity should be extended to the surface of the outer skin. The plug should be covered with imbricated strappings of adhesive plaster. Fixation of the leg involved may be performed with Volkmann's splint, and an abduction splint may be applied to the arm. The secretion of the wound is absorbed by the sand and there is no suppuration. After an eight day rest the dressing may be removed and the wound cleansed with a swab. Irrigation of the wound is undesirable, and the filling with the sterilized sand should be repeated at eight day intervals. A period of from eight to twelve weeks is required for the formation of "firm masses," depending on the extent of the cavity. After-treatment may consist in ordinary dressing and in continued immobilization of the limb. X-ray examination of 3 wounded soldiers with shell fragments retained in the head of the right humerus, in the tarsal bone and in the condyle of the tibia respectively demonstrated that regeneration of the bone substance resulted from the treatment described. Function of the extremities was restored to normal. Silicon dioxide, the principal ingredient of the sand, is extremely hygroscopic. Its readiness to absorb moisture makes it suitable for draining the infectious process. The bone marrow requires the withdrawal of fluids for the new growth of bone. In addition to the desiccating effect of the sand its small grains may stimulate the new growth, which seems to originate in the endosteum without any participation of the periosteum. The treatment is economical because sand is inexpensive and helps to save dressing material. Not the slightest untoward reaction has been observed.

**Surgical Treatment of Prostatic Disorders.**—Kohlmayer reports experience gained from 238 cases in which prostatectomy was performed and from 194 cases in which transurethral prostatic electroresection was practiced at Denk's surgical clinic in Vienna from 1934 to 1942. One hundred and twenty-five of the 194 patients were operated on with a modern McCarthy cutting loop, the large and broad loop of which insured the excision of considerable portions of tissue and the retrograde

lens system insured adequate vision of the resected area. Spinal anesthesia with tropacocaine is the method of choice in prostatectomy, whereas evipal sodium is the preferred anesthetic in electroresection. Prostatectomy is the method of choice in benign cases of so-called prostatic hypertrophy which present a large, soft prostate. The essential features of Kohlmayer's technic of prostatectomy are use of the Harris suture made with the Boomerang needle-holder, insertion of a thin drain for two or three days followed by closure of the vesicle, omission of tamponade (the mortality rate in cases with tamponade amounted to 11.6 per cent as compared to 2.7 per cent in those without) and local prophylactic treatment of the suprapubic operative wound with sulfathiazole powder. Electroresection is suggested in cases of prostatic hypertrophy with a small hard prostate, in which the good results following resection equaled those following prostatectomy. Electroresection is likewise recommended for so-called sphincter sclerosis and specifically for subvesical microhypertrophies. Electroresection should not be undertaken in cases of soft large prostate except for those in which prostatectomy cannot be practiced for extrarenal reasons such as abnormal obesity, disorders of the heart and circulation, severe emphysema and chronic bronchitis. A multiple stage resection may be preferred in the latter cases in order to reduce the risk. Electroresection is the method of choice for cancer of the prostate. Reports of 8 cases of cancer of the prostate reveal that there was no residual urine after the resection or that the residual urine was reduced considerably. Recovery was demonstrated on continued control of these patients, provided there were no metastases and no nerve pains. Electroresection may for years insure the feeling of good health in inoperable patients in spite of the palliative character of this method.

**Acute Porphyria.**—Brugsch discusses the symptomatology of acute porphyria, which begins with abdominal symptoms of colic, constipation and vomiting. Disturbances of the nervous system such as amaurosis, facial nerve paresis and paresis of muscles of the shoulder and of the arm may be present. The disturbances in the muscles are to be considered as those of myoglobulin metabolism. Psychic disturbances may occur and the patients may become delirious. Differential diagnosis may be difficult, since porphyria may occasionally be associated with considerable leukocytosis. Urinalysis is suggested in doubtful cases of abdominal colic, nervous disturbances, polyneuritis and toxic psychosis. A simple test should be performed prior to surgical intervention by boiling the urine with 25 per cent hydrochloric acid. Porphyria is suggested by an intense dark red-brown discoloration of the urine. Demonstration of uroporphyrin in the urine is a definite proof of porphyria. Demonstration of uroporphyrin may be difficult because of simultaneous presence in the urine of a red pigment which may be responsible for its discoloration. The pigment may be excreted as chromogen. It is insoluble in ether, in contrast to the soluble urobilinogen which may likewise be present. The term porphyrinonin is suggested for this peculiar red pigment which is characteristic of porphyria, and another new term, porphyrigen, is suggested for the chromogen. Reports of 3 cases of porphyria in women aged 38, 46 and 44 are presented. None of the patients died. A family tendency to porphyria, a hereditary disturbance of the porphyrin metabolism, could be demonstrated in these cases. Colics alternated with free periods. Medical treatment with sedatives as well as surgical intervention are contraindicated, since the deteriorated porphyrin metabolism may become worse. Anesthesia, hemorrhage and destruction of tissue may place an additional load on the already disturbed metabolism, and collapse and death may follow.

## Book Notices

**The Doctor's Job.** By Carl Binger, M.D. Cloth. Price \$3. Pp. 243. New York: W. W. Norton & Company, Inc., 1945.

Many a writer has tried to explain the doctor-patient relationship to the public. Nowadays people are much more interested than they used to be. When medicine was mostly mysticism, people had to have confidence in their physicians and follow blindly the instructions given; today medicine is much more scientific. People are learning much more about its technics and even about its theories. Once mind and body were considered as two wholly separate factors in health. Today the intimate relationship between mind and body has become a special department of medicine called psychosomatic medicine.

In a smooth, rather conversational tone, Dr. Binger discusses the evolution of modern medical science, the growth of specialization, the doctor-patient relationship, the influence of psychoanalysis and psychosomatic medicine on modern practice, and our present knowledge of a number of common conditions. He turns then to the organization of medicine for service, with special attention to convalescent care, preventive medicine and socialized medicine. Although the book will say little that is new to the doctor, it will say much that is important to the public. Dr. Binger does not see medicine as a completed science but as one in an early stage of evolution. He sees the great problem of the future as the maintenance of humanity against the advance of the machines and a better distribution of all that is good in life. The book is written with a fine background of medical history, with culture and with sympathy. Dr. Binger loves his profession and respects it. That is the tone of his book. It is so much better than most of the diatribes, exposés or encomiums written at both extremes of the subjects it discusses that it merits a great audience. Physicians need not hesitate to recommend it to their patients.

**The Midwest Pioneer: His Ills, Cures, & Doctors.** By Madge E. Pickard and R. Carlyle Buley. Boards. Price, \$5. Pp. 339, with illustrations. Crawfordsville, Indiana: R. E. Banta, 1945.

This volume comes as a great surprise at a time when restrictions on the use of paper have made books with adequate margins, widely spaced type and fine printing an unusual item in the field of typography. The authors have had the assistance of several physicians, who have aided in the collection of the material. Their book gives a good picture of the state of medical practice in the Midwest during pioneer times. There are records of the early development of the medical schools in the Midwest and of the medical periodicals. The charlatans are given adequate consideration. Altogether, this is a volume that will appeal to any physician interested in medical history in the United States. The book is illustrated with interesting black and white sketches and reproductions.

**Patients Have Families.** By Henry B. Richardson, M.D., F.A.C.P., Associate Professor of Clinical Medicine, Cornell University Medical College, New York. Cloth. Price, \$3. Pp. 408. New York: Commonwealth Fund; London: Oxford University Press, 1945.

In his introduction the author points out that the relationship of the patient to the family is like that of the organ to the diseased body. The recognition of the patient as part of the family unit is particularly the concern of the medical social worker and the neuropsychiatric social worker. After discussing the family as a unit of illness and treatment, the author considers the special problems that have arisen in wartime and the possibilities for future research. The book is based on studies conducted cooperatively by the faculties of public health, medicine and psychiatry of Cornell University Medical College and the New York Hospital. In the current trend toward a social point of view in medical practice, this work establishes fundamental technics.

**Food Values of Portions Commonly Used.** Compiled by Anna dePlanter Nowes, M.A., and Charles F. Church, M.D., M.S. Fifth edition. Paper. Price, \$1.50. Pp. 46. Philadelphia, 1944.

The continuous reproduction and modification of this work since 1937 indicates that it is a most useful compilation. As a table-side companion for those desiring to reduce, no other work can be more recommended.

**A New German-English Psycho-Analytical Vocabulary.** By Alix Strachey. Research Supplements to the International Journal of Psycho-Analysis. Edited by Edward Glover. No. 1. Fabrikoid. Price, \$2.50. Pp. 84. Baltimore: William Wood & Company, 1943.

**Glossary of Technical Terms for Beginning Students in Abnormal Psychology, Mental Hygiene and Medical Social Service.** Compiled by Calvin P. Stone, Professor of Psychology, Stanford University. Paper. Price, 25 cents. Pp. 15. Stanford University, Calif.: Stanford University Press; London: Oxford University Press, 1944.

Almost from the first the psychoanalysts developed a jargon of their own which makes their terms difficult for the average physician. This "New German-English Psycho-Analytical Vocabulary" will not help very much in making an undertsanding easier. It seems rather to be even more confusing, since it depends largely on the German language and translates most of the German terms into English by giving the same term over as if it were English. The terms that are not thus translatable are easily found in any German-English dictionary.

The student of neurology and psychiatry will find the fifteen page "Glossary of Technical Terms" with a selection of terms for definition far more useful. It constitutes in brief a condensed course in neuropsychiatry.

**The Avitaminoses: The Chemical, Clinical and Pathological Aspects of the Vitamin Deficiency Diseases.** By Walter H. Eddy, Ph.D., and Gilbert Dalldorf, M.D., Pathologist of the Grasslands, and Northern Westchester Hospitals, Westchester County, New York. Third edition. Cloth. Price, \$4.50. Pp. 438, with illustrations. Baltimore: Williams & Wilkins Company, 1944.

This edition gives evidence of having been extensively revised to include recent important contributions in the literature. The book covers more material than its title indicates. Information concerning recently established facts on the nature and function of vitamins is given in the forepart of the book. Inclusion of the historical development in each case traces the progress made in knowledge concerning vitamins to the present. The authors offer a rational discussion of the relationship of nutrition to health and disease, pointing out the frequent misconception and overemphasis so often placed on the role of vitamins in nutrition.

The main body of the book covers the experimental and clinical findings associated with deficiency of the vitamins which have been shown to be essential for man and other less well known B factors and vitamin E. The material is covered well from the point of animal studies and observations on human beings, with clear distinction made between the two. Much practical information on the relation of vitamin lack to clinical disease conditions is found in the book. Histologic sections showing tissue changes associated with vitamin deficiencies are reproduced. Special diagnostic aids for detection of deficiencies and methods of treatment are included, although this is incidental to the main purpose of the book. Criticisms are limited to the inadequate discussion of riboflavin deficiency, in which no mention is made of the contention of some ophthalmologists that certain vascular changes in the cornea are not attributable to riboflavin deficiency. The sections at the end of the book appear to be cut short and poorly organized. They might better have been omitted.

Altogether this book can be considered a valuable summary of the present knowledge of vitamin function and effect of vitamin lack. The facts are accurately recorded and supported by an extensive bibliography. The close correlation of experimental work, pathology and clinical observations is noteworthy.

**John Dalton: Some Unpublished Letters of Personal and Scientific Interest with Additional Information About His Colour-Vision & Atomic Theories.** By E. M. Brockbank, M.B.E., M.D., F.R.C.P. Publications of the University of Manchester No. CCLXXXVII. Cloth. Price, \$2; 1s. 6d. Pp. 62, with 10 illustrations. Manchester, England: Manchester University Press, 1944.

At the meeting of the British Medical Association in Manchester in 1929 Dr. Brockbank read an essay with the title "John Dalton—Experimental Physiologist and Would-Be Physician." Dr. Brockbank became interested because he had access to letters, documents and materials that had been used by Dalton. The material has now been developed into a monograph that is a fine contribution to medical history. Here is the genesis of the anatomic theory and the beginning of scientific chemistry.

## Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

### IMMUNIZATION OF DOGS AGAINST RABIES

**To the Editor:**—I should like to know the current status of the immunization of dogs against rabies. Last year, in an adjacent county, compulsory single injection vaccination at state expense was instituted because of an increase in the number of rabid dogs. At the same time Washington, D. C., had a number of cases confirmed by laboratory examinations and at least two human deaths despite adequate Pasteur treatment. At the present time, following the discovery of several rabid dogs in the Washington area, the District health authorities are advocating a program of compulsory immunization of all licensed dogs in the District. They have made the statement that a new method developed "by an Alabamian" has made the one dose method an effective prophylactic. On the other hand Kern (*M. Clin. North America*, November 1944) states that "the immunizing value of such treatments is directly proportional to the number of doses used. . . . As W. J. Lentz (*J. Am. Vet. M. A.* 76:34, 1930) has shown experimentally, the single dose method is probably worthless. . . . Immunization of dogs is of value only if it is carried out by a course of at least five doses of good rabies vaccine, and if it is repeated once or twice at intervals of a year." It is further stated, by both Kern and others, that the one shot method can be dangerous by engendering a false sense of security in both dog owners and health officials. My own reaction lies more toward this view. It is my belief that the cost of such a program would be more effective if directed toward a more rigid licensing and quarantining of dogs and to a more active program of removing stray (licensed or not) dogs found running at large. Specifically I should like to inquire whether any reliable one or two dose method for the immunization of dogs exists, and I should also like some comment on the most logical and feasible methods to be employed in the control of such an outbreak.

William C. Claudy, M.D., Washington 6, D. C.

**ANSWER.**—The question whether a reliable one or two dose method of immunizing dogs is available can now be answered affirmatively. The experiments by Johnson and Leach (*Studies on the Single Injection Method of Canine Rabies Vaccination*, *Am. J. Pub. Health* 32:176 [Feb.] 1942) have established that the single subcutaneous injection of a chloroform-treated or carbolyzed antirabic vaccine produces a high degree of immunity in the dog. In Alabama the vaccination of dogs appears to be giving satisfactory results. An effective program to control canine rabies must include quarantine to prevent the spread of the virus by stray dogs and dog traffic. There seems to be no question that canine rabies can be controlled by means of quarantine and vaccination. It should be borne in mind that the virus may be spread to the dog by other animals than the dog, e. g. the rat, the squirrel, the domestic cat, the woodchuck, the fox and the skunk; hence the entire dog population of a community must be kept immunized in order to secure complete safety from canine rabies.

### DAKIN'S SOLUTION—SULFONAMIDES AND THE HEALING OF FRACTURES

**To the Editor:**—Has the use of Dakin's solution become taboo, or is it still useful? The statement has been made that the sulfonamides are definitely acid in reaction, that their use definitely delays union in compound fractures and that they are frequently the cause of nonunion. What is the general opinion?

Harry G. Nicks, M.D., St. Louis.

**ANSWER.**—The use of the sodium hypochlorite solution (Dakin) has been almost completely abandoned in this country. The English surgeons use it occasionally, particularly in the Carrel-envelop treatment of burns of the extremities. The Carrel-Dakin treatment has been given up because it is cumbersome and because of more effective newer methods.

Sulfonamide compounds possess little acidity and when applied locally to wounds do not affect the pH of the secretions of the wound. The slightly acid effect of sulfonamides can be counteracted by the simultaneous administration of sodium bicarbonate. A sufficient intake of water and an adequate output of urine will prevent the deleterious effect of these drugs on the kidney.

The Committee on Medical Research of the Office of Scientific Research and Development, in a report which included 471 cases of compound fractures, concluded that the sulfonamides minimized the spread of general infections and cut down the incidence of septicemia and death. They did not find evidence, however, that the sulfonamides lessened the incidence of local infection.

The consensus is that the sulfonamides, applied either locally or systemically, have a definite place in the treatment of compound fractures. Local application is generally practiced in first aid, in follow-up treatment at the time of débridement and subsequently at the infrequent dressings required by the open fracture. The unfavorable results reported in the early use of the sulfonamides were due to indiscriminate use of the drugs by local application. It is felt now that the maximal local dosage for a large wound should not exceed 8 Gm. of a sulfonamide. Major Lyons, who is considered an authority on the subject, believes that systemically administered sulfonamides are as effective as sulfonamides applied locally. Sensitivity of the hemolytic streptococcus is such that the systemically administered concentration is as effective as the higher local concentration.

Sulfonamides, whether applied locally, systemically or by both methods, have no deleterious effect on the healing of compound fractures provided they are used in proper amounts.

### GENTIAN VIOLET IN TREATMENT OF OXYURIASIS

**To the Editor:**—1. What information is available as to the toxicity of gentian violet when given in enteric coated tablets in the dose level of 3 grains (0.2 Gm.) per day for adults and the correct dose level for normal children? Faust and Wright and Brady recommend 1 grain (0.06 Gm.) enteric coated tablets one hour before meals, three times a day, until 50 grains (3.25 Gm.) is taken in the case of strongyloides and 30 grains (2 Gm.) in the case of oxyuris infection. An investigation made by one of my students indicated that the enteric coating of gentian violet tablets as sold by various companies on the market varied considerably in disintegration time. Further, when an accurately tested four and one-half hour enteric coated tablet is given to normal persons minor intolerances, with special reference to vomiting, are reduced to almost nil. 2. Reports in the literature on the gentian violet treatment of pinworms indicate that ascarids should be eliminated before treating with gentian violet. This precaution was first encountered in the treatment of hookworm with carbon tetrachloride and tetrachlorethylene; these volatile organic solvents stimulate the ascarids and cause migration. However, in *in vitro* tests, using *Ascaris suis*, carbon tetrachloride and tetrachlorethylene stimulate ascarids into great activity, causing them to try to crawl out of the beaker, whereas when they are immersed in various strength solutions of gentian violet they are depressed and become inactive and rigid. These observations would indicate that the precaution of eliminating ascarids prior to administration of gentian violet is unnecessary.

J. D. McIntyre, Professor of Physiology, Philadelphia.

**ANSWER.**—1. When given at the rate of 3 grains (0.2 Gm.) a day for adults and the correct dose level for normal children, gentian violet may produce gastric irritation in some persons. More recent papers on the use of this drug in oxyuriasis present no new evidence concerning toxicity, the percentage of reactions being about the same as those reported by Wright and Brady. Such reactions are usually limited to nausea, vomiting and diarrhea, with occasional symptoms of headache, constipation and lassitude. As far as is known, reports of serious reactions have not appeared in the literature.

2. Wright and Brady suggested the presence of *Ascaris lumbricoides* as a contraindication for gentian violet therapy not on the basis of any evidence but as a matter of precaution pending more information concerning the possibility of the drug stimulating the worms to inordinate activity, such as occasionally occurs following the administration of chlorinated hydrocarbons. As far as is known, cases of this sort have not been reported, although it seems probable that the drug has been given in cases with concomitant *Ascaris* infections. The information in the query would seem to indicate that the drug has an opposite effect from that of stimulation. If such is the case there would be little danger in the administration of the drug to patients with *Ascaris* infection.

### PAINS IN ARMS DURING LATE PREGNANCY

**To the Editor:**—A correspondent in *Queries and Minor Notes* in *The Journal*, Feb. 17, 1945, inquires about the cause of pains in the arms, hands and fingers in women during the last months of pregnancy, occurring especially at night. It seems to me that this symptom might be explained on the basis of compression of the brachial plexus (the scalenus anticus syndrome). Women in the late months of pregnancy habitually sleep on one side or the other, and this position is conducive to such symptoms in certain people. Reichert (*The Journal*, Jan. 24, 1942, p. 294) has described methods of arranging pillows in order to relax the scalenus muscles. Many patients can be relieved in this way.

H. E. Lawrence, Lieutenant, M. C., A. U. S.

## SECTION OFFICERS

PRACTICE OF MEDICINE—Chairman, William D. Stroud, Philadelphia; Vice Chairman, W. O. Thompson, Chicago; Secretary, Cecil J. Watson, 412 Delaware St. S.E., Minneapolis

SURGERY, GENERAL AND ABDOMINAL—Chairman, Daniel C. Elkin, Atlanta, Ga.; Vice Chairman, William D. Andrus, New York; Secretary, Alton Ochsner, 1430 Tulane Ave., New Orleans

OBSTETRICS AND GYNECOLOGY—Chairman, Philip F. Williams, Philadelphia; Vice Chairman, Francis B. Carter, Durham, N. C.; Secretary, William F. Mengert, 2211 Oak Lawn, Dallas, Texas

OPHTHALMOLOGY—Chairman, Frederick C. Cordes, San Francisco; Vice Chairman, Grady E. Clay, Atlanta, Ga.; Secretary, Robert J. Masters, 23 East Ohio St., Indianapolis

LARYNGOLOGY, OTOTOLOGY AND RHINOLOGY—Chairman, Louis H. Clerf, Philadelphia; Vice Chairman, Henry B. Orton, Newark, N. J.; Secretary, Fletcher D. Woodward, 102 E. Market St., Charlottesville, Va.

PEDIATRICS—Chairman, John Aikman, Rochester, N. Y.; Vice Chairman, Henry G. Poncher, Chicago; Secretary, Gilbert J. Levy, 188 S. Bellevue Blvd., Memphis, Tenn.

EXPERIMENTAL MEDICINE AND THERAPEUTICS—Chairman, Edgar V. Allen, Rochester, Minn.; Vice Chairman, Carl A. Dragstedt, Chicago; Secretary, Dwight L. Wilbur, 237 14th Ave., San Francisco

PATHOLOGY AND PHYSIOLOGY—Chairman, Virgil H. Moon, Philadelphia; Vice Chairman, J. J. Moore, Chicago; Secretary, Frank W. Hartman, 2799 West Grand Ave., Detroit

NERVOUS AND MENTAL DISEASES—Chairman, Percival Bailey, Chicago; Vice Chairman, H. Houston Merritt, Boston; Secretary, R. P. Mackay, 8 S. Michigan Blvd., Chicago

DERMATOLOGY AND SYPHILIGOLOGY—Chairman, Clyde L. Cummer, Cleveland; Vice Chairman, Dudley C. Smith, Charlottesville, Va.; Secretary, Nelson P. Anderson, 2007 Wilshire Blvd., Los Angeles

PREVENTIVE AND INDUSTRIAL MEDICINE AND PUBLIC HEALTH—Chairman, E. L. Stebbins, New York; Vice Chairman, C. O. Sappington, Chicago; Secretary, W. A. Sawyer, 343 State Street, Rochester, N. Y.

UROLOGY—Chairman, Arbor D. Munger, Lincoln, Neb.; Vice Chairman, Lloyd G. Lewis, Washington, D. C.; Secretary, Grayson L. Carroll, 539 N. Grand Blvd., St. Louis

ORTHOPEDIC SURGERY—Chairman, Theodore A. Willis, Cleveland; Vice Chairman, Francis M. McKeever, Los Angeles; Secretary, J. Warren White, 206 E. North St., Greenville, S. C.

GASTROENTEROLOGY AND PROCTOLOGY—Chairman, J. Arnold Borgen, Rochester, Minn.; Vice Chairman, Martin S. Kleckner, Allentown, Pa.; Secretary, Sara M. Jordan, 603 Commonwealth Ave., Boston

RADIOLOGY—Chairman, Edwin C. Ernst, St. Louis; Vice Chairman, Barnard P. Widmann, Philadelphia; Secretary, U. V. Portmann, 2020 E. 93d St., Cleveland

ANESTHESIOLOGY—Chairman, Ansel M. Caine, New Orleans; Vice Chairman, Harold C. Kelley, New York; Secretary, John S. Lundy, 102 Second Ave. S.W., Rochester, Minn.

# JOURNALS ABSTRACTED IN THE CURRENT MEDICAL LITERATURE DEPARTMENT, JANUARY—APRIL 1945

Titles have been listed or abstracts made of important articles in the following journals in the Current Literature Department of THE JOURNAL during the past four months. Any of the journals, except those starred, will be lent by THE JOURNAL to subscribers in continental United States and Canada and to members of the American Medical Association for a period not exceeding three days. Three journals may be borrowed at a time. No journals are available prior to 1933. Requests for periodicals should be addressed to the Library of the American Medical Association and should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Thus most of these journals are accessible to the general practitioner.

## SUBJECT INDEX

This is an index to all the reading matter in THE JOURNAL. In the Current Medical Literature Department only the articles which have been abstracted are indexed.

The letters used to explain in which department the matter indexed appears are as follows: "BI," Bureau of Investigation; "E," Editorial; "C," Correspondence; "OS," Organization Section; "ab," abstracts; the star (\*) indicates an original article in THE JOURNAL.

This is a subject index and one should, therefore, look for the subject word, with the following exceptions: "Book Notices," "Deaths," "Medicolegal Abstracts" and "Societies" are indexed under these titles at the end of the letters "B," "D," "M," and "S." State board examinations are entered under the general heading State Board Reports, and not under the names of the individual states. Matter pertaining to the Association is indexed under "American Medical Association." The name of the author, in brackets, follows the subject entry.

For author index see page 1204.

## A

- A. A. F.: See World War II, aviation  
A B C Preparations, 944—BI  
A. C. B. Serum of Bogoemolets to be studied at Western Reserve, 174  
ASTRP: See Army, U.S., Specialized Training Reserve Program  
ABBOTT-MILLER Tube: See Miller-Abbott Tube  
ABDOMEN: See also Ascites; Gastrointestinal Tract; Pelvis; Peritoneum  
pain in children, A.M.A. Section symposium, [Brennemann] \*691; (correction) 1141; (due to allergy) [Rattner] \*696; (due to diabetic acidosis and pyelonephritis) [Giltrow] 1148—C  
Surgery: See also Appendectomy; Gastroenterostomy; etc.  
surgery, pull on abdominal muscles after incision, 494  
surgery, synergism of morphine and pentothal in postoperative phase, [Lieberman] 1147—C  
surgery, use curare in anesthesia to improve muscle relaxation, [Griffith] \*642; [Cole] 1151—ab  
ABNORMALITIES: See Crippled; under specific organ and region  
ABORTION, criminal, Boudwin (C. B.) faces imprisonment, Calif., 236  
criminal, Dukoff (C. V.) convicted, 288  
criminal, Reilly (P. A.) 346  
ABSCESS: See also Ulcers; under organs affected as Brain; Teeth  
refractory, possibility of tuberculosis, 555  
treatment, penicillin, [Harford & others] \*255; \*327  
ABSENTEEISM: See Industrial Health workers  
ABSORPTION: See under organ, region or substance concerned as Mercury; Penicillin  
ACADEMY: See also American Academy; National Academy; under Societies at end of letter S  
of Medical Sciences of U.S.S.R., 49; 869  
of medicine proposed, England, 610  
ACARIASIS, pulmonary, cause of asthma, [Soyka] 1157—ab  
ACCIDENTS: See also Disability; Disasters; Trauma; World War II, casualties; Wounds  
Automobile: See Automobiles  
Aviation: See Aviation  
fatal football, 348  
fatal, to physicians in 1944, 90—E  
First aid for: See First aid  
from venomous snakes, Brazil, 938  
Industrial: See Industrial Accidents; Workmen's Compensation  
Prevention: See National Safety Council  
Traffic: See also Automobiles, accidents  
traffic, disability from closed head injury, [Denny-Brown] \*429  
traffic, safety contest prize winners, 1063  
2-ACETAMINOFLOURENE, thiolurea and carcinogenesis in thyroid, 278—E  
ACETONE Bodies in Blood: See Blood  
ACETYLCHOLINE, etiologic role in myasthenia gravis, [Viets] \*1089  
ACETYLENE, skin hazards in making synthetic rubber, [Schwartz] \*390  
ACHLORHYDRIA: See Stomach acidity  
ACID, Amino Acids: See Amino Acids  
 $\beta$ -aminohippuric, to prolong action of penicillin, 161—E  
 $\beta$ -aminohippuric use as penicillin excretory blockade, (correction), 414  
Ascorbic: See also Vitamins C  
ascorbic, minimal daily requirement, [Pijoan] 547—ab  
ascorbic, N.N.R., (Breon) 277  
ascorbic, reaction for, [Rossi] 1159—ab  
ascorbic, relation to allergy, [Newbold] 424—ab  
ascorbic, toxic effect of continued large doses? 683  
boric, treatment of chronic suppurative otitis media, [Collins] 366—ab  
boric, treatment of larva migrans, 128  
Carbonic: See Carbonic Anhydrase  
Carcinoma: See Acid, ascorbic  
ACID—Continued  
citric, solution G dissolves renal calculi, [Hamer] 1019—ab  
dehydrochloric, hepatotoxic action of arsenicals, [Annegers] 1151—ab  
helvolic, aspergillus antibiotics, 922—E  
Mesoxalic, Ureide of: See Alloxan  
nicotinic, diethylamide of: See Nikethamide  
nicotinic, enriched bread should be continued after the war, 160—E  
nicotinic, treatment of angina pectoris, [Stokes] 54—ab  
Phosphatase: See Blood phosphatase  
salicylic, Mester test for rheumatic diseases, [Woods & Comroe] \*582  
tannic, liver necrosis from, [Jackson] 426—ab  
tartaric, 280—E  
ACIDITY, Gastric: See Stomach  
ACIDOSIS, Diabetic: See Diabetes Mellitus  
ACNE: See Furunculosis  
ACRYLONITRILE, skin hazards in making synthetic rubber, [Schwartz] \*391  
ACTINOMYCETES graminis causes endocarditis, [Beamer] 1077—ab  
ACTINOMYCOMA of third ventricle, probably primary, [Orr] \*757  
ACTINOMYCOSIS: See also Actinomycoma  
treatment, penicillin, [Harford & others] \*327  
ACTIVITY: See also Exercise  
unrestricted, in primary tuberculosis, [Levine] 736—ab  
ADDICTION: See Alcoholism; Coca leaves; Narcotics  
ADENOCARCINOMA, uterine, recognizing, treating woman predisposed to, [Randall] \*20  
ADENOIDECTOMY, hazards; number of deaths per year, 740  
ADENOMA: See also Cystadenoma  
Nontoxic, of Thyroid: See Goiter  
of Islet of Langerhans, hypoglycemia in, [Walker] 1151—ab  
Toxic, of Thyroid: See Goiter, Toxic  
ADENOSINE triphosphate, 714—E  
ADIPOSE Tissue: See Fat tissue  
ADOLESCENCE, 4½ million 4-F's rejected for military service (Pepper subcommittee report), 28—E; 36—OS; 37—OS  
precocious puberty, [Kennedy] \*580  
small stature of 13 year old girl, 620  
ADOPTION laws, improvement urged, 284—OS  
laws sought to curb "baby brokers," 348  
ADRENALECTOMY: See Adrenals, excision  
ADRENALIN: See Epinephrine  
ADRENALS, Cortex Hormone (crystalline): See Desoxycorticosterone  
cortex insufficiency, salt tolerance tests, 127  
excision, effect during hibernation, 252  
Hemorrhage: See Waterhouse-Friderichsen Syndrome  
Hormone (Sympathetic): See Epinephrine  
precocious sexual development, [Kennedy] \*580  
ADVERTISING claims of "Serutan," 733—BI  
AEROEMBOLISM, decompression sickness, [Bridge] 360—ab  
AERONAUTICS: See Aviation  
AEROSOLS, insecticidal, to kill mosquitoes, 556  
AFTERBIRTH: See Placenta  
AGE, Adolescent: See Adolescence  
crime in relation to, 460—E  
of physicians dying in 1944, 90—E  
Old: See Old Age  
AGGLUTININS AND AGGLUTINATION, cold, and atypical pneumonia, [McNeill] 1013—ab  
cold hemagglutination test in primary atypical pneumonia, [Humphrey] 616—ab  
Rh: See Rh Factor  
test (macroscopic), rocker used in, [Sako & others] \*380  
AGGLUTINOGEN, Rh: See Rh Factor  
AGRAULOCYTOSIS, ACUTE, etiology, mapharsen, [Freeman] 422—ab  
etiology, thioracil, [Rubinstein] 420—ab; (fatal) [Ferrer & others] \*646; [Garth & Lesses] \*891  
treatment, penicillin, [Harford & others] \*327  
AID to Russia Fund, 177  
AIR: See also Oxygen  
conduction type of hearing aids, 1024  
disinfection, glycols for, [Bigg] 360—ab  
Embolism: See Embolism  
fresheners, A. M. A. Committee to Study Air Conditioning statement, 990—E  
mapharsen solutions exposed to, 56  
Presence of, in Cavity: See Pneumothorax  
pressure, decompression sickness, [Bridge] 360—ab  
pressure in relation to tissue pressure, [Engel & Ferris] 944—C; [Berry, Whitehorn] 945—C  
pressure (reduced atmospheric) treatment for nasal sinusitis, [Butler] 185—ab  
AIR FORCE: See Aviation; World War II  
AIR RAIDS, eye injuries, [Blake] 1156—ab  
AIRE-LITE: new plastic bandage, [Kulowski] 545—ab  
AIRPLANE: See Aviation  
ALASKA, Northwest Medicine to serve, 112  
ALBUMIN in Blood: See Blood proteins  
diuretic agent in nephritis, [Stare & Thorn] \*1126  
penicillin complex, 594—E  
ALCOHOL Addicts: See Alcoholism  
Butyl: See Butyl Alcohol  
crime and, [Lukas] 1010—ab  
mixing and mixed drinks, 956  
National Committee on Alcohol Hygiene incorporated, 47; (official organ: Alcohol Hygiene) 473  
neurosis and, [Masserman] 1014—ab  
production by body in diabetes, Möllerström's research, 176  
study, Yale University, 723; [Haggard & Jellinek] 1010—C  
ALCOHOLISM, Alcoholics Anonymous, 428; [Rotman] \*567  
center for aid to addicts, Rochester, N. Y., 1066  
clinic for chronic addicts, Washington, D. C., 410—OS  
diagnosis, chemical tests, A.M.A. Committee—National Safety Council joint report, 30—E  
electroencephalogram in, [Greenblatt] 183—ab  
mixing and mixed drinks, 956  
of newborn from alcohol used on mother's breasts, [Gonzaga] 426—ab  
social disease, [Rotman] \*564; (correction) [Haggard & Jellinek] 1010—C  
treatment, 462—E  
treatment: conditioned reflex; hypnosis; electric shock; psychotherapy, 428  
treatment, insulin, [THIM] 1014—ab  
ALFARO, R. J., heads UNRRA mission in Caribbean area, 410—OS  
ALIENS: See Physicians, foreign  
ALKALI reserve, sodium salicylate effect on, [Fashena] 736—ab  
ALLEN'S Method: See Anesthesia, refrigeration  
ALLERGY: See Anaphylaxis and Allergy  
ALLIES: See World War II  
ALL-INDIA Medical Conference, prizes awarded during, 727  
ALLOXAN diabetes, control in rats by high fat diet, 400—E  
diabetes relation to thyroid induced diabetes, [Carrasco-Formiguera] 482—C  
ALL-UNION Institute of Experimental Medicine, 869  
de ALMEIDA, M. O., epilepsy produced in frogs by sudden cooling of spinal cord, 416  
ALOPECIA areata, heredity, 302  
etiology, tryptophan deficiency? 1024

prothrombin time, effects of sodium salicylate, [Fashena] 736—ab  
prothrombin, vitamin K controls hypoprothrombinemia from salicylates, 460—E  
sedimentation (rapid) with early plasma coagulation, 302  
sedimentation rate in infective hepatitis and in malaria, [Wood] 1157—ab
- Serum:** See various subheads under Blood; Blood Transfusion; Serum
- Splitting Up:** See Hemoptysis
- Substitutes:** See Blood Transfusion
- Sugar:** See also Diabetes Mellitus  
sugar and physical inactivity, [Blotner] 1016—ab  
sugar, hypoglycemia, dietary protein in, [Stare & Thorn] \*1125  
sugar, hypoglycemia in adenoma of islets of Langerhans, [Walker] 1151—ab
- Supply:** See Blood circulation
- Test:** See Syphilis serodiagnosis
- Transfusion:** See BLOOD TRANSFUSION
- Types:** See Blood groups
- Universal:** See Blood groups
- Vessels:** See BLOOD VESSELS
- volume determination with dye T-1824,** 222—E  
volume (plasma) in traumatic shock, [Crooke] 365—ab
- BLOOD PRESSURE,** asymmetrical in right and left arm; also higher in morning; treatment with potassium thiocyanate, 555
- High:** See also Nephrosclerosis  
high, antispasmodic action of "hypotensive" extracts on smooth muscles: depropanex and padutin, 522—E  
high, Bogomolets serum for, 174  
high, gift to Dr. Goldblatt for research, 46  
high, increased capillary fragility in, [Griffith] 736—ab
- high malignant, differentiating from terminal glomerulonephritis (renal aspects)** [Corcoran] 358—ab; (cardiac aspects) [Taylor] 359—ab
- high portal, nonsuture portal-caval anastomosis for,** [Blakemore & Lord] \*750
- high, reducing fractions in protein free blood filtrates,** [Holden] 488—ab
- high, symptoms of impending cerebral hemorrhage,** [Taylor & Page] \*384
- low, in Cuna Indians,** 924—E
- nitrite drugs effect on,** [Weaver] 484—ab
- variability in students,** [Salt] 360—ab
- BLOOD TRANSFUSION,** blood bank, government appeals for 100,000 pints, 172—OS
- blood bank, life of whole blood flown to Europe extended to 21 days,** 1059
- blood bank, 193,000 pints flown to wounded,** 1061
- blood bank, malaria from,** 1131—E
- blood bank, plasma service, Dr. Scudder goes to China to organize,** 724
- blood bank, seek fund to finance, N. Y.,** 606; (governor signs bill) 1001
- blood banks, Red Cross blood procurement program for armed forces, also local bank,** [McGinnes, Robinson & others] 100—OS
- blood donor record, Australian gave 83 transfusions totaling about 100 pints,** 291
- blood donor (universal), blood group O as,** 881
- blood substitutes, gelatin,** [Jacobson] 122—ab
- blood substitutes: gelatin and pectin solutions in shock,** [Popper] 1152—ab
- in anemia and hypoproteinemia complicating pneumonia,** [Armstrong & others] \*303
- in Middle Ages,** 149—ab
- in surgical shock,** [Pheister] \*1109
- of centrifuged type O erythrocytes resuspended and stored in corn syrup vs. isotonic sodium chloride solution,** [Thalhimer & Taylor] \*1096
- of plasma, massive,** 881
- of Rh positive blood in erythroblastosis fetalis,** [Darrow] 1146—C
- of whole blood, possible role in military medicine,** 737
- due to Rh incompatibility,** [Karlier] \*627
- patitis,** 683
- also Aorta; Arteries;**
- arteriosclerosis; Arteries;**
- Raynaud's Disease**
- disease (peripheral), oscilometer and thermocouple in diagnosis,** [Moses] 360—ab
- neurovascular syndrome from hyperabduction of arms,** [Wright] 1077—ab
- surgery, nonsuture anastomosis,** [Blakemore & Lord] \*685, \*748
- BLOOD Method:** See Blood cholesterol
- BLUE Cross Plan:** See Hospitals, expense insurance
- BOARD:** See also under specific names as American Board  
for Coordination of Malarial Studies, (testing antimalarial drugs), 650—E
- of Health:** See Health
- of Trustees:** See American Medical Association

**BOBBY PIN**, in food and air passages, magnet for, [Eguen] \*87  
**BODY**, Examination after Death: See Autopsies  
Fluids: See Fluids, body  
Growth: See Growth  
Heat Production of: See Metabolism, basal  
height and weight, fluorine and fractures, 399—E; [McClure] 425—ab  
height, small stature of 13 year old girl, 620  
Organs: See Viscera  
Temperature: See Fever; Skin temperature  
Weight: See Body height and weight; Obesity  
**BOGOMOLETS**, A. A., serum for cancer, arthritis and high blood pressure, 174  
**BOHLERS**, substances used to inhibit corrosion in, corrodic acid and coraval, 683  
**BOILS**: See Furunculosis  
**BOJBS**: See Explosions  
**BONE MARROW**: See also Osteomyelitis  
Infusions in pediatrics, 882

## Medicolegal Abstracts

- BASIC SCIENCE ACTS:** certificate; issuance without examination to existing legal practitioners; provision valid, 945.  
constitutionality upheld, 945  
naturopaths; requirements not unreasonable, 945
- BURNS:** See Malpractice
- CATARACT:** eye; following piercing of eyeball by glass splinters, 295
- CHIROPRACTORS:** See also Malpractice  
"medical treatment;" chiropractic treatment as constituting, 1075
- COMMERCE:** medicine; practice of as constituting, 945
- COMPENSATION OF PHYSICIANS:** services requested by third party, 483
- EMPLOYEE:** medical director as, 182
- EVIDENCE:** See Malpractice; Workmen's Compensation Acts
- EYE:** cataract following piercing of eyeball by glass splinters, 295
- HOSPITALS, CHARITABLE:** labor relations act; applicability to hospital employees, 1148
- HOSPITALS For Profit:** operating table, equipment; injury from objects on, 734
- HOSPITALS, IN GENERAL:** "business undertaking," hospital as, 1148  
trade and commerce, hospital engaged in, 1148
- INDEPENDENT CONTRACTOR:** medical director as, 182
- INFRA RED RAYS:** See Malpractice
- INSURANCE, LIFE:** "medical treatment" construed to include chiropractic treatment, 1075
- LABOR RELATIONS ACTS:** hospital employees; applicability of act, 1148
- MALPRACTICE:** anesthetized patient; injury to res ipsa loquitur doctrine applicable, 734  
bone peg; use of broken steel drill as, 614  
burns, infra red treatment; explosion of bulb, 355  
chiropractors; infra red treatment; explosion of bulb, 355  
drill; fragment left in humerus as bone peg, 614  
evidence; res ipsa loquitur; doctrine applicable, 734  
evidence; witnesses, expert; necessity for, 614  
foreign bodies; drill; fragment left in fractured humerus, 614  
infra red treatment; explosion of bulb, 355  
limitation of actions; accrual of right of action, 295  
limitation of actions; concealment of injury, 295  
limitation of actions; fraud as suspending statute, 295
- MEDICAL SERVICES:** chiropractic treatments as constituting, 1075
- MEDICINE, PRACTICE OF:** as commerce, 945
- NATUROPATHY:** basic science requirement valid, 945
- PNEUMOCONIOSIS:** silicosis, second stage; impairment of capacity to work; necessity for, 121
- ROENTGENOGRAMS:** as evidence of silicosis, 121
- SELECTIVE SERVICE AND TRAINING ACT:** veterans; right to former employment, 182
- SHERMAN ANTI-TRUST ACT:** intrastate practice of naturopathy in relation to, 945
- SILICOSIS:** See Pneumoconiosis
- STATUTE OF LIMITATIONS:** See Malpractice, limitation of actions
